

Figure 1: View of the stream upstream of the weir. The weir causes sediment entrapment and this promotes weed establishment as is present in this area. The main channel of the stream is indicated by the blue line.

Figure 2: View of the stream downstream of the weir. Note the closed canopy due to the absence of the sediment impact of the weir.

Figure 3: The weir within the stream on which the pipeline will be attached (red line).

Figure 4: Limited littering takes place within the stream.

Figure 5: Alternative pipeline crossing downstream of the weir. This alternative will have a higher impact.
