Site Category: Shell Midden

**SiteComments:**

This site is characterised by several dense patches of virtually whole shell. It would appear that even the surface indications of this site have been minimally disturbed - mole activity here appears to be low. No artefacts were seen although fragments of ostrich egg shell (used both as a food and a commodity by prehistoric people) were seen among the shells. Shell species represented are *Patella granatina*, *Patella granularis* and *Choromytilus meridionalis*. Other species present in lesser quantities are *Patella argenvillei*, *Patella barbara*, *Patella cochlear*, *Burnupena* sp. and *Donax serra*.

Damage Types:
