# Attention: SAVANNAH ENVIRONMENTAL (Pty) Ltd Candy Mahlangu: candy@savannahsa.com

# To whom it may concern:

ECOLOGICAL SPECIALIST INPUT FOR THE PART 1 AMENDMENT OF THE ENVIRONMENTAL AUTHORISATION (EA) FOR THE PROPOSED 75MW BOESMANLAND SOLAR FARM, PORTION 6 (A PORTION OF PORTION 2) FARM 62 ZUURWATER, NEAR AGGENEYS IN THE KHÂI-MA LOCAL MUNICIPALITY, NORTHERN CAPE PROVINCE.

# Background

Boesmanland Solar Farm (Pty) Ltd is proposing to amend the Environmental Authorization (EA) for the Zuurwater 62 solar facility, by extending the EA validity by an additional ten (10) years. Extension of the validity of the EA will ensure that the EA remains valid for the undertaking of the authorised activities.

Savannah Environmental have been appointed as the Registered Environmental Assessment Practitioner (EAP) to prepare the Application. The EA Amendment will be completed in terms of Regulation 30(1)(a) of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended, including additional specialist studies and public participation required by the DFFE. Condition 7 of the First Issue Environmental Authorisation, Issued on the 16th of July 2013, DEA Reference 14/12/16/3/3/2/222 states that:

"This activity must commence within a period of three (3) years from the date of issue of this authorisation. If commencement of the activity does not occur within that period, the authorisation lapses and a new application for environmental authorisation must be made in order for the activity to be undertaken."

Consequent amendments to extend the validity of the authorisation have been made as follows:

- 14/12/16/3/3/2/222/AM1 authorised on the 22 February 2016 extending the validity to commence within two (2) years from the date of expiry of the EA issued on 16 July 2013.
- 14/12/16/3/3/2/222/AM2 authorised on the 30 July 2018 extending the validity to the 16 July 2020.
- 14/12/16/3/3/2/222/AM3 authorised on the 12 August 2020 extending the validity to the 16 July 2023 which states the following:

"This activity must commence within a period of ten (10) years from the date of issue of this authorisation (i.e. the EA lapses on 16 July 2023). If commencement of the activity does not occur within that period, the authorisation lapses and a new application for environmental authorisation must be made in order for the activity to be undertaken."

# the **BIODIVERSITY** company

The Biodiversity Company Cell: +27 81 319 1225 Fax: +27 86 527 1965 info@thebiodiversitycompany.com www.thebiodiversitycompany.com

The applicant, Boesmanland Solar Farm (Pty) Ltd thus requests that the Competent Authority amends Condition 7 of the original EA (Page 9) as amended (DFFE Reference: 14/12/16/3/3/2/222/AM3; dated 12 August 2020).

The Biodiversity Company was appointed to provide specialist inputs for this Amendment Application. This report is a component of the Ecological Assessment and the Scope of Work for this report is as follows:

- A single site visit to confirm the status of the environment compared to that at the time of the original assessment. This is required in order to make a statement as to whether the environment has changed since the original assessment supported by a site verification report.
- An indication as to whether the impact rating as provided in the initial assessment remains valid; if the mitigation measures provided in the initial assessment are still applicable; or if there are any new mitigation measures which need to be included into the EA, should the request to extend the commencement period be granted by the Department.
- An indication as to whether there are any new assessments/guidelines which are now relevant to the authorised development which were not undertaken as part of the initial assessment, must be taken into consideration and addressed in the report.
- A description and an assessment of any changes to the biophysical environment that has occurred since the initial EA was issued.
- A description and an assessment of the surrounding environment, in relation to new developments or changes in land use which might impact on the authorised project, the assessment must consider the following:
  - o similar developments within a 30km radius; and
  - Identified cumulative impacts, and where possible the size of the identified impact must be quantified and indicated, i.e., hectares of cumulatively transformed land.

# Assumptions and Limitations

The field survey for this assessment was undertaken 30<sup>th</sup> of April to the 7<sup>th</sup> of May 2023, constituting an austral late summer season survey. We assessed avifauna within and around the previously approved PAOI. Based on the previous reports and considering the structure of the habitats and dominant avifauna species, there is a high confidence level in understanding the present ecological condition and avifauna community structures.

# **Results and Outcomes**

1. The following assessments were considered for this avifauna report:

Cape Environmental Assessment Practitioners (Pty) Ltd. 2013. Suurwater 62, Boesmanland 75MW solar farm, Aggeneys fauna and flora specialist report for impact assessment

# 2. Avifauna

2.1. The PAOI surprisingly high avian diversity for an arid zone with 39 species being confirmed.

- 2.2. Of the 39 avian species recorded within and around the PAOI, five species are listed namely Lanner Falcon *Falco biarmicus* (regionally Vulnerable), Red Lark *Calendulauda burra* (Gloabally Vulnerable), Verreaux's Eagle *Aquila verreauxii* (Not Assessed), Lappet-faced Vulture *Torgos tracheliotos* (Globally Endangered), Burchell's Courser *Cursorius rufus* (Regionally Vulnerable).
- 2.3. Collisions and electrocution from power-line infrastructure are significant causes of mortality for bustards, eagles and vultures Powerlines must be fitted with industry standard bird flight diverters in order to make the lines as visible as possible to collision-susceptible species.
- 2.4. *Calendulauda burra* was recorded more frequently than expected, with at least seven individuals observed during the site visit. Densities of *Calendulauda burra* were highest in the southwestern regions of the PV site and southern sections of the transmission lines, particularly where dune habitat formed part of the proposed POAI. These observations, therefore, provide a unique opportunity to assess the impact of Solar Park developments on the *Calendulauda burra* bird community.
- 2.5. Starks Lark *Spizocorys starki* was present in high densities, particularly on the north and eastern sections of the proposed PV site during the avifaunal assessments. The gravel plains within the PV site are important habitats for this highly nomadic species.
- 3. The Impact Assessment from the Specialist Study report included the following:
  - 3.1. Impact Assessment

Impact	Rating after mitigation
Construction Phase	
Loss of Vegetation within the development footprint	Medium
Displacement of faunal (including avifaunal) communities due to habitat loss,	Medium
direct mortalities, and disturbance	
Collection of eggs, nest destruction and poaching	Low -Medium
Operational Phase	
Continued fragmentation and degradation of habitats and ecosystems	Low-Medium
Ongoing displacement and direct mortalities of faunal community (including	Medium
SCC) due to disturbance (road collisions, collisions with infrastructure, noise,	
light, dust, vibration)	
Collisions with powerlines and connection lines	Medium
Electrocution by powerlines	Medium

4. The Site Sensitivity Verification (TBC 2023) for the Zuurwater 62, Aggeneys Part 1 Amendment, does not include a full impact assessment and associated tables due to its nature as a Site Sensitivity Verification.

- 5. The conclusions of the Site Sensitivity Verification for the Zuurwater 62 site is as follows:
  - 5.1. The Project Area was identified with the Environmental Screening Tool as possessing a Very High sensitivity within a Terrestrial Biodiversity Theme. This is due to overlap with Critical Biodiversity Areas, Ecological Support Areas and Protected Areas Expansion Strategy Focus Areas.
  - 5.2. The Project Area was identified with the Environmental Screening Tool as possessing a mosaic of High and Medium sensitivity within the Animal Theme. This is due to the presence of several listed avian species namely Lanner Falcon *Falco biarmicus*, Red Lark *Calendulauda burra*, Burchell's Courser *Cursorius rufus*, Ludwig's Bustard *Neotis ludwigii* and Secretarybird *Sagittarius serpentarius*.
  - 5.3. The Project Area was identified with the Environmental Screening Tool as possessing a Very High sensitivity within the Avian Sensitivity Theme. This is due to PAOI being within 2Km of a powerline ≥ 132kV, falling with the probable core of the Red Lark Calendulauda burra distribution, being within 1km of an IBA and falling within 2km of a known Martial Eagle Polemaetus bellicosus nest site.
  - 5.4. The Site Ecological Importance (SEI), as provided by the Species Environmental Assessment Guidelines (SANBI, 2020), was determined for the Project Area. This will provide the most appropriate and up-to-date sensitivity information. A single-taxon approach was considered for the SEI determination.

- 5.5. The Project Area was a mosaic of Very Low to Very High habitats. Habit congruent with the Screening Tool. The Very High SEI areas were due to the presence of SCC, as well as its Functional Integrity and very low Receptor Resilience.
- 5.6. Based on the layout design, there is overlap of infrastructure with 'High' and 'Very High' SEI areas. Appropriate mitigation measures would be to minimise the footprints of these as much as possible and rehabilitation of degraded areas.
  - 5.6.1.The PV site is a combination of High and Medium SEI habitats.
  - 5.6.2. The proposed transmission lines cross an array of SEI areas some being Very High. Mitigation measures must be implemented to ensure that ecological disturbances are minimised while resilience is maximised.
- 6. Mitigation measures prescribed by each of the reviewed specialist reports remain applicable and must be adhered to.
- 7. Cumulative impacts were not assessed as part of the initial studies however, they are assessed as part of the Sensitivity Verification Report. Impacts of the proposed layout are expected to be low overall and high when considered cumulatively.

7.1. Cumulative impacts are assessed within the context of the extent of the proposed PAOI other developments and activities in the area (existing and proposed) and general habitat loss and disturbance resulting from any other anthropogenic activities in the area. The impacts of projects are often assessed by comparing the post-project situation to a pre-existing baseline. Where projects can be considered in isolation this provides a good method of assessing a project's impact. However, in areas where baselines have already been affected, or where future development will continue to add to the impacts in an area or region, it is appropriate to consider the cumulative effects of development or disturbance activities. This is similar to the concept of shifting baselines, which describes how the environmental baseline at a specific point in time may actually represent a significant change from the original state of the system. This section describes the potential cumulative impacts of the project on the local and regional avifauna community.

Localised cumulative impacts include those from operations that are close enough to potentially cause additive effects on the local environment or any sensitive receivers (such as nearby large road networks, other solar PV facilities, and power infrastructure). Relevant activities and impacts include dust deposition, noise and vibration, loss of corridors or habitat, disruption of waterways, groundwater drawdown, groundwater and surface water depletion, and transport activities. Long-term cumulative impacts associated with the site development activities can lead to the loss of endemic and threatened species, including natural habitat and vegetation types, and these impacts can even lead to the degradation of conserved areas such as the adjacent game parks and reserves.

The total area within the 30 km buffer around the project area amounts to 335,198 ha, but when considering the transformation (1,285 ha) that has taken place within this radius, 333,913 ha of intact habitat remains, according to the 2018 National Biodiversity Assessment. Therefore, the area within 30 km of the project has experienced approximately 0.38% loss in natural habitat. Considering this context, the project footprint for the proposed development (according to the provided layout), and similar projects that exist in the 30 km region measuring a maximum of 96,337 ha (as per the latest South African Renewable Energy EIA Application Database). This means that the total amount of remaining habitat lost as a result of solar projects in the region amounts to 28.67% (the sum of all related developments as a percentage of the total remaining habitat). Table outlines the calculation procedure for the spatial assessment of cumulative impacts.

	Total Habitat (ha)	Total Loss (ha)	Tot. Remaining Habitat (ha) (Remnants)	Total Historical Loss (%)	Cumulative Projects (ha)	Tot. Remaining Habitat (ha)	Cumulative Habitat Lost (%)
Approximate Solar development cumulative effects (Spatial)	335,198	1,285	333,913	0.38%	96,337	238,180	28.67

#### Table 1Loss of habitat within a 30 km radius of the project

The overall cumulative impact assessment is presented in **Error! Reference source not found.** and **Error! Reference source not found.** below. Approximately 0.38% of the habitat has already been lost, and as discussed above, the proposed solar developments will result in a further cumulative loss of approximately 28.67% from only similar developments (Solar, approved and in process) in the area, as such the cumulative impact from the proposed development is rated as medium (**Error! Reference source not found.**). This means that the careful spatial management and planning of the entire region must be a priority, and existing large infrastructure projects must be carefully monitored over the long term.

Figure 1 Cumulative effects within a 30km buffered area of the PAOI

Impact Nature: Cumulative	habitat loss within the region				
The development of the proposed infrastructure will contribute to cumulative habitat loss and thereby impact the ecological processes					
in the region.					
	Overall impact of the proposed development considered in isolation	Cumulative impact of the project and other projects in the area			
Extent	Very low (1)	High (4)			
Duration	Long term (4)	Long term (4)			
Magnitude	Low (4)	Moderate (8)			
Probability	Probable (3)	Definite (5)			

Significance	Low (27)	High (80)			
Status (positive or negative)	Negative	Negative			
Reversibility	Moderate	Low			
Irreplaceable loss of resources?	No	Yes			
Can impacts be mitigated	Can impacts be mitigated To some extent, but most of the impacts result from the construction and operation activities of the variou facilities that cannot be well mitigated.				
Mitigation:					
Establish set-aside and offset areas for associated projects.					
Development and implementation of Habitat Rehabilitation Plans.					

- 8. All prescribed mitigation measures and supporting recommendations presented will help to achieve an acceptable residual impact. These measures and recommendations will remain applicable for the requested extension of the EA. To this end, these measures have been included in the updated EMPr for this development as per the requirements of the Environmental Authorisation.
- 9. In order to manage the impacts effectively, the following additional mitigation management should be put into place for the general impacts associated with avifauna:

Management Outcome: Habitats					
have a d Maria and a strain	Implementatio	n	Monitoring		
Impact Management Actions	Phase	Responsible Party	Aspect	Frequency	
All development areas must be clearly demarcated. No development is to occur in areas possessing 'Very High' SEI wherever practicable. Only the 'High' SEI areas that have been authorised for development should be intruded into. Pylons may only be considered in "Very High SEI" areas where is it not feasible to span the area entirely. In such instances the minimum possible number of pylons with the smallest possible footprint must be utilised and the disturbance footprint must be strictly controlled. A service track (jeep track) is permissible in Very High SEI areas only to the extent required to establish and maintain the powerline, and only if no other access options are available in areas of lower sensitivity.	Life of operation	Project Manager	Infringement into these areas	Ongoing	
Areas of indigenous vegetation outside of the direct project footprint, should under no circumstances be fragmented or disturbed further.	Life of operation	Project Manager	Natural Areas (Karoo scrub, Rocky outcrops and Riparian thicket)	Ongoing	
All activities must make use of existing roads and tracks as far as practically and feasibly possible.	Life of operation	Project Manager	Roads and paths used	Ongoing	

# the **BIODIVERSITY** company

All laydown areas, chemical toilets etc. should be restricted to existing transformed areas. Any materials may not be stored for extended periods of time and must be removed from the project area once the construction phase has been concluded. Use of re- usable/recyclable materials are recommended.	Construction	Project Manager Foreman	Laydown areas and material storage & placement.	Ongoing
Progressive rehabilitation of areas that have been cleared of invasive plants will enable topsoil to be returned more rapidly, thus ensuring more recruitment from the existing seedbank Any woody material removed can be shredded and used in conjunction with the topsoil to augment soil moisture and prevent further erosion.	Life of operation	Project Manager	Site footprint rehabilitation	Ongoing
Areas that have been disturbed but will not undergo development must be revegetated with indigenous vegetation.	Life of operation	Project Manager	Rehabilitated are	as Ongoing
A spill management plan must be put in place to ensure that should there be any chemical spill out or over that it does not run into the surrounding areas. The Contractor shall be in possession of an emergency spill kit that must always be complete and available on site. Drip trays or any form of oil absorbent material must be placed underneath vehicles/machinery and equipment when not in use.	Life of operation	Project Manager Contractors Foreman	Spill events, Vehicles dripping	Ongoing I.
Eroded areas must be rehabilitated using the appropriate techniques and re-vegetated using indigenous flora.	Life of operation	Project Manager Contractor	Erosion area	Annually

Powerlines must be fitted with industry standard bird flight diverters in order to make the lines as visible as possible to collision-susceptible species. Shaw et al (2021) demonstrated that large avifauna species mortality was reduced by 51% (95% Cl: 23–68%). Recommended bird diverters such as flapping devices (dynamic device) and thickened wire spirals (static device) or similar diverters that increase the visibility of the lines should be fitted 5 m apart. The Inotec BFD88 bird diverter is highly recommended due to its visibility under low light conditions when most species move from roosting to feeding sites.

Specific mitigation recommendations need to be inline with the EWT/ESKOM partnership Guidelines:

- Removal of earth wire or increase wire thickness to make it more visible;
- Use 'Self Support' structures and avoid 'Cross Rope' structures;
- Bands or stripes on Conductors (2 black, neoprene bands (35x35cm), crossed, with a bright strip, fixed every 10 m with plastic peg);
- Static vibration damper, spirals, BFDs or 'pig-tails' (White polypropylene spirals, 1 m long, 30 cm diameter, stagged on two static wires to effect marking every 5 m);
- All the parts of the infrastructure must be nest proofed and anti-perched devices placed on areas that can lead to electrocution;
- All exposed parts must be covered (insulated) to reduce electrocution risk;
- All conductor wires in the same horizontal plane.

All the parts of the infrastructure must be nest proofed and anti-perch devices placed on areas that can lead to electrocution	Planning and construction	Environmental Officer & Contractor, Engineer	Presence of electrocuted birds	During phase
Install anti-perch devices such as spikes to prevent Pied Crows from nesting/perching.	Planning and construction	Environmental Officer & Contractor, Engineer	Over predation of tortoise	During phase

As needed

- 10. It is the opinion of the specialist that based on the observations made during the field survey, that the ecological importance of the site from an avifauna perspective has not decreased. In consideration that the project has been previously authorised the proposed development may proceed, under the condition that all mitigation measures provided in this report and previous reports are adhered to.
- 11. We trust you find the above in order. If there are any uncertainties or additional information required, please feel free to contact the undersigned.

Kind regards

# ENVIRONMENTAL IMPACT METHOD

The impact significance rating methodology, as provided by Nala, is guided by the requirements of the NEMA EIA Regulations 2014 (as amended).

Direct, indirect and cumulative impacts associated with the projects must be assessed in terms of the following criteria:

- The extent, wherein it will be indicated whether the impact will be local (limited to the immediate area or site of development) or regional, and a value between 1 and 5 will be assigned as appropriate (with 1 being low and 5 being high):
- » The **duration**, wherein it will be indicated whether:
  - \* the lifetime of the impact will be of a very short duration (0–1 years) assigned a score of 1;
  - \* the lifetime of the impact will be of a short duration (2-5 years) assigned a score of 2;
  - medium-term (5–15 years) assigned a score of 3;
  - \* long term (> 15 years) assigned a score of 4; or
  - \* permanent assigned a score of 5;
- The magnitude, quantified on a scale from 0-10, where 0 is small and will have no effect on the environment, 2 is minor and will not result in an impact on processes, 4 is low and will cause a slight impact on processes, 6 is moderate and will result in processes continuing but in a modified way, 8 is high (processes are altered to the extent that they temporarily cease), and 10 is very high and results in complete destruction of patterns and permanent cessation of processes.
- The probability of occurrence, which shall describe the likelihood of the impact actually occurring. Probability will be estimated on a scale of 1–5, where 1 is very improbable (probably will not happen), 2 is improbable (some possibility, but low likelihood), 3 is probable (distinct possibility),

4 is highly probable (most likely) and 5 is definite (impact will occur regardless of any prevention measures).

- > the significance, which shall be determined through a synthesis of the characteristics described above and can be assessed as low, medium or high; and
- » the **status**, which will be described as either positive, negative or neutral.
- » the degree to which the impact can be reversed.
- » the degree to which the impact may cause irreplaceable loss of resources.
- » the *degree* to which the impact can be *mitigated*.
- The **significance** is calculated by combining the criteria in the following formula:

S = (E+D+M) P

- S = Significance weighting
- E = Extent
- D = Duration
- M = Magnitude
- P = Probability

The significance weightings for each potential impact are as follows:

- > < 30 points: Low (i.e., where this impact would not have a direct influence on the decision to develop in the area),</p>
- » 30-60 points: Medium (i.e., where the impact could influence the decision to develop in the area unless it is effectively mitigated),
- > > 60 points: High (i.e., where the impact must have an influence on the decision process to develop in the area).

### Example of Impact table summarising the significance of impacts (with and without mitigation)

Nature: [Outline and describe fully the impact anticipated as per the assessment undertaken]			
	Without mitigation	With mitigation	
Extent	High (3)	Low (1)	
Duration	Medium-term (3)	Medium-term (3)	
Magnitude	Moderate (6)	Low (4)	

Probability	Probable (3)	Probable (3)
Significance	Medium (36)	Low (24)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	

Mitigation:

"Mitigation", means to anticipate and prevent negative impacts and risks, then to minimise them, rehabilitate or repair impacts to the extent feasible.

Provide a description of how these mitigation measures will be undertaken keeping the above definition in mind

#### **Residual Impacts:**

"Residual Risk", means the risk that will remain after all the recommended measures have been undertaken to mitigate the impact associated with the activity (Green Leaves III, 2014).
