

Sparsely vegetated section of the study area which still contained numerous forbs and grasses despite being overgrazed and trampled by cattle (Looking towards the north-east).

Heavily wooded section of the study area (Looking towards the south-west).

Wetland visible in sharp contrast to the arid sandy surroundings.

Grave site with three marked graves in the foreground and unmarked graves visible in the background.

Declining and Protected *Boophone disticha* and *Hypoxis hemerocallidea* found at the site.

Several animal burrows and a diversity of insects (including various butterfly species) were observed during the field scan.
