|-----------------|---|--------|------------|
| Version 1 | Determine the Air Quality Impact of the Proposed Botshabelo Rendering Plant, Free State Province. | - | 12/04/2022 |

DISCLAIMER

Even though every care is taken to ensure the accuracy of this report, Air Quality Impact Assessment studies are limited in scope, time and budget. Discussions are to some extent made on reasonable and informed assumptions built on bona fide information sources, as well as deductive reasoning. Since air quality impact studies deal with dynamic natural systems additional information may come to light at a later stage during the impact assessment phase. The author does not accept responsibility for conclusions made in good faith based on own databases or on the information provided. Although the Author exercised due care and diligence in rendering services and preparing documents, he accepts no liability, and the client, by receiving this document, indemnifies the Author against all actions, claims, demands, losses, liabilities, costs, damages and expenses arising from or in connection with services rendered, directly or indirectly by the authors and by the use of this document. This report should therefore be viewed and acted upon with these limitations in mind.

EXECUTIVE SUMMARY

Enviroworks was appointed by Supreme Poultry (PTY) Ltd to undertake the Atmospheric Impact Assessment (AIA) and Air Emissions License (AEL) Application process in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA) and the National Environmental Air Quality Act, 2004 (Act No. 39 of 2004) (NEM:AQA) listed activities for their existing Rendering Plant situated on Portion 0 of Erf 166, Botshabelo, Free State Province. The proposed project will trigger the following listed activities in terms of the NEM:AQA:

- Government Notice 893 of 2013 as amended by Government Notice 551 of 12 June 2015: Category 1 (Combustion Installations, Subcategory 1.6: Waste Co-feeding Combustion Installations); and,
- Government Notice 893 of 2013 as amended by Government Notice 551 of 12 June 2015: Category 8 (Thermal Treatment of Hazardous and General Waste, Subcategory 8.1: Thermal Treatment of General and Hazardous Waste).

PROJECT DESCRIPTION

The site where the proposed expansion is set to occur is situated on Portion 0 of Erf No. 166 in the Industrial Area of Botshabelo, Free State Province.

The Processing Plant is an established facility, with the current slaughtering volumes not exceeding one hundred and twenty thousand (120 000) units per day. The Applicant proposes an expansion of the output to one hundred and forty thousand (140 000) units per day. The Processing Plant was designed to process more units than what it currently achieved; therefore no physical construction will occur in order to facilitate this increase of the slaughtering volumes. The Processing plant and associated infrastructure has a development footprint of ten thousand square metres (10 000 m²), with approximately twelve thousand, three hundred kilogrammes (12 300 kg) of general waste recycled per month.

The standard activities taking place in the abattoir consist of four (4) phases. The initial phase includes the delivery of the chickens, ante-mortem (before slaughtering) inspection and the lairage (where the birds are kept prior to slaughtering). The second phase includes the slaughtering activities, which consist of the stunning and bleeding out of the chickens, debunking, removal of feathers and internal organs. After the organs are removed, they are washed, packaged, weighed, and stored. Hereafter the organs are sold to the intended prospective clients. The blood, fat and feathers are removed and transported via conveyer belts and pipes to the Sterilizing Plant. The third phase includes the packaging and cooling of the processed units. A post-mortem inspection is performed on the meat whereafter carcass registration takes place. The cutting or quartering of the carcasses into portions then takes place, after which the portions are washed at the cut-up wash station. Hereafter the portions are packaged and chilled in large industrial freezers and in “fresh areas”. Finally, the last phase constitutes of the delivery phase, whereby the processed portions are transported to the loading bay area and then transferred to the intended prospective clients. Should the post-mortem inspection identify undesirable or unusable biological material, this material will be transported to the Sterilizing Plant.

An average of thirty-one (31) tonnes of Grade A coal is delivered to the Supreme Poultry Botshabelo Processing Plant on a monthly basis. The coal is stored in a bund storage area, before being loaded into the two Boilers, or steam generators, present on site. Coal is burnt in the two Boilers, hereby generating steam which is

subsequently transferred to various areas of Production and the Sterilizing Plant. The coal ash produced by the Boilers are then stored in a designated storage area, whereafter it is removed by a brick maker. Approximately two thousand three hundred and forty kilogrammes (2 340 kg) of ash is produced daily. As mentioned above, the blood, feathers, fats and Dead-on Arrival birds are received from the processing plant with dedicated pipe lines and conveyer belts at the Sterilizing Plant. Steam obtained from the Boilers, or steam generators, is utilised in order to cook the biological material. After the cooking process has been finalised, the material is then dried out, and grounded. The final product is the feather meal, which is packaged and stacked, whereafter it will be sold to prospective clients. For more clarity, please refer to Figure 1 down below regarding the operation of the Boilers and Sterilizing Plant.

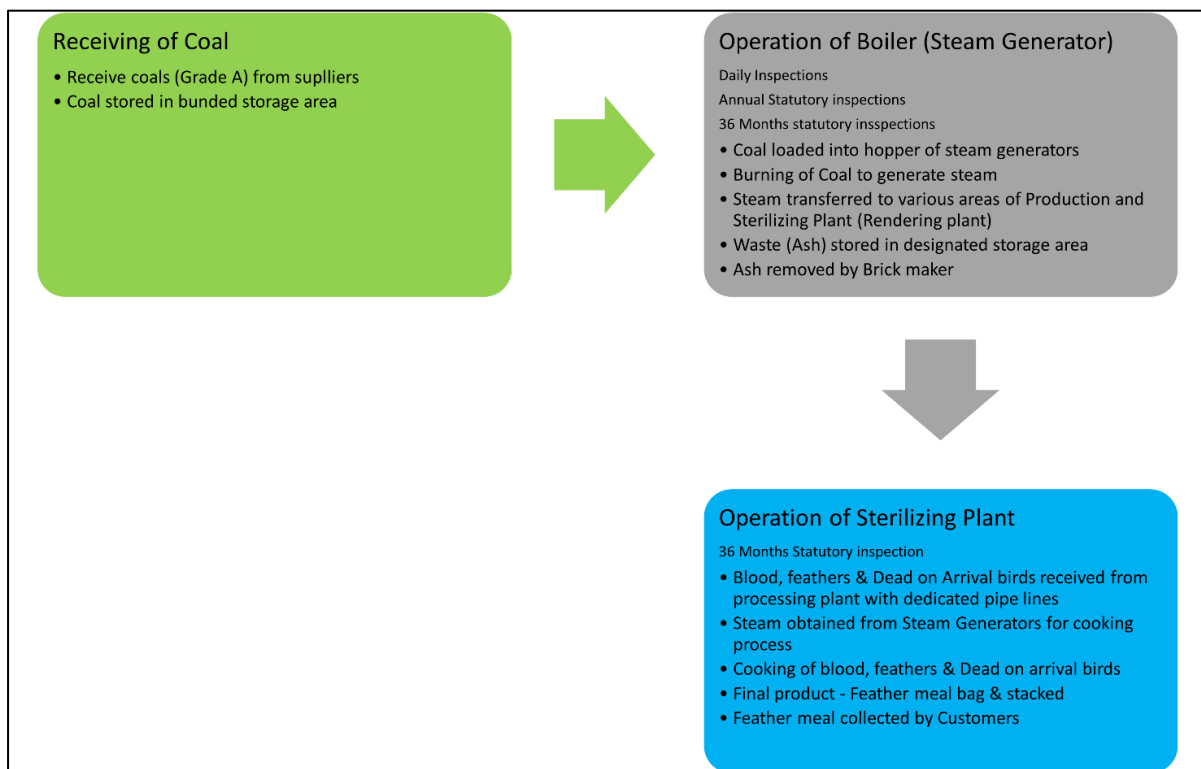

Figure 1: Flow diagram indicating the operation of the Boiler and Sterilizing Plant

As of January 2021, the facility produces two hundred and eleven thousand, five hundred and eleven kilogrammes (211 511 kg) of blood, feathers and fat per month, with Dead on Arrival birds included within this figure. The upper and lower limits for the quantity of Dead-on Arrival birds per month are nineteen point five four (19.54) tonnes and five point nine seven (5.97) tonnes respectively. The feathers, blood, fat and Dead-on Arrival birds are re-worked into feather meal via the Sterilizing Plant. This process involves the cooking, drying out and grounding of the material whereby the biological material is transformed into feather meal. Sieves at the back of the facility collect any solid materials (when the blood, feathers and fat material is removed), preventing these materials from entering the effluent drains. The liquid effluent is discarded within the municipality drains and is tested monthly. The excess fat and blood are collected from the sieves, and processed at the Sterilizing Plant, whereafter it would be sold as feather meal. Overall, more than ten thousand kilogrammes (10 000 kg) of general waste (blood, feathers, fat, Dead on Arrival birds) are processed by the Sterilizing Plant daily.

Sanitary and Medical Waste are collected by a registered waste removal contractor (Compass Waste Services) and are incinerated off site. Sewerage from the ablution processing, admin, stores and workshop areas, as well as grey water from the showers and washing facilities are disposed of at an approved treatment facility. Additionally, industrial effluent from processing activities is disposed of via the municipal effluent system. Paper, cardboard, plastic, scrap metal and wood pallets are recycled and reused wherever possible. Food waste produced within the Canteen is collected by a local pig farmer and/or disposed of at the local, registered landfill site by a registered general waste removal contractor.

CONCLUSION AND RECOMMENDATIONS

Simulated ambient criteria pollutant (SO₂, NO_x, CO and PM) concentrations were well below the South African National Ambient Air Quality Standards (SA NAAQS) at all identified sensitive receptor locations as summarised in the Table below. **The level of impact is considered to be of low significance to human health.**

| EMISSION | NAAQS THRESHOLD | MODELED CONCENTRATION VALUE | | | SPARE CAPACITY |
|------------------|-----------------------------------|-----------------------------|------------------------|------------------------|----------------|
| | | HOURLY | 24 HOUR | ANNUAL | |
| SO ₂ | 50 µg/m ³ (annual) | 139.52176 µg/m ³ | 25 µg/m ³ | 6.6 µg/m ³ | 87 % (annual) |
| NO ₂ | 40 µg/m ³ (annual) | 61 µg/m ³ | 10.9 µg/m ³ | 3 µg/m ³ | 93 % (annual) |
| PM ₁₀ | 40 µg/m ³ (annual) | 102 µg/m ³ | 17.6 µg/m ³ | 5.2 µg/m ³ | 77 % (annual) |
| CO | 30 000 µg/m ³ (hourly) | 377 µg/m ³ | 64 µg/m ³ | 16.2 µg/m ³ | 98 % (hourly) |

The contribution from the proposed facility to cumulative ambient air quality is regarded insignificant based on the low simulated ground level concentrations and monitoring results from the nearby monitoring station (Pelonomi NAQI Monitoring Station). It is recommended that mitigation measures as stated within the Air Quality Management Plan be adhered to in order to keep the concentrations below the thresholds during the operational phase of the Facility.

DECLARATION OF THE SPECIALIST

I, **Christoff du Plessis, ID 911126 5012 084**, declare that I:

- am an Environmental Specialist at Enviroworks;
- act as an independent Specialist Consultant in the field of Air Quality Impact Assessments;
- am assigned as Specialist Consultant by Supreme Poultry for this proposed project;
- I do not have or will not have any financial interest in the undertaking of the activity other than remuneration for work as stipulated in the terms of reference;
- remuneration for services by the proponent in relation to this proposal is not linked to approval by decision-making Authorities responsible for permitting this proposal;
- the consultancy has no interest in secondary or downstream developments as a result of the Authorisation of this project.
- have no and will not engage in conflicting interests in the undertaking of the Activity;
- undertake to disclose to the Client and the Competent Authority any material, information that have or may have the potential to influence the decision of the Competent Authority required in terms of the Environmental Impact Assessment Regulations 2017, as amended; and,
- will provide the Client and Competent Authority with access to all information at my disposal, regarding this project, whether favourable or not.

Christoff du Plessis

Baccalaureus Scientiae (B.Sc) in Environmental Geography: University of the Free State (2014)

Work Experience

January 2015 – Present: Environmental Specialist at Enviroworks

Key Specialist Experience

Visual Impact Assessment (VIA):

- Phalaborwa Wildlife Activity Hub, Kruger National Park, Limpopo Province (SANParks).
- 4.9ha Sand Mine on Portion 5 of the Farm Doornekraal No. 830, Western Cape Province (Greenmined).
- Proposed development of the Harvard Powerline, Bloemfontein, Free State Province (Centlec).
- Proposed development of the 35 m Buffeljagsrivier Monopole Mast, Buffeljagsrivier, Western Cape Province (Coast to Coast Towers).
- Proposed development of the 25 m Robertson Monopole Mast, Robertson, Western Cape Province (Coast to Coast Towers).
- Proposed development of the Klein Mooimaak Rest Camp Facility, West Coast National Park (SANParks).
- Proposed development of a Sand Mine near Malmesbury, Western Cape Province (Greenmined).
- Proposed upgrade of the R27 Gate and Geelbek Restaurant, West Coast National Park, Western Cape Province (SANParks).
- Proposed development of the 25 m Roodekrans Monopole Mast, Krugersdorp, Gauteng Province (Coast to Coast Towers).
- Proposed development of a 25 m Monopole Mast on Portion 25 of the Farm Klein Bottelary No. 17, Brackenfell, Western Cape Province (Coast to Coast Towers).
- Proposed development of a Landfill Site on Portion 3 of the Farm Katbosch No. 93, Sasolburg, Free State Province (Metsimaholo Landfill).
- Proposed development of numerous visitor information centres at Schroda and Mapungubwe Hill, Mapungubwe National Park, Limpopo Province (SANParks).

- Proposed development of a 35 m Monopole Mast on Portion 13 of the Farm Van Aries Kraal No. 455, Grabouw, Western Cape Province (Coast to Coast Towers).
- Proposed development of a 25 m Monopole Mast on Erf 532, Gansbaai, Western Cape Province (Coast to Coast Towers).
- Proposed development of a 35 m Lattice Mast on Portion 7 of the Farm Jagersvlakte No. 292, Grabouw, Western Cape Province (Warren Petterson Planning).
- Proposed development of a 35 m Lattice Mast on Erf 532, Stanford, Western Cape Province (Warren Petterson Planning).
- Proposed development of a 15 m Lattice Mast on Portion 4 of the Farm No. 53, Genadendal, Western Cape Province (Warren Petterson Planning).
- Proposed development of a 25 m Monopole Mast on Portion 8 of the Farm Delta No. 1003, Groot Drakenstein, Western Cape Province (Coast to Coast Towers).
- Proposed development of a 30 m Tree Mast on Portion 87 of the Farm Langverwacht No. 241, Kuils River, Western Cape Province (Warren Petterson Planning).
- Proposed development of a 20 m Tree Mast on Erf 679, Gouda, Western Cape Province (Atlas Towers).
- Proposed development of an IPP 400kV Power Line from Grommis to Aggeneys, Northern Cape Province (Eskom).
- Proposed development of a 30 m Lattice Mast on Erf 2819, Caledon, Western Cape Province (Atlas Towers).
- Proposed development of a 54 m Lattice Mast on Portion 7 of the Farm Haane Kuil No. 335, Beaufort West, Western Cape Province (Star Towers).
- Proposed development of a 25 m Monopole Mast on Erf 1035, Caledon, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Tree Mast on Erf 47, Birkenhead, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Monopole Mast on Erf 1201, Van Dyks Bay, Western Cape Province (Atlas Towers).
- Proposed development of a 20 m Tree Mast on Erf 1671, Melkbosstrand, Western Cape Province (Atlas Towers).
- Proposed development of a 15 m Tree Mast on Erf 740, Klein Brak River, Western Cape Province (Atlas Towers).
- Proposed Upgrades to the Alpha 1 Recreational Lounge, Robben Island, Western Cape Province (Robben Island Museum).
- Proposed development of a 25 m Tree Mast on Erf 969, Picaltsdorp, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Tree Mast on Erf 20601, George, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Monopole Mast on Erf 571, Dellville Park, Western Cape Province (Atlas Towers).
- Proposed development of a 15 m Tree Mast on Portion 113 of the Farm Ruygte Vally No. 205, Sedgefield, Western Cape Province (Atlas Towers).
- Proposed development of a 15 m Dome Mast on Erf 8281, Mossel Bay, Western Cape Province (Atlas Towers).

- Proposed development of a 35 m Tree Mast on Portion 42 of the Farm Harkerville No. 428, Plettenberg Bay, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Monopole Mast on the Remaining Extent of the Farm No. 790, Philippi, Western Cape Province (Atlas Towers).
- Proposed development of a 15 m Tree Mast on Portion 3 of the Farm No. 452, Grabouw, Western Cape Province (Atlas Towers).
- Proposed development of a 15 m Tree Mast on the Remainder of Erf 3331, Vredenburg, Western Cape Province (Atlas Towers).
- Proposed development of a 40 m Lattice Mast on Portion 24 of the Farm Olyven Boomen No. 83, Malan Valley, Western Cape Province (Atlas Towers).
- Proposed development of the Lendlovu Lodge, Addo Elephant Park, Eastern Cape Province (SANParks).
- Proposed development of a 25 m Tree Mast on Erf 2, Villiersdorp, Western Cape Province (Atlas Towers).
- Proposed development of a 25 m Tree Mast on Erf 270, Franschoek, Western Cape Province (Galaxy Palms).
- Proposed development of a 25 m Lattice Mast on Erf 9, Nuwerus, Western Cape Province (Atlas Towers).
- Proposed development of the Karoo Power Reserve, Prieska, Northern Cape Province (Greenbox Consulting).
- Proposed development of the Khauta Solar PV Cluster (Three 100 MW PV Plants) near Welkom, Free State Province (WKN Windcurrent).
- Proposed development of the 25 m Monopole Mast on Erf 3266, Onrusrivier, Western Cape Province (Gyro)

Wetland Delineation Studies:

- Wetlands Delineation study for the development of 13 borrow pits along National Road 8, Ladybrand, Free State Province (SANRAL).
- Wetland Delineation study for the development of a 12.5ha cemetery on Erf 4233, Western Cape Province (Theewaterskloof Local Municipality).
- Wetland Delineation study for the proposed development of an Agri-Hub near Cederville, Eastern Cape Province (Femplan).
- Wetland Delineation study for the proposed development of an Agri-Hub near Lambasi, Eastern Cape Province (Femplan).
- Wetland Delineation study for the proposed development of the Blue Hills Curro Castle, Midrand, Gauteng Province (Curro Holdings).

Stormwater Management Plans:

- Stormwater Management Plan for the Agri-World Recycling Plant, Swellendam, Western Cape Province (Agri-World Recycling Plant).
- Stormwater Management Plan for the Klaasvoogds Granite Mine, Springbok, Northern Cape Province (Greenmined Environmental).
- Stormwater Management Plan for the Moreson Poultry Project, Brandfort, Free State Province (Moreson Poultry).

- Stormwater Management Plan for the Sintier Poultry Project, Bronkhorstspuit, Gauteng Province (Sintier Poultry).
- Stormwater Management Plan for the maintenance and extending of a canal near Karatera, Western Cape Province (Eden Municipality).
- Stormwater Management Plan for Layer Hen Houses on the Remaining Extent of Portion 1 of the Farm Elandsfontein No. 21, Moloti City, North West Province (Bramakama Poultry).
- Stormwater Management Plan for the Proposed Installation Battery Energy Storage Facility on Erf 2202, Ashton, Western Cape Province (Eskom)

REQUIREMENTS OF A SPECIALIST REPORT

Appendix 6 of Government Notice Regulation 326 of 7 April 2017 outlines the basic requirements of a Specialist Report. Please refer to the Table below for a summary of all requirements.

| REQUIREMENTS | YES/NO |
|---|--------|
| A Specialist report prepared in terms of these Regulations must contain – | |
| a. Details of – | |
| i. The Specialist who prepared the report; and, | Yes |
| ii. The expertise of that Specialist to compile a specialist report including a curriculum vitae; | |
| b. A declaration that the Specialist is independent in a form as may be specified by the Competent Authority; | Yes |
| c. An indication of the scope of, and the purpose for which, the report was prepared; | |
| i. An indication of the quality and age of base data used for the Specialist Report; | Yes |
| ii. A description of existing impacts on site, cumulative impacts of the proposed development and levels of acceptable change; | |
| d. The duration, date and season of the site investigation and the relevance of the season to the outcome of the assessment; | Yes |
| e. A description of the methodology adopted in preparing the report or carrying out the specialised process inclusive of equipment and modelling used; | Yes |
| f. Details of an assessment of the specific identified sensitivity of the site related to the proposed activity or activities and its associated structures and infrastructure, inclusive of a site plan identifying site alternatives; | Yes |
| g. An identification of any areas to be avoided, including buffers; | Yes |
| h. A map superimposing the activity including the associated structures and infrastructure on the environmental sensitivities of the site including areas to be avoided, including buffers; | Yes |
| i. A description of any assumptions made and any uncertainties or gaps in knowledge; | Yes |
| j. A description of the findings and potential implications of such findings on the impact of the proposed activity or activities; | Yes |
| k. Any mitigation measures for inclusion in the EMP'r | Yes |
| l. Any conditions for inclusion in the Environmental Authorisation; | Yes |
| m. Any monitoring requirements for inclusion in the EMP'r or Environmental Authorisation; | Yes |
| n. A reasoned opinion – | |
| i. Whether the proposed activity, activities or portions thereof should be authorised; | Yes |

| REQUIREMENTS | YES/NO |
|--|--------|
| ii. If the opinion is that the proposed activity, activities or portions thereof should be authorised, any avoidance, management and mitigation measures that should be included in the EMP'r, and where applicable, the closure plan; | |
| o. A description of any consultation process that was undertaken during the course of preparing the specialist report; | N/A |
| p. A summary and copies of any comments received during any consultation process and where applicable all responses thereto; and, | N/A |
| q. Any other information requested by the Competent Authority. | Yes |

1 INTRODUCTION

Enviroworks was appointed by Supreme Poultry (PTY) Ltd to undertake the Atmospheric Impact Assessment (AIA) and Air Emissions License (AEL) Application process in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA) and the National Environmental Air Quality Act, 2004 (Act No. 39 of 2004) (NEM:AQA) listed activities for their existing Rendering Plant situated on Portion 0 of Erf 166, Botshabelo, Free State Province. The proposed project will trigger the following listed activities in terms of the NEM:AQA:

- Government Notice 893 of 2013 as amended by Government Notice 551 of 12 June 2015: Category 1 (Combustion Installations, Subcategory 1.6: Waste Co-feeding Combustion Installations); and,
- Government Notice 893 of 2013 as amended by Government Notice 551 of 12 June 2015: Category 8 (Thermal Treatment of Hazardous and General Waste, Subcategory 8.1: Thermal Treatment of General and Hazardous Waste).

1.1 PURPOSE AND SCOPE OF WORK

- Review of the ambient air quality monitoring information (if available);
- Review of guidelines and standards against which air emissions, ambient air quality and inhalation health impacts are assessed and/or screened;
- Study of physical environmental parameters that influence the dispersion of pollutants in the atmosphere, including terrain, land use and meteorology;
- Assessment of compliance of estimated emissions standards and Atmospheric Emission License (AEL) requirements;
- Atmospheric dispersion modelling to determine ground level pollutant concentrations; and,
- A health risk and environmental screening study based on predicted ground level pollutant concentrations in comparison with selected air quality criteria.

1.2 LIMITATIONS OF THE STUDY

- Baseline ambient air quality is not computed due to unavailability of data from the Mangaung Metropolitan Municipality Air Quality Monitoring Network Stations;
- As this facility is yet to be constructed, no stack monitoring has been done, thus some parameters used for the modelling purpose of this study may change during the operational stage of the facility; and,
- Dust modelling was not undertaken for the purpose of this study.

1.5 LOCATION AND EXTENT OF THE FACILITY

The facility in question is situated on Portion 0 of Erf 166 within the Botshabelo Industrial Areas which fall under the jurisdiction of the Mangaung Metropolitan Municipality, Free State Province.

1.6 DESCRIPTION OF SURROUNDING LAND USE (WITHIN 5 KM RADIUS)

The site in question is situated on Portion 0 of Erf No. 166, Botshabelo, Free State Province. The site is situated within the centre of the Botshabelo Industrial Zone and is surrounded by Industrial Warehouses (Free State Development Corporation). As distance increases from the Supreme Poultry Botshabelo Plant the land-use transforms from industrial warehousing to residential areas with scattered commercial properties. The outskirts of Botshabelo predominantly consist of Agricultural Farmland and/or natural areas. Table 4 below provide the name, land-use, co-ordinates, distance from the activity and compass direction of the fifty-seven (57) receptors identified for this study.

Table 4: Details of Surrounding Land-uses.

2 PROJECT DESCRIPTION

The site where the proposed expansion is set to occur is situated on Portion 0 of Erf No. 166 in the Industrial Area of Botshabelo, Free State Province.

The Processing Plant is an established facility, with the current slaughtering volumes not exceeding one hundred and twenty thousand (120 000) units per day. The Applicant proposes an expansion of the output to one hundred and forty thousand (140 000) units per day. The Processing Plant was designed to process more units than what it currently achieved; therefore no physical construction will occur in order to facilitate this increase of the slaughtering volumes. The Processing plant and associated infrastructure has a development footprint of ten thousand square metres (10 000 m²), with approximately twelve thousand, three hundred kilogrammes (12 300 kg) of general waste recycled per month.

The standard activities taking place in the abattoir consist of four (4) phases. The initial phase includes the delivery of the chickens, ante-mortem (before slaughtering) inspection and the lairage (where the birds are kept prior to slaughtering). The second phase includes the slaughtering activities, which consist of the stunning and bleeding out of the chickens, debunking, removal of feathers and internal organs. After the organs are removed, they are washed, packaged, weighed, and stored. Hereafter the organs are sold to the intended prospective clients. The blood, fat and feathers are removed and transported via conveyer belts and pipes to the Sterilizing Plant. The third phase includes the packaging and cooling of the processed units. A post-mortem inspection is performed on the meat whereafter carcass registration takes place. The cutting or quartering of the carcasses into portions then takes place, after which the portions are washed at the cut-up wash station. Hereafter the portions are packaged and chilled in large industrial freezers and in “fresh areas”. Finally, the last phase constitutes of the delivery phase, whereby the processed portions are transported to the loading bay area and then transferred to the intended prospective clients. Should the post-mortem inspection identify undesirable or unusable biological material, this material will be transported to the Sterilizing Plant.

An average of thirty-one (31) tonnes of Grade A coal is delivered to the Supreme Poultry Botshabelo Processing Plant on a monthly basis. The coal is stored in a bund storage area, before being loaded into the two Boilers, or steam generators, present on site. Coal is burnt in the two Boilers, hereby generating steam which is subsequently transferred to various areas of Production and the Sterilizing Plant. The coal ash produced by the Boilers are then stored in a designated storage area, whereafter it is removed by a brick maker. Approximately two thousand three hundred and forty kilogrammes (2 340 kg) of ash is produced daily. As mentioned above, the blood, feathers, fats and Dead-on Arrival birds are received from the processing plant with dedicated pipe lines and conveyer belts at the Sterilizing Plant. Steam obtained from the Boilers, or steam generators, is utilised in order to cook the biological material. After the cooking process has been finalised, the material is then dried out, and grounded. The final product is the feather meal, which is packaged and stacked, whereafter it will be sold to prospective clients. For more clarity, please refer to Figure 4 down below regarding the operation of the Boilers and Sterilizing Plant.

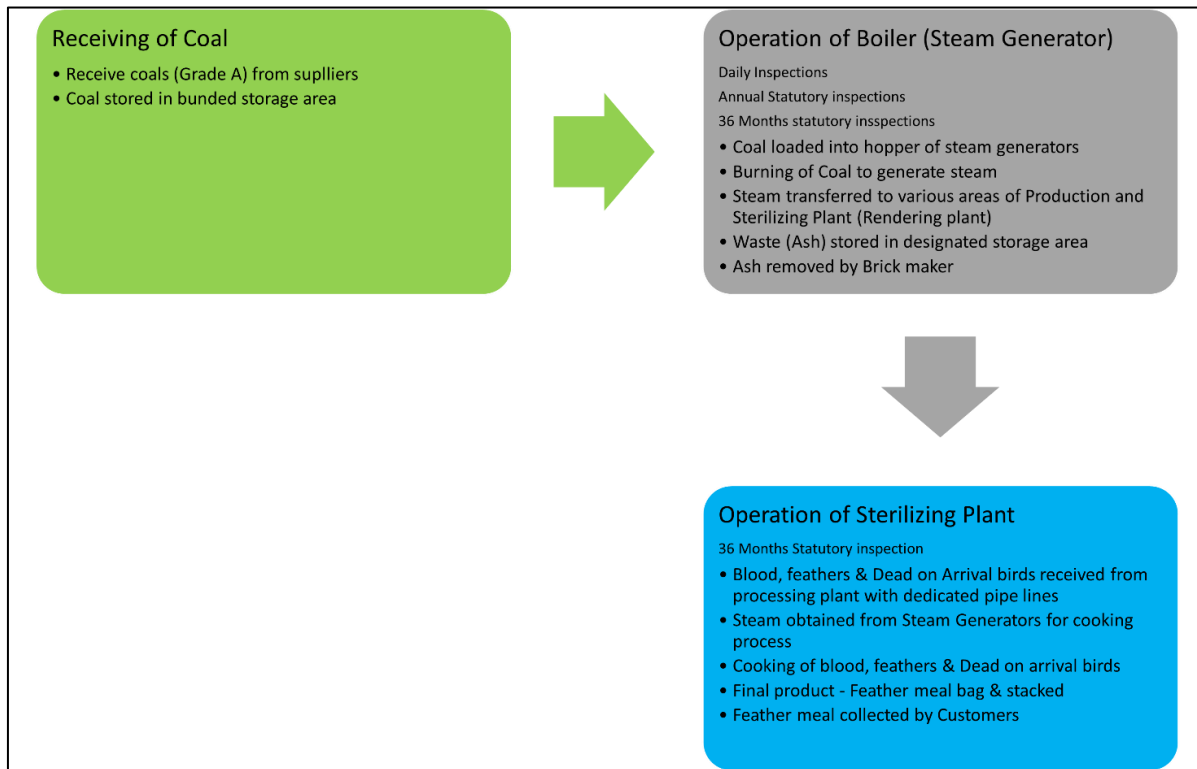

Figure 4: Flow diagram indicating the operation of the Boiler and Sterilizing Plant

As of January 2021, the facility produces two hundred and eleven thousand, five hundred and eleven kilogrammes (211 511 kg) of blood, feathers and fat per month, with Dead on Arrival birds included within this figure. The upper and lower limits for the quantity of Dead-on Arrival birds per month are nineteen point five four (19.54) tonnes and five point nine seven (5.97) tonnes respectively. The feathers, blood, fat and Dead-on Arrival birds are re-worked into feather meal via the Sterilizing Plant. This process involves the cooking, drying out and grinding of the material whereby the biological material is transformed into feather meal. Sieves at the back of the facility collect any solid materials (when the blood, feathers and fat material is removed), preventing these materials from entering the effluent drains. The liquid effluent is discarded within the municipality drains and is tested monthly. The excess fat and blood are collected from the sieves, and processed at the Sterilizing Plant, whereafter it would be sold as feather meal. Overall, more than ten thousand kilogrammes (10 000 kg) of general waste (blood, feathers, fat, Dead on Arrival birds) are processed by the Sterilizing Plant daily.

Sanitary and Medical Waste are collected by a registered waste removal contractor (Compass Waste Services) and are incinerated off site. Sewerage from the ablution processing, admin, stores and workshop areas, as well as grey water from the showers and washing facilities are disposed of at an approved treatment facility. Additionally, industrial effluent from processing activities is disposed of via the municipal effluent system. Paper, cardboard, plastic, scrap metal and wood pallets are recycled and reused wherever possible. Food waste produced within the Canteen is collected by a local pig farmer and/or disposed of at the local, registered landfill site by a registered general waste removal contractor.

3 LEGISLATIVE CONTEXT

The following Acts will be applicable:

Table 5: Applicable Legislation applicable to the Project.

| TITLE OF LEGISLATION, POLICY OR GUIDELINE | APPLICABILITY TO THE PROJECT | ADMINISTERING AUTHORITY | DATE |
|---|---|---|------|
| National Environmental Management Act, 1998 (Act No. 107 of 1998) | The proposed project will be subjected to a Basic Assessment Process for Environmental Authorisation. | Department of Economic, Small Business Development, Tourism and Environmental Affairs | 1998 |
| National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004) | The proposed project will require an Air Emissions License. | Mangaung Metropolitan Municipality | 2004 |
| National Environmental Management: Waste Act, 2008 (Act No. 59 of 2008) | Given the treatment and recycling of waste on site a Waste Management License will be required. | National Department of Fisheries, Forestry and Environment | 2008 |

Table 6: Listed Activities Triggered.

| CATEGORY OF LISTED ACTIVITY | SUB-CATEGORY OF THE LISTED ACTIVITY | NAME OF THE LISTED ACTIVITY | DESCRIPTION OF THE LISTED ACTIVITY |
|---|-------------------------------------|--|--|
| Category 1 (Combustion Installations) | Subcategory 1.6 | Waste Co-feeding Combustion Installations | Combustion installations co-feeding waste with conventional fuels in processes used primarily for steam raising or electricity generation. |
| Category 8 (Thermal Treatment of Hazardous and General Waste) | Subcategory 8.1 | Thermal Treatment of General and Hazardous Waste | Facilities where general and hazardous waste are treated by the application of heat. All installations treating 10 kg per day of waste. |

5.3 POINT SOURCE EMISSION ESTIMATION INFORMATION

Table 10: Point Source Emission Rate Estimates.

| ID | BASIS FOR EMISSIONS RATES |
|--------|---|
| STCK 1 | Emission rates were determined by Mr K.C Wyngaardt during the annual emission survey conducted on 25 August 2021. |
| STCK 2 | Emission rates were determined by Mr K.C Wyngaardt during the annual emission survey conducted on 25 August 2021. |

6 EMERGENCY INCIDENTS

No emergency incidents have been recorded to date on site.

7 IMPACT OF ENTERPRISE ON THE RECEIVING ENVIRONMENT

7.1 STUDY METHODOLOGY

The study methodology can conveniently be divided into a “planning phase” and “execution phase”. The planning phase included the following basic steps prior to performing the actual dispersion modelling and analyses:

1. Understand Scope of Work;
2. Assign Appropriate Specialists;
3. Review of legal requirements (e.g. dispersion modelling guidelines); and,
4. Decide on a Dispersion Model.

The Regulations regarding Air Dispersion Modelling (Gazette No. 37804 published 11 July 2014) was referenced for the dispersion model selection. Three (3) levels of assessment are defined within the Regulations regarding Air Dispersion Modelling:

- **Level 1:** Where worst-case air quality impacts are assessed using simpler screening models;
- **Level 2:** For assessment of air quality impacts as part of license application or amendment processes, where impacts are the greatest within a few kilometres downwind (less than 50 km); and,
- **Level 3:** Requires more sophisticated dispersion models (and corresponding input data, resources and model operator expertise) in situations:
 - Where a detailed understanding of air quality impacts, in time and space, is required;
 - Where it is important to account for causality effects, calms, non-linear plume trajectories, spatial variations in turbulent mixing, multiple source types, and chemical transformations;
 - When conducting permitting and/or environmental assessment processes for large industrial developments that have considerable social, economic and environmental consequences, when evaluating air quality management approaches involving multi-source, multi-sector contributions from permitted and non-permitted sources in an air-shed; or,
 - When assessing contaminants resulting from non-linear processes (e.g. deposition, ground-level ozone (O₃), particulate formation and visibility).

This study was considered to meet the requirements of a Level 2 assessment, and AERMOD was selected on the basis that this Gaussian plume model is well suited to simulate dispersion where transport distances are likely to be less than fifty kilometres (50 km).

The execution phase (i.e. dispersion modelling and analyses) firstly involves gathering specific information in relation to the emission source(s) and site(s) to be assessed. The includes:

1. **Source Information:** Emission rate, exit temperature, volume flow, exit velocity, etc;
2. **Site Information:** Site building layout, terrain information, land-use data, etc;
3. **Meteorological Data:** Wind speed, wind direction, temperature, cloud cover, mixing height, etc; and,

4. **Receptor Information:** Locations using discrete receptors and/or gridded receptors.

The model uses this specific input data to run various algorithms to estimate the dispersion of pollutants between the source and receptor. The model output is in the form of a predicted time-averaged concentration at the receptor. These predicted concentrations are added to suitable background concentrations and compared with the relevant ambient air quality standard or guideline. In some cases post-processing can be carried out to produce percentile concentrations or contour plots that can be prepared for reporting purposes.

7.1.1 DISPERSION MODEL SELECTION

Gaussian plume models are best used for near-field applications where the steady-state meteorology assumption is most likely to apply. One of the most widely used Gaussian plume model is the US EPA AERMOD model that was used in this study. AERMOD is a model developed with the support of the AMS/EPA Regulatory Model Improvement Committee (AERMIC), whose objective has been to include state-of-the-art science in regulatory models (Hanna *et al*, 1999). AERMOD is a dispersion modelling system with three (3) components, namely: AERMOD (AERMIC Dispersion Model), AERMAP (AERMOD terrain pre-processor) and AERMET (AERMOD meteorological pre-processor).

AERMOD is an advanced new-generation model. It is designed to predict pollution concentration from continuous point, flare, area, line, and volume sources. AERMOD offers new and potentially improved algorithms for plume rise and buoyancy, and the computation of vertical profiles of wind, turbulence and temperature; however, it retains the single straight line trajectory limitation. AERMET is a meteorological pre-processor for AERMOD. Input data can come from hourly cloud cover observations, surface meteorological observations and parameters and vertical profiles of several atmospheric parameters. AERMAP is a terrain pre-processor designed to simplify and standardise the input of terrain data for AERMOD. Input data includes receptor terrain elevation data. The terrain data may be in the form of digital terrain data. The output includes, for each receptor, location and height scale, which are elevations used for the computation of air flow around hills. Receptors were identified using satellite imagery (Google Earth) and the 2013 Landcover Map for South Africa was used for verification purposes. Each receptor was plotted on Google Earth and imported into AERMOD for modelling purposes.

A disadvantage of the model is that spatial varying wind fields, due to topography or other factors cannot be included. Input data types required for the AERMOD model include: source data, meteorological data (pre-processed by the AERMET model), terrain data and information on the nature of the receptor grid. Version 10 of the AERMOD and its pre-processors were used in the study.

7.1.2 LEGAL REQUIREMENTS

7.1.2.1 ATMOSPHERIC IMPACT REPORT

According to the NEM:AQA, an Air Quality Officer (AQO) may require the submission of an Atmospheric Impact Report (AIR) in terms of Section 30, if:

1. The AQO reasonably suspects that a person has contravened or failed to comply with the NEM:AQA or any conditions of an AEL and that detrimental effects on the environment occurred or there was a contribution to the degradation in ambient air quality; or,
2. A review of a provisional AEL or an AEL is undertaken in terms of Section 45 of the NEM:AQA.

The format of the AIR is stipulated in the Regulations prescribing the format of the AIR, Government Gazette No. 36904, and Notice No. 747 of 2013 of 11 October 2013.

7.1.2.2 NATIONAL AMBIENT AIR QUALITY STANDARDS

Measured and modelled concentrations were assessed against National Ambient Air Quality Standards (NAAQS).

Table 11: National Ambient Air Quality Standards (NAAQS) 2015.

| POLLUTANT | AVERAGING PERIOD | CONCENTRATION ($\mu\text{g}/\text{m}^3$) | FREQUENCY OF EXCEEDANCE | COMPLIANCE DATE |
|------------------|------------------|--|-------------------------|-----------------|
| SO ₂ | 1 Hour | 350 | 88 | Immediate |
| | 24 Hours | 125 | 4 | Immediate |
| | 1 Year | 50 | 0 | Immediate |
| NO ₂ | 1 Hour | 200 | 88 | Immediate |
| | 1 Year | 40 | 0 | Immediate |
| PM ₁₀ | 24 Hours | 75 | 4 | Immediate |
| | 1 Hour | 40 | 0 | Immediate |
| CO | 1 Hour | 30 000 | 88 | Immediate |
| | 8 Hour | 10 000 | 11 | Immediate |

7.1.2.3 LISTED ACTIVITIES AND MINIMUM EMISSIONS STANDARDS

The proposed activity is a Listed Activity under Section 21 of the NEM:AQA and requires an AEL to operate. The minimum emission limits as per the Listed Activity Sub-Category 1.6 and 8.1 are provided in Table 12 and Table 13 below.

7.1.3 ATMOSPHERIC DISPERSION POTENTIAL

Meteorological mechanisms govern the dispersion, transformation and eventual removal of pollutants from the atmosphere. The analysis of hourly average meteorological data is necessary to facilitate a comprehensive understanding of the dispersion potential of the site. The horizontal dispersion of pollution is largely a function of the wind field. The wind speed determines both the distance of downward transport and the rate of dilution of pollutants. For this assessment the AERMET processed meteorological data for the period January 2019 to December 2021 provided the parameters useful for describing the dispersion and dilution potential of the site i.e., wind speed, wind direction, temperature and rainfall, as discussed below.

7.1.3.1 LOCAL WIND FIELD

The vertical dispersion of pollution is largely a function of the wind field. The wind speed determines both the distance of downward transport and the rate of dilution of pollutants. The generation of mechanical turbulence is similarly a function of the wind speed, in combination with the surface roughness.

Figure 5: Wind Frequency Distribution at Botshabelo, Free State Province.

Wind roses for Botshabelo are given in Figures 6 to 12 for the period January 2021 to December 2021. These wind roses comprise of thirty-six (36) spokes, which represents the directions from which winds blew during the period. The colours reflect the different categories of wind speeds with the dotted circles indicating the frequency of occurrence, and each circle represents a one percent (1 %) frequency of occurrence.

The period wind field at Botshabelo (Figure 12) shows the dominant wind direction being from the northeast six-point-nine percent (6.9 %) of the time and from northwest two to four percent (2 % – 4 %) of the time. The prevailing wind speed were between three point six (3.6) and five point seven metres per second (5.7 m/s) which occurred throughout the year. The average wind speed recorded was three point six metres per second (3.6 m/s) between 2019 and 2021. Differences in the daytime and night-time wind fields occur. During night-time (18:00 – 06:00) higher wind speeds were recorded, and the dominant winds are from the northeast (Figure 11). During daytime conditions (06:00 – 18:00) the dominant winds came from the northeast and west northwest, and slightly lower speeds as compared to that of night-time (Figure 10).

The seasonal wind field for Botshabelo is presented in Figures 6, 7, 8 and 9. The highest wind speeds were recorded from the northeast with the highest wind speeds occurring in spring and summer. Generally lower wind speeds were recorded during winter and autumn, with an increased contribution of wind from the west. Spring has the lowest frequency of calms with an average of one and a half percent (1.5 %). Increased frequencies are observed during winter with calms with an average of three percent (3 %).

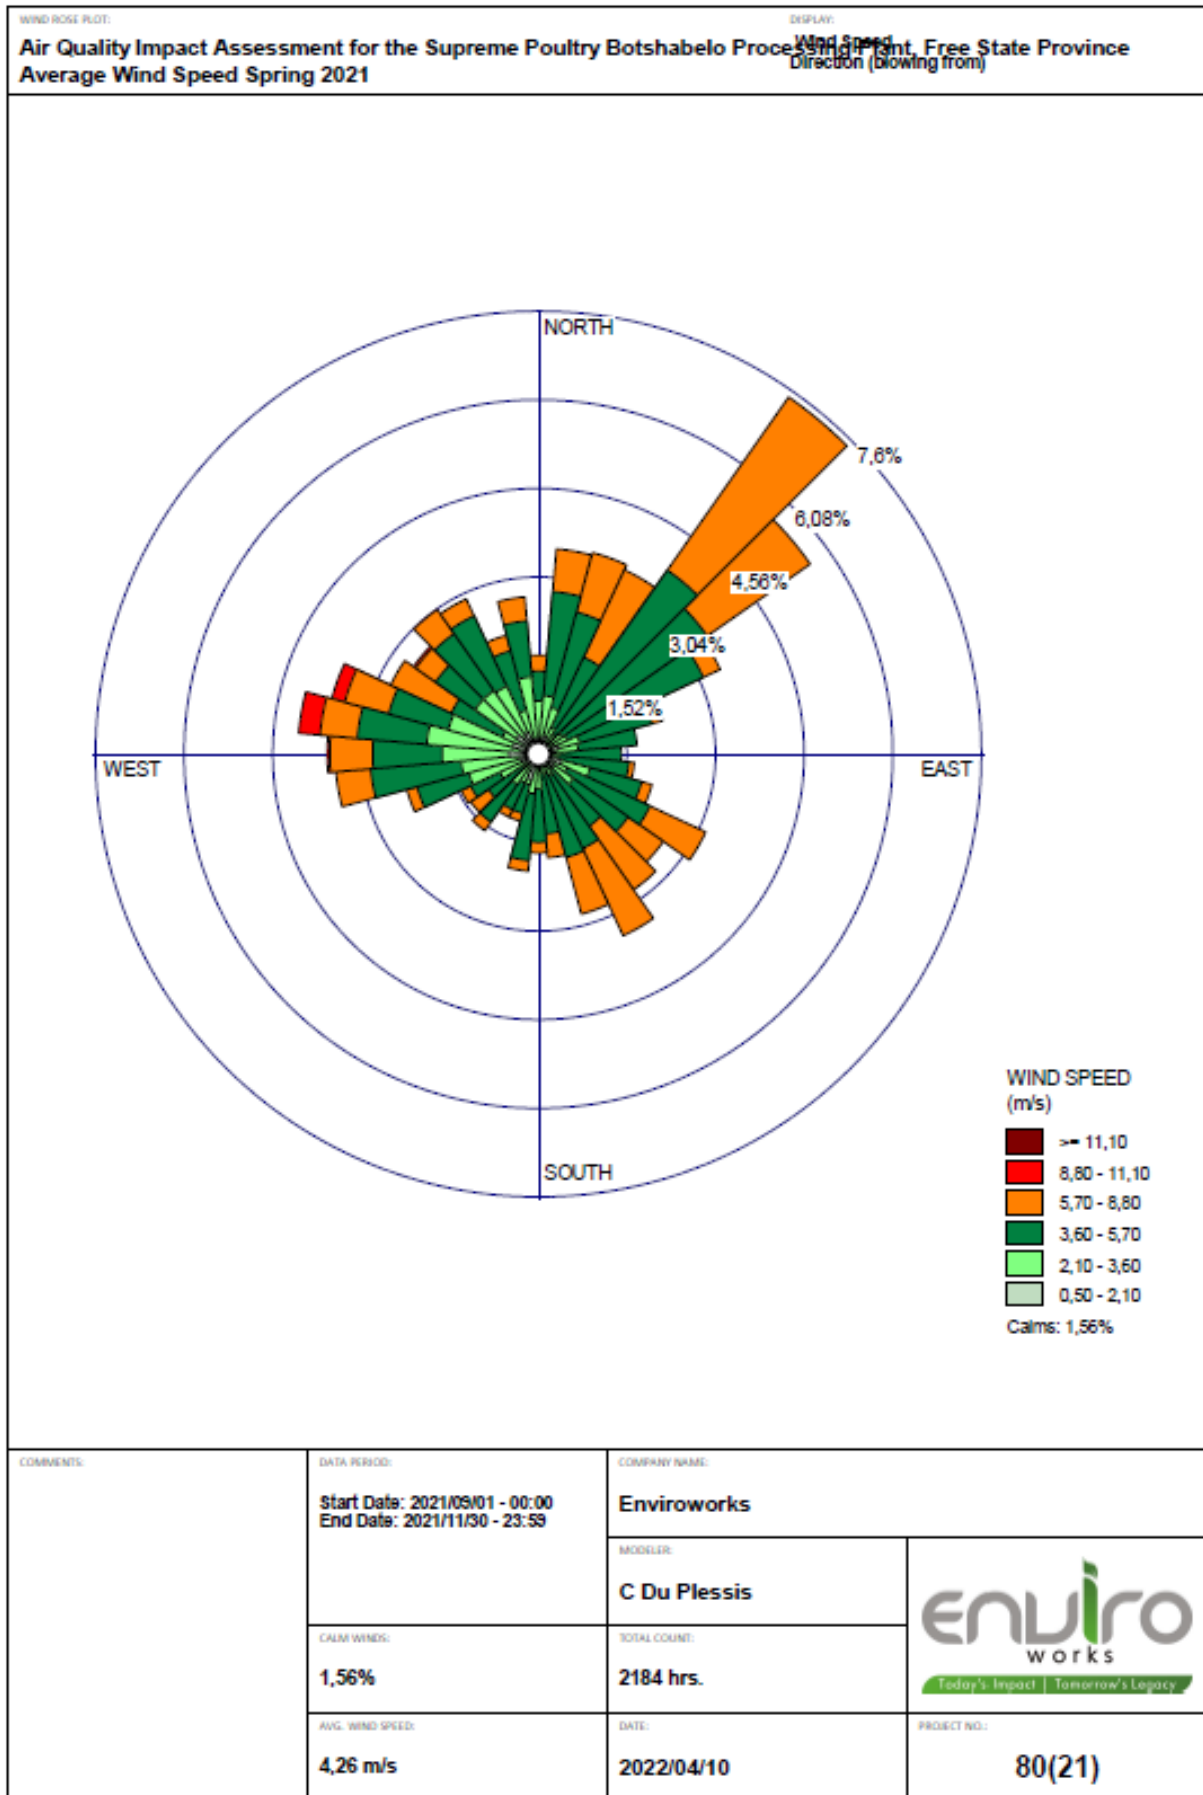

Figure 9: Wind Frequency Distribution Spring 2021.

Figure 10: Wind Frequency Distribution Daytime 2021.

Figure 11: Wind Frequency Distribution Night-time 2021.

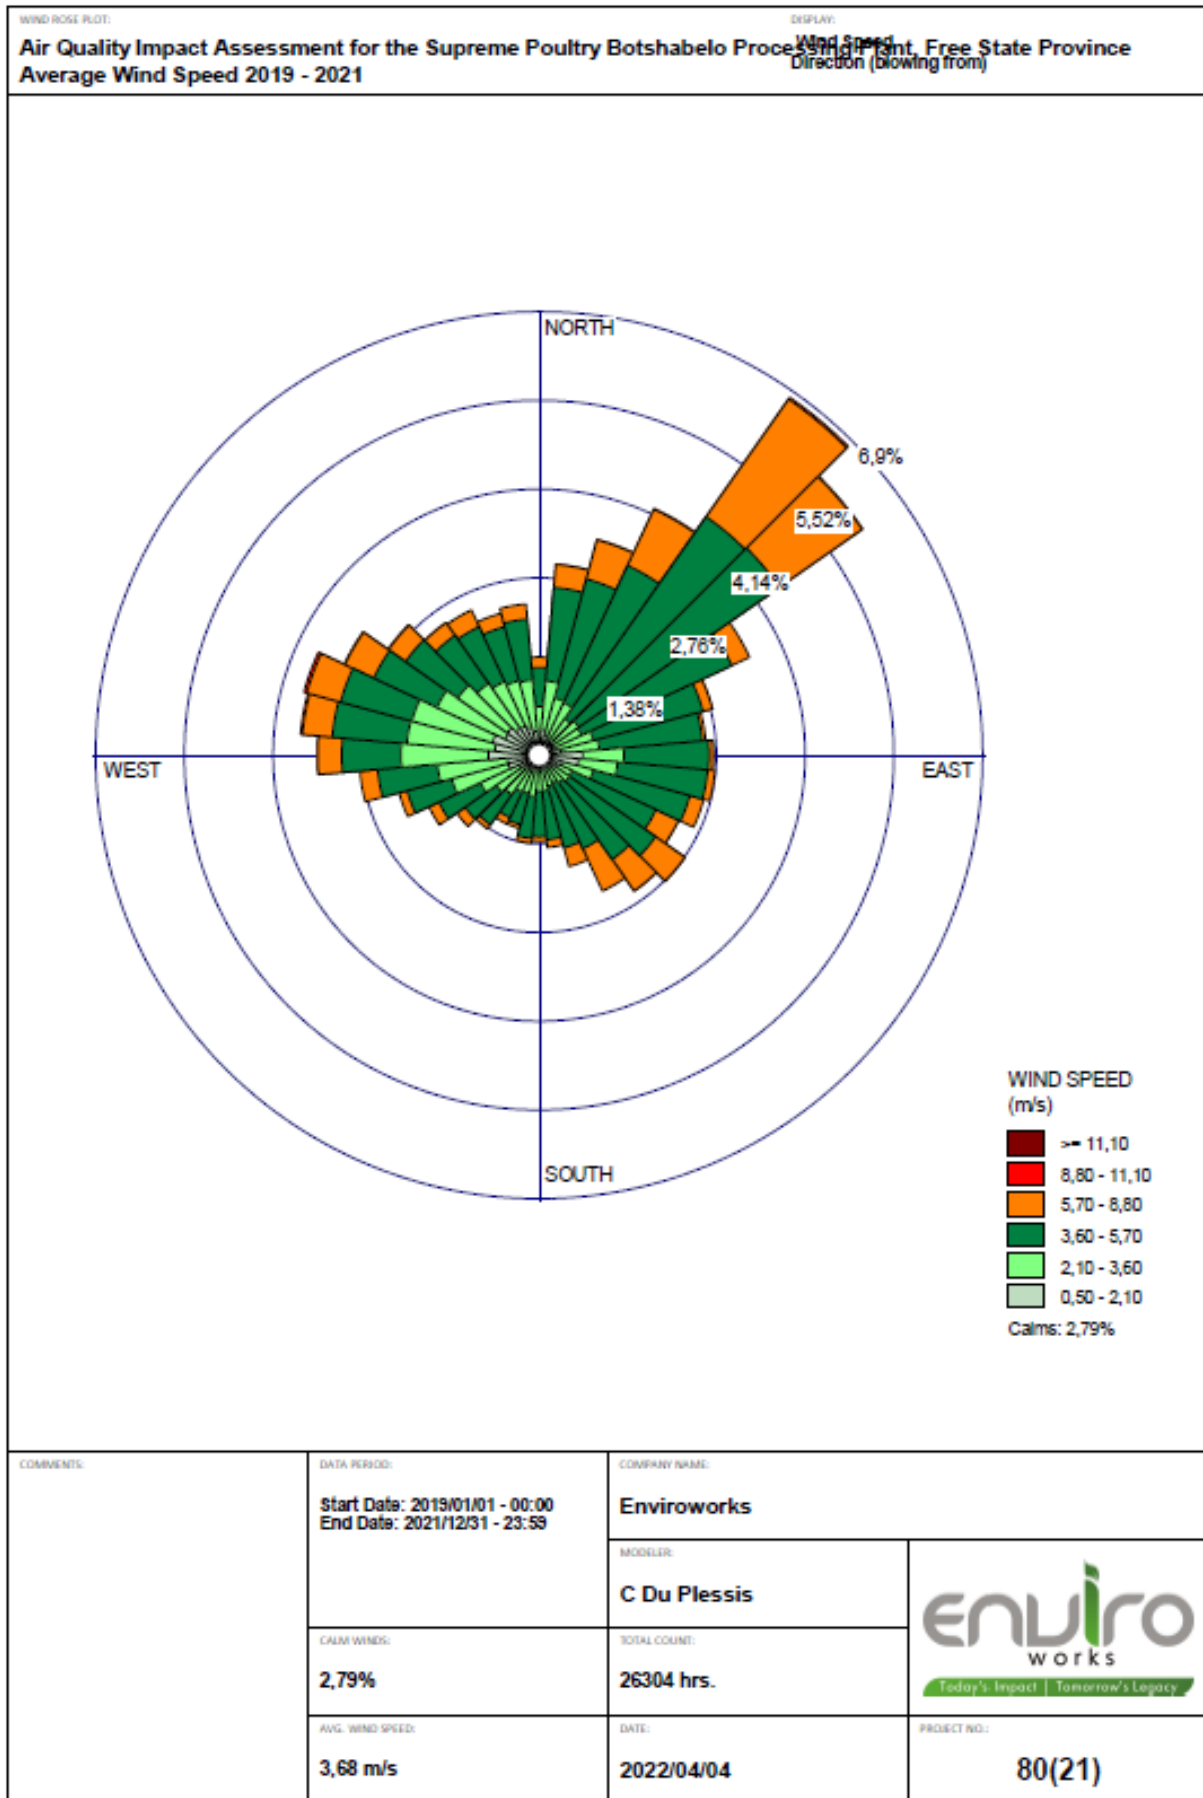

Figure 12: Wind Frequency Distribution January 2019 - December 2021.

7.1.3.2 AMBIENT TEMPERATURE

The air temperature is important for determining the development of the mixing and inversion layers. The mean, minimum and maximum temperatures recorded in Botshabelo during 2021 were sixteen point seven degrees Celsius (16.7 °C), minus two point nine degrees Celsius (-2.9 °C) and thirty-two point six degrees Celsius (32.6 °C) respectively. The month with the highest mean temperature was January 2021 (23.6 °C) while the coldest month was July 2021 (8.7 °C).

Figure 13: Ambient temperature captured between January 2021 and December 2021.

7.1.3.3 PRECIPITATION

Precipitation represents an effective removal mechanism of atmospheric pollutants. Moderate showers (usually of short duration) commonly occur in summer while the winters are dry. The maximum rainfall occurs during the December-January period. Figure 14 below illustrates the precipitation data recorded for Botshabelo for the period January 2021 to December 2021. The rainfall ranged from a quarter of a millimetre per hour (0.25 mm/hr) to thirteen point seven millimetres per hour (13.7 mm/hr).

Figure 14: Precipitation data captured at Botshabelo for the period January 2021 to December 2021.

7.1.3.4 ATMOSPHERIC STABILITY

The atmospheric boundary layer properties are described by two parameters namely the boundary layer depth and the Monin-Obukhov length. The Monin-Obukhov length (L_{Mo}) provides a measure of the importance of buoyancy generated by the heating of the ground and mechanical mixing generated by the frictional effect of the earth's surface. Physically, it can be thought of as representing the depth of the boundary layer within which mechanical mixing is the dominant form of turbulence generation (CERC, 2004). The atmospheric boundary layer constitutes the first few hundred metres of the atmosphere. During daytime, the atmospheric boundary layer is characterised by thermal turbulence due to the heating of the earth's surface. Night-times are characterised by weak vertical mixing and the predominance of a stable layer. These conditions are normally associated with low wind speeds and lower dilution potential.

Figure 15: Atmospheric Stability captured at Botshabelo for the period January 2021 to December 2021.

7.1.3.5 PLUME BUOYANCY

Gases leaving a stack mix with ambient air and undergo three (3) phases namely the initial phase, the transition phase and the diffusion phase (Figure 16). The initial phase is greatly determined by the physical properties of the emitted gases. These gases may have momentum as they enter the atmosphere and are often heated and as such warmer than the surrounding ambient air. Warmer gases are less dense than the ambient air and are therefore buoyant. A combination of the gases' momentum and buoyancy causes the gases to rise (vertical jet section, (Figure 16). In the Bent-Over Jet Section, entrainment of the cross flow is rapid since by this time appreciable growth of vortices has taken place.

The self-generated turbulence causes mixing and determines the growth of plume in the thermal Section. This is referred to as plume rise and allows air pollutants emitted in this gas stream to be lofted higher in the atmosphere. Since the plume is higher in the atmosphere and at a further distance from the ground, the plume will disperse more before it reaches ground level. With greater volumetric flow and increased exit gas temperatures, the plume centreline would be higher than if either the volumetric flow or the exit gas temperature is reduced. The subsequent ground level concentrations would therefore be lower. This is particularly important in understanding the dispersion model results discussed in the Sections below.

Figure 16: Graphical illustration of Plume Buoyancy.

8 AIR QUALITY MONITORING DATA

The Pelonomi-NAQI Monitoring station is owned by the Department of Fisheries, Forestry and Environment (DFFE) and maintained by the South African Weather Service. Data reported on at this station include SO₂ and PM₁₀; however, although provision has been made for the monitoring of CO no data has been captured to date. Data used for the purpose of this report includes the timeframe from 01 January 2021 to 31 December 2021 and includes all seasons. It is assumed that the pollutant concentrations measured at this urban station (closest to the proposed project) will likely be influenced by different emission sources, such as domestic fuel burning and vehicle exhaust emissions and agricultural activities other than pollutant concentration in the study area. These include seasonal sources of particulates such as vehicle dust entrainment on unpaved roads and dust storms during springtime. Below is a graphical representation of the measured pollutants from January 2021 to January 2022.

8.1 SULPHUR DIOXIDE (SO₂):

The highest concentration recorded for SO₂ at the Pelonomi-NAQI monitoring station was twenty-three parts per billion (23,044 ppb) with an annual average of one point eight parts per billion (1.8 ppb) and as such no exceedance on SO₂ emissions were recorded for the one-hour (1 hr) threshold of one hundred and thirty-four parts per billion (134 ppb).

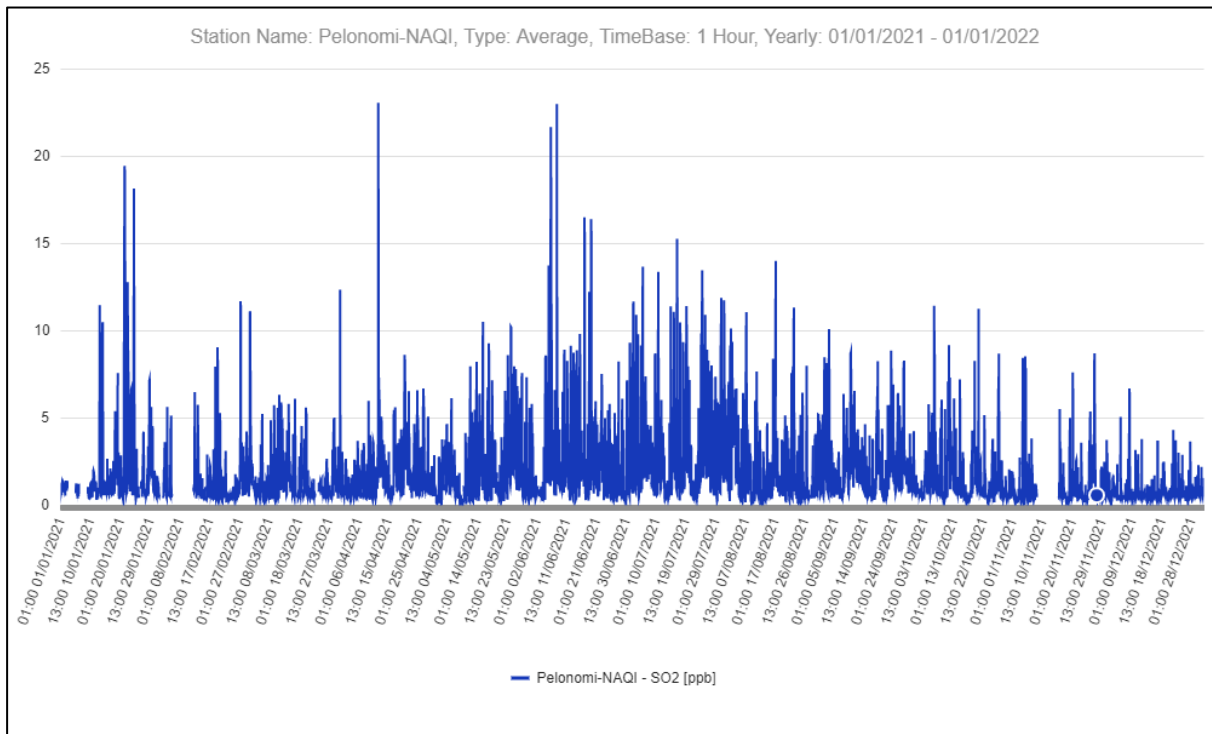

Figure 17: SO2 Concentrations measured at Pelonomi-NAQI Monitoring Station during 2021.

8.2 PARTICULATES (PM₁₀)

The highest concentration of Particulates measured at the Pelonomi-HAQI Monitoring Station was one thousand four hundred and ninety-two micrograms per cubic metre (1 492 µg/m³) for the period January 2021 to January 2022 with an average reading of one hundred micrograms per cubic metre (100.83 µg/m³). As illustrated by Figure 18 multiple exceedances on PM₁₀ emissions were recorded for the twenty-four-hour (24 hr) threshold of seventy-five micrograms per cubic metre (75 µg/m³).

Figure 18: PM10 Concentrations measured at Pelonomi-NAQI Monitoring Station during 2021.

8.3 CARBON MONOXIDE (CO)

No data is available for Carbon Monoxide for the period January 2021 to January 2022.

8.4 OXIDES OF NITROGEN (NOX)

No data is available for Oxides of Nitrogen for the period January 2021 to January 2022.

9 DISPERSION MODELLING RESULTS

As the plant is already in operation and monitoring data is readily available the following parameters were applied during the dispersion modelling for Boiler Stack No. 1 & 2 as determined by K.C van Wyngaardt (Appendix A):

Table 14: Emission Point Source Details for Boiler Stack No. 1

9.1 SIMULATED AMBIENT SO₂ CONCENTRATIONS

Simulated SO₂ concentrations are low compared to the standards as listed within the SA NAAQS at all the identified sensitive receptor locations (as illustrated within Table 18). The highest concentration recorded during the one-hour (1 hr) averaging period was one hundred and thirty-nine micro-grams per cubic metre (139.52176 µg/m³) from receptor 19 (Industrial Warehouse) situated one hundred and fifty-six metres (156 m) towards east northeast. The highest concentration captured during the twenty-four-hour cycle was from Receptor 13 (Industrial Warehouse) situated ninety-three metres (93 m) towards the west of the activity with a concentration of twenty-five micro-grams per cubic metre (25 µg/m³). Receptor No 12 (Industrial Warehouse) situated one hundred and fifteen metres (115 m) towards the west southwest will experience the highest concentration of SO₂ over an annual period with a concentration of six point six micro-grams per cubic metre (6.6 µg/m³). The concentrations for the period of one-hour, twenty-four-hours and annually are sixty-one percent (61 %), eighty percent (80 %) and eighty-seven percent (87%) respectively below the allowed threshold as stipulated within the NAAQS.

9.2 SIMULATED AMBIENT NO₂ CONCENTRATIONS

Table 19 illustrates the concentration values for Nitrogen Oxides (NO₂) over a one-hour (1 hr), twenty-four-hour (24 h) and annual period respectively. Sixty-one point eight micro-grams per cubic metre (61 µg/m³) was the highest concentration recorded over the hourly simulation and occurred as Receptor 19. Receptor 19 is situated one hundred and fifty-six metres (156 m) towards the east northeast and consist of an industrial warehouse. Over the twenty-four-hour (24 h) period the highest concentration captured was ten point nine micro-grams per cubic metre (10.9 µg/m³) and was simulated at Receptor 13 (Industrial Warehouse). The highest annual concentration was simulated from Receptor 12 (Industrial Warehouse) with a peak of three micro-grams per cubic metre (3 µg/m³). Receptor 12 is situated one hundred and fifteen metres (115 m) towards the west southwest of the activity. The concentration value over an hourly period is seventy percent (70 %) below the NAAQS thresholds and ninety-three percent (93 %) over an annual period.

Table 19: Simulated ambient NO₂ concentrations on sensitive receptors.

9.3 SIMULATED AMBIENT PM₁₀ CONCENTRATIONS UNDER CONTROLLED CONDITIONS

Simulated PM₁₀ concentrations for the hourly period won't exceed one hundred and two micro-grams per cubic metre (102 µg/m³). The highest concentration during the hourly period will occur at Receptor 19 (Industrial Warehousing) situated one hundred and fifty-six metres (156 m) towards the east northeast of the activity. During the twenty-four-hour (24 hr) period the highest concentration will occur at Receptor 13 which consist of Industrial Warehousing and is situated ninety-three metres (93 m) towards the west. The concentration captured at Receptor 13 was seventeen point six micro-grams per cubic metre (17.6 µg/m³). The highest concentration for Particulate Matter over an annual period was five point two micro-grams per cubic metre (5.2 µg/m³) and was captured at Receptor 12 situated one hundred and fifteen metres (115 m) towards the west southwest of the activity. When compared against the NAAQS it was found that over a twenty-four-hour (24 hr) period the concentration was seventy-seven percent (77 %) below the threshold and eighty-seven percent (87 %) below the threshold over the annual period.

9.4 SIMULATED AMBIENT CO CONCENTRATIONS UNDER CONTROLLED CONDITIONS

Simulated CO concentrations under controlled conditions illustrated that the highest concentration over an hourly period will be three hundred and seventy-seven micro-grams per cubic metre ($377 \mu\text{g}/\text{m}^3$) and will occur at Receptor 14 situated ninety-eight metres (98 m) towards the north northwest and consist of a workshop. The highest concentration over the twenty-four-hour (24 hr) period will occur from Receptor 13 with a concentration of sixty-four point nine micro-grams per cubic metre ($64 \mu\text{g}/\text{m}^3$). Simulated results for Carbon Monoxide over an annual period illustrated that the highest concentration will occur from Receptor 12 with a maximum concentration of sixteen point two micro-grams per cubic metre ($16.2 \mu\text{g}/\text{m}^3$). When compared against the NAAQS it was found that over a one-hour (1 hr) period the concentration was ninety-eight percent (98 %) below the threshold.

9.5 SIMULATED METALS, HCL, HFL AND DIOXINS

Simulated metals, compound acids and dioxin concentrations due to the operation of the activity being applied for are undetectable at all identified sensitive receptor locations and as such is well below the listed thresholds described in Section 21 of the NEM:AQA.

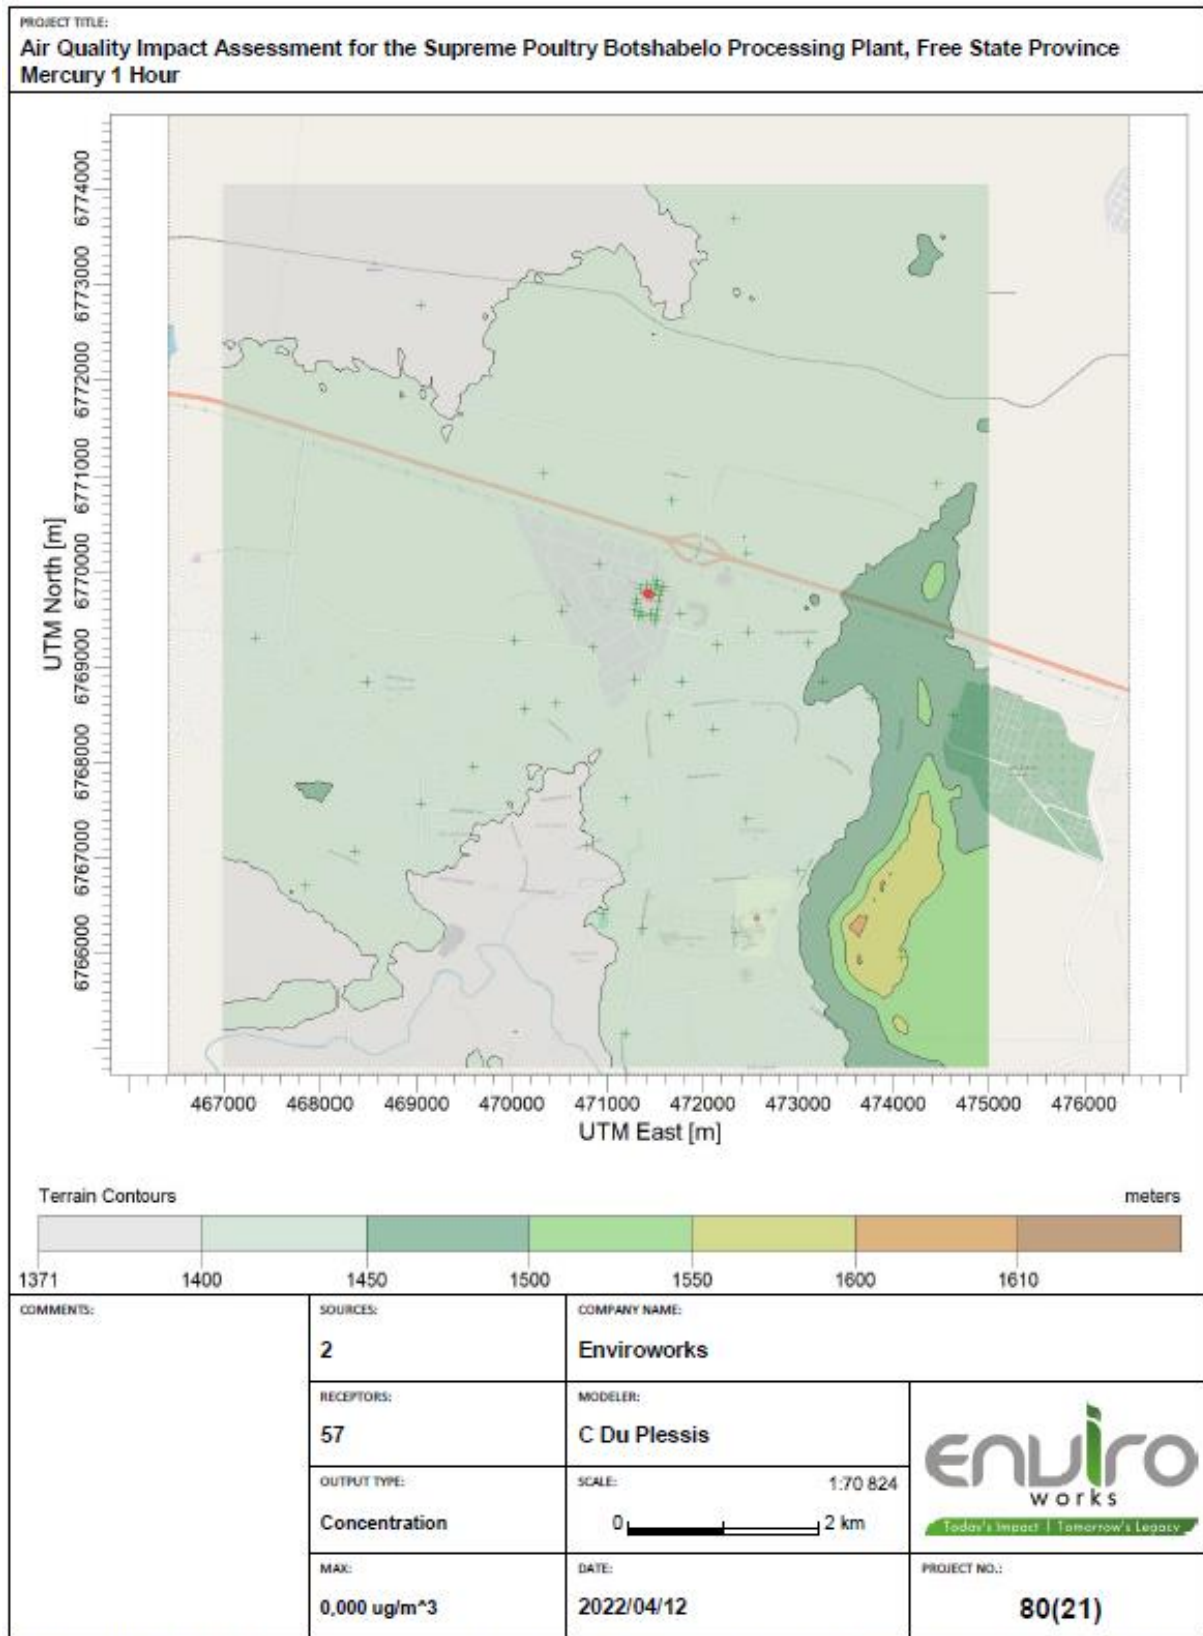

Figure 31: Concentration of Metals, HCL, HFL and Dioxins over a one-hour period.

9.6 UNCERTAINTY OF MODELLED RESULTS

There will always be some error in any geographical model; however, modelling is recognised as a credible method for evaluating impacts, but it is desirable to structure the model in such a way to minimise the total error. A model represents the most likely outcome of an ensemble of experimental results. The total uncertainty can be thought of as the sum of three (3) components namely the uncertainty due to errors in the model physics; the uncertainty due to data errors; and the uncertainty due to stochastic processes (turbulence) in the atmosphere.

The stochastic uncertainty includes all errors or uncertainties in data such as source variability, observed concentrations, and meteorological data. Even if the field instrument accuracy is excellent, there can still be large uncertainties due to unrepresentative placement of the instrument (or taking of a sample for analysis). Model evaluation studies suggest that the data input error term is often a major contributor to total uncertainty. Even in the best tracer studies, the source emissions are known only with an accuracy of \pm five percent (5 %), which translates directly into a minimum error of that magnitude in the model predictions. It is well known that wind direction errors are the major cause of poor agreement, especially for relatively short-term predictions (minutes to hourly) and long downwind distances. All of the above factors contribute to the inaccuracies not even associated with the mathematical models themselves.

Similar to the ISC model, a disadvantage of the model is that spatial varying wind fields, due to topography or other factors cannot be included. Although the model has been shown to be an improvement on the ISC model, especially short-term predictions, the range of uncertainty of the model predictions is fifty- to two hundred percent (50 % - 200 %). The accuracy improves with fairly strong wind speeds and during neutral atmospheric conditions. In quantifying the uncertainty of the modelled results for this assessment, measured ambient data is required which was not available for this study.

10 ANALYSIS OF EMISSIONS IMPACT ON HUMAN HEALTH

Few sensitivity receptors were identified around the project site; it is important to highlight the potential health impact considering wind direction and wind speed which will affect the dispersal of the pollutants. Drawing conclusions about the potential human health effects of these emissions is not straight forward; however, the following can be stated with a reasonable degree of confidence.

10.1 SULPHUR DIOXIDE (SO₂)

Simulated SO₂ concentrations are in general very low as compared to the set SA NAAQS. Most SO₂ only penetrates as far as the nose and throat, with minimal amounts reaching the lungs, unless the individual is breathing heavily, breathing only through the mouth, or if the concentration of SO₂ is rapid, within ten minutes (10 min) in people suffering from asthma (WHO, 2005).

Effects such as a reduction in lung function, an increase in airway resistance, wheezing and shortness of breath, are enhanced by exercise that increases the volume of air inspired, as it allows SO₂ to penetrate further into the respiratory tract (WHO, 1999). SO₂ reacts with cell moisture in the respiratory system to form sulphuric acid. This can lead to impaired cell function and effects such as coughing, broncho-constriction, exacerbation of asthma and reduced lung function. Baseline ambient concentrations of SO₂ at the proposed site are seen to be fully

compliant with the NAAQS. However, this compliance cannot be argued to imply no health risks, but it has to be accepted as a permissible health risk. Areas of full compliance with the SO₂ NAAQS are again deemed not to be free of health risks necessarily; however, the health risks are permissible.

The impact is seen to be of a **very low significant level and may increase to relatively low** during the operation of the facility.

10.2 NITROGEN DIOXIDE (NO₂)

Exposure to NO₂ is typically inhalation and the seriousness of the effects depend more on the concentration than on the length of exposure. Roughly eighty- to ninety percent (80 % - 90 %) of inhaled nitrogen dioxide is absorbed through the lungs (CCINFO, 1998). Nitrogen dioxide (present in the blood stream as the nitrite ion) oxidises unsaturated membrane lipids and proteins, which then results in the loss of control of cell permeability. Nitrogen dioxide caused decrements in lung function, particularly increased airway resistance. People with chronic respiratory problems and people who work, or exercise outside will be more at risk to NO₂ exposure.

This impact is seen to be of a **very low significant level and may increase to relatively low** during the operation of the facility.

10.3 PARTICULATE MATTER (PM)

Particulate Matter (PM) may contain both organic and inorganic pollutants. The extent to which particulates are considered harmful depends on their chemical composition and size. Very fine particulates pose the greatest health risk as they can penetrate deep into the lung, as opposed to larger particles that may be filtered out through the airways natural mechanisms. PM₁₀ is generally found relatively close to the source except in strong winds. Given that the pollutant is a nationwide concern it is; therefore, advisable to implement monitoring during the operational phase to quantify compliance with the NAAQS.

The impact is seen to be of a **very low significant level and may increase to relatively low** during the operation of the facility.

10.4 CARBON MONOXIDE

Carbon monoxide diffuses rapidly across alveolar, capillary, and placental membranes. Approximately eighty- to ninety percent (80 % - 90 %) of the absorbed carbon monoxide binds with haemoglobin for carbon monoxide, the COHb concentration increases rapidly at the onset of exposure, starts to level off after three (3) hours, and reaches a steady state after six (6) to eight (8) hours of exposure. The elimination half-life in the fetus is much longer in the pregnant mother. The simulated concentration of CO is fairly high as compared to the NAAQS, thus the **impact is anticipated to be high during the operation of the facility.**

10.5 ANALYSIS OF EMISSIONS IMPACT ON THE ENVIRONMENT

An assessment of air pollution impact on soil, water and receptors other than human were not included in the investigation since it was not specifically requested by the Air Quality Officer. Given the low simulated ambient concentration of NO₂ and SO₂, the impacts on soil and water receptors are expected to be of low significance.

11 COMPLAINTS

A Complaints Register is readily available on site and updated as complaints are received. During the time of the site inspection no active complaints were open.

12 CURRENT OR PLANNED AIR QUALITY MANAGEMENT INTERVENTIONS

A Standard Operating Procedure (Document No.: OHSaES 7.8.1.3P) is readily available on site and was approved by Management on 28 August 2019. The SOP states the following:

12.1 EMISSIONS

1. Stack emissions: Correct combustion procedure will be followed to produce a minimum of stack emissions.
2. Noise: Machinery will be effectively and sustainably maintained to prevent loose guards, machine parts etc, from rattling and open-door areas will be fitted with noise screens to prevent and/or mitigate excessive noise being emanated from the plant.
3. Odours: Odours being emanated from the factory will be prevented by:
 - a. By having all waste removed at regular intervals as to prevent it from accumulating and decomposing on site.
 - b. Where possible all effluent and sanitary drains will be covered with a solid type cover/lid.
 - c. In the case of animal matter being processed it must be processed per day. In cases where it has to stand over for longer than a day, it must be effectively covered as to limit emanating of odours. Should this not be possible, the animal matter must be immediately disposed of and treated in an appropriate manner at a landfill registered for this purpose.
 - d. In the case of effluent treatment systems, it must be ensured that the effluent is treated with recognisable chemical substances as to prevent odours. Where possible, effluent puts to be covered effectively with a canvas or lid.
4. **Botshabelo Processing Plant** will comply with all national laws and by-laws in terms of Emissions Management.

12.2 EXISTING MEASURES

1. The methods employed will be adequate.
2. Existing methods will be continually reviewed and upgraded if necessary.
3. An emissions survey will be conducted by an approved inspection authority, on a two (2) yearly basis.

12.3 MONITORING AND CONTROL OF STACK AND EXHAUST EMISSIONS

1. All stack and exhaust emissions shall be kept within the local by-laws and the national legal requirements. Listed below are the different stacks and exhaust emission points.
 - a. Stacks for fuel burning equipment (NO_x, SO_x, CO₂ and Particulates):
 - i. Boiler No. 1 Stack; and,
 - ii. Boiler No. 2 Stack.

2. If any continuous visible emissions from any of the above emission points are noted, it must be reported to the **SHE Officer** and the **Maintenance Manager** in order to take the necessary corrective action. The log sheet must consist of the following points:
 - a. The date of the incident;
 - b. The time of the incident;
 - c. The reason for the incident; and,
 - d. The approximate time the incident was corrected.
3. Any poor combustion, besides causing pollution, results in large wastes of energy, and enormous escalation in cost of coal. Thus, besides remaining compliant, it is in our best interests to burn coal efficiently. For fuel burning equipment, an emissions violation or potential violation of the Local By-laws, would result in the Local Authorities being informed of the incident, and the following information would be conveyed to them:
 - a. Where the emission stems from;
 - b. The reason for the emission; and,
 - c. The possible duration of non-conformances.

12.4 STACK EMISSIONS INTERNAL CONTROL

1. The boiler operator on shift must use the “Ringelman Smoke Chart” (OHSaES 7.8.1.3CHAR) to evaluate the emission density as to endeavour to not exceed Stack emissions for an aggregate period of three minutes (3 min) during any continuous period of thirty minutes (30 min), where the emissions exceed the First Schedule shade of two (2) on the smoke chart. This must be done per shift.
2. The above would not apply to smoke emanating from a fuel burning appliance during the start-up period, during night time or if such emissions could not reasonably have been prevented, due to such appliances is being overhauled or during the period of any breakdown or disturbance of such appliance.

12.5 SOURCE REDUCTION

1. This will be achieved by running all machinery and vehicles as optimum energy efficiency.
2. Employees are responsible to ensure efficient energy use within their Departments.
3. The more efficiently energy is used, the less fuel is required to produce the same results, the less emissions are produced.

12.6 RESPONSIBILITY

1. The **SHE Officer** will monitor air pollution control measures; and,
2. The **Maintenance Manager** will be responsible for the effective and sustainable management of emissions emanating from the site.

12.7 MANAGEMENT AND MITIGATION

The following objectives are implemented on site:

- To reduce SO₂, NO₂, CO and PM₁₀ emissions from facility operations to ensure compliance with air quality emission thresholds and health exposure benchmarks;
- To reduce impacts of fugitive emissions; and,

- To ensure compliance with the set standards acceptable for human health.

12.8 ACTIONS AND RESPONSIBILITY

| NO | ISSUE | MANAGEMENT AND MITIGATION PLAN | RESPONSIBILITY | FREQUENCY |
|---------------------------------------|---|---|--|-----------|
| ACTIVITY: INCINERATOR | | | | |
| 1 | NO ₂ , and SO ₂ emissions Control | Install and implement a daily (continuous) monitoring system for NO ₂ and SO ₂ emissions from stacks. | Environmental Manager | Ongoing |
| 2 | | Make use of wet scrubbers to absorb NO ₂ , SO ₂ and CO. | Operations Director/ Environmental Manager | Ongoing |
| 3 | | Regulate NO ₂ and SO ₂ emission levels in line with NAAQS and WHO standards. Any activities that lead to a sustained increase in NO ₂ and SO ₂ emissions levels above the RSA SANS (SANS: 1929, 2004) will not be allowed. Production and process engineering or optimisation changes where sustained increases within the allowable SANS NO ₂ and SO ₂ emissions window are a possibility, will be subjected to an environmental and health risk assessment prior to initiation to inform the decision on whether the activity is to be allowed. | Operations Director/ Environmental Manager | Ongoing |
| 4 | | Continuous ambient monitoring of NO ₂ and SO ₂ to provide a warning system when levels are above the NAAQS. | Environmental Manager | Ongoing |
| 5 | | Implement corrective management actions should NO ₂ and SO ₂ levels exceed guideline levels as per the RSA SANS limits (SANS:1929,2004), and in line with the accepted number of exceedances of NAAQS. | Operations Director/ Environmental Manager | Ongoing |
| 6 | Regular maintenance | Schedule adequate and regular maintenance activities across all operations in order to ensure stable operations of the plant and related emissions control of dust and gas. | Engineering Manager | Ongoing |
| Activity: Emissions Monitoring | | | | |
| 7 | Ambient Air Monitoring | Undertake stack emission testing for the full operational cycle of the Incinerator in order to validate theoretical emission estimates | Operations Director / Environmental Manager | On-going |

| NO | ISSUE | MANAGEMENT AND MITIGATION PLAN | RESPONSIBILITY | FREQUENCY |
|----|-------|--|---|---------------------------|
| 8 | | Undertake stack emissions testing on the outlet of the converter baghouse over the full converter cycle and at all other outlets to the atmosphere in order to monitor the efficiency of controls. | Operations Director / Environmental Manager | Ongoing |
| 9 | | Measure facility fugitive emissions as well as determine the extent of fugitive emissions from the operational activities. | Operations Director / Environmental Manager | Ongoing |
| 10 | | Improve data availability on the PM ₁₀ analysers installed at the site ambient monitoring stations and include additional equipment for monitoring the PM _{2.5} parameter. Also maintain data availability for NO ₂ , SO ₂ by establishing passive monitoring programme and ensuring that critical spare equipment is kept in stock. | Environmental Manager | Ongoing |
| 11 | | Any anomalies or elevated levels in the ambient air quality monitoring station data should be immediately communicated to the site management team in order to ascertain the likely links of such anomalies with specific facility performance | Environmental Manager Ambient air quality data consultant | Ongoing |
| 12 | | Consider extending the ambient air quality monitoring network to include two additional monitoring stations within the boundaries of the facility. | Environmental Manager | Within 1 year of approval |

As part of this AQMP the following recommendations are made for the air quality monitoring procedure:

- Undertake continuous SO₂, NO₂, CO and PM monitoring at the plants' emission stacks;
- Continue with stack emission testing for the full operational cycle of the facility; and,
- Ensure to make use of wet scrubber to absorb gaseous emissions.

13 COMPLIANCE AND ENFORCEMENT HISTORY

Based on simulated results, the proposed facility is in compliance with the set emission standards for CO, SO₂ and NO₂, thus emissions are more than fifty percent (50%) below the NAAQS. However, measures to keep concentrations below threshold should be implemented during the operational phase.

14 ADDITIONAL INFORMATION

Additional information relating to the dispersion modelling will be made available on request by the Air Quality Officer.

15 CONCLUSION AND RECOMMENDATIONS

Simulated ambient criteria pollutant (SO₂, NO_x, CO and PM) concentrations were well below the SA NAAQS at all identified sensitive receptor locations as summarised in the Table below. **The level of impact is considered to be of low significance to human health.**

Table 22: Summary of simulated concentrations for each emission type.

| EMISSION | NAAQS THRESHOLD | CONCENTRATION VALUE | | | SPARE CAPACITY |
|------------------|--------------------------------------|-----------------------------|------------------------|------------------------|-------------------|
| | | HOURLY | 24 HOUR | ANNUAL | |
| SO ₂ | 50 µg/m ³ (annual) | 139.52176 µg/m ³ | 25 µg/m ³ | 6.6 µg/m ³ | 87 % (annual) |
| NO ₂ | 40 µg/m ³ (annual) | 61 µg/m ³ | 10.9 µg/m ³ | 3 µg/m ³ | 93 % (annual) |
| PM ₁₀ | 40 µg/m ³ (annual) | 102 µg/m ³ | 17.6 µg/m ³ | 5.2 µg/m ³ | 77 % (annual) |
| CO | 30 000 µg/m ³ (hourly) | 377 µg/m ³ | 64 µg/m ³ | 16.2 µg/m ³ | 98 % (hourly) |

The contribution from the proposed facility to cumulative ambient air quality is regarded insignificant based on the low simulated ground level concentrations and monitoring results from the nearby monitoring station (Pelonomi NAQI Monitoring Station). It is recommended that mitigation measures as stated within the Air Quality Management Plan be adhered to, to keep the concentrations below the thresholds during the operational phase of the Facility.
