**CommonName:**

Site 4

BroadAgeCategory: LIA

Site Category: Stone walling

**SiteComments:**

This site is an even larger than the first one and also consists of a wide variety of stone walling. The site is found on and around another one of the stone hills within the mine boundary. At least 18 different circular shaped walls were identified, but again the extremely dense vegetation made an accurate count impossible. The diameter of the walling varies between 7 and 20 m and the height between 0,40 and 1,20 m. After completion of the field work the area was checked on Google and it seems that a few more stone walls than those identified in the field, are present. A reservoir on the hill most likely has damaged some of the walling on site.

Damage Types:
