

### mineral resources

Department: Mineral Resources REPUBLIC OF SOUTH AFRICA

## BASIC ASSESSMENT REPORT And ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT

SUBMITTED FOR ENVIRONMENTAL AUTHORIZATIONS IN TERMS OF THE NATIONAL ENVIRONMENTAL MANAGEMENT ACT, 1998 AND THE NATIONAL ENVIRONMENTAL MANAGEMENT WASTE ACT, 2008 IN RESPECT OF LISTED ACTIVITIES THAT HAVE BEEN TRIGGERED BY APPLICATIONS IN TERMS OF THE MINERAL AND PETROLEUM RESOURCES DEVELOPMENT ACT, 2002 (MPRDA) (AS AMENDED).

NAME OF APPLICANT: Mwelase Group of Companies (Pty) Ltd

TEL NO:011 802 0565FAX NO:NAPOSTAL ADDRESS:Ground Floor, West Block; 28 Fricker Road; Illovo, SandtonPHYSICAL ADDRESS:Ground Floor, West Block; 28 Fricker Road; Illovo, SandtonFILE REFERENCE NUMBER SAMRAD: MP 30/5/1/1/2/16645PR

#### **1. IMPORTANT NOTICE**

In terms of the Mineral and Petroleum Resources Development Act (Act 28 of 2002 as amended), the Minister must grant a prospecting or mining right if among others the mining **%** ill not result in unacceptable pollution, ecological degradation or damage to the environment+.

Unless an Environmental Authorisation can be granted following the evaluation of an Environmental Impact Assessment and an Environmental Management Programme report in terms of the National Environmental Management Act (Act 107 of 1998) (NEMA), it cannot be concluded that the said activities will not result in unacceptable pollution, ecological degradation or damage to the environment.

In terms of section 16(3)(b) of the EIA Regulations, 2014, any report submitted as part of an application must be prepared in a format that may be determined by the Competent Authority and in terms of section 17 (1) (c) the competent Authority must check whether the application has taken into account any minimum requirements applicable or instructions or guidance provided by the competent authority to the submission of applications.

It is therefore an instruction that the prescribed reports required in respect of applications for an environmental authorisation for listed activities triggered by an application for a right or a permit are submitted in the exact format of, and provide all the information required in terms of, this template. Furthermore please be advised that failure to submit the information required in the format provided in this template will be regarded as a failure to meet the requirements of the Regulation and will lead to the Environmental Authorisation being refused.

It is furthermore an instruction that the Environmental Assessment Practitioner must process and interpret his/her research and analysis and use the findings thereof to compile the information required herein. (Unprocessed supporting information may be attached as appendices). The EAP must ensure that the information required is placed correctly in the relevant sections of the Report, in the order, and under the provided headings as set out below, and ensure that the report is not cluttered with uninterpreted information and that it unambiguously represents the interpretation of the applicant.

#### 2. Objective of the basic assessment process

The objective of the basic assessment process is to, through a consultative process

- (a) determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context;
- (b) identify the alternatives considered, including the activity, location, and technology alternatives;
- (c) describe the need and desirability of the proposed alternatives,
- (d) through the undertaking of an impact and risk assessment process inclusive of cumulative impacts which focused on determining the geographical, physical, biological, social, economic, heritage, and cultural sensitivity of the sites and locations within sites and the risk of impact of the proposed activity and technology alternatives on the these aspects to determine:
  - (i) the nature, significance, consequence, extent, duration, and probability of the impacts occurring to; and
  - (ii) the degree to which these impacts-
    - (aa) can be reversed;
    - (bb) may cause irreplaceable loss of resources; and
    - (cc) can be managed, avoided or mitigated;
- (e) through a ranking of the site sensitivities and possible impacts the activity and technology alternatives will impose on the sites and location identified through the life of the activity to-
  - (i) identify and motivate a preferred site, activity and technology alternative;
  - (ii) identify suitable measures to manage, avoid or mitigate identified impacts; and
  - (iii) identify residual risks that need to be managed and monitored.

#### PART A

#### SCOPE OF ASSSSMENT AND BASIC ASSESSMENT REPORT

3. Contact Person and correspondence address

#### a) Details of

#### i) Details of the EAP

Name of The Practitioner: Tim van Stormbroek Tel No.: 082 483 6303 Fax No. : NA e-mail address: tim@amberearth.co.za

#### ii) Expertise of the EAP.

#### (1) The qualifications of the EAP

Tim holds a Magister Technologiae (MTech) in Environmental Health (Ecotoxicology) and has studied various additional short courses. He started his professional career at the Impact Assessment cc assessing and writing reports on noise, chemical and thermal stresses and ventilation and illumination. At the same time and over a 5 year period he was also lecturing at the Cape Peninsula University of Technology (CPUT) and HACCP Academy on Occupation Health, Anatomy and Physiology, Management Practice and Food Hygiene. He was under full time employment at Ferret Mining and Environmental Service (Pty) Ltd for a 10 year period and was responsible for all aspects of environmental management with emphasis on EIA¢, BAR¢ WULA¢, monitoring and reporting in the mining industry. All related stakeholder engagement requirements on various projects was also undertaken. He is a qualified Radiation Protection Officer (RPO) registered with the National Nuclear Regulator and is also experienced in ISO 14001:2004 system development and implementation and is qualified as a lead auditor (TÜV SÜD). Tim has been leading Amber Earth consultancy since 2013. A copy of the applicable qualifications is available.

#### (2) Summary of the EAP's past experience.

(In carrying out the Environmental Impact Assessment Procedure) The following Project examples are provided:

British American Tobacco

- " Waste License Application via NEMA Sec24G process
- " Environmental Authorisation for Solar PV Project
- Water Use License

Masama Coal (Botswana)

" EIA: Waste stream specialist study

Mzimkhulu Colliery

- EMP Amendment
- ´ WULA

- Monthly EMP and WUL compliance monitoring
- Tasman RSA Mines
- " Public Consultation Process project management
- " Scoping, EIA/EMPr, Closure Plan Development
- " Departmental Liaison

Central Rand Gold Ltd

- Monthly EMP Compliance Monitoring
- " Monthly Surface and Ground Water monitoring and reporting
- " Certificate of Registration application development and NNR approval
- " Public consultation

Wescoal Mining

- "Weekly waste management compliance inspection
- " Monthly EMP Compliance Monitoring
- " Monthly Surface and Ground Water monitoring and reporting
- " Monthly Change House Swab sampling
- " DMR/DWS Submission and liaison
- " Annual Water Use License External Audits
- " EMPr Amendment and Consolidation
- " Closure Plan Development

Bokoni Platinum Mine

- "Bi-annual Sewage Plant Audits (5 x sewage treatment plants)
- Annual Waste Management Audits
- " Soil contamination assessment
- " EMPr Consolidation
- Closure Plan Revision

Eskom Generation - Coal

- " ISO14001 Certification audits under TÜV SÜD for 13 Eskom Power Stations Eskom Generation. Nuclear
- ISO14001 Certification audits under TÜV SÜD for Koeberg Power Stations Kendal Siding
- " WUL application
- " Dust fall out monitoring (monthly)
- " Surface and ground water monitoring (monthly)

Transalloys

- Alien Vegetation Assessment and control programme
- " Ground Water Impact Assessment

Anglo Coal: Kleinkopje Colliery

- <sup>"</sup> Section 102 EMPr amendment
- <sup>"</sup> EMPr amendment public consultation process
- <sup>~</sup> Independent Power Producer (Khanyisa Power Station) EIA: Waste Stream Specialist Study Keldoron

c) Locality map (show nearest town, scale not smaller than 1:250000).

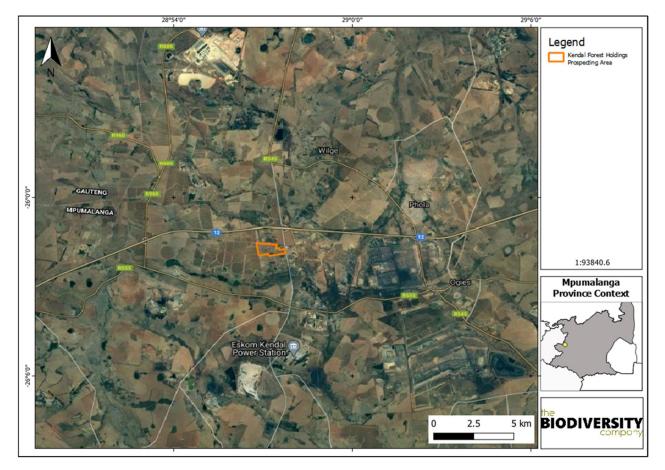

Figure 1: Locality Plan

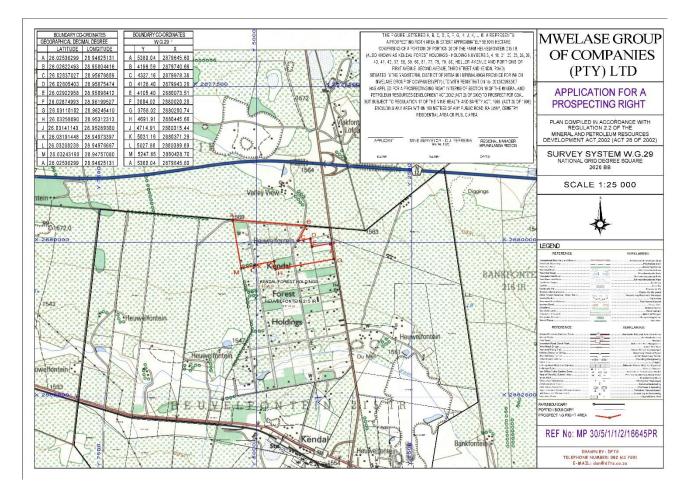

Figure 2: Regulation 2.2 plan indicating prospecting application area.

#### d) Description of the scope of the proposed overall activity.

The applicant, Mwelase Group of Companies Pty Ltd, are applying for a prospecting Right over the abovementioned properties for coal. Figure 3 below illustrates the application area relative to the individual plots as well as the initial 15 bore hole positions. Later infill bore holes will be sited in accordance with resource results.

Figure 3. Positions of initial bore hole locations.

#### (i) Listed and specified activities

| NAME OF ACTIVITY (All activities<br>including activities not listed)<br>(E.g. For Prospecting: drill sites, site<br>camp, ablution facilities,<br>accommodation, equipment storage,<br>sample storage, site office, access<br>route, etcetc)  | Aerial extent of the<br>Activity<br>Ha or m²   | LISTED<br>ACTIVITY<br>Mark with an X<br>where applicable<br>or affected. | APPLICABLE<br>LISTING<br>NOTICE<br>(GNR 544, GNR<br>545 or GNR<br>546)/NOT<br>LISTED |
|---|--|--|--|
| Prospecting:<br>An initial 15 diamond core drill<br>holes (64mm diameter) are planned<br>within the prosecting application<br>area. These will be drilled to an<br>approximate depth of 40mbs.<br>A diamond drill rig and it associated<br>infrastructure (i.e. sump) require<br>approximately 115m <sup>2</sup> at each drill<br>site.<br>In-fill drilling will be conducted<br>based on the PWP and results of<br>initial drilling. | 88,1011 hectares   | X<br>Activity 20   | GN R327  |
| Ancillary Activities:<br>Site office: this will be off-site<br>Sample/core storage: this will be<br>off-site<br>Equipment Storage: this will be off-<br>site.   | Off-site   | NA   | NA   |
| Ablution Facilities:<br>A single chemical toilet will be<br>made available for the drilling team<br>at the drill rig.   | Within the 115m <sup>2</sup> drill pad area.   | NA   | NA   |
| Site Access:<br>No road access development is<br>planned. The best practical route<br>from the plot entrance to the bore<br>hole site will be discussed with<br>each land owner/occupier. Due to<br>the short duration of drilling no road<br>development/clearing will be<br>required.   | This will be agreed<br>with the land<br>owner/legal occupier<br>within the total<br>88,1011 hectares | NA   | NA   |
| <u>Clearance of Vegetation:</u><br>Clearance of vegetation will be<br>limited to the drill pad area and will<br>be done in consultation with the<br>land owner/occupier.  | Within the 115m <sup>2</sup> drill pad area.   | NA   | NA   |

#### (ii) Description of the activities to be undertaken

| Non-Invasive Prospecting: | digital desktop map work   |
|---------------------------|--|
| Invasive Prospecting:     | Diamond core drilling and core logging and evaluation                          |
| Bore Hole rehabilitation: | Capping of bore hole with a suitable stone/slab/cover which will not allow the |
|                           | topsoil cover to subside.  |
|                           |  |

Scarification of final drill footprint topsoil.

#### e) Policy and Legislative Context

| APPLICABLE LEGISLATION AND<br>GUIDELINES USED TO COMPILE THE<br>REPORT<br>(a description of the policy and legislative context<br>within which the development is proposed including<br>an identification of all legislation, policies, plans,<br>guidelines, spatial tools, municipal development<br>planning frameworks and instruments that are<br>applicable to this activity and are to be considered<br>in the assessment process | REFERENCE<br>WHERE<br>APPLIED                           | HOW DOES THIS<br>DEVELOPMENT COMPLIY WITH<br>AND RESPOND TO THE<br>LEGISLATION AND POLICY<br>CONTEXT.<br>(E.g. In terms of the National Water Act a<br>Water Use License has/ has not been applied<br>for) |
|---|---|--|
| National Environmental Management Act<br>(Act 107 of 1998)  | Chapter 6 of<br>GNR 982<br>promulgated<br>under<br>NEMA | Environmental Authorisation<br>has been applied for<br>prospecting. No prospecting<br>will take place without an<br>approved prospecting right.  |

#### f) Need and desirability of the proposed activities.

When assessing the need and desirability of this prospecting right application, the following needs to be considered:

- The intended purpose of a prospecting right application for coal is to pursue a mining right application should the resource justify this and all the legislated requirements be met.
- The Kusile Power Station site/position was historically selected based primarily on the local coal resources to supply the power station for its lifetime.
- The Kendal Power Station is also in close proximity to this prospecting application area.
- Its location and relative proximity between the Kendal and now operational Kusile Power Stations makes this potential resource important for the Eskom fleet.

#### g) Motivation for the overall preferred site, activities and technology alternative.

The availability and geographic location of the mineral resource that the applicant wishes to prospect dictates the preferred location to a large degree. The location of the bore holes are determined by the anticipated location of the mineral resource. Although the location of the minerals cannot be altered, the impact of the prospecting footprint associated with drilling has been assessed in this BAR.

Key criteria for consideration when identifying need, alternatives and preferred location include practicability, feasibility, relevance, reasonability and viability. Mwelase Group of Companies propose to follow the most pragmatic prospecting method to determine and evaluate the mineral resource while minimizing surface disturbance.

## h) Full description of the process followed to reach the proposed preferred alternatives within the site.

Since no site infrastructure is planned for this prospecting right application, no site alternatives have been considered. The positions of the initial bore holes (which constitutes site activities) as indicated in Figure 3 above were sited by the project Geologist based on the Prospecting Work Programme and the initial resource determination drilling. The final actual location of each bore hole will be finalised through liaison with the landowner and/or occupier where applicable. Wherever possible existing infrastructure must be avoided.

#### i) Details of the development footprint alternatives considered.

The only alternative/s that can be considered for this prospecting application are the locations of bore hole positions. This is because no other infrastructure is planned on site. All other infrastructure such as offices/core storage/equipment storage/vehicle over-night parking will be off-site.

The final location/siting of bore holes will be done in consultation with the landowners and/or land occupier to ensure that impact/s on existing plot infrastructure is minimized.

#### ii) Details of the Public Participation Process Followed

#### Site Notices:

Site notices will be placed on the boundary of the application area on 15 January 2021. A copy of these site notices and evidence of their erection with coordinates will be provided in Appendix 3.

#### **News Paper Advert:**

A newspaper advert will be placed in the Witbank News and published on 15 January 2021. A copy of the advert proof as well as the news paper tear page will be provided in Appendix 3.

#### **Background Information Document:**

The Background Information Document (BID) included the following information:

- Proposed Activities
- Location Map
- Initial bore hole location map
- NEMA Listed Activity
- DMRE Reference number
- Size of the application area
- Contact details of the EAP
- Invitation to comment on the Draft BAR
- A description of the anticipated scale of the impact of prospecting drilling
- Notification of the 30 day comment period (a total time of 32 days has been provided)
- A IAP Registration and Comment sheet
- Mechanism for providing comment either in hard copy (i.e. handed back to the EAP during one-on-one consultation or scanned and emailed or photographed and sent via WhatsApp).

A Background Information Document was prepared and distributed by hand to all land owners/occupiers where such persons were available on their properties. Each person who received the BID were requested to sign for receipt. Where no person was available the BID was emailed to those where email addresses were available. Where only postal addresses were available the BID was set via registered mail.

#### **Public Meeting:**

A public meeting opportunity is normally available to all IAPs on request however the COVID-19 Level 3 lockdown at the time of consultation meant that socially distanced one-on-one consultation and remote consultation were favoured. It should however the stated that no requests for consultation were denied. A 1 hour MS Teams meeting was arranged and held with the legal representatives of Plot 1 on 10 February 2021.

#### Door to door Consultation:

On Friday 15 January 2021 the Amber Earth team will conduct door-to-door consultation of the affected plots as well as the neighbouring plots. A record of this consultation and physical distribution of the BIDs will be included in Appendix 3.

#### iii)

#### Project Area in Relation to the Mpumalanga Biodiversity Sector Plan

The key output of this systematic biodiversity plan is a map of biodiversity priority areas (MTPA, 2014). The MBSP CBA map delineates Critical Biodiversity Areas, Ecological Support Areas, Other Natural Areas, Protected Areas, and areas that have been irreversibly modified from their natural state (MTPA, 2014).

**CBAs** are terrestrial and aquatic areas of the landscape that need to be maintained in a natural or near-natural state to ensure the continued existence and functioning of species and ecosystems and the delivery of ecosystem services. CBAs are areas of high biodiversity value and need to be kept in a natural state, with no further loss of habitat or species (MTPA, 2014). Thus, if these areas are not maintained in a natural or near natural state then biodiversity targets cannot be met. Maintaining an area in a natural state can include a variety of biodiversity compatible land uses and resource uses (SANBI-BGIS, 2017).

The Mpumalanga Biodiversity Sector Plan (MBSP) specifies two different CBA areas, **Irreplaceable CBA's and Optimal CBA's**. Irreplaceable CBA¢ include: (1) areas required to meet targets and with irreplaceability biodiversity values of more than 80%; (2) critical linkages or pinch-points in the landscape that must remain natural; or (3) critically Endangered ecosystems (MTPA, 2014).

**ESAs** are not essential for meeting biodiversity targets but play an important role in supporting the ecological functioning of Critical Biodiversity Areas and/or in delivering ecosystem services. Critical Biodiversity Areas and Ecological Support Areas may be terrestrial or aquatic (SANBI-BGIS, 2017).

**ONAs** consist of all those areas in good or fair ecological condition that fall outside the protected area network and have not been identified as CBAs or ESAs. A biodiversity sector plan or bioregional plan must not specify the desired state/management objectives for ONAs or provide land-use guidelines for ONAs (SANBI-BGIS, 2017).

**Moderately or Heavily Modified Areas** (sometimes called ±ransformedqareas) are areas that have been heavily modified by human activity so that they are by-and-large no longer natural, and do not contribute to biodiversity targets (MTPA, 2014). Some of these areas may still provide limited biodiversity and ecological infrastructural functions but, their biodiversity value has been significantly, and in many cases irreversibly, compromised.

Error! Reference source not found. shows the project area overlaps with the terrestrial features classified as

- Heavily modified;
- Moderately modified -old lands; and
- Other Natural areas.

Figure 7-1 The project area superimposed on the Mpumalanga Biodiversity Sector Plan, Terrestrial CBA (MTPA, 2014).

#### Project Area in Relation to the NBA

The National Biodiversity Assessment (NBA) was completed as a collaboration between the SANBI, the DEA and other stakeholders, including scientists and biodiversity management experts throughout the country over a three-year period (Skowno *et al.*, 2019).

The purpose of the NBA is to assess the state of South Africac biodiversity with a view to understanding trends over time and informing policy and decision-making across a range of sectors (Skowno *et al.*, 2019).

The two headline indicators assessed in the NBA are *ecosystem threat status* and *ecosystem protection level* (Skowno *et al.*, 2019).

#### (a) Ecosystem Threat Status

Ecosystem threat status outlines the degree to which ecosystems are still intact or alternatively losing vital aspects of their structure, function and composition, on which their ability to provide ecosystem services ultimately depends (Skowno *et al.*, 2019).

Ecosystem types are categorised as Critically Endangered (CR), Endangered (EN), Vulnerable (VU) or Least Threatened (LT), based on the proportion of each ecosystem type that remains in good ecological condition (Skowno *et al.*, 2019).

The project area was superimposed on the terrestrial ecosystem threat status (Figure Error! No text of specified style in document.-1). The whole project area is situated in a VU ecosystem (Figure Error! No text of specified style in document.-1).

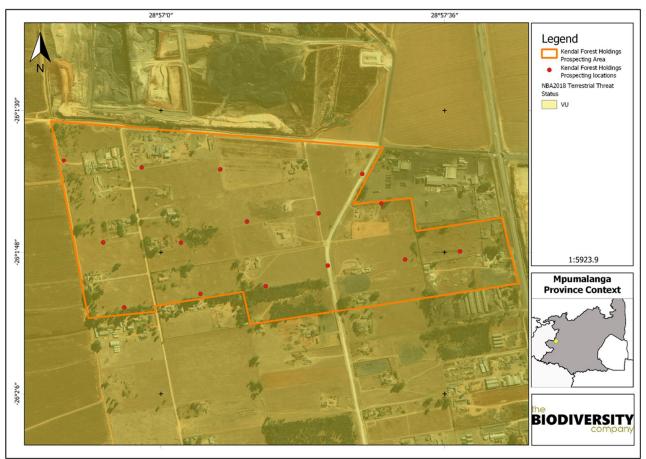

Figure Error! No text of specified style in document.-1. The project area showing the regional ecosystem threat status of the associated terrestrial ecosystems (NBA, 2018).

#### **Ecosystem Protection Level**

Ecosystem protection level tells us whether ecosystems are adequately protected or under-protected. Ecosystem types are categorised as not protected, poorly protected, moderately protected or well protected, based on the proportion of each ecosystem type that occurs within a protected area recognised in the Protected Areas Act (Skowno *et al.*, 2019).

The project area was superimposed on the ecosystem protection level map to assess the protection status of terrestrial ecosystems associated with the prospecting (Figure Error! No text of specified style in document.-2). Based on Figure Error! No text of specified style in document.-2 the terrestrial ecosystems associated the project

area is classified as *poorly protected*. This means that these ecosystems are considered not to be adequately protected in areas such as national parks or other formally protected areas.

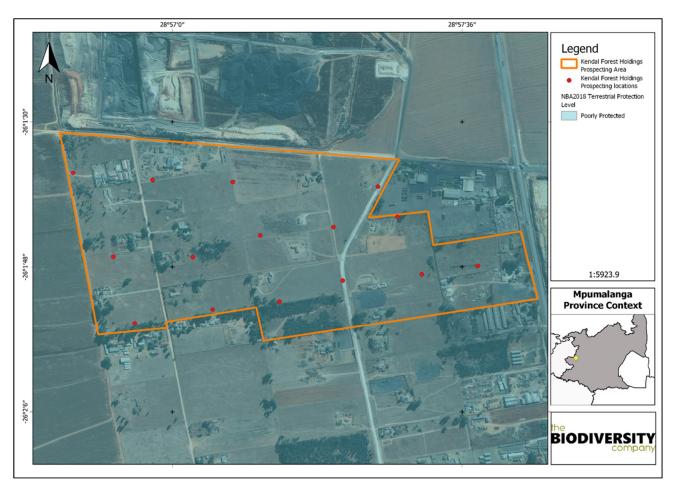

Figure Error! No text of specified style in document.-2. The project area showing the regional level of protection of terrestrial ecosystems (NBA, 2018).

#### Wetland National Biodiversity Assessment

This spatial dataset is part of the South African Inventory of Inland Aquatic Ecosystems (SAIIAE) which was released as part of the National Biodiversity Assessment (NBA) 2018. National Wetland Map 5 includes inland wetlands and estuaries, associated with river line data and many other data sets within the South African Inventory of Inland Aquatic Ecosystems (SAIIAE) 2018.

Ecosystem threat status (ETS) of river ecosystem types is based on the extent to which each river ecosystem type had been altered from its natural condition. Ecosystem types are categorised as CR, EN, VU or LC, with CR, EN and VU ecosystem types collectively referred to as <u>#hreatenedq(Van Deventer *et al.*, 2019;</u> Skowno *et al.*, 2019).

Figure Error! No text of specified style in document.-**3** shows that no wetlands can be found in or within the 500m regulated area based on the NBA (2018) data (Figure Error! No text of specified style in document.-**4**).

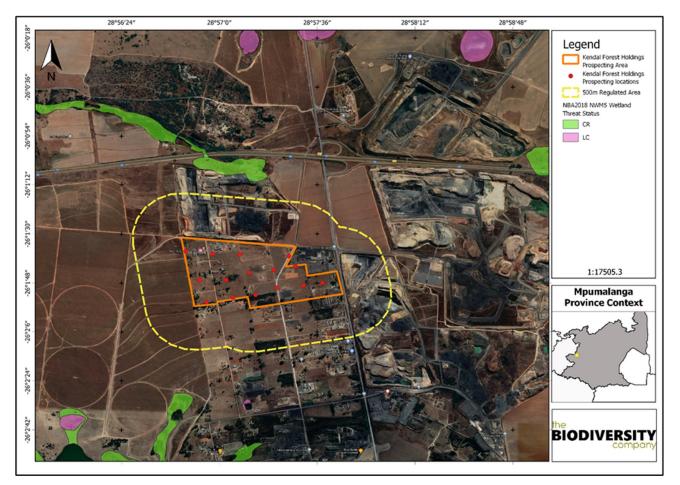

Figure Error! No text of specified style in document.-3. The project area in relation to the NBA threat status of the wetlands (NBA, 2018)

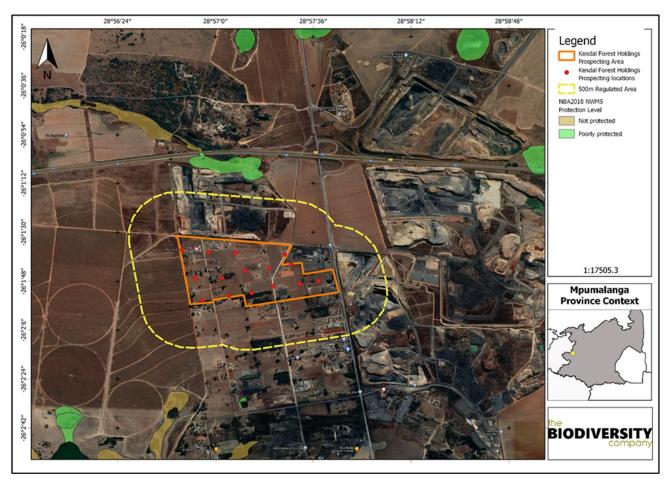

Figure Error! No text of specified style in document.-4. The project area in relation to the NBA Protection level of the wetlands (NBA, 2018).

#### Mpumalanga Highveld Wetlands

The purpose of the Mpumalanga Highveld Grasslands Wetland project was to:

- Ground-truth and refine the current data layers of the extent, distribution, condition and type of freshwater ecosystems in the Mpumalanga Highveld coal belt, to support informed and consistent decision-making by regulators in relation to the water-biodiversity-energy nexus;
- To incorporate these revised data layers into the atlas of high-risk freshwater ecosystems and guidelines for wetland offsets, currently being developed by SANBI, to improve the scientific robustness of these tools; and
- To support the uptake, and development of the necessary capacity to apply the data, atlas and guidelines by regulators and the coal mining industry in their planning and decision-making processes (SANBI, 2012).

The Mpumalanga Highveld Grasslands Wetland data also classifies NFEPA land cover based on the defined condition of each area. These are known as the NFEPA wetland conditions categories. The categories are listed in Table Error! No text of specified style in document.-2 and are represented in relation to the project area in Figure Error! No text of specified style in document.-5.

## Table Error! No text of specified style in document.-2. A breakdown of the NFEPA wetland condition categories as defined by the MH dataset

Figure Error! No text of specified style in document.**-5** below shows the project area in relation to the Mpumalanga Highveld Grasslands Wetland data as provided by SANBI. The project area does not intersect with FEPA wetlands.

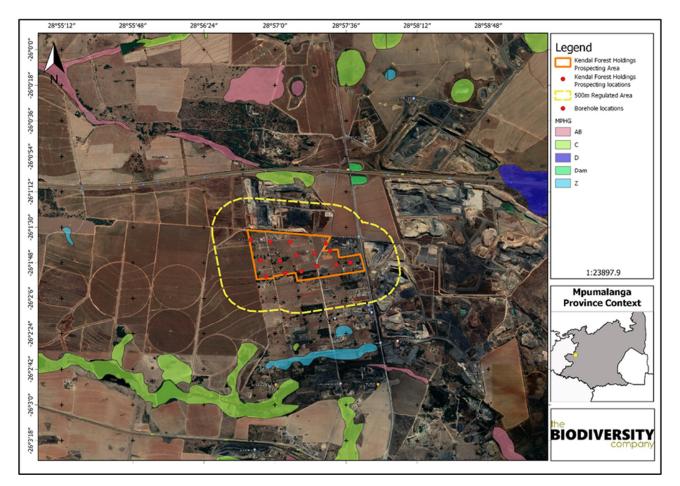

Figure Error! No text of specified style in document.-5. Shows the overall project area in relation to the Mpumalanga Highveld Grasslands Wetlands (SANBI, 2012).

#### Vegetation Assessment

The project area is situated within the grassland biome. This biome is centrally located in southern Africa, and adjoins all except the desert, fynbos and succulent Karoo biomes (Mucina & Rutherford, 2006). Major macroclimatic traits that characterise the grassland biome include:

- Seasonal precipitation; and
- The minimum temperatures in winter (Mucina & Rutherford, 2006).

The grassland biome is found chiefly on the high central plateau of South Africa, and the inland areas of KwaZulu-Natal and the Eastern Cape. The topography is mainly flat and rolling but includes the escarpment itself. Altitude varies from near sea level to 2 850 m above sea level.

Grasslands are dominated by a single layer of grasses. The amount of cover depends on rainfall and the degree of grazing. The grassland biome experiences summer rainfall and dry winters with frost (and fire), which are unfavourable for tree growth. Thus, trees are typically absent, except in a few localized habitats. Geophytes (bulbs) are often abundant. Frosts, fire and grazing maintain the grass dominance and prevent the establishment of trees.

#### Vegetation Types

The grassland biome comprises many different vegetation types. The whole project area is found within the Eastern Highveld Grassland according to Mucina & Rutherford (2006) (Figure Error! No text of specified style in document.-6).

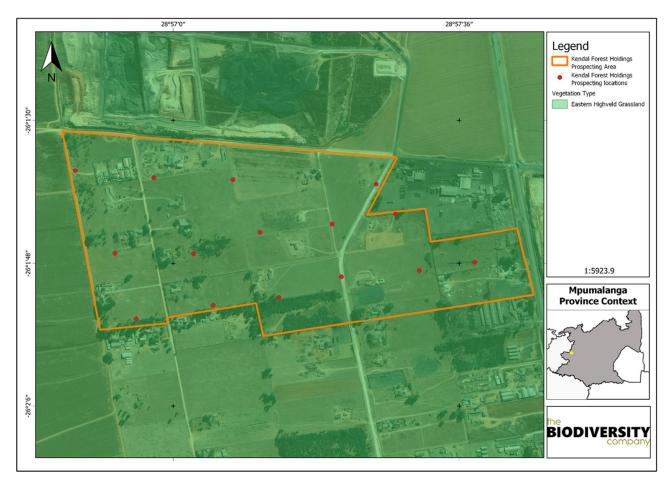

Figure Error! No text of specified style in document.-6. The project area showing the vegetation type based on the Vegetation Map of South Africa, Lesotho & Swaziland (BGIS, 2018).

#### Eastern Highveld Grassland

This vegetation type occurs on slightly to moderately undulating planes, including some low hills and pan depressions. The vegetation is a short dense grass land dominated by the usual highveld grass composition (*Aristida, Digitaria, Eragrostis, Themeda, Tristachya* etc.) with small scattered rocky outcrops with, wiry sour grasses and some woody species. Some 44% transformed primarily by cultivation, plantations, mines, urbanisation and by building of dams. No serious alien invasions are reported (Mucina & Rutherford, 2006).

#### Important Plant Taxa

Important plant taxa are those species that have a high abundance, a frequent occurrence or are prominent in the landscape within a particular vegetation type (Mucina & Rutherford, 2006).

The following species are important in the Eastern Highveld Grassland vegetation type:

**Graminoids:** Aristida aequiglumis, A. congesta, A. junciformis subsp. Galpinii, Brachiaria serrata, Cynodon dactylon, Digitaria monodactyla, D. tricholaenoides, Elionurus muticus, Eragrostis chloromelas, E. curvula, E plana, E racemosa E sclerantha Heteropogon contortus, Loudetia simplex, Microchloa caffra, Monocymbium ceresiiforme, Setaria sphacelata, Sporobolus africanus, S. pectinatus, Themeda triandra, Trachypogon spicatus, Tristachya leucothrix, T. rehmanni, Alloteropsis semialata subsp. eckloniana, Andropogon appendiculatus, A schirensis, Bewsia biflora, Ctenium concinnum, Diheteropogon amplectens, Eragrostis capensis, E. gummiflua, E. patentissima, Harpochloa falx, Panicum natalense, Rendlia altera, Schizachyrium sanguineum, Setaria nigrirostris, Urelytrum agropyroides;

**Herbs:** Berkheya setifera, Haplocarpha scaposa, Justicia anagalloides, Acalypha angusta, Chamaecrista mimosoides, Dicoma anomala, Euryops gilfillanii, E. transvalensis subsp. setilobus, Helichrysum aureonitens, H caespititium, H. callicomum, H. oreophilum, H. caespititium, H. oreophilum, H rugulosum, ipomoea crassipes,

Pentanisia prunelloides subsp. latifolia, Selago densiflora, Senecio coronatus, Vernonia oligocephala, Wahlenbergia undulata;

**Geophytic herbs:** Gladiolus crassifolius, Haemanthus humilis subsp. hirsutus, Hypoxis rigidula var. pilosissima, Ledebouria ovatifolia;

Succulent herb: Aloe ecklonis; and

Low shrubs: Anthospermum rigidum subsp. pumilum, Stoebe plumosa.

#### **Conservation Status**

According to Mucina and Rutherford (2006), this vegetation type is classified as Endangered. The national target for conservation protection for both these vegetation types is 24%, but only a few patches are statutorily conserved in Nooitgedacht Dam and Jericho Dam Nature Reserves and in private reserves (Holkranse, Kransbank, Morgenstond).

Some 44% of this vegetation type has already been transformed primarily by cultivation, plantations, mines, urbanisation and by building of dams. Cultivation may have had a more extensive impact, indicated by land-cover data. No serious alien invasions are reported, but *Acacia mearnsii* can become dominant in disturbed sites.

#### Plant Species of Conservation Concern

Based on the Plants of Southern Africa (BODATSA-POSA, 2019) database, 485 plant species have the potential to occur in the project area and its surroundings (Figure Error! No text of specified style in document.-7). Of these 485 plant species, four are classified as Species of Conservation Concern (SCC) (Table Error! No text of specified style in document.-3).

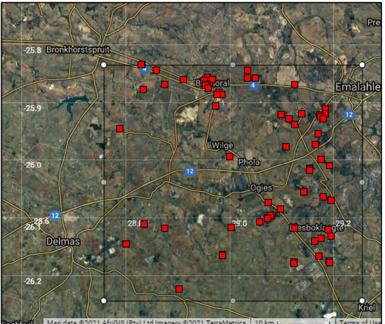

Figure Error! No text of specified style in document.-7. Map showing the grid drawn in order to compile an expected plant species list (BODATSA-POSA, 2019)

#### Table Error! No text of specified style in document.-3. Plant species of conservation concern

| Family         | Taxon                    | Author         | IUCN | Ecology             |
|----------------|--------------------------|----------------|------|---------------------|
| Hyacinthaceae  | Merwilla plumbea         | (Lindl.) Speta | NT   | Indigenous          |
| Amaryllidaceae | Nerine gracilis          | R.A.Dyer       | VU   | Indigenous; Endemic |
| Fabaceae       | Argyrolobium longifolium | (Meisn.) Walp. | VU   | Indigenous; Endemic |
| Iridaceae      | Gladiolus paludosus      | Baker          | VU   | Indigenous          |

#### **Faunal Assessment**

#### Avifauna

Based on the South African Bird Atlas Project, Version 2 (SABAP2) database, 236 bird species have the potential to occur in the vicinity of the project area. The full list of potential bird species is provided in Appendix B of the specialist report.

Of the potential bird species, twelve (12) species are listed as SCC either on a regional or global scale (Table Error! No text of specified style in document.-4).

The SCC include the following:

- Two (2) species that are listed as EN on a regional basis;
- Four (4) species that are listed as VU on a regional basis; and
- Six (6) species that are listed as NT on a regional basis.

On a global scale, three (3) species are listed as VU and three (3) species as NT (Table Error! No text of specified style in document.-4).

## Table Error! No text of specified style in document.-4. List of bird species of regional or global conservation importance that are expected to occur in close vicinity to the project area.

| Species                  | Common Name               | Conservation           | Likelihood of |            |
|--------------------------|---------------------------|------------------------|---------------|------------|
|                          |                           | Regional (SANBI, 2016) | IUCN (2017)   | Occurrence |
| Alcedo semitorquata      | Kingfisher, Half-collared | NT                     | LC            | Low        |
| Anthropoides paradiseus  | Crane, Blue               | NT                     | VU            | Low        |
| Circus ranivorus         | Marsh-harrier, African    | EN                     | LC            | Low        |
| Geronticus calvus        | Ibis, Southern Bald       | VU                     | VU            | Moderate   |
| Glareola nordmanni       | Pratincole, Black-winged  | NT                     | NT            | Low        |
| Mycteria ibis            | Stork, Yellow-billed      | EN                     | LC            | Low        |
| Oxyura maccoa            | Duck, Maccoa              | NT                     | NT            | Low        |
| Phoenicopterus minor     | Flamingo, Lesser          | NT                     | NT            | Low        |
| Phoenicopterus ruber     | Flamingo, Greater         | NT                     | LC            | Low        |
| Sagittarius serpentarius | Secretarybird             | VU                     | VU            | Moderate   |
| Sterna caspia            | Tern, Caspian             | VU                     | LC            | Low        |
| Tyto capensis            | Grass-owl, African        | VU                     | LC            | Low        |

*Geronticus calvus* (Southern Bald Ibis) is listed as VU on a regional basis and prefers high rainfall (>700 mm p.a.), sour and alpine grasslands, with an absence of trees and a short, dense grass sward and also occurs in lightly wooded and relatively arid country. It forages on recently burned ground, also using unburnt natural grassland, cultivated pastures, reaped maize fields and ploughed areas. It has a varied diet, mainly consisting of insects and other terrestrial invertebrates (IUCN, 2017). The likelihood of occurrence is rated as moderate as suitable foraging habitat can be found in the project area.

Sagittarius serpentarius (Secretarybird) occurs in sub-Saharan Africa and inhabits grasslands, open plains, and lightly wooded savanna. It is also found in agricultural areas and sub-desert (IUCN, 2017). The likelihood of occurrence is rated as moderate as suitable grasslands can be found in the project area, the level of disturbance nearby does decrease the likelihood of occurrence of this species.

#### Mammals

The IUCN Red List Spatial Data (IUCN, 2017) lists 74 mammal species that could be expected to occur within the project area. Species that are generally restricted to protected areas such as game reserves, are not expected to occur in the project area and were removed from the expected species list.

Of the 74 mammal species, sixteen (16) are listed as being of conservation concern on a regional or global basis (Table Error! No text of specified style in document.-5).

The list of potential species includes:

- Three (3) that are listed as EN on a regional basis;
- Five (5) that are listed as VU on a regional basis;
- Seven (7) that are listed as NT on a regional scale.

On a global scale, 1 is listed as EN, 2 are listed as VU and 5 as NT (Table Error! No text of specified style in document.-5).

### Table Error! No text of specified style in document.-5. List of mammal species of conservation concern that may occur in the project area as well as their global and regional conservation statuses.

| Species                 | Common Name                     | Conservation Sta       | Likelihood of |            |
|-------------------------|---------------------------------|------------------------|---------------|------------|
|                         |                                 | Regional (SANBI, 2016) | IUCN (2017)   | occurrence |

| Poecilogale albinucha   | African Striped Weasel          | NT                     | LC            | Moderate   |
| Redunca fulvorufula     | Mountain Reedbuck               | EN                     | LC            | Low        |

Atelerix frontalis (South African Hedgehog) has a tolerance of a degree of habitat modification and occurs in a wide variety of semi-arid and sub-temperate habitats (IUCN, 2017). Based on the Red List of Mammals of South Africa, Lesotho and Swaziland (2016), *A. frontalis* populations are decreasing due to the threats of electrocution, veld fires, road collisions, predation from domestic pets and illegal harvesting. Based on the grassland habitat that can be found in the project area there is a moderate likelihood of this species occurring.

Leptailurus serval (Serval) occurs widely through sub-Saharan Africa and is commonly recorded from most major national parks and reserves (IUCN, 2017). The Serval¢ status outside reserves is not certain, but they are inconspicuous and may be common in suitable habitat as they are tolerant of farming practices provided there is cover and food available. In sub-Saharan Africa, they are found in habitat with well-watered savanna long-grass environments and are particularly associated with reedbeds and other riparian vegetation types.

Grasslands can be found in the project area and wetlands can be found nearby, therefore the species has a moderate likelihood of occurrence.

*Poecilogale albinucha* (African Striped Weasel) is usually associated with savanna habitats, although it probably has a wider habitat tolerance (IUCN, 2017). Due to its secretive nature, it is often overlooked in many areas where it does occur. There is sufficient habitat although somewhat disturbed for this species in the project area and the likelihood of occurrence of this species is therefore considered to be moderate.

#### Herpetofauna (Reptiles & Amphibians)

Based on the IUCN Red List Spatial Data (IUCN, 2017) and the ReptileMap database provided by the Animal Demography Unit (ADU, 2019) 58 reptile species have the potential to occur in the project area. Three of the expected species are SCCs (IUCN, 2017) (Table Error! No text of specified style in document.-6).

Based on the IUCN Red List Spatial Data (IUCN, 2017) and the AmphibianMap database provided by the Animal Demography Unit (ADU, 2019) 20 amphibian species have the potential to occur in the project area. No amphibian SCCs is expected to be present in the project area.

## Table Error! No text of specified style in document.-6. Reptile specie of conservation concern that may occur in the project area as well as their global and regional conservation statuses (IUCN, 2017; SANBI, 2016).

| Species               | Common Name             | Conservation State     | Likelihood of |            |
|-----------------------|-------------------------|------------------------|---------------|------------|
| ·                     |                         | Regional (SANBI, 2016) | IUCN (2017)   | Occurrence |
| Chamaesaura aenea     | Coppery Grass Lizard    | NT                     | NT            | Low        |
| Crocodylus niloticus  | Nile Crocodile          | VU                     | LC            | Low        |
| Homoroselaps dorsalis | Striped Harlequin Snake | NT                     | LC            | Moderate   |

*Homoroselaps dorsalis* (Striped Harlequin Snake) is partially fossorial and known to inhabit old termitaria in grassland habitat (IUCN, 2017). Most of its range is at moderately high altitudes, reaching 1,800 m in Mpumalanga and Swaziland, but it is also found at elevations as low as about 100 m in KwaZulu-Natal. The likelihood of occurrence was rated as moderate as suitable grassland habitat can be found in the project area.

#### Pedology

#### Soils and Geology

According to the land type database (Land Type Survey Staff, 1972 - 2006), the project area is characterised by the Ba4 land type, with Ba5 nearby (Figure Error! *No text of specified style in document.-8*). Figure Error! No text of specified style in document.-9 illustrates the terrain units relevant to the Ba4 land type with the expected soils illustrated in **Error! Reference source not found.**.

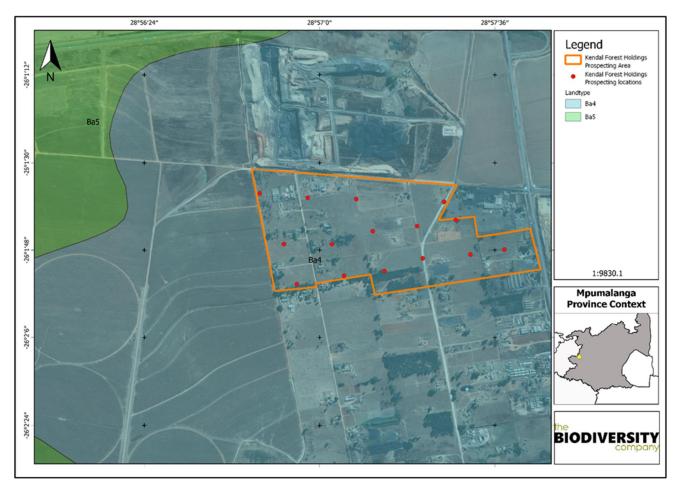

Figure Error! No text of specified style in document.-8. The project in relation to the land type.

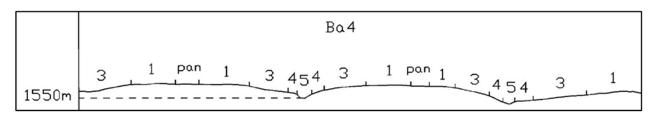

Figure Error! No text of specified style in document.-9. Illustration of land type Ba4 terrain units (Land Type Survey Staff, 1972 – 2006.

## Table 7- 7. Soils expected at the respective terrain units within the Ba4 land type (Land Type Survey Staff, 1972 - 2006)

| Terrain Units |    |           |    |           |    |             |    |  |  |  |  |
|---------------|----|-----------|----|-----------|----|-------------|----|--|--|--|--|
| 1 (45%)       |    | 3 (40%)   |    | 4 (10%)   |    | 5 (5%)      |    |  |  |  |  |

| Glencoe       | 10 | Glencoe   | 5  | Wasbank   | 5  |             |    |  |  |  |  |
| Clovelly      | 5  | Clovelly  | 5  |           |    |             |    |  |  |  |  |

| Cartref | 5 | Cartref   | 5 |
|---------|---|-----------|---|
| Mispah  | 5 | Swartland | 5 |

The geology of this vegetation type is characterised by the Pretoria group and the Witwatersrand Subgroups quartzite ridges as well as the Rooiberg Groups Selons River Formation which is from the Transvaal Supergroup. The parent geology from this vegetation type supports shallow soils like Glenrosa and Mispah which typically forms on slopes and ridges where topsoil is likely to wash off (Mucina & Rutherford, 2006).

#### Climate

This region is characterised by a strongly seasonal rainfall, dry winters and a mean annual precipitation of approximately 726 mm and is relatively uniform across the distribution of the Gm 12 vegetation type (Mucina & Rutherford, 2006). Incidence of frost ranges between 13 to 42 days a year and occurs more at higher elevations, see Figure Error! No text of specified style in document.**-10**.

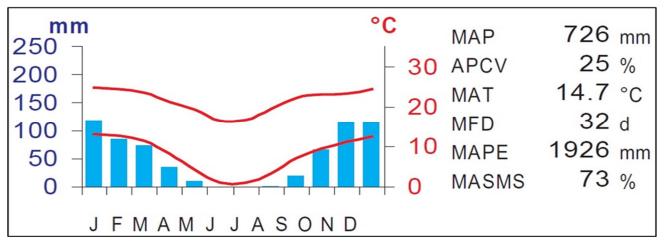

Figure Error! No text of specified style in document.-10. Climate for the project area (Mucina & Rutherford, 2006).

#### Soil Conservation Services (SCS) Hydrological Soil Groups

Soil properties has been categorised hydrologically by the Soil Conservation Services (SCS) into four basic groups i.e., A, B, C and D. Their characteristics are summarised in Figure Error! No text of specified style in document.**-7** as per SANRAL (2013).

## Table Error! No text of specified style in document.-7. Characteristics of the four basic SCS hydrological soil groups

| Soil Group A | Low stormflow potential. Infiltration is high and permeability is rapid in this   |
|--------------|---|
| 1            | group. Overall drainage is excessive to well-drained (Final infiltration rate ~ 25  |
|              | mm/h. Permeability rate > 7,6 mm/h).  |
| Soil Group B | Moderately low stormflow potential. The soils of this group are characterised by  |
|              | moderate infiltration rates, effective depth and drainage. Permeability is slightly   |
|              | restricted (Final infiltration rate ~ 13 mm/h. Permeability rate 3,8 to 7,6 mm/h).  |
| Soil Group C | Moderately high stormflow potential. The rate of infiltration is slow or deteriorates   |
|              | rapidly in this group. Permeability is restricted. Soil depth tends to be shallow (Final infiltration rate $\simeq 6$ mm/h. Permeability rate 1.3 to 3.8 mm/h).   |
| Soil Group D | High stormflow potential. Soils in this group are characterised by very low infiltration rates and severely restricted permeability. Very shallow soils and those |
|              | of high shrink-swell potential are included in this group (Final infiltration rate ~3   |
|              | mm/h. Permeability rate < 1,3 mm/h).  |

The project area falls in soil group B, meaning the soil has a moderately low stormflow potential (Figure Error! No text of specified style in document.-11).

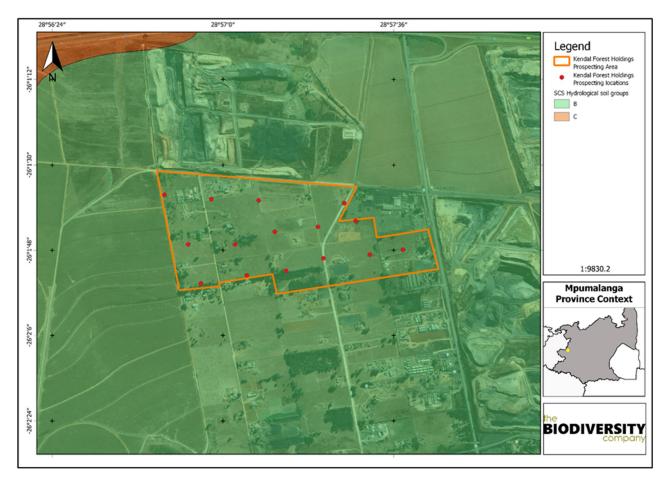

Figure Error! No text of specified style in document.-11. The SCS hydrological soil group associated with the project area.

#### (b) Description of the current land uses.

The various plots are used for differing purposes. The table below describes the uses for each plot:

| Plot Number | Land Use                           |
|-------------|------------------------------------|
| 3           | Business Use (Hardware)            |
|             | Business Use (Truck Rest and Fuel  |
| 4           | Pump)                              |
| 19          | Historical Residence               |
| 21          | Residence                          |
| 22          | Residence                          |
| 23          | Coal Stockyard                     |
| 38          | Residence and Historical Farming   |
| 39          | Residence                          |
| 40          | Residence                          |
| 41          | Residence                          |
| 42          | Residence                          |
| 57          | Business Use (Mechanical Workshop) |
| 58          | Residence                          |
| 59          | Residence                          |
| 60          | Residence                          |

| 61 | Residence                |
|----|--------------------------|
| 77 | Business ( Mine Offices) |
| 78 | Residence                |
| 79 | Residence                |
| 80 | Residence                |

## (c) Description of specific environmental features and infrastructure on the site.

Infrastructure on site varies from plot to plot. As presented in the table below infrastructure descriptions are provided:

| Plot Number | Infrastructure                        |
|-------------|---------------------------------------|
|             | Hardware sales building on Eastern    |
| 3           | portion of property                   |
|             | Various buildings used for Business   |
|             | (Truck Rest and Fuel Pump) on eastern |
| 4           | and western sides of plot             |
| 19          | Historical Residence: ruins of a home |
|             | Residence: Home with large, scraped   |
| 21          | area.                                 |
| 22          | Residence: home & outbuildings        |
| 23          | Coal Stockyard & buildings            |
|             | Unoccupied Residence and Historical   |
| 38          | Farming                               |
| 39          | Residence: home & outbuildings        |
| 40          | Residence: home & outbuildings        |
| 41          | Residence: home & outbuildings        |
| 42          | Residence: home & outbuildings        |
| 57          | Business Use (Mechanical Workshop)    |
| 58          | Residence: home & outbuildings        |
| 59          | Residence: home & outbuildings        |
| 60          | Residence: home & outbuildings        |
| 61          | Residence: home & outbuildings        |
| 77          | Business ( Mine Offices)              |
| 78          | Residence: home & outbuildings        |
| 79          | Residence: home & outbuildings        |
| 80          | Residence: home & outbuildings        |

#### (d) Environmental and current land use map.

(Show all environmental, and current land use features)

The current land use varies from plot to plot. The plan below illustrates the degree of modification of land within the prospecting application area relative to the MTPA of 2014.

# v) Impacts and risks identified including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts

#### **Planning Phase**

The impacts in the planning phase are minimal as it would be mainly initial site surveys. Only one possible impact was considered:

Temporary disturbance of wildlife due to increased human presence and possible use of machinery and/or vehicles.

#### **Construction Phase**

The following potential impacts on the biodiversity were considered for the construction phase of the proposed prospecting. This phase refers to the period when the drill and associated infrastructure will be set up. This phase is considered to have the largest direct impact on biodiversity. The following potential impacts to terrestrial biodiversity were considered:

- Destruction of, and fragmentation of, portions of the vegetation communities classified as EN;
- Loss of poorly protected and VU ecosystem;
- Displacement of faunal community due to habitat loss, disturbance (noise, dust and vibration) and/or direct mortalities; and
- Encroachment by alien invasive species.

These impacts were combined for each drill site to evaluate the impact on the relevant features of each.

#### **Operational Phase**

The following potential impacts were considered on biodiversity (fauna and flora) during operational phase:

- Continued encroachment and displacement of the vegetation communities (EN) and due to alien invasive plant species;
- Further loss of poorly protected and VU ecosystems;
- Continued displacement and fragmentation of the faunal community (including SCCs) due to ongoing anthropogenic disturbances (noise, traffic and dust); and
- Potential leaks from the water collections and portable toilets into the surrounding environment.

A combination of the impacts relevant to each site was assessed.

#### **Decommissioning and Rehab Phase**

The following potential impacts were considered on terrestrial fauna and vegetation communities:

- Continued encroachment and displacement of an EN vegetation community by alien invasive plant species and erosion;
- Continued displacement of the faunal community (including threatened or protected species) due to ongoing anthropogenic disturbances and habitat degradation (litter, road mortalities and/or poaching).

The impacts were envisioned to be similar for the drill sites and as such they were assessed collectively.

## vi) Methodology used in determining and ranking the nature, significance, consequences, extent, duration and probability of potential environmental impacts and risks;

Potential impacts were evaluated against the data captured during the desktop assessment to identify relevance to the project area. The relevant impacts were then subjected to a prescribed impact assessment methodology. The details of this methodology can be provided on request.

#### **Terrestrial Impact Assessment**

#### **Assessment of Significance**

The assessment of impact significance considers pre-mitigation as well as implemented of post-mitigation scenarios. The mitigation actions required to lower the risk of the impact are provided in Section 9.1.6 of this report.

#### **Planning Phase**

The planning phase is regarded as temporary, and if conducted on foot the significance of the impact could be reduced from  $\pm$  owqto  $\pm$ Absentq(Table Error! No text of specified style in document.-8).

#### **Construction Phase**

Table Error! No text of specified style in document.-9 summarises the significance of potential impacts associated with the development on biodiversity before and after implementation of mitigation measures. Prior to implementation of mitigation measures the significance of impact to the EN vegetation community were rated as  $\pm$  Moderately-Highq due to the importance of this type and number of SCCs likely to occur. Implementation of mitigation measures could reduce the impact to  $\pm$  Moderately-Highqprior to implementation of fauna due to disturbance and/or direct mortalities was rated as  $\pm$  Moderately-Highqprior to implementation of mitigation measures. The implementation of mitigation measures such as walking through the area prior to construction could reduce this impact to  $\pm$  Moderate+.

#### **Operational Phase**

Table Error! No text of specified style in document.-10 summarises the significance of the operational phase impacts on biodiversity before and after implementation of mitigation measures. The impact significance of

potential leaks was rated as ±Moderateqprior to mitigation. Implementation of mitigation measures reduced the significance of the impact to an ±Absentqlevel.

#### **Decommissioning Phase**

Table Error! No text of specified style in document.-11 shows the impacts associated with the decommissioning and rehabilitation of the drill sites. Should the rehabilitation be done successfully, the impacts significance would be %bsentq

## vii) The positive and negative impacts that the proposed activity (in terms of the initial site layout) and alternatives will have on the environment and the community that may be affected.

 Table Error! No text of specified style in document.-8. Planning phase impacts to the terrestrial biodiversity

|   |   |  | Prior to r  | nitigation  |                              |                  | Post mitigation                                 |  |  |   |                              |                  |  |

#### Pedology Impact Assessment

Some of the drill sites were placed in more sensitive undisturbed area, while others are found on/adjacent to roads in less sensitive areas. Table Error! *No text of specified style in document.-12* shows the anticipated impacts associated with the prospecting activities on the soil based on desktop data. The methodology used can be made available on request.

#### Table Error! No text of specified style in document.-12. Anticipated impacts for the proposed prospecting on agricultural resources and soil

| Main Impact            | Project activities that can cause loss/impacts to habitat  | Secondary impacts anticipated   |
|------------------------|--|---|
| oss of land capability | <ul> <li>Construction, operation and decommissioning of possible access roads</li> <li>Construction, operation and decommissioning of temporary camp</li> <li>Construction, operation and decommissioning of drill sites</li> <li>Soil Stripping; and</li> <li>Mixing of soil</li> </ul> | <ul> <li>Erosion;</li> <li>Soil degradation;</li> <li>Compaction;</li> <li>Increase in salinity;</li> <li>Land contamination; and</li> <li>Loss of soil via aeolian processes.</li> </ul> |

#### **Planning Phase**

The planning phase for the construction and operation of prospecting will lead to compaction and erosion of soil resources due to the increase of traffic.

The pre- and post- mitigation significance ratings have been scored 'Negligible . Negativeq(Table Error! No text of specified style in document.-13).

#### **Construction Phase**

The construction phase for the proposed prospecting will lead to compaction and erosion of soil resources due to altered surface dynamics, the increased volume of traffic and general degradation of soil resources, which could result in the loss of land capability.

It is however worth noting that limited impacts are expected for the construction phase. The pre- and postmitigation significance ratings have been scored 'Negligible . Negativeq(Table Error! No text of specified style in document.-13).

#### Operational Phase

The operational phase will lead to compaction and erosion of soil resources due to the sheer weight of the drill machinery and the cleared areas will also increase the likelihood of storm water run off and erosion.

It is however worth noting that some impacts are expected for the operational phase. The pre- and postmitigation significance ratings have been scored <u>A</u>linor. Negativeqand <u>A</u>legligible. Negativeqrespectively (Table Error! No text of specified style in document.-13).

#### **Decommissioning and Rehabilitation Phase**

The decommissioning and rehabilitation phase will lead to compaction and erosion of soil resources predominantly due to increased traffic associated with rehabilitation which could result in the loss of land capability.

It is however worth noting that limited impacts are expected for the rehabilitation phase aspects. The pre- and post- mitigation significance ratings have been scored *Alegligible*. Negativeq(Table Error! No text of specified style in document.-13).

# Table Error! No text of specified style in document.-13Impact assessment for the proposedprospecting activities during the planning, construction, operation, decommissioning andrehabilitation phase

|   | Impac                                |                               |                       | Pre                                      | -mitigation                       |                 |                              |                               |                       | Pos                            | t-mitigation                      |                    |                              |

# viii) The possible mitigation measures that could be applied and the level of risk.

#### **Terrestrial Ecology Mitigation Actions**

The focus of mitigation measures should be to reduce the significance of potential impacts associated with the exploration and thereby to:

- Prevent the unnecessary destruction of, and fragmentation, of the EN vegetation community (Including a VU ecosystem); and
- Prevent the loss of the faunal community associated with these vegetation communities.

From a desktop perspective the project area is regarded as moderate-high sensitive. The areas in which the drill sites fall are mostly similar, from the desktop assessment. The assumption of the sensitivity is based on the EN vegetation type, the VU ecosystem (including its poorly protected level), the number of SCCs that could possibly

occur and the disturbed nature of the surrounding areas that would have made these areas a green space. Prescribed mitigation and rehabilitation measures include the following:

- Drilling sites must be located in already disturbed areas;
- Drill sites must be rehabilitated to the pre-drill land use and condition;
- Selected drilling sites should also be adjacent to existing access routes to avoid the construction of new routes. Alternatively, in the event new routes are required these should be established in already disturbed areas and kept to an absolute minimum with regards to width and length;
- The Contractor should inform all site staff to the use of supplied ablution facilities and under no circumstances shall indiscriminate excretion and urinating be allowed other than in supplied facilities;
- The Contractor must supply sealable and properly marked domestic waste collection bins and all solid waste collected shall be disposed of at a licensed disposal facility;
- Where a registered disposal facility is not available close to the project area, the Contractor must provide a method statement with regard to waste management. Under no circumstances may domestic waste be burned on site;
- Refuse bins must be emptied and secured;
- Temporary storage of domestic waste must be in covered waste skips;
- Maximum domestic waste storage period will be 10 days;
- The areas where exploration is to take place must be specifically demarcated so that only the demarcated areas be impacted upon and preventing movement of workers into surrounding environments;
- Areas that are denuded need to be re-vegetated with indigenous vegetation to prevent erosion during flood events. This will also reduce the likelihood of encroachment by alien invasive plant species;
- No materials may not be stored for extended periods of time and must be removed from the site once the construction/closure phase has been concluded;
- The area must be walk through prior to construction to chase up any animals that could be hiding in burrows or under vegetation. Should burrows be identified, the ECO must ensured that the animals have moved out of it, as they will most likely be hiding out due to the noise, before construction can begin;
- A qualified environmental control officer must be on site when construction begins to identify species that will be directly disturbed and to relocate fauna that is found during construction (including all reptiles and amphibians);
- Dust reducing mitigation measures must be put in place and must be strictly adhered to, during the construction and operational phase of the project;
- A storm water management plan must be put in place and implemented to reduce the likelihood of erosion;
- Leaking equipment must be repaired immediately or be removed from the site to facilitate repair;
- The Contractor must be in possession of an emergency spill kit that must be complete and available at all times on site;
- All vehicles and equipment must be well maintained to ensure that there are no oil or fuel leakages;
- All contaminated soil / yard stone must be treated in situ or removed and be placed in containers;

- All personnel and contractors to undergo Environmental Awareness Training. A signed register of attendance must be kept for proof. Discussions are required on sensitive environmental receptors within the project area to inform contractors and site staff of the presence of Red / Orange List species, their identification, conservation status and importance, biology, habitat requirements and management requirements;
- A temporary fence must be placed around the drill sites to ensure no animals can fall into the hole while the process is still ongoing;
- Drilling at night must be prohibited in order to reduce the impact on faunal species;
- An alien invasive plant management plan needs to be compiled and implemented post construction to control current invaded areas and prevent the growth of invasives on cleared areas, monitoring must be done on a monthly basis by the ECO for the duration of the project and then as stated in the management plan;
- A spill management plan must be put in place to ensure that should the water spill out into the surrounding area during the drilling process this does not result in erosion;
- Rehabilitation of the disturbed areas existing in the project area must be made a priority. Topsoil must also be utilised, and any disturbed area must be re-vegetated with plant and grass species which are endemic to this vegetation type; and
- The sites must be rehabilitated after they have been refilled and sealed, the sites must be rehabilitated progressively as the process moves from one site to the other.

#### **Pedology Mitigation Actions**

The main aim of the mitigations is to ensure that closure and rehabilitation can be done successfully at the end of the prospecting. The following mitigations are suggested:

- Areas stripped must be revegetated to restrict erosion;
- Prioritise prospecting during the dry season (May to August) to avoid erosion of bare areas caused by run-off;
- Ensure proper storm water management designs are in place;
- Compacted areas are to be ripped to loosen the soil structure;
- Prevent any spills from occurring. Machines must be parked within hard park areas and must be checked daily for fluid leaks;
- Leaking vehicles will have drip trays place under them where the leak is occurring; and
- Only the designated access routes are to be used to reduce any unnecessary compaction.

#### ix) Motivation where no alternative sites were considered.

No site alternative has been considered as no infrastructure is planned and the option of resiting bore hole positions will have negligible effect on the impact ratings.

# x) Statement motivating the alternative development location within the overall site.

This is not applicable as no site development alternatives have been considered. The initial drill site locations have been selected by the project geologist but final siting will be done in liaison with property owners and or occupiers where applicable.

# i) Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site (In respect of the final site layout plan) through the life of the activity.

The following process was undertaken to identify and describe the potential environmental risks associated with the proposed prospecting right:

- Desktop description of the baseline receiving environment specific to the field of expertise (general surrounding area as well as site specific environment);
- Identification and description of any sensitive receptors in terms of relevant specialist disciplines (biodiversity) that occur in the project area, and the manner in which these sensitive receptors may be affected by the activity;
- Identify significant qecological, botanical and faunal features within the proposed development areas;
- Identification of conservation significant habitats around the project area which might be impacted by the proposed development;
- Conducting a desktop pedology assessment which includes a description of the physical properties which characterise the soil within the proposed project area;
- Screening to identify any critical issues (potential fatal flaws) that may result in project delays or rejection
  of the application; and
- Suggest possible impacts, mitigation and rehabilitation measures to prevent or reduce the possible impacts.

#### j) Assessment of each identified potentially significant impact and risk

This process in turn requires a<br>heritage resources management (HRM) process in terms of section 38(8)<br>of the NHRA.  | X  | Section 6 on page 10<br>of the specialist<br>Report  |

| Amber Earth requested the Heritage Foundation to undertake the HRM process, limited to this NID and RfE. The document was prepared following site screening and a brief desktop review of available heritage reports. The Heritage Foundation undertook site screening to record the current state of the landscape. |  |
|--|--|
| Based on the relatively small scale of the proposed development, the low significance of the geology in terms of fossil sensitivity and the absence of visible, recorded surface heritage resources, it is recommended that exemption be granted from all further heritage studies for this project.                 |  |

Attach copies of Specialist Reports as appendices: See Appendix 4.

#### I) Environmental impact statement

# (i) Summary of the key findings of the environmental impact assessment;

#### **Terrestrial Ecology**

From a desktop perspective the project area is regarded as moderate-high sensitive. The areas in which the drill sites fall are mostly similar, from the desktop assessment. The assumption of the sensitivity is based on the EN vegetation type, the VU ecosystem (including its poorly protected level), the number of SCCs that could possibly occur and the disturbed nature of the surrounding areas that would have made these areas a green space. Fieldwork will confirm the state of the habitat and determine what species of fauna is present at the sites, this will allow for a more comprehensive impact study with supporting mitigation measures.

#### Pedology

It is apparent from the desktop assessment that the project area is characterised by freely drained soils, predominantly Hutton and Avalon soils. % Legligible-negative+final significance ratings are expected for the various phases of the project. These impact ratings are preliminary and will be revisited should additional prospecting be planned in future.

#### (ii) Final Site Map

The final site layout includes only bore hole positions as no infrastructure is planned to be placed in site.

Figure 4. Positions of initial bore hole locations.

# (iii)Summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;

#### Positive Impacts:

Positive Socio-economic impacts are limited to the job-creation during the prospecting process. No Positive Environmental Impacts have been identified.

#### Negative Impacts:

Potential negative impacts identified during the impact assessment process include the following:

- Temporary disturbance of wildlife due to increased human presence and possible use of machinery and/or vehicles.
- Destruction of, and fragmentation of, portions of the vegetation communities classified as EN;
- Loss of poorly protected and VU ecosystem;
- Displacement of faunal community due to habitat loss, disturbance (noise, dust and vibration) and/or direct mortalities; and
- Encroachment by alien invasive species.
- Continued displacement and fragmentation of the faunal community (including SCCs) due to ongoing anthropogenic disturbances (noise, traffic and dust); and
- Potential leaks from the water collections and portable toilets into the surrounding environment.

#### Identified Alternatives:

No site alternative has been considered as no infrastructure is planned and the option of re-siting bore hole positions will have negligible effect on the impact ratings.

### m) Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;

The management objective associated with this impact assessment and its associated EMPr include the following:

- Implementation of all mitigation measures
- Rehabilitation of bore hole sites including the capping and/or plugging of each bore hole.
- Drill site rehabilitation to pre-prospecting status.

#### n) Aspects for inclusion as conditions of Authorisation.

It is recommended that the following be included as conditions of authorisation:

- Drilling sites must be located in already disturbed areas;
- Drill sites must be rehabilitated to the pre-drill land use and condition;
- Selected drilling sites should also be adjacent to existing access routes to avoid the construction of new routes. Alternatively, in the event new routes are required these should be established in already disturbed areas and kept to an absolute minimum with regards to width and length;
- The Contractor should inform all site staff to the use of supplied ablution facilities and under no circumstances shall indiscriminate excretion and urinating be allowed other than in supplied facilities;
- The Contractor must supply sealable and properly marked domestic waste collection bins and all solid waste collected shall be disposed of at a licensed disposal facility;
- Where a registered disposal facility is not available close to the project area, the Contractor must provide a method statement with regard to waste management. Under no circumstances may domestic waste be burned on site;
- Refuse bins must be emptied and secured;
- Temporary storage of domestic waste must be in covered waste skips;

- Maximum domestic waste storage period will be 10 days;
- The areas where exploration is to take place must be specifically demarcated so that only the demarcated areas be impacted upon and preventing movement of workers into surrounding environments;
- Areas that are denuded need to be re-vegetated with indigenous vegetation to prevent erosion during flood events. This will also reduce the likelihood of encroachment by alien invasive plant species;
- No materials may not be stored for extended periods of time and must be removed from the site once the construction/closure phase has been concluded;
- The area must be walk through prior to construction to chase up any animals that could be hiding in burrows or under vegetation. Should burrows be identified, the ECO must ensured that the animals have moved out of it, as they will most likely be hiding out due to the noise, before construction can begin;
- A qualified environmental control officer must be on site when construction begins to identify species that will be directly disturbed and to relocate fauna that is found during construction (including all reptiles and amphibians);
- Dust reducing mitigation measures must be put in place and must be strictly adhered to, during the construction and operational phase of the project;
- A storm water management plan must be put in place and implemented to reduce the likelihood of erosion;
- Leaking equipment must be repaired immediately or be removed from the site to facilitate repair;
- The Contractor must be in possession of an emergency spill kit that must be complete and available at all times on site;
- All vehicles and equipment must be well maintained to ensure that there are no oil or fuel leakages;
- All contaminated soil / yard stone must be treated in situ or removed and be placed in containers;
- All personnel and contractors to undergo Environmental Awareness Training. A signed register of attendance must be kept for proof. Discussions are required on sensitive environmental receptors within the project area to inform contractors and site staff of the presence of Red / Orange List species, their identification, conservation status and importance, biology, habitat requirements and management requirements;
- A temporary fence must be placed around the drill sites to ensure no animals can fall into the hole while the process is still ongoing;
- Drilling at night must be prohibited in order to reduce the impact on faunal species;
- An alien invasive plant management plan needs to be compiled and implemented post construction to control current invaded areas and prevent the growth of invasives on cleared areas, monitoring must be done on a monthly basis by the ECO for the duration of the project and then as stated in the management plan;
- A spill management plan must be put in place to ensure that should the water spill out into the surrounding area during the drilling process this does not result in erosion;
- Rehabilitation of the disturbed areas existing in the project area must be made a priority. Topsoil must
  also be utilised, and any disturbed area must be re-vegetated with plant and grass species which are
  endemic to this vegetation type; and

• The sites must be rehabilitated after they have been refilled and sealed, the sites must be rehabilitated progressively as the process moves from one site to the other.

#### o) Description of any assumptions, uncertainties and gaps in knowledge.

Although not known at this stage, there is a possibility that grave sites may exist. These are heritage sites and must be avoided. The drilling team must liaise with the landowner and/or occupier to ensure any selected drilling sites do not impact on any heritage resources.

# p) Reasoned opinion as to whether the proposed activity should or should not be authorised

#### i) Reasons why the activity should be authorized or not.

The specialist assessment as well as the EAP have not identified any fatal flaws with regard to the proposed prospecting activity.

#### ii) Conditions that must be included in the authorisation

See Section N above.

#### q) Period for which the Environmental Authorisation is required.

The Applicant is applying for Environmental Authorisation for five (5) Years

#### r) Undertaking

The applicant confirms that the undertaking required to meet the requirements of this section is provided at the end of the EMPr and is applicable to both the Basic assessment report and the Environmental Management Programme report.

#### s) Financial Provision

The financial provision associated with the rehabilitation of bore holes is a relatively simple assessment. The post closure target is to leave a drill site where no risk to persons/animals exist due to a collapsed bore hole collar/cap and where the topsoil is left in a state where natural re-growing of the grass cover is possible. The financial provision required is as follows:

| DMRE Ref No  | Farm Name     | Farm Number | Portions | Recommended Financial<br>Provisioning |
|--------------|---------------|-------------|----------|---------------------------------------|
| (MP) 16645PR | Heuvelfontein | 215 IR      | Re       | 41 bore holes                         |
|              |               |             |          | R44,075.00                            |

#### i) Explain how the aforesaid amount was derived.

The Financial Provision calculation is based on real on-site experience of bore hole and drill site rehabilitation which is incorporated into the table below.

| Task  | Rate  |
|---|---|
| Supervisor                                      | R350.00/hr – rehabilitation = 2hrs/bore hole      |
| Land Surveyor                                   | Not Required                                      |
| Back-actor (topsoil replacement & re-shaping of | The drill footprint area will not require a Back- |
| roads and tracks)                               | actor (TLB).                                      |
| Tractor & scarifier (access tracks)             | The access route will not require scarifying      |
| Equipment Transport                             | No heavy equipment will be required for bore      |
|   | hole site rehabilitation                          |
| Bore hole Capping                               | R200.00/hole                                      |
| Fertilizer                                      | No fertilizing will be required due to the short  |
|   | duration the drill rig will be on site.           |
| Seeding   | No seeding is anticipated due to the short        |
|   | duration that drill rig will be on site.          |
| Rehabilitation Monitoring                       | R350.00/hr – monitoring = 0,5hrs/bore hole        |
| Rehabilitation Cost per bore hole               | R1075.00/bore hole                                |

#### ii) Confirm that this amount can be provided for from operating expenditure.

This rehabilitation cost (R1075/bore hole) forms part of the operational cost estimate as illustrated in Table 3 of the Prospecting Work Programme.

#### t) Specific Information required by the competent Authority

i) Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). the EIA report must include the:-

#### (1) Impact on the socio-economic conditions of any directly affected person.

The process of prospecting through diamond core drilling processes will not impact on the socio-economic conditions of the landowners and/or occupiers. The Applicant drilling team must liaise with each landowner and/or occupier regarding the final position of the bore hole as well as access to the position.

# (2) Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act.

The proposed prospecting boreholes and associated activities will not affect any existing, tangible heritage resources. Impacts on fossil heritage are highly unlikely. There remains an inevitable risk that subsurface heritage resources may be exposed during construction. The potential that significant subsurface heritage resources are present is, however, very unlikely.

A Basic Assessment process is required to obtain necessary Environmental Authorisation for the PRA. This process in turn requires a heritage resources management (HRM) process in terms of section 38(8) of the NHRA.

Amber Earth requested the Heritage Foundation to undertake the HRM process, limited to this NID and RfE. The document was prepared following site screening and a brief desktop review of available heritage reports. The Heritage Foundation undertook site screening to record the current state of the landscape.

Based on the relatively small scale of the proposed development, the low significance of the geology in terms of fossil sensitivity and the absence of visible, recorded surface heritage resources, it is recommended that exemption be granted from all further heritage studies for this project.

#### u) Other matters required in terms of sections 24(4)(a) and (b) of the Act.

No site alternative has been considered as no infrastructure is planned on site and the option of re-siting bore hole positions will have negligible effect on the impact ratings.

#### PART B

#### **ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT**

#### 1) Draft environmental management programme.

a) **Details of the EAP**, (Confirm that the requirement for the provision of the details and expertise of the EAP are already included in PART A, section 1(a) herein as required).

Please see Part A of this BAR.

#### b) Description of the Aspects of the Activity

This is already included in Part A of this BAR.

c) Composite Map

See Appendix 2

# d) Description of Impact management objectives including management statements

#### i) Determination of closure objectives.

The management objective associated with this impact assessment and its associated EMPr include the following:

- Implementation of all mitigation measures
- Rehabilitation of bore hole sites including the capping and/or plugging of each bore hole.
- Drill site rehabilitation to pre-prospecting status.

#### ii) Volumes and rate of water use required for the operation.

#### Potable Water:

The drilling team will provide their own potable water on site sourced from off-site. Ablution Facilities:

Chemical toilets will be used on site requiring no additional water source.

**Drilling Water Needs:** 

Diamond Core drilling required a limited amount of water per bore hole. An average of 5kl of water will be used per bore hole. This water will be sourced by the drilling contractor prior to drilling and not from the prospecting holes being drilled.

#### iii) Has a water use licence has been applied for?

No Section 21 water uses are triggered by the proposed prospecting activities therefore no water use license is required.

#### iv) Impacts to be mitigated in their respective phases

#### Measures to rehabilitate the environment affected by the undertaking of any listed activity

| ACTIVITIES   | PHASE  | SIZE AND   | MITIGATION MEASURES   | COMPLIANCE WITH   | TIME PERIOD FOR  |
|--|--|--|---|---|--|
|  |  | SCALE of   |   | STANDARDS   | IMPLEMENTATION   |

#### f) Impact Management Actions

| ACTIVITY<br>whether listed or not<br>listed.   | POTENTIAL IMPACT                                    | MITIGATION<br>TYPE  | TIME PERIOD FOR<br>IMPLEMENTATION  | COMPLIANCE WITH STANDARDS |
|--|---|---|--|---------------------------|
| Drill site preparation                         | Surface disturbance                                 | Minimise surface area<br>disturbance by demarcating<br>the drill site area  | Implementation during pre-<br>construction and operational<br>phase.<br>Rehabilitation immediately<br>upon cessation of drilling | NEMA Duty of Care         |
| Drill site access road for drill rig and LDVos | Surface disturbance and topsoil compaction          | Selection of least impact route through liaison with land owner.  | Implementation during pre-<br>construction and operational<br>phase.<br>Rehabilitation immediately<br>upon cessation of drilling | NEMA Duty of Care         |
| Drilling Operations                            | Waste Management                                    | Ensure waste management<br>related mitigation measures<br>are implemented on site   | Implementation during pre-<br>construction and operational<br>phase.<br>Rehabilitation immediately<br>upon cessation of drilling | NEMA Duty of Care         |
| Drilling Operations                            | Spillage or leaking of any HCS                      | Ensure site is equipped with a drip tray and spill kit.   | Implementation during pre-<br>construction and operational<br>phase.<br>Rehabilitation immediately<br>upon cessation of drilling | NEMA Duty of Care         |
| Drill Site Rehabilitation                      | Increased and<br>unnecessary surface<br>disturbance | Conduct as much rehabilitation<br>work on foot or with only LDV<br>access. Ensure all solid waste<br>is removed from site and<br>disposed of correctly. | Implementation during the Rehabilitation Phase   | NEMA Duty of Care         |
| Drill site access                              | Dust emissions and road degradation                 | Inspection of access roads and<br>implementation of dust<br>suppression with a water<br>bowser if required  | Full period of on-site<br>prospecting  | NEMA Duty of Care         |

#### i) Financial Provision

(1) Determination of the amount of Financial Provision.

(a) Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under the Regulation.

The closure objective associated with this impact assessment and its associated EMPr include the following:

- Implementation of all mitigation measures during all applicable phases in order to support the closure objectives of this site.
- Rehabilitation of bore hole sites including the capping and/or plugging of each bore hole.
- Drill site rehabilitation to pre-prospecting status.

(b) Confirm specifically that the environmental objectives in relation to closure have been consulted with landowner and interested and affected parties.

These closure objectives have been included in the draft Basic Assessment Report (this report) for public consultation will all registered IAPcs.

(c) Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main prospecting activities, including the anticipated prospecting area at the time of closure.

This is not applicable to this prospecting right application since the only invasive aspect of this prospecting right application is the drilling of bore holes. Implementation of the rehabilitation of bore holes as described in the mitigation measures will ensure that no residual prospecting areas will remain at the time of closure.

(d) Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives.

The closure objectives have been described in conjunction with the rehabilitation plan and cannot function independently. The rehabilitation plan

seeks to meet each closure objective in order to satisfy the DMRE that closure has been reached while achieving a pre-prospecting status.

# (e) Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline.

The financial provision associated with the rehabilitation of bore holes is a relatively simple assessment. The post closure target is to leave a drill site where no risk to persons/animals exist due to a collapsed bore hole collar/cap and where the topsoil is left in a state where natural re-growing of the grass cover is possible. The financial provision required is as follows:

| DMRE Ref No  | Farm Name     | Farm Number | Portions | Recommended Financial<br>Provisioning |
|--------------|---------------|-------------|----------|---------------------------------------|
| (MP) 16645PR | Heuvelfontein | 215 IR      | Re       | 41 bore holes                         |
|              |               |             |          | R44,075.00                            |

# (f) Confirm that the financial provision will be provided as determined.

The applicant has committed to the financial provision as determined in this BAR within the operational budget of the prospecting programme.

#### Mechanisms for monitoring compliance with and performance assessment against the environmental management programme and reporting thereon, including g) Monitoring of Impact Management Actions

- h) Monitoring and reporting frequency
   i) Responsible persons
- j) Time period for implementing impact management actions
   k) Mechanism for monitoring compliance

| SOURCE ACTIVITY                         | IMPACTS REQUIRING  | FUNCTIONAL REQUIREMENTS FOR | ROLES AND RESPONSIBILITIES                                  | MONITORING AND REPORTING                           |
|---|--|-----------------------------|---|--|
|   | MONITORING   | MONITORING                  | (FOR THE EXECUTION OF THE MONITORING                        | FREQUENCY and TIME PERIODS                         |
|   | PROGRAMMES   |                             | PROGRAMMES)   | FOR IMPLEMENTING IMPACT                            |
|   |  |                             |   | MANAGEMENT ACTIONS                                 |
| Construction and<br>Operational phase   | Surface disturbance<br>Spillages<br>Ablution facilities<br>Waste management<br>Drilling water  | Site inspection by ECO      | Physical on-site inspection and written report on findings. | Monthly during construction and operational phases |
| Closure and<br>Decommissioning<br>Phase | Drill footprint state<br>Evidence of any<br>residue<br>Any remaining drill<br>related waste on site<br>Bore hole<br>capping/plugging<br>Rehabilitation of drill<br>footprint | Site inspection by ECO      | Physical on-site inspection and written report on findings. | Monthly during construction and operational phases |

#### I) Indicate the frequency of the submission of the performance assessment/ environmental audit report.

An annual Performance Assessment Reports will be submitted to the DMRE.

#### m) Environmental Awareness Plan

# (1) Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work.

*Induction Programme:* An Induction Programme, which will include the environmental awareness programme, will be established for the prospecting area in question. During the training sessions various topics will be discussed such as, but not limited to: Water Pollution Prevention, Good Environmental Housekeeping, spill protection and clean up etc. Through the Induction Programme, the mine manager safety officer, or any other responsible appointed person shall ensure that all staff receives training in:

- Administrative requirements and procedures, which will include the Environmental Emergency Procedures.
- Resource conservation, environmental reporting and general environmental awareness for mine related environmental issues.

All employees (including contractor employees) will undergo induction. This induction includes training and awareness on environmental issues within the prospecting area and is compulsory for all new employees. The induction programme will as mentioned above, have an environmental management component. On an annual basis, the environmental section of the induction will be updated to ensure all prospecting components adhere to applicable environmental legislation. Consideration should be given to:

- Significant environmental impacts as identified in the BAR & EMP;
- Environmental awareness and emergency procedures
- Trends in incidents;
- Trends in audit findings;

*Trainee needs:* The identification of environmental training and environmental awareness needs are derived from an analysis of the different roles that employees play at the mine. The following categories are considered:

- Senior Management
- Middle management (Environmental Officers)
- Supervisors
- Operators
- Visitors and contractors

Each of these categories has different responsibilities and therefore has different knowledge requirements and environmental awareness training needs to obtain that knowledge.

# (2) Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment.

The contractor on site is responsible for the ultimate implementation of all mitigation measures as described in this EMP. For this reason communication of these objectives and mitigation measures should be clear and regular. Site inspections by the project ECO must determine compliance with these mitigation measures as well as effectiveness of such.

#### n) Specific information required by the Competent Authority

The applicant confirms that the Financial Provision will be reviewed annually and submitted to the DMRE.

#### 2) UNDERTAKING

The EAP herewith confirms

- a) the correctness of the information provided in the reports X
- b) the inclusion of comments and inputs from stakeholders and I&APs ; X
- c) the inclusion of inputs and recommendations from the specialist reports where relevant; X and
- d) that the information provided by the EAP to interested and affected parties and any responses by the EAP to comments or inputs made by interested and affected. parties are correctly reflected herein.X
