APPENDIX F: IMPACT ASSESSMENT TABLES 10166MR SHIP FEIR

Table 1: Impact Assessment during Construction Phase

CONSTRUCTION PHASE: SITE ACC	CESS AND SITE ESTABLISHMENT	
Potential impact and risk:	IMPACT 1: SOIL EROSION & SOIL COMPACTION:	
Loss of topsoil, increased dust levels, and soil compaction	The clearing of areas for mining logistics, the waste rock dump site and TSF at Rietberg and all other infrastruction existing historical mining footprint will result in the removal of existing vegetation and topsoil. This will disturb potential for soil erosion by wind and loss of soil in the event of rainfall. Soil compaction will result from ong access tracks.	rb the soil increasing the
ALTERNATIVE	PREFERRED AND ONLY ALTERNATIVE	NO-GO ALTERNATIVE
Nature of impact:	Negative	N/A
Extent and duration of impact:	Site and Short term	N/A
Consequence of impact or risk:	Loss	N/A
Probability of occurrence:	Probable	N/A
Degree to which the impact may cause irreplaceable loss of resources:	Low	N/A
Degree to which the impact can be reversed:	Reversible	N/A
Indirect impacts:	 Dust impacting on adjacent vegetation and causing a nuisance to workers. Compaction of topsoil where vehicles drive outside demarcated areas damages seed bank and habitat for invertebrates. 	N/A
Cumulative impact prior to mitigation:	Medium	N/A
Significance rating of impact prior to mitigation (e.g. Low, Medium, Medium-High, High, or Very-High)	Medium	
Degree to which the impact can be avoided :	High	N/A
Degree to which the impact can be managed:	High	N/A
Degree to which the impact can be mitigated :	High	N/A
Proposed mitigation:	 After clearing, the affected area shall be stabilized to prevent any erosion or sediment runoff. Stabilized areas shall be demarcated accordingly. Incremental clearing of ground cover should take place to avoid unnecessary exposed surfaces. Reasonable measures must be undertaken to ensure that any exposed areas are adequately protected against the wind and potential stormwater run-off. Topsoil shall be removed separately and stockpiled separately from other soil base layers. The stockpile areas for soil base layers are temporary as they will be re-used on a cut and fill basis. Stockpiles should ideally be located to create the least visual impact and must be maintained to avoid erosion of the material. Topsoil storage areas must be convex and should not exceed 2m in height. Topsoil must be treated with care, must not be buried or in any other way be rendered unsuitable for further use (e.g. by mixing with spoil) and precautions must be taken to prevent unnecessary handling and compaction. In particular, topsoil must not be subject to compaction greater than 1 500 kg/m² and must not be pushed by a bulldozer for more than 50 metres. Trucks may not be driven over the stockpiles. Reduce drop height of material to a minimum. Temporarily halt material handling in windy conditions. A speed limit of 30km/hour will be displayed and enforced through a fining system. All vehicle drivers using the access road and entering the site will be informed of the speed limit. 	N/A

	Soil erosion and compaction on the section of public road (should this road not be surfaced) is required to be	I
	• Soil erosion and compaction on the section of public road (should this road not be surfaced) is required to be monitored and timeously repaired.	
	 Soil erosion on private haul roads is to be regularly monitored and repaired. 	
	 Compacted areas that are not required for access shall be scarified after use during decommissioning and 	
	rehabilitation.	
Residual impacts:	Potential loss of invertebrates that live in the top layers of the soil.	N/A
Cumulative impact post mitigation:	Low	N/A
Significance rating of impact after mitigation	Low	N/A
(e.g. Low, Medium, Medium-High, High, or Very-High)		
Potential impact and risk:	IMPACT 2: SURFACE & GROUND WATER RESOURCES	
Potential Impacts on Water		
Resources	2.1 Surface water resources:	
Resources	Potential for watercourse pollution due to oil spills during routine maintenance of equipment, and potential for	or polluted run-off into
	nearby watercourses during construction.	or ponacou run on meo
	Ephemeral watercourses are located at the Rietberg Mine and the processing facility, TSF and logistics have be	seen located to avoid
	these wherever possible. The water pipeline from the Henkries line will cross watercourses using existing his	
	the Rietberg Mine. Construction activities will need to be managed to avoid pollution of watercourses.	torical pilitris to reacti
		and the discourse
	An ephemeral watercourse is located to the north of the Jubilee Mine historically impacted on by mine waste rock dumps.	
	Management of stormwater run-off will be required to keep clean water from entering polluted water system	ms.
	Any watercourse crossings for haul roads will be designed to minimise impact on the water resource.	
	2.2 Groundwater quality:	
	Limited use of groundwater during site establishment due to poor quality that will require treatment prior to	use for construction
	purposes, such as mixing with cement. Potential for groundwater pollution due to oil spills during routine ma	intenance of equipment.
	2.3 Groundwater quantity:	
	Limited use of groundwater during site establishment due to poor quality.	
ALTERNATIVE	PREFERRED AND ONLY ALTERNATIVE	NO-GO ALTERNATIVE

Degree to which the impact can be managed:	High	N/A
Degree to which the impact can be mitigated :	High	N/A
·	Surface water mitigation measures	N/A
	Generic mitigation measures for surface water resources	
Dranged mitigation	Manage any road widening activities and construction of culverts and pipelines within watercourses and (National	
Proposed mitigation:	Water Act Regulated Area), to prevent an increase in suspended solids, turbidity and pollution from machinery	
	entering the watercourse habitat.	
	Oils and lubricants must be stored within sealed containment structures.	1

- Any mechanical equipment maintenance must be undertaken on drip trays or UPVC sheets to prevent spills/ leaks
 onto the soil.
- When not in use, a drip tray must be placed beneath mechanical equipment and vehicles.
- Machinery must be kept in good working order and regularly inspected for leaks.
- A spill kit will be available on each site where mining activities are in progress.
- Any spillages will be cleaned up immediately and treated in the bio-cells (soil farms) which are located on the adjacent mine.
- Waste materials generated on site must be stored in suitable lidded containers and removed off site to a suitable disposal facility.
- Waste separation must be undertaken if practical for recycling
- Provide all workers with environmental awareness training and comply with the requirements of the EMPr.
- Provide a bin at the site and provide a mobile ablution facility.

Site Specific Mitigation measures

- Plan the location of the processing facility, TSF, waste rock dump and logistics at Rietberg to be outside the active river channel of the ephemeral watercourses wherever possible.
- Make use of the existing historical plinths to raise the water pipeline from the Henkries line above the watercourses to reach the Rietberg Mine.
- Avoid further impact on the Koeries River (ephemeral watercourse) located to the north of the Jubilee Mine historically impacted on by mine waste rock dumps.
- Management of stormwater run-off will be required to keep clean water from entering polluted water systems.
- Any watercourse crossings for haul roads will need to be designed to minimise impact on the water resource.

Stormwater management

- Ensure that soil erosion berms are placed in locations to prevent stormwater run-off eroding unconsolidated exposed soil.
- Ensure that stormwater runoff is not contaminated and can enter watercourses.

Groundwater quality during construction (Appendix D)

Essential groundwater mitigation measures during construction are as follows:

- Take care that onsite sanitation facilities are well maintained and serviced regularly.
- Ensure that good housekeeping is implemented and followed.
- Ensure that the design of the TSF and WRD complies with GN R632 published in terms of the NEM:WA: the
 Regulations Regarding the Planning and Management of Residue Stockpiles and Residue Deposits, unless motivation
 for an alternative design is accepted by the regulatory authorities.
- Establish facilities posing a risk to groundwater contamination as far as possible away from known fault zones and perched intergranular aquifers associated with the dry drainage channels of the Koeries River.
- Place oil traps under stationary machinery, only re-fuel machines at fueling station, construct structures to trap fuel
 spills at fueling station, immediately clean oil and fuel spills and dispose contaminated material (soil, etc.) at licensed
 sites only.
- Draw-up and strictly enforce procedures for the storage, handling and transport of different hazardous materials.
- Ensure vehicles and equipment are in good working order and drivers and operators are properly trained.

Best practice groundwater mitigation measures during construction are as follows:

- Implement a monitoring system to record the abstraction point's water level and volume abstracted on a regular basis, i.e. at least monthly, preferably weekly:
- Monitor water levels at the proposed new monitoring boreholes (see section 9 on page 73 for details) and Rietberg Natural Spring on a regular basis, i.e. at least monthly, preferably weekly;

	 Collect water samples at the new monitoring boreholes and Rietberg Natural Spring every three months and submit to SANAS accredited laboratories for analysis of pH, EC, macro-chemistry (Na, Mg, K, Ca, NH4, Cl, SO4, Total Alkalinity, PO4, F, NO3), TPH, TOC and selected trace-metals (Fe, Al, Se, Cu, Pb, Zn, Cd, As, Sb and U) and microbiology. Minimise storage of hazardous substances onsite during construction. Service construction vehicles at a commercial service station if possible. Maintain vehicles to limit the potential for accidental hydrocarbon spillages. Encourage contractors to report, react and manage all spills and leaks so that any subsequent spills can be cleaned up immediately to prevent contamination of the groundwater. Maintain and service onsite sanitation facilities regularly. Groundwater quantity mitigation measures during Construction Phase (Appendix D) Essential groundwater mitigation measures during construction are as follows: If boreholes are used to augment construction water supplies, limit abstraction from these to 130 KL/d over an eight hour per day schedule, followed by 16 h recovery, before the next pumping schedule commences. 	
	Implement and follow water saving procedures and methodologies.

Potential impact and risk:	IMPACT 7: POTENTIAL FOR HERITAGE, PALAEONTOLOGICAL AND CULTURAL IMPACTS:	
Potential Impacts on Heritage,	Refer to Appendix C . The heritage resources identified as no-go area have been demarcated at the Home	ep mine where the mine
•	footprint will not impact on it, and at the Jubilee mine the graveyard is outside the mine footprint. There are	
Paleontological and Cultural	palaeontological resources.	me expected impacts on
landscape	paraconicological resources.	
ALTERNATIVE	PREFERRED AND ONLY ALTERNATIVE	NO-GO ALTERNATIVE
Nature of impact:	Negative for loss	N/A
	Positive for potential provincial heritage site related to the history of the area as recommended in the HIA.	
Extent and duration of impact:	Local & Long term	N/A
Consequence of impact or risk:	Loss of some resources at the Jubilee mine located partially buried by the waste rock dump site. No loss expected for fossils.	N/A
Probability of occurrence:	Possible	N/A
Degree to which the impact may cause	No loss (according to Specialist Report).	N/A
irreplaceable loss of resources:		

Degree to which the impact can be reversed:	Irreversible for loss	N/A
Indirect impacts:	Blasting at Jubilee is likely to cause fly-rock (small rock pieces) to land on the graveyard located to the north-east of the open pit.	N/A
Cumulative impact prior to mitigation:	Low	N/A
Significance rating of impact prior to mitigation (e.g. Low, Medium, Medium-High, High, or Very-High)	Medium	N/A
Degree to which the impact can be avoided :	Low	N/A
Degree to which the impact can be managed:	Medium	N/A
Degree to which the impact can be mitigated :	High	N/A
Proposed mitigation:	 All haul roads must make use of existing roads as far as possible (including where they cross or follow the historic copper mining railway). All upgrades to haul roads must be centered on the existing roads as far as possible so as to minimize impacts to features located close to these roads. Any alteration to the overall project footprint (i.e. mine fences and haul road locations) must be subjected to further assessment as may be required. All surface activities must be contained within the three mine fences to avoid impacts to unsurveyed areas. 	N/A
	The final layout of each of the three mines must be considered by an archaeologist or heritage consultant to determine whether any specific mitigation measures or no-go areas not anticipated in the present assessment might be required prior to construction.	
	• The graveyard in the Jubilee Mine (Waypoint 111) must be fenced with a 30 m buffer and declared a no-go area. A gate should be provided for potential visitors and to allow cleaning of any wind-blown litter.	
	The historical stone-built mining-related structures in the Jubilee Mine must be preserved. They can be reused if required but their modification must be approved by SAHRA to ensure that their heritage significance is not diminished (this may require the services of a heritage architect).	
	 The stone house and threshing floor in the Homeep Mine (Waypoint 163) must be avoided and declared a no-go area. A 30 m buffer should be imposed if possible but this is not required. The structure should not be used for mining-related activities. (This has been demarcated on Figure 3d and is excluded from the mine site boundary.) 	
	• All ruins, livestock enclosures and structures related to local herder activity and hence living heritage) must be avoided as far as is possible.	
	• If any herder enclosures or structures will need to be removed or will be covered by mine dumps then this must be done in consultation with their owners (if traceable) or other community members.	
	• If any historical underground mine workings are opened then these must be inspected (insofar as it is safe to do so) for historical traces such as hand tools, mining equipment, graffiti or other features. A report including a photographic record must be submitted to SAHRA for approval prior to modification or destruction of the historical workings.	
	A chance finds procedure for recording and recovering isolated fossil finds must be incorporated into the environmental management program for the project. (Included as Table 21 in Part B: EMPr of this report).	
	• If any Stone Age, historical or industrial archaeological material (e.g. stone tools, historical rubbish dumps, historic mining equipment or tools) or human burials are uncovered during the course of development then work in the immediate area should be halted. The find would need to be reported to the heritage authorities and may require inspection by an archaeologist. Such heritage is the property of the state and may require excavation and curation in an approved institution	
	SAHRA Final Comment (17/11/2020):	
	The following comments are made as a requirement in terms of section 3(4) of the NEMA Regulations and section 38(8) of the NHRA in the format provided in section 38(4) of the NHRA and must be included in the Final EMPr:	
	38(4)a – The SAHRA Archaeology, Palaeontology and Meteorites (APM) Unit and the Burial Grounds and Graves (BGG) Unit has no objections to the proposed development;	

	 Should it not be possible to avoid the identified highly significant heritage resources that are protected by section 35 of the NHRA, as stated on page 32 of the HIA, a permit in terms of section 35 of the NHRA must be applied for in order to mitigate these sites. This must be conducted prior to the construction phase Should it not be possible to avoid the identified burial grounds with a 100m buffer including Waypoint 111 a consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves; 	
•	 level of significance; A buffer-zone of at-least 100m must be maintained around all grave-sites protected under section 36. A fence with access gate must be erected around these sites; Should it not be possible to avoid the identified highly significant heritage resources that are protected by section 35 of the NHRA, as stated on page 32 of the HIA, a permit in terms of section 35 of the NHRA must be applied for in order to mitigate these sites. This must be conducted prior to the construction phase Should it not be possible to avoid the identified burial grounds with a 100m buffer including Waypoint 111 a consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves; Should relocation of the graves be found to be the way forward, a permit in terms of section 36(3) of the NHRA and 	
•	 Should it not be possible to avoid the identified highly significant heritage resources that are protected by section 35 of the NHRA, as stated on page 32 of the HIA, a permit in terms of section 35 of the NHRA must be applied for in order to mitigate these sites. This must be conducted prior to the construction phase Should it not be possible to avoid the identified burial grounds with a 100m buffer including Waypoint 111 a consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves; Should relocation of the graves be found to be the way forward, a permit in terms of section 36(3) of the NHRA and 	
•	of the NHRA, as stated on page 32 of the HIA, a permit in terms of section 35 of the NHRA must be applied for in order to mitigate these sites. This must be conducted prior to the construction phase Should it not be possible to avoid the identified burial grounds with a 100m buffer including Waypoint 111 a consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves; Should relocation of the graves be found to be the way forward, a permit in terms of section 36(3) of the NHRA and	
	consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves; Should relocation of the graves be found to be the way forward, a permit in terms of section 36(3) of the NHRA and	
•	Should relocation of the graves be found to be the way forward, a permit in terms of section 50(5) of the NTINA and	
•	Once the layouts of the mines are finalised, a revised HIA must be compiled by a qualified heritage practitioner that provides a site-specific impact assessment for each identified heritage resources and site-specific mitigation measures. Currently, it is not clear what the impacts to each heritage resource is, however, it is understood that the layout has not yet been finalised;	
•	• A Heritage Management Plan (HMP) must be developed in order to manage the in-situ heritage resources and the historical mining infrastructure including the historical underground workings. This HMP must be submitted to SAHRA for review and comment prior to the commencement of the construction phase;	
•	 All decisions regarding heritage resources protected by section 34 of the NHRA must be sought from the Northern Cape Provincial Heritage Resources Authority; 	
•	• 38(4)c(i) – If any evidence of archaeological sites or remains (e.g. remnants of stone-made structures, indigenous ceramics, bones, stone artefacts, ostrich eggshell fragments, charcoal and ash concentrations), fossils or other categories of heritage resources are found during the proposed development, SAHRA APM Unit (Natasha Higgitt/Phillip Hine 021 462 5402) must be alerted as per section 35(3) of the NHRA. Non-compliance with section of the NHRA is an offense in terms of section 51(1)e of the NHRA and item 5 of the Schedule;	
•	• 38(4)c(ii) – If unmarked human burials are uncovered, the SAHRA Burial Grounds and Graves (BGG) Unit (Thingahangwi Tshivhase/Mimi Seetelo 012 320 8490), must be alerted immediately as per section 36(6) of the NHRA. Non-compliance with section of the NHRA is an offense in terms of section 51(1)e of the NHRA and item 5 of the Schedule;	
•	36(1)4 366 366 361 31(1) 31 116 1111111,	
	• 38(4)e – The following conditions apply with regards to the appointment of specialists:	
	palaeontologist, depending on the nature of the finds, must be contracted as soon as possible to inspect the heritage resource. If the newly discovered heritage resources prove to be of archaeological or palaeontological significance, a Phase 2 rescue operation may be required subject to permits issued by SAHRA;	
•	The Final Envana Environmental Se Submitted to Symmetro Federal purposes.	
•	 The decision regarding the EA Application must be communicated to SAHRA and uploaded to the SAHRIS Case application. 	
Residual impacts:	None identified for insignificant findings	N/A

Significance rating of impact prior to mitigation e.g. Low, Medium, Medium-High, High, or /ery-High)	Medium	N/A
Degree to which the impact can be avoided :	Medium	N/A
Degree to which the impact can be managed:	Medium	N/A
Degree to which the impact can be mitigated :	Medium	N/A
Proposed mitigation:	 The focus of topographic rehabilitation may not be obvious at the time of mine planning and must be addressed as the mine develops and the Closure Plan must be reviewed periodically for continued relevance in the light of changed mine path or long-term plans. The waste rock dump must be designed to meet minimum slope stability and safety standards and vegetated to reduce erosion and runoff. The ongoing management of the self-raising TSF shall be in accordance with the relevant regulations and as per the Report attached at Appendix D. The basic rehabilitation methodology will strive to replicate the pre-mining topography, wherever possible, or at least not to increase overall slope gradients without emplacement of adequately designed erosion control or runoff diversion structures. 	N/A
Residual impacts:	 Visual change in landscape and topography following rehabilitation improving sense of place. Creation of new habitats. Potential for instability below ground. 	N/A
Cumulative impact post mitigation:	Medium-Low	N/A
Significance rating of impact after mitigation (e.g. Low, Medium, Medium-High, High, or Very-High)	Medium-Low	N/A

Extent and duration of impact: Consequence of impact or risk:	Site & Long term	N/A N/A
Probability of occurrence:	Loss Definite	N/A N/A

Degree to which the impact may cause	Medium	N/A
irreplaceable loss of resources:		
Degree to which the impact can be reversed:	Reversible	N/A
Indirect impacts:	 Dust impacting on adjacent vegetation decreasing palatability for livestock and fauna and causing a nuisance to workers, considering that vegetation is very sparse and livestock farming is limited. Compaction of topsoil damages seed bank and habitat for invertebrates. 	N/A
Cumulative impact prior to mitigation:	Medium	N/A
Significance rating of impact prior to mitigation	Medium	N/A
(e.g. Low, Medium, Medium-High, High, or Very-High)		
Degree to which the impact can be avoided :	Medium	N/A
Degree to which the impact can be managed:	Medium	N/A
Degree to which the impact can be mitigated :	Medium	N/A
Proposed mitigation:	 After clearing, the affected area shall be stabilized to prevent any erosion or sediment runoff. Stabilised areas shall be demarcated accordingly. Incremental clearing of vegetation should take place to avoid unnecessary exposed surfaces. Reasonable measures must be undertaken to ensure that any exposed areas are adequately protected against the wind and storm water run-off. Stockpiles should ideally be located to create the least visual impact and must be maintained to avoid erosion of the material. Reduce drop height of material to a minimum. Temporarily halt material handling in windy conditions. A speed limit of 30km/hour will be displayed and enforced through a fining system. All vehicle drivers using the access road and entering the site will be informed of the speed limit. Compacted areas that are not required for access shall be scarified after use during decommissioning and rehabilitation. Provision must also be made for efficient storm water control to prevent erosion. Soil erosion and compaction on the section of public road, should it remain unsurfaced, used by the Applicant is required to be monitored and timeously repaired. Soil erosion on private haul roads is to be regularly monitored and repaired. 	N/A
Residual impacts:	 Unmanaged soil erosion will result in loss of topsoil. Unmanaged dust from unsurfaced roads will cause a nuisance and impact on the health of the workers. Dust impacting on adjacent vegetation decreasing palatability for livestock and fauna. Climate change is predicted to result in less rainfall in the western areas of South Africa with increases in temperature and reduction in vegetation growth, increasing soil erosion. 	N/A
Cumulative impact post mitigation:	Low	N/A
Significance rating of impact after mitigation (e.g. Low, Medium, Medium-High, High, or Very-High)	Low	N/A
Potential impact and risk: Potential Impacts on Surface water Resources	IMPACT 3.1: SURFACE WATER RESOURCES Ephemeral watercourses are located at the Rietberg Mine and the processing facility, TSF and logistics have be these wherever possible. The water pipeline from the Henkries line will cross watercourses to reach the Rietle An ephemeral watercourse is located to the north of the Jubilee Mine historically impacted on by mine waster Management of stormwater run-off will be required to keep clean water from entering polluted water system. Any watercourse crossings for haul roads will be designed to minimise impact on the water resource and main operation.	perg Mine. rock dumps. ns.

Degree to which the impact can be mitigated :	High	N/A
	The Tailings Storage Facility (TSF) will be lined with a Class C containment system as detailed in Appendix	N/A
	D, thus preventing groundwater contamination.	
	Mitigation Measures during Operational Phase (Appendix D):	
	Essential groundwater mitigation measures during operations are as follows:	
	Take care that onsite sanitation facilities are well maintained and serviced regularly.	
	 Ensure that the design of the TSF and WRD complies with GN R632 published in terms of the NEM:WA: the Regulations Regarding the Planning and Management of Residue Stockpiles and Residue Deposits, unless motivation for an alternative design is accepted by the regulatory authorities. 	
	Design and construct the RWD and SWD with adequate liners.	
	Slope the WRD and RoM Stockpiles to prevent rainwater ponding and maximise storm water runoff.	
	Channel stormwater runoff to the SWD.	
	Draw-up and strictly enforce procedures for the storage, handling and transport of different waste materials.	
	 Place oil traps under stationary machinery, only re-fuel machines at fueling station, construct structures to trap fuel spills at fueling station, immediately clean oil and fuel spills and dispose contaminated material (soil, etc.) at licensed sites only. 	
	 Draw-up and strictly enforce procedures to handle accidental spillage and leaks on process water pipelines and incorporate adequate leakage detection and spill control measures in the facility's design and construction. 	
	• Ensure vehicles and equipment are in good working order and drivers and operators are properly trained.	
	• Ensure that good housekeeping rules are applied, and emergency spill clean-up procedures and equipment are in place.	
Proposed mitigation:	Best practise groundwater mitigation measures during operation:	
rroposeu miligation.	 Reduce salinity of groundwater derived process water from mine dewatering and possibly the O'Kiep mine, by blending with better quality water, e.g. less saline treated wastewater from the O'Kiep and/or Concordia Municipal WWTW, or Sedibeng Water's pipeline; 	
	 Install a groundwater monitoring system with monitoring boreholes drilled upstream and downstream of facilities where potential groundwater risk is highest, i.e. TSF, RWD, SWD and Treatment Plant. Suggested number of monitoring boreholes are as follows: TSF and RWD – one upstream and two downstream; and SWD – one upstream and one downstream. 	
	 Install a monitoring borehole upstream and downstream of each mine site to monitor groundwater levels and chemistry in the fractured-rock aquifers; 	
	 Monitor groundwater dewatering discharge and water quality at the three SHIP mines, i.e. Rietberg, Jubilee and Homeep; 	
	 The groundwater monitoring should include the following: The water levels at all monitoring boreholes and the three mines must be recorded on at least a monthly basis	
	 CI, SO4, Total Alkalinity, PO4, F, NO3), COD, TPH and selected trace-metals (Fe, Mn, Al, Se, Cu, Pb, Zn, Cd, As, Sb and U); and A SACNASP registered hydrogeologist should evaluate the monitoring data on an annual basis and compile a monitoring report. 	
	Minimise storage of hazardous substances onsite during operation.	
Residual impacts:	The lined TSF will ensure that the groundwater quality is not impacted on by the mining activities.	N/A

Cumulative impact post mitigation:	Low	N/A

Proposed mitigation:	 Waste rock from the mining process is to be disposed of in the waste rock dumps. Industrial waste (i.e. including hazardous wastes and oils and greases) Separation of wastes into classes will ensure that waste is disposed of safely and according to the correct procedure. In order to ensure that waste classes are kept in separate streams, training will be undertaken. Petrochemical spillages to be collected in a drip tray and drum to store; excavate spill affected soil for disposal at a registered hazardous waste facility. Hazardous waste is to be disposed of at Vissershoek Landfill. Domestic waste (i.e. waste that is generated from the offices) Domestic waste - separated at source into recyclable products. These must then be removed and recycled by recognised contractors. (Note that the mine is responsible for the waste from cradle to grave). Disposal at a registered and officially permitted commercial or municipal landfill site is the most cost-effective option for materials that cannot be recycled. Domestic waste generated by workers needs to be sorted and all biodegradable waste must be stored in separate drums provided for. Mine residue Disposal Storage Facility (MRDSF) The TSF will be lined preventing groundwater contamination (Appendix D). Manage according to the Report (Appendix D) to ensure that the waste disposal facility complies with relevant legislation. Wastewater Equipment used in the mining process will be adequately maintained so that during operations it does not spill oil, diesel, fuel, or hydraulic fluid. By keeping contaminated and clean water separate and establishing controlled runoff washing bays, the flow and end destination of decontamination washing water will be controlled. Slow storm water runoff with contoured, low-gradient drains and channels, as well as retention ponds. A series of ponds ma	N/A
Residual impacts:	Recycling of waste material creates employment.	N/A

Degree to which the impact can be managed :	Medium	N/A
Degree to which the impact can be mitigated :	High	N/A
Proposed mitigation:	 All haul roads must make use of existing roads as far as possible (including where they cross or follow the historic copper mining railway). All upgrades to haul roads must be centered on the existing roads as far as possible so as to minimize impacts to features located close to these roads. Any alteration to the overall project footprint (i.e. mine fences and haul road locations) must be subjected to further assessment as may be required. All surface activities must be contained within the three mine fences to avoid impacts to unsurveyed areas. The final layout of each of the three mines must be considered by an archaeologist or heritage consultant to determine whether any specific mitigation measures or no-go areas not anticipated in the present assessment might be required prior to construction. 	N/A

- The graveyard in the Jubilee Mine (Waypoint 111) must be fenced with a 30 m buffer and declared a no-go area. A
 gate should be provided for potential visitors and to allow cleaning of any wind-blown litter.
- The historical stone-built mining-related structures in the Jubilee Mine must be preserved. They can be reused if
 required but their modification must be approved by SAHRA to ensure that their heritage significance is not diminished
 (this may require the services of a heritage architect).
- The stone house and threshing floor in the Homeep Mine (Waypoint 163) must be avoided and declared a no-go area. A 30 m buffer should be imposed if possible but this is not required. The structure should not be used for mining-related activities. (This has been demarcated on Figure 3d and is excluded from the mine site boundary.)
- All ruins, livestock enclosures and structures related to local herder activity and hence living heritage) must be avoided
 as far as is possible.
- If any herder enclosures or structures will need to be removed or will be covered by mine dumps then this must be
 done in consultation with their owners (if traceable) or other community members.
- If any historical underground mine workings are opened then these must be inspected (insofar as it is safe to do so) for historical traces such as hand tools, mining equipment, graffiti or other features. A report including a photographic record must be submitted to SAHRA for approval prior to modification or destruction of the historical workings.
- A chance finds procedure for recording and recovering isolated fossil finds must be incorporated into the environmental management program for the project. (Included as Table 21 in Part B: EMPr of this report).
- If any Stone Age, historical or industrial archaeological material (e.g. stone tools, historical rubbish dumps, historic
 mining equipment or tools) or human burials are uncovered during the course of development then work in the
 immediate area should be halted. The find would need to be reported to the heritage authorities and may require
 inspection by an archaeologist. Such heritage is the property of the state and may require excavation and curation in
 an approved institution.

SAHRA Final Comment (17/11/2020):

- The following comments are made as a requirement in terms of section 3(4) of the NEMA Regulations and section 38(8) of the NHRA in the format provided in section 38(4) of the NHRA and must be included in the Final EMPr:
- 38(4)a The SAHRA Archaeology, Palaeontology and Meteorites (APM) Unit and the Burial Grounds and Graves (BGG)
 Unit has no objections to the proposed development;
- 38(4)b The recommendations of the specialists are supported and must be adhered to. Further additional specific
 conditions are provided for the development as follows:
- A 30 m no-go buffer zone must be adhered to around all identified heritage resources with a Grade 111A or higher level of significance;
- A buffer-zone of at-least 100m must be maintained around all grave-sites protected under section 36. A fence with access gate must be erected around these sites;
- Should it not be possible to avoid the identified highly significant heritage resources that are protected by section 35
 of the NHRA, as stated on page 32 of the HIA, a permit in terms of section 35 of the NHRA must be applied for in
 order to mitigate these sites. This must be conducted prior to the construction phase
- Should it not be possible to avoid the identified burial grounds with a 100m buffer including Waypoint 111 a consultation process for a full 60 days in terms of Chapter XI of the NHRA Regulations must be conducted in order to understand the way forward regarding the preservation of the graves;
- Should relocation of the graves be found to be the way forward, a permit in terms of section 36(3) of the NHRA and Chapter IX of the NHRA Regulations must be applied for. This must be completed prior o the construction phase;
- Once the layouts of the mines are finalised, a revised HIA must be compiled by a qualified heritage practitioner that
 provides a site-specific impact assessment for each identified heritage resources and site-specific mitigation
 measures. Currently, it is not clear what the impacts to each heritage resource is, however, it is understood that the
 layout has not yet been finalised;

	A Heritage Management Plan (HMP) must be developed in order to manage the in-situ heritage resources and the historical mining infrastructure including the historical underground workings. This HMP must be submitted to SAHRA for review and comment prior to the commencement of the construction phase;	
	 All decisions regarding heritage resources protected by section 34 of the NHRA must be sought from the Northern Cape Provincial Heritage Resources Authority; 	
	• 38(4)c(i) – If any evidence of archaeological sites or remains (e.g. remnants of stone-made structures, indigenous ceramics, bones, stone artefacts, ostrich eggshell fragments, charcoal and ash concentrations), fossils or other categories of heritage resources are found during the proposed development, SAHRA APM Unit (Natasha Higgitt/Phillip Hine 021 462 5402) must be alerted as per section 35(3) of the NHRA. Non-compliance with section of the NHRA is an offense in terms of section 51(1)e of the NHRA and item 5 of the Schedule;	
	• 38(4)c(ii) – If unmarked human burials are uncovered, the SAHRA Burial Grounds and Graves (BGG) Unit (Thingahangwi Tshivhase/Mimi Seetelo 012 320 8490), must be alerted immediately as per section 36(6) of the NHRA. Non-compliance with section of the NHRA is an offense in terms of section 51(1)e of the NHRA and item 5 of the Schedule;	
	• 38(4)d – See section 51(1) of the NHRA;	
	• 38(4)e – The following conditions apply with regards to the appointment of specialists:	
	 If heritage resources are uncovered during the course of the development, a professional archaeologist or palaeontologist, depending on the nature of the finds, must be contracted as soon as possible to inspect the heritage resource. If the newly discovered heritage resources prove to be of archaeological or palaeontological significance, a Phase 2 rescue operation may be required subject to permits issued by SAHRA; 	
	The Final EIA and EMPr must be submitted to SAHRA for record purposes;	
	The decision regarding the EA Application must be communicated to SAHRA and uploaded to the SAHRIS Case	
	application.

	the mine develops and the Closure Plan must be reviewed periodically for continued relevance in the light of changed mine path or long-term plans. Compacted areas shall be scarified after use during decommissioning and rehabilitation. Any stored topsoil shall be spread over the scarified surfaces. Rehabilitation of the TSF as per Appendix D. Other mitigating with regard to residual environmental impact Implementing screening as part of the cleaning activities before materials is moved from the mine. The infrastructure area will be screened for petrochemical spills and cleaned and waste from the temporary storage facility will be removed and the area cleaned. Unwanted steel, sheet metal and equipment needs to be sold or disposed of as scrap metal. Recycling and reusing materials may reduce garbage haul fees or generate income through the sale of scrap metal and old equipment. All steel structures and reinforcing will be discarded or sold as scrap. All equipment and other items used during the mining operation needs to be removed from the site. Used oils / hydrocarbons fuels / liquids are to be collected in sealed containers (stored on concrete slabs) and removed from site for recycling by a reputable company. All waste in the temporary storage area for used lubrication products and other hazardous chemicals will be disposed of at a collection point from where it will be collected by a waste recycling company. All temporary waste storage areas need to be cleaned out and waste removed. Tyres to be return to supplier or a company that uses old tyres for making door mats, shoes, swings, etc. Batteries to be return to supplier or disposed at a permitted hazardous waste facility.	

	 Laboratory waste (chemicals) - Returned to supplier or disposed of at a permitted facility that is capable of disposing of the waste. Industrial chemicals (laboratory waste) - Returned to supplier or disposed of at a permitted facility that is capable of disposing of the waste. These liquid wastes cannot be disposed of on the waste dumps. Redundant structures, buildings and civil foundations (down to one meter below surface for subsurface infrastructure) will be removed for use elsewhere or demolished and discarded. All redundant infrastructure and services needs to be demolished including ruins, buildings, foundations and footings. Building rubble will be used as backfill in excavations or removed from site in the absence of excavations. 	
	 Remove all power and water supply installations not to be retained by landowner in terms of section 44 of the MPRDA. Removing underground infrastructure to one meter below surface. Excavations created by removing subsurface infrastructure needs to be filled, levelled and compacted. 	
	 Final walk through of complete mining lease area to ensure no mining related waste and of re-usable infrastructure remain on site. As part of this phase training of personnel in the implementation of the Closure Plan will be done and the implementation of the environmental awareness plan will be an ongoing process.

	Ensure vehicles and equipment are in good working order and drivers and operators are properly trained.	
	Ensure that good housekeeping rules are applied.	
	Limit rainwater infiltration by topsoiling and vegetating the TSF.	
	Continue to collect and return leachate from the under drainage and seepage collection facilities to the RWD until dry.	
	 Maintain RWD until leachate from the under drainage and seepage collection facilities of the TSF are dry before decommissioning the RWD. 	
	Continue with groundwater monitoring.	
	Best practice groundwater mitigation measures during decommissioning are as follows:	
	Maintain the groundwater monitoring system and procedures described in Appendix E.	
	 The groundwater monitoring should include the following: The water levels at all monitoring boreholes, wells, spring and the three mines, if possible, must be recorded on at least a three-monthly basis. Best results are obtained if automatic water level recorders set to take hourly readings are installed; Water samples must be collected at all monitoring boreholes and the three SHIP mines, if possible, on a three- 	
	monthly basis and submitted to a SANAS accredited laboratory for analysis of pH, EC, macro-chemistry (Na, Mg, K, Ca, NH4, Cl, SO4, Total Alkalinity, PO4, F, NO3), COD, TPH and selected trace-metals (Fe, Mn, Al, Se, Cu, Pb, Zn, Cd, As, Sb and U); and • A SACNASP registered hydrogeologist should evaluate the monitoring data on an annual basis and compile a monitoring report.
