SYNOPSIS

Preparation of a Transport Study for the proposed Bloemsmond Solar 4 Energy Facility in the Northern Cape Province, pertaining to all relevant traffic and transportation engineering aspects.

KEY WORDS:

Solar Energy Facility, Transport Study

SPECIALIST EXPERTISE

IRIS SIGRID WINK

Profession	Civil Engineer (Traffic & Transportation)
Position in Firm	Associate
Area of Specialisation	Manager: Traffic & Transportation Engineering
Qualifications	PrEng, MSc Eng (Civil & Transportation)
Years of Experience	17 Years
Years with Firm	7 Years

SUMMARY OF EXPERIENCE

Iris is a Professional Engineer registered with ECSA (20110156). She joined JG Afrika (Pty) Ltd. in 2012. Iris obtained a Master of Science degree in Civil Engineering in Germany and has more than 15 years of experience in a wide field of traffic and transport engineering projects. Iris left Germany in 2003 and has worked as a traffic and transport engineer in South Africa and Germany. She has technical and professional skills in traffic impact studies, public transport planning, non- motorised transport planning and design, design and development of transport systems, project planning and implementation for residential, commercial and industrial projects and providing conceptual designs for the abovementioned. She has also been involved with transport assessments for renewable energy projects and road safety audits.

PROFESSIONAL REGISTRATIONS & INSTITUTE MEMBERSHIPS

PrEng -Registered with the Engineering Council of South Africa No. 20110156

-Registered Mentor with ECSA for the Cape Town Office of JG Afrika

MSAICE -Member of the South African Institution of Civil Engineers

-Member of ITS SA (Intelligent Transport Systems South Africa)

SAWEA -Member of the South African Wind Energy Association

SARF -South African Road Federation: Committee Member of Council

SARF WR - SARF Western Region Committee Member

SARF RSC - Road Safety Committee Member

IRF - Global Road Safety Audit Team Leader with the International Road Federation (IRF)

EDUCATION

1996 - Matric - Matric (Abitur) - Carl Friedrich Gauss Schule, Hemmingen, Germany

1998 - Diploma as Draughtsperson – Lower Saxonian State Office for Road and Bridge Engineering

2003 - MSc Eng (Civil and Transportation) - Leibniz Technical University of Hanover, Germany

SPECIFIC EXPERIENCE

JG Afrika (Pty) Ltd (Previously Jeffares & Green (Pty) Ltd) 2016 – Date

Position – Associate

 Rondekop Windfarm – Transport study for the proposed Kudusberg Windfarm near Sutherland, Northern Cape – Client: G7 Renewable Energies

- Kudusberg Windfarm Transport study for the proposed Kudusberg Windfarm near Sutherland, Northern Cape – Client: G7 Renewable Energies
- Mogara Solar PV Facility Traffic Impact and Route Assessment for the proposed Solar Facility near Kathu, Northern Cape – Client: Atlantic Renewable Energy Partners
- Gaetsewe Solar PV Facility Traffic Impact and Route Assessment for the proposed Solar Facility near Kathu, Northern Cape – Client: Atlantic Renewable Energy Partners
- Bloemsmond Solar 1 PV Facility Traffic Impact and Route Assessment for the proposed Solar Facility near Kathu, Northern Cape – Client: Atlantic Renewable Energy Partners
- Bloemsmond Solar 2 PV Facility Traffic Impact and Route Assessment for the proposed Solar Facility near Kathu, Northern Cape – Client: Atlantic Renewable Energy Partners
- Kuruman Windfarm Transport study for the proposed Kuruman Windfarm in Kuruman,
 Northern Cape Client: Mulilo Renewable Project Developments
- Coega West Windfarm Transportation and Traffic Management Plan for the proposed Coega
 Windfarm in Coega, Port Elizabeth Client: Electrawinds Coega
- Traffic and Parking Audits for the Suburb of Groenvallei in Cape Town Client: City of Cape Town Department of Property Management.
- Road Safety Audit for the Upgrade of N1 Section 4 Monument River Client: Aurecon on behalf of SANRAL
- Sonop Windfarm Traffic Impact Assessment for the proposed Sonop Windfarm, Coega, Port Elizabeth – Client: Founders Engineering
- Universal Windfarm Traffic Impact Assessment for the proposed Universal Windfarm, Coega,
 Port Elizabeth Client: Founders Engineering
- Road Safety Audit for the Upgrade of N2 Section 8 Knysna to Wittedrift Client: SMEC on behalf of SANRAL
- Road Safety Audit for the Upgrade of N1 Section 16 Zandkraal to Winburg South Client: SMEC on behalf of SANRAL
- Traffic and Road Safety Studies for the Improvement of N7 Section 2 and Section 3 (Rooidraai and Piekenierskloof Pass) Client: SANRAL
- Road Safety Appraisals for Northern Region of Cape Town Client: Aurecon on behalf of City of Cape Town (TCT)
- Traffic Engineering Services for the Enkanini Informal Settlement, Kayamandi Client: Stellenbosch Municipality
- Lead Traffic Engineer for the Upgrade of a 150km Section of the National Route N2 from Kangela to Pongola in KwaZulu-Natal, Client: SANRAL
- Traffic Engineering Services for the Kosovo Informal Settlement (which is part of the Southern Corridor Upgrade Programme), Client: Western Cape Government
- Traffic and Road Safety Studies for the proposed Kosovo Informal Housing Development (part
 of the Southern Corridor Upgrade Program), Client: Western Cape Government.
- Road Safety Audit Stage 3 Upgrade of the R573 Section 2 between Mpumalanga/Gauteng and Mpumalanga/Limpopo, Client: AECOM on behalf of SANRAL
- Road Safety Audit Stage 1 and 3 Upgrade of the N2 Section 5 between Lizmore and Heidelberg, Client: Aurecon on behalf of SANRAL

- Traffic Safety Studies for Roads Upgrades in Cofimvaba, Eastern Cape Client: Cofimvaba Municipality
- Road Safety Audit Stage 1 and 3 Improvement of Intersections between Olifantshoek and Kathu, Northern Cape, Client: Nadeson/Gibb on behalf of SANRAL
- Road Safety Audit Stage 3 Upgrade of the Beacon Way Intersection on the N2 at Plettenberg Bay, Client: AECOM on behalf of SANRAL
- Traffic Impact Assessment for a proposed Primary School at Die Bos in Strand, Somerset West,
 Client: Edifice Consulting Engineers
- Road Safety Audit Stage 1 and 3 Improvement of R75 between Port Elizabeth and Uitenhage,
 Eastern Cape, Client: SMEC on behalf of SANRAL

SPECIALIST DECLARATION

I, <u>IRIS WINK</u>, as the appointed independent specialist, in terms of the 2014 EIA Regulations, hereby declare that I:

- I act as the independent specialist in this application;
- I perform the work relating to the application in an objective manner, even if this results in views and findings that are not favorable to the applicant;
- Regard the information contained in this report as it relates to my specialist input/study to be true and correct, and do not have and will not have any financial interest in the undertaking of the activity, other than remuneration for work performed in terms of the NEMA, the Environmental Impact Assessment Regulations, 2014 and any specific environmental management Act;
- I declare that there are no circumstances that may compromise my objectivity in performing such work;
- I have expertise in conducting the specialist report relevant to this application, including knowledge of the Act, Regulations and any guidelines that have relevance to the proposed activity;
- I will comply with the Act, Regulations and all other applicable legislation;
- I have no, and will not engage in, conflicting interests in the undertaking of the activity;
- I have no vested interest in the proposed activity proceeding;
- I undertake to disclose to the applicant and the competent authority all material information in my possession that reasonably has or may have the potential of influencing - any decision to be taken with respect to the application by the competent authority; and - the objectivity of any report, plan or document to be prepared by myself for submission to the competent authority;
- I have ensured that information containing all relevant facts in respect of the specialist input/study was distributed or made available to interested and affected parties and the public and that participation by interested and affected parties was facilitated in such a manner that all interested and affected parties were provided with a reasonable opportunity to participate and to provide comments on the specialist input/study;
- I have ensured that the comments of all interested and affected parties on the specialist input/study were considered, recorded and submitted to the competent authority in respect of the application;
- All the particulars furnished by me in this specialist input/study are true and correct; and
- I realise that a false declaration is an offence in terms of regulation 48 and is punishable in terms of section 24F of the Act.

Signature of the specialist:	
Name of Specialist: IRIS WINK	

Date: 02 July 2019

COMPLIANCE WITH THE APPENDIX 6 OF THE 2014 EIA REGULATIONS

Require	ements of Appendix 6 – GN R326 EIA Regulations of 7 April 2017	Addressed in the Specialist Report
1. (1) A	specialist report prepared in terms of these Regulations must contain-	Yes. See attached
a)	details of-	CV
•	i. the specialist who prepared the report; and	
	ii. the expertise of that specialist to compile a specialist report including a	
	curriculum vitae;	
b)	a declaration that the specialist is independent in a form as may be specified by the	Yes. See attached
	competent authority;	declaration
c)	an indication of the scope of, and the purpose for which, the report was prepared;	Yes. See section
		1.1
	(cA) an indication of the quality and age of base data used for the specialist report;	n/a
	(cB) a description of existing impacts on the site, cumulative impacts of the proposed	Yes. See section
	development and levels of acceptable change;	6.1
d)	the duration, date and season of the site investigation and the relevance of the season	n/a
	to the outcome of the assessment;	
e)	a description of the methodology adopted in preparing the report or carrying out the	Yes. See section
	specialised process inclusive of equipment and modelling used;	1.3
f)	details of an assessment of the specific identified sensitivity of the site related to the	Yes. Chapters 3
•	proposed activity or activities and its associated structures and infrastructure, inclusive	and 6
	of a site plan identifying site alternatives;	
g)	an identification of any areas to be avoided, including buffers;	Yes. Chapter 3
h)	a map superimposing the activity including the associated structures and infrastructure	n/a
	on the environmental sensitivities of the site including areas to be avoided, including	
	buffers;	
i)	a description of any assumptions made and any uncertainties or gaps in knowledge;	Yes. Section 1.4
j)	a description of the findings and potential implications of such findings on the impact of	Yes. Chapters 3, 6
-	the proposed activity, including identified alternatives on the environment or activities;	8 and 9
k)	any mitigation measures for inclusion in the EMPr;	Yes. Chapter 10
l)	any conditions for inclusion in the environmental authorisation;	n/a
m)	any monitoring requirements for inclusion in the EMPr or environmental authorisation;	n/a
n)	a reasoned opinion-	Yes. Chapter 6
•	i. as to whether the proposed activity, activities or portions thereof should be	·
	authorised;	
	(iA) regarding the acceptability of the proposed activity or activities; and	
	ii. if the opinion is that the proposed activity, activities or portions thereof should	
	be authorised, any avoidance, management and mitigation measures that	
	should be included in the EMPr, and where applicable, the closure plan;	
o)	a description of any consultation process that was undertaken during the course of	n/a
•	preparing the specialist report;	
p)	a summary and copies of any comments received during any consultation process and	n/a
. ,	where applicable all responses thereto; and

PROPOSED BLOEMSMOND SOLAR 4 DEVELOPMENT: SOLAR ENERGY PV FACILITY AND ASSOCIATED INFRASTRUCTURE, NORTHERN CAPE PROVINCE

1 INTRODUCTION AND METHODOLOGY

1.1 Scope and Objectives

Bloemsmond Solar 4 (Pty) Ltd proposes to develop a photovoltaic (PV) solar energy facility (SEF) on Bloemsmond Farm 455, located south-west of Upington in the Northern Cape Province. Bloemsmond Solar 4 is part of three projects earmarked for implementation on Portion 5 and Portion 14 of the Farm Bloemsmond 455, as shown in the Figure 1-1 below.

The PV energy facility is to consist of solar photovoltaic technology, fixed-tilt-, single-axis tracking- or dual-axis tracking- mounting structures, with a net generating capacity of 100 MW, as well as associated infrastructure.

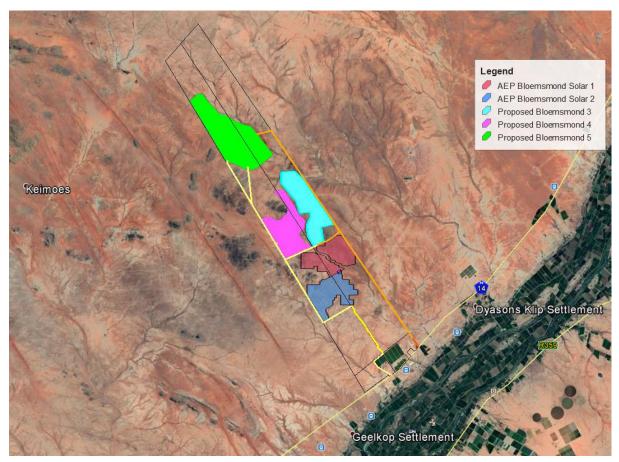

Figure 1-1: Bloemsmond Solar 4 Development site

As part of the Environmental Impact Assessment (EIA), the services of a Transportation Specialist are required to conduct a Transport Study. The main objective of this report is to undertake the Transport Study for the proposed Bloemsmond Solar 4 Development site.

The following two main transportation activities will be investigated:

- Abnormal load vehicles transporting components to the site.
- The transportation of construction materials, equipment and people to and from the site/facility.

The transport study will aim to provide the following objectives:

- Assess activities related to traffic movement for the construction and operation (maintenance) phases of the facility.
- Recommend a preliminary route for the transportation of the components to the proposed site.
- Recommend a preliminary transportation route for the transportation of materials, equipment and people to site.
- Recommend alternative or secondary routes where possible.

1.2 Terms of Reference

The Terms of Reference for this Transport Study include the following:

General:

- A description of the environment that may be affected by the activity and the manner in which the environment may be affected by the proposed project;
- A description and evaluation of environmental issues and potential impacts (including direct, indirect, cumulative impacts and residual risks) that have been identified; and
- Direct, indirect, cumulative impacts and residual risks of the identified issues must be evaluated within the EIA Report in terms of the following criteria:
 - The nature, which shall include a description of what causes the effect, what will be affected and how it will be affected;
 - A statement regarding the potential significance of the identified issues based on the evaluation of the issues/impacts;
 - A comparative evaluation of the identified feasible alternatives, and nomination of a preferred alternative;
 - Any aspects conditional to the findings of the assessment which are to be included as conditions of the Environmental Authorisation;
 - This must also include any gaps in knowledge at this point of the study.
 Consideration of areas that would constitute "acceptable and defendable loss" should be included in this discussion;
 - A reasoned opinion as to whether the proposed project should be authorized;
 - Summary of the positive and negative impacts and risks of the proposed project and identified alternatives; and
 - Mitigation measures and management recommendations to be included in the Environmental Management Programme to be submitted with the FEIR.

Specific:

- Extent of the transport study and study area;
- The proposed development;
- Trip generation for the facility during construction and operation;

- Traffic impact on external road network;
- Accessibility and turning requirements;
- National and local haulage routes;
- Assessment of internal roads and site access;
- Assessment of freight requirements and permitting needed for abnormal loads; and
- Traffic accommodation during construction.

1.3 Approach and Methodology

The report deals with the traffic impact on the surrounding road network in the vicinity of the site:

- during the construction of the access roads;
- construction of the facility; and
- operation and maintenance during the operational phase.

This transport study was informed by the following:

Project Assessment

- Overview of project background information including location maps, component specs and any possible resulting abnormal loads to be transported; and
- Research of all available documentation and information relevant to the proposed facility.

The transport study considered and assessed the following:

Traffic and Haul Route Assessment

- Estimation of trip generation;
- Discussion on potential traffic impacts;
- Assessment of possible haul routes; and
- Construction and operational (maintenance) vehicle trips.

Site layout, Access Points and Internal Roads Assessment per Site

- Description of the surrounding road network;
- Description of site layout;
- Assessment of the proposed access points; and
- Assessment of the proposed internal roads on site.

The findings of the transport assessment are detailed in this report prepared as part of the EIA process for the proposed Bloemsmond Solar 4 Development.

1.4 Assumptions and Limitations

The following assumptions and limitations apply:

- This study is based on the project information provided by Atlantic Energy Partners (Pty) Ltd (AEP);
- According to the Eskom Specifications for Power Transformers (Eskom Power Series, Volume 5: Theory, Design, Maintenance and Life Management of Power Transformers), the following dimensional limitations need to be kept when transporting the transformer – total maximum height 5 000mm, total maximum width 4 300 mm and total maximum length 10 500 mm;

- Maximum vertical height clearances along the haulage route is 5.2 m for abnormal loads;
- Imported elements will be transported from the most feasible port of entry, which is deemed to be the Port of Saldanha in the Western Cape;
- If any elements are manufactured within South Africa, these will be transported from their respective manufacturing centers, which would be either in the greater Johannesburg, Pinetown/Durban or Cape Town for the transformer, inverter and the support structures.
- All haulage trips will occur on either surfaced national and provincial roads or existing gravel roads;
 and
- Material for the construction of internal access roads will be sourced locally as far as possible.

1.5 Source of Information

Information used in a transport study includes:

- Project Information provided by Atlantic Energy Partners (Pty) Ltd (AEP);
- Google Earth.kmz provided by Atlantic Energy Partners (Pty) Ltd (AEP);
- Google Earth Satellite Imagery;
- Information gathered from the Traffic Studies conducted for Bloemsmond Solar 1 and 2; and
- Project research of all available information.

2 DESCRIPTION OF PROJECT ASPECTS RELEVANT TO THE TRANSPORT STUDY

2.1 Port of Entry

The two possible ports of entry to receive the imported parts are Saldanha and Port Elizabeth. The distance from Port Elizabeth to the site via road is approximately 940km, and from Saldanha to the site approximately 763km via the N7 and R27 (shown in purple in the following Figure 2-1) and approximately 880km via the N7 and N14 (shown in orange in Figure 2-1). Based on minimal travel distance, the preferred port of entry is Saldanha.

The Port of Saldanha is the largest and deepest natural port in the Southern Hemisphere able to accommodate vessels with a draft of up to 21.5m. The port covers a land and sea surface area of just over 19,300 hectares within a circumference of 91km with maximum water depths of 23.7m. Unique to the port is a purpose-built rail link directly connected to a jetty bulk loading facility for the shipment of iron ore. The Port is operated by Transnet National Ports Authority.

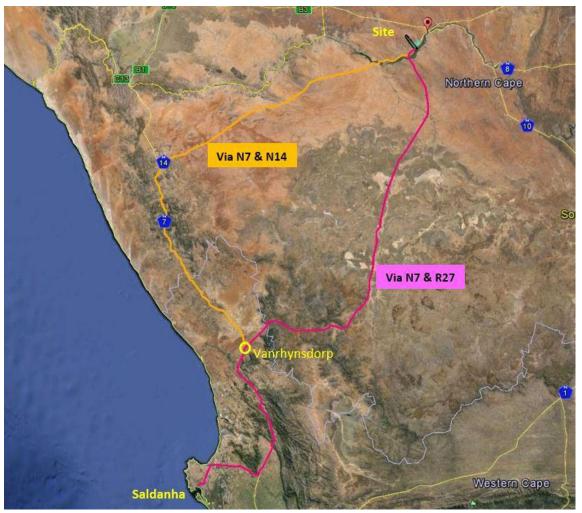

Figure 2-1: Haulage Routes (Saldanha Port of Entry)

2.2 Transportation requirements

It is anticipated that the following vehicles will access the site during construction:

- Conventional trucks within the freight limitations to transport building material to the site;
- 40ft container trucks transporting solar panels, frames and the inverter, which are within freight limitations;
- Flatbed trucks transporting the solar panels and frames, which are within the freight limitations;
- Light Differential Vehicle (LDV) type vehicles transporting workers from surrounding areas to site;
- Drilling machines and other required construction machinery being transported by conventional trucks or via self-drive to site; and
 - The transformers will be transported as abnormal loads.

2.3 Abnormal Load Considerations

It is expected that the transformers will be transported with an abnormal load vehicle. Abnormal permits are required for vehicles exceeding the following permissible maximum dimensions on road freight transport in terms of the Road Safety Act (Act No. 93 of 1996) and the National Road Traffic Regulations, 2000:

- Length: 22 m for an interlink, 18.5 m for truck and trailer and 13.5 m for a single unit truck
- Width: 2.6 m
- Height: 4.3 m measured from the ground. Possible height of load 2.7 m.
- Weight: Gross vehicle mass of 56 t resulting in a payload of approximately 30t
- Axle unit limitations: 18 t for dual and 24 t for triple-axle units
- Axle load limitation: 7.7 t on the front axle and 9 t on the single or rear axles

Any dimension / mass outside the above will be classified as an Abnormal Load and will necessitate an application to the Department of Transport and Public Works for a permit that will give authorisation for the conveyance of said load. A permit is required for each Province that the haulage route traverses.

2.4 Further Guideline Documentation

The Technical Recommendations for Highways (TRH 11): "Draft Guidelines for Granting of Exemption Permits for the Conveyance of Abnormal Loads and for other Events on Public Roads" outlines the rules and conditions that apply to the transport of abnormal loads and vehicles on public roads and the detailed procedures to be followed in applying for exemption permits are described and discussed. Legal axle load limits and the restrictions imposed on abnormally heavy loads are discussed in relation to the damaging effect on road pavements, bridges and culverts.

The general conditions, limitations and escort requirements for abnormally dimensioned loads and vehicles are also discussed and reference is made to speed restrictions, power / mass ratio, mass distribution and general operating conditions for abnormal loads and vehicles. Provision is also made for the granting of permits for all other exemptions from the requirements of the Road Traffic Act and the relevant regulations.

2.5 Permitting – General Rules

The limits recommended in TRH 11 are intended to serve as a guide to the Permit Issuing Authorities. It must be noted that each Administration has the right to refuse a permit application or to modify the conditions under which a permit is granted. It is understood that:

- a) A permit is issued at the sole discretion of the Issuing Authority. The permit may be refused because of the condition of the road, the culverts and bridges, the nature of other traffic on the road, abnormally heavy traffic during certain periods or for any other reason.
- b) A permit can be withdrawn if the vehicle upon inspection is found in any way not fit to be operated.
- c) During certain periods, such as school holidays or long weekends an embargo may be placed on the issuing or permits. Embargo lists are compiled annually and are obtainable from the Issuing Authorities.

2.6 Load Limitations

The maximum load that a road vehicle or combination of vehicles will be allowed to carry legally under permit on a public road is limited by:

- the capacity of the vehicles as rated by the manufacturer;
- the load which may be carried by the tyres;
- the damaging effect on pavements;
- the structural capacity on bridges and culverts;
- the power of the prime mover(s);
- the load imposed by the driving axles; and
- the load imposed by the steering axles.

2.7 Dimensional Limitations

A load of abnormal dimensions may cause an obstruction and danger to other traffic. For this reason, all loads must, as far as possible, conform to the legal dimensions. Permits will only be considered for indivisible loads, i.e. loads that cannot, without disproportionate effort, expense or risk of damage, be divided into two or more loads for the purpose of transport on public roads. For each of the characteristics below there is a legally permissible limit and what is allowed under permit:

- Width;
- Height;
- Length;
- Front Overhang;
- Rear Overhang;
- Front Load Projection;
- Rear Load Projection;
- Wheelbase;
- Turning Radius; and
- Stability of Loaded Vehicles.

2.8 Transporting Other Plant, Material and Equipment

In addition to transporting the specialised equipment, the normal Civil Engineering construction materials, plant and equipment will need to be transported to the site (e.g. sand, stone, cement, gravel, water, compaction equipment, concrete mixers, etc.). Other components, such as electrical cables, pylons and substation transformers, will also be transported to site during construction. The transport of these items will generally be conducted with normal heavy loads vehicles, except for the transformers which require an abnormal load vehicle.

3 DESCRIPTION OF THE AFFECTED ENVIRONMENT

3.1 Description of the site

The proposed Bloemsmond Solar 4 Development will be located on Bloemsmond Farm 455. The site is located approximately 25km south-west from Upington and approximately 16km north-east of Keimoes in the Northern Cape Province, as shown below.

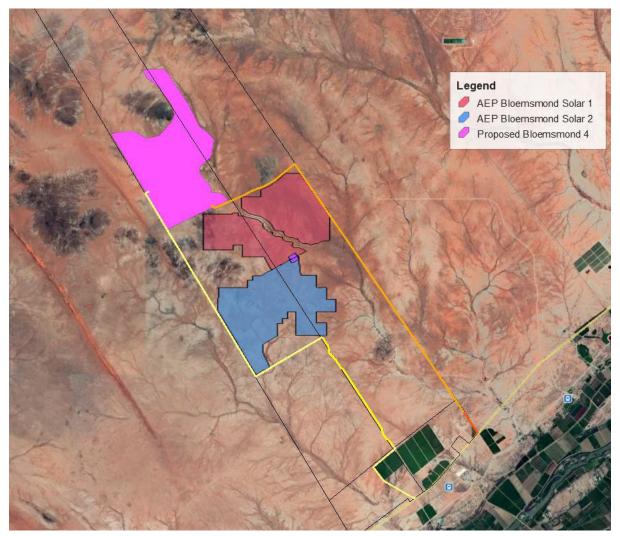

Figure 3-1: Aerial View of Proposed Bloemsmond Solar 4 Development

Bloemsmond Solar 4 Development will have a contracted capacity of up to 100MW and will include the following:

- Mounting structures to support the PV panels;
- On-site switching station / substation
- Auxiliary buildings (gate-house and security, control center, office, warehouse, canteen & visitors center, staff lockers etc.);
- Inverter-stations, transformers and internal electrical reticulation (underground cabling);
- A 132kV overhead power line between the on-site Collector Substation and the Upington MTS;
- Rainwater tanks;
- Laydown area;

- Main access road to the site;
- Internal access roads; and
- Perimeter fencing and security infrastructure.

3.2 National Route to Site for Imported Components

It is assumed that the Solar PV panels will be imported and transported to the site. There are two viable options for the port of entry for imported components - the Port of Saldanha in the Western Cape and the Port of Ngqura in Port Elizabeth. The Port of Saldanha is located approximately 763km away from the site via the N7 and R27 whilst the Port of Ngqura is located approximately 940km travel distance from the proposed site. The Port of Saldanha is the preferred port of entry due to the shorter travelling distance, however, the Port of Ngqura can be used as an alternative should the Port of Saldanha not be available.

The preferred route from the preferred point of entry is shown in green in the Figure below. An alternative route, shown in purple, deviates from the preferred route at Vanrhynsdorp. The preferred route is approximately 763km in length and will start at the Port of Saldanha, heading northeast and passing Velddrif via the R27, Piketberg via the R399, Vanrhynsdorp via the N7, Keimoes via the N14 en route to the site.

An alternative route from the Port of Ngqura, shown in blue in the Figure below, is approximately 940km in length and follows the N10 in a northwest direction en route towards Upington. The route passes Upington onto the N14 and heads west along the N14 to the proposed site.

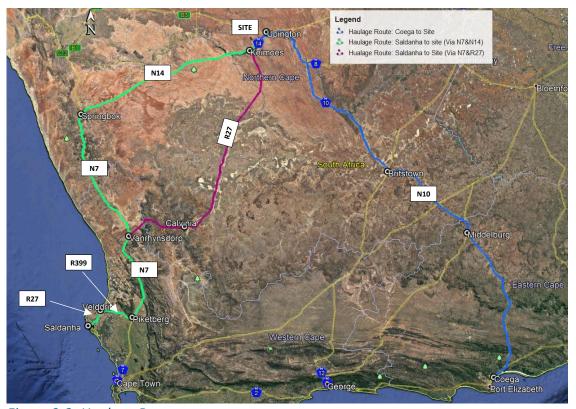

Figure 3-2: Haulage Routes

With the above route options there are several passes, bridges and other road structures, which the haulage vehicles will pass over. However, none of the imported goods will require abnormal loads and there are no limitations for normal heavy vehicles using these routes.

It is critical to ensure that the abnormal load vehicle will be able to move safely and without obstruction along the preferred route. The preferred route should be surveyed prior to construction to identify any problem areas, e.g. intersections with limited turning radii and sections of the road with sharp horizontal curves or steep gradients, that may require modification. After the road modifications have been implemented, it is recommended to undertake a "dry-run" with the largest abnormal load vehicle, prior to the transportation of any components, to ensure that the delivery will occur without disruptions.

3.3 Route for Components manufactured within South Africa

It is anticipated that elements manufactured within South Africa will be transported to the site from the Cape Town, Johannesburg and/or Pinetown/Durban areas.

The transformer will be transported with an abnormal load vehicle and therefore it needs to be verified that the route from the manufacturer to the site does not have any load limitations for abnormal vehicles. At this stage, only a high-level assessment can be undertaken as no information of the exact location of the manufacturer is known and all road structures (such as bridges and culverts) need to be confirmed for their load bearing by SANRAL or the respective Roads Authority.

3.3.1 Route from Johannesburg Area to Site – Normal Loads

With the haulage distance being the minimal haulage distance to site, it is assumed that the inverter and support structure will be manufactured in the Johannesburg area and transported to site via road. The general route distance is around 795km and no road limitations are expected on this route for normal loads vehicles as it will mainly follow national and provincial roads. The haulage route is shown in the Figure 3-3 below.

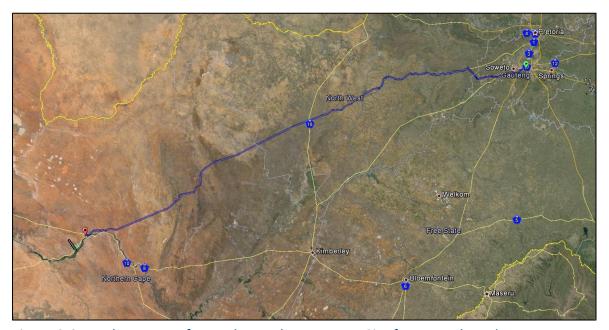

Figure 3-3: Haulage Route from Johannesburg Area to Site for Normal Loads

3.3.2 Route from Pinetown / Durban to Site - Normal load

As a manufacturing centre, Pinetown/Durban can manufacture the inverter and support structures which will then be transported to site via road transportation.

The inverter and support structures elements are typically transported as normal loads and no road limitations are envisaged along the route for normal load freight, shown in the Figure below. Haulage vehicles will mainly travel on national and provincial roads and the total distance is approximately 1 200km. This distance is however 450km longer than the Johannesburg haulage route.

Figure 3-4: Haulage Route from Pinetown Area to Site

3.3.3 Route from Cape Town Area to Site-Normal Load

The inverter and support structures can also alternatively be manufactured in Cape Town and transported to site. The recommended haulage route for this option will follow National Road N7 from Cape Town to Saldanha. From Saldanha it will follow the same route proposed for the imported components. The general route distance is around 943km and no road limitations are expected on this route for normal loads vehicles as it will mainly follow national and provincial roads. The route is, however, 148km longer than the Johannesburg haulage route.

3.3.4 Route from Johannesburg Area to Site – Abnormal Load

It is understood that the transformer will be manufactured locally in South Africa and be transported from the Johannesburg area to site. As the transformer will be transported with an abnormal load vehicle, the route planning needs a more detailed investigation of the feasible routes taking into account any limitations due to existing road structures. Furthermore, a load of abnormal dimensions may cause an obstruction and danger to other traffic and therefore the transformer needs to be transported as far as possible on roads that are wide enough for general traffic to pass. It is expected that the transformer can be transported to site via the same route used for normal loads.

There are several bridges and culverts along this route, which need to be confirmed for load bearing and height clearances. There will be several turns along the way and a couple of small towns to pass

through, such as Delareyville and Vryburg. According to the desktop study, all turning movements along the route are manageable for the abnormal vehicle.

However, there are a number of alternative routes which can be investigated if the above route or sections of the route should not be feasible.

3.4 Proposed main access road to the Proposed Development

Two access options to the sites are under consideration. Both access options intersect with the N14, as shown in the Figure below.

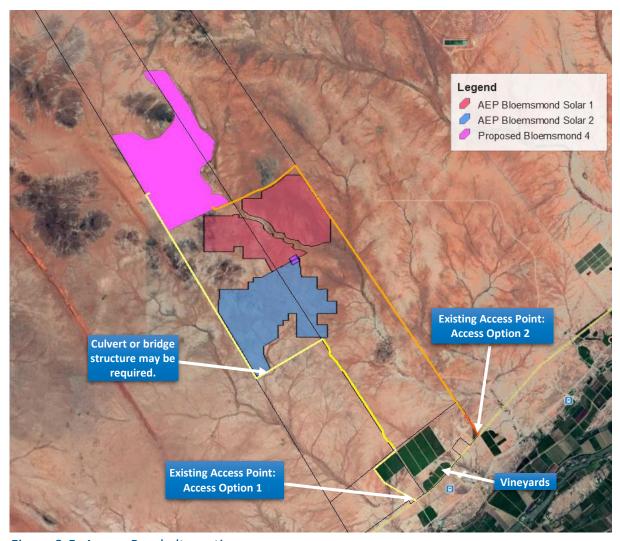

Figure 3-5: Access Road alternatives

3.4.1 Access Option 1

This access option is located at km13.6 on National Road N14, which has been confirmed as an acceptable access location by SANRAL (Bloemsmond Solar 1 and 2 Traffic Impact Assessment). The N14 is classified as a Class 1 Expressway and passes the site to the South. This road is a single carriageway with one lane per direction running in an east-west direction.

The access point would be located directly opposite an existing farm access as shown in the Figure below. Sight distances at this access point are deemed acceptable.

Figure 3-6: Access Option 1

The image below shows the existing gravel farm road at the access point, which will need to be upgraded to cater for the construction vehicles navigating the road to the laydown areas on site. Generally, the road width at the access point needs to be a minimum of 6m and the access roads on site a minimum of 5m. The radius at the access point from the N14 needs to be large enough to allow for all construction vehicles to turn safely onto the site. It is recommended that the access point shall be surfaced and the internal access roads on site can be gravel.

Figure 3-7: Existing Access Point - Access Option 1

The access road largely follows existing gravel tracks. The proposed road track crosses a stream (see Figure 3-5) which may require the construction of a culvert or a small bridge. The exact location and design of the internal access road needs to be established at detailed design stage. Existing structures and services such as drainage structures and pipelines will need to be evaluated if impacting on the access road.

It is assumed that the site access will be access controlled via boom and gatehouse. Based on information obtained from the Bloemsmond Solar 1 and 2 Traffic Studies, it is planned to have security staff on site at the access booms during construction and to implement an electronic number plate reader once the solar farm is in operation. It is recommended to allow for at least 25m stacking distance between the boom and the road edge of the N14.

3.4.2 Access Option 2

The second access option is located at km marker 14.6E on the N14. This option, however, passes the Dyasonsklip Solarfarm. The dust generated by construction traffic could end up on the solar panels, which could have a low impact on production levels. The contractor would need to commit to excessive dust suppression and low speed limits (<30km/h) during construction if this access option was to be considered.

As with Access Option 1, it is assumed that the site access will be access controlled via a boom and gatehouse and it is recommended to allow for at least 25m stacking distance between the boom and the road edge of the N14.

Figure 3-8: Aerial view of access options

Figure 3-9: Existing Access Point on N14 – Access Option 2

3.4.3 Preferred Access Option

Access Option 1 is considered suitable and has SANRAL approval (in principle). However, the matter of protecting the vineyards must be considered when deciding on this access option.

Access Option 2 is also considered suitable. However, dust generated by construction traffic will have a slight impact on the Dyasonsklip Solarfarm.

Both access road alternatives are considered suitable. Access Option 1 is deemed the preferred access road alternative as it has SANRAL approval (in principle) and was also deemed suitable for the Bloemsmond Solar 1 and 2 developments. It furthermore makes sense, from an access management point of view, that neighbouring facilities share an access point to limit the number of accesses along the N14.

Table 3-1: Summary of access road alternatives

Access Road Alternative	Preference	Reasons (incl. potential issues)
Access Option 1	Preferred	SANRAL approved.
		Considered for Bloemsmond Solar 1 and 2
		i.e. access can be shared.
		Neighbouring vineyards need to be considered.
Access Option 2	Favourable	Dust generated by construction traffic will have a
		low impact on the Dyasonsklip Solarfarm.

It needs to be ensured that the gravel sections of the haulage routes remain in good condition and will hence need to be maintained during the additional loading of the construction phase and then reinstated after construction is completed. The gravel roads will require grading with a grader to obtain a flat even surface and the geometric design of these gravel roads needs to be confirmed at detailed design stage.

3.5 Assessment of Access Road Alternatives

As discussed in section 3.4.3 above, Access Option 1 is deemed the preferred access as it can safely be implemented and has SANRAL approval (in principle). The Table below shows the comparative assessment of the access road alternatives. The assessment methodology is attached as **Annexure A**.

| | | | |

Mitigation:

- Dust suppression
- Reduce the construction period
- The use of mobile batch plants and quarries in close proximity to the site

Residual Impacts:

- Dust and noise pollution during the construction phase cannot be completely mitigated but mitigation measures will significantly reduce the impact.
- The construction of new roads and upgrading of existing gravel road will have a permanent, irreversible impact on the environment.

3.6 Main Route for the Transportation of Materials, Plant and People to the proposed site

The nearest towns in relation to the proposed site are Upington, Keimos and Kakamas. It is envisaged that most of the materials, plant and labour will be sourced from these towns.

Concrete batch plants and quarries in the vicinity could be contracted to supply materials and concrete during the construction phase, which would reduce the impact on traffic on the surrounding road network. Alternatively, mobile concrete batch plants and temporary construction material stockpile yards could be commissioned on vacant land near the proposed site. Delivery of materials to the mobile batch plant and the stockpile yard could be staggered to minimise traffic disruptions.

It is envisaged that most materials, water, plant, services and people will be procured within a 60 km radius from the proposed site; however, this would be informed by the REIPPPP requirements.

4 APPLICABLE LEGISLATION AND PERMIT REQUIREMENTS

Key legal requirements pertaining to the transport requirements for the proposed development are:

- Abnormal load permits, (Section 81 of the National Road Traffic Act)
- Port permit (Guidelines for Agreements, Licenses and Permits in terms of the National Ports Act No. 12 of 2005), and
- Authorisation from Road Authorities to modify the road reserve to accommodate turning movements of abnormal loads at intersections.

5 IDENTIFICATION OF KEY ISSUES

5.1 Identification of Potential Impacts

The potential transport related impacts are described below.

5.1.1 Construction Phase

Potential impact

- Construction related traffic
- The construction traffic would also lead to noise and dust pollution.
- This phase also includes the construction of roads, excavations, trenching for electrical cables and other ancillary construction works that will temporarily generate the most traffic.

5.1.2 Operational Phase

During operation, it is expected that staff and security will periodically visit the facility. Approximately 30 full-time employees will be stationed on site. The traffic generated during this phase will be minimal and will not have an impact on the surrounding road network.

5.1.3 Cumulative Impacts

- Traffic congestion/delays on the surrounding road network.
- Noise and dust pollution

6 ASSESSMENT OF IMPACTS AND IDENTIFICATION OF MANAGEMENT ACTIONS

6.1 Potential Impact (Construction Phase)

- Nature of the impact
 - Potential traffic congestion and delays on the surrounding road network and associated noise and dust pollution.
- Significance of impact without mitigation measures
 - Traffic generated by the construction of the facility will have a significant impact on the surrounding road network. The exact number of trips generated during construction will be determined by the haulage company transporting the components to site, the staff requirements and where equipment is sourced from.

From experience on other projects of similar nature, the number of heavy vehicles per 7MW installation is estimated to range between 200 and 300 trips depending on the site conditions and requirements. For the 100MW, the total trips can therefore be estimated to be between 2 858 and 4 286 heavy vehicle trips, which will generally be made over a 12-month construction period. Choosing the worst-case scenario of 4 286 heavy vehicles over a 12-month period travelling on an average of 22 working days per month, the resulting daily number of vehicle trips is 17. Considering that the number of vehicle trips during peak hour traffic in a rural environment can roughly be estimated at around 20-40% of the average daily traffic, the resulting vehicle trips for the construction phase are approximately 4-7 trips. The impact on general traffic on the N14 is therefore deemed nominal.

The PV panels are to be imported instead of manufactured within South Africa, the respective shipping company will be able to indicate how the panels can be packed (for example using 2MW packages and 40ft containers). These can then be stored at the port and repacked onto flatbed trucks.

During operation, approximately 30 full-time employees will be stationed on site and hence vehicle trips generated are low and will have a negligible impact on the external road network.

The developer will accommodate rainwater tanks on site and may investigate the use of borehole water for the cleaning of the PV panels. Should rainwater or borehole water not be available or suitable, the following assumptions have been made to estimate the resulting trips generated from transporting water to the site:

- 5 000 litre water bowsers to be used for transporting the water
- Approximately 5 litres of water needed per panel
- A range of between 270,000 300,000 Solar panels are expected for the site
- Assuming the worst-case scenario of 300,000 Solar panels, the total number of trips is therefore approximately 300 water bowsers can be expected.
- Panels will be cleaned four times a year.

It is expected that these trips will not have a significant impact on external traffic. However, to limit the impact, it is recommended to schedule these trips outside of peak traffic periods. Additionally, the provision of rainwater tanks at the site is expected to decrease the number of trips.

The significance of the transport impact without mitigation measures during the construction phase can be rated as medium. However, considering that this is temporary and short term in nature, the impact can be mitigated to an acceptable level.

Proposed mitigation measures

- The delivery of components to the site can be staggered and trips can be scheduled to occur outside of peak traffic periods.
- Dust suppression of gravel roads during the construction phase, as required.
- Regular maintenance of gravel roads by the Contractor during the construction phase and by the Owner/Facility Manager during the operation phase.
- The use of mobile batch plants and quarries near the site would decrease the traffic impact on the surrounding road network.
- Staff and general trips should occur outside of peak traffic periods as far as possible.
- If required, low hanging overhead lines (lower than 5.1m) e.g. Eskom and Telkom lines, along the proposed routes will have to be moved to accommodate the abnormal load vehicles.
- The preferred route should be surveyed to identify problem areas (e.g. intersections with limited turning radii and sections of the road with sharp horizontal curves or steep gradients, that may require modification). After the road modifications have been implemented, it is recommended to undertake a "dry-run" with the largest abnormal load vehicle, prior to the transportation of any components, to ensure that delivery will occur without disruptions. This process is to be undertaken by the haulage company transporting the components and the contractor, who will modify the road and intersections to accommodate abnormal vehicles. It needs to be ensured that the gravel sections of the haulage routes remain in good condition and will need to be maintained during the additional loading of the construction phase and reinstated after construction is completed.
- Design and maintenance of internal roads. The internal gravel roads will require grading with a grader to obtain a flat even surface and the geometric design of these gravel roads needs to be confirmed at detailed design stage. This process is to be undertaken by a civil engineering consultant or a geometric design professional.

Significance of impact with mitigation measures

The proposed mitigation measures for the construction traffic will result in a minor reduction of the impact on the surrounding road network, but the impact on the local traffic will remain moderate as the existing traffic volumes are deemed to be low. The dust suppression, however, will result in significantly reducing the impact.

7 NO-GO ALTERNATIVE

The no-go alternative implies that the proposed Bloemsmond Solar 4 Development does not proceed. This would mean that there will be no negative environmental impacts and no traffic impact on the surrounding network. However, this would also mean that there would be no socioeconomic benefits to the surrounding communities and it will not assist government in meeting the targets for renewable energy. Hence, the no-go alternative is not a preferred alternative.

8 IMPACT ASSESSMENT SUMMARY

The assessment of impacts and recommendation of mitigation measures as discussed above are collated in the tables below. The assessment methodology is attached as **Annexure A**.

Table 8-1: Impact Rating - Construction Phase

IMPACT TABLE	- CONSTRUCTION PHASE

	the impact. Noise pollution is limited to the		
	construction period.		

Table 8-4: Impact Rating - Operation Phase

IMPACT TABLE – OPERATION PHASE

The traffic generated during this phase will be minimal and will have not have any impact on the surrounding road network.

9 CUMULATIVE IMPACTS

To assess the cumulative impact, it was assumed that all renewable energy projects within 50km currently proposed and authorized, would be constructed at the same time. This is the precautionary approach as in reality these projects would be subject to a highly competitive bidding process. Only a handful of projects would be selected to enter into a power purchase agreement with Eskom, and construction is likely to be staggered depending on project-specific issues.

The construction and decommissioning phases are the only significant traffic generators for renewable energy projects. The duration of these phases is short term (i.e. the impact of the generated traffic on the surrounding road network is temporary and renewable energy facilities, when operational, do not add any significant traffic to the road network). Even if all renewable energy projects within the area are constructed at the same time, the roads authority will consider all applications for abnormal loads and work with all project companies to ensure that loads on the public roads are staggered and staged to ensure that the impact will be acceptable.

The assessments of cumulative impacts are collated in the table below.

Table 9-1: Cumulative Impact

	Overall impact of the proposed	Cumulative impact of the	
	project considered in isolation	project and other projects in	
		the area	
Extent	Low (2)	High (5)	
Duration	Very Short (1)	Medium-term (3)	
Magnitude	Moderate (6)	High (8)	
Probability	Highly probable (4)	Definite (5)	
Significance	Medium (36)	High (80)	
Status (positive/negative)	Negative	Negative	
Reversibility	High	High	
Loss of resources?	No	No	
Can impacts	Yes	Yes	
be mitigated?			

Confidence in findings: High.

Mitigation:

- Stagger component delivery to site
- Dust suppression
- Reduce the construction period
- The use of mobile batch plants and quarries in close proximity to the site
- Staff and general trips should occur outside of peak traffic periods

10 ENVIRONMENTAL MANAGEMENT PROGRAM INPUTS

It is recommended that dust suppression and maintenance of gravel roads form part of the EMPr. This would be required during the Construction phase where an increase in vehicle trips can be expected. No traffic related mitigation measures are envisaged during the Operation phase due to the negligible traffic volume generated during this phase.

Table 10-1: EMPr Input – Construction Phase

Impact	Mitigation/Management Objectives	Mitigation/Management Actions	Monitoring				
			Methodology	Frequency	Responsibility

		overhead lines (lower than 5.1m) e.g. Eskom and Telkom lines, along the proposed routes will have to be moved to accommodate the abnormal load vehicles, if required			

11 CONCLUSION AND RECOMMENDATIONS

As it had not been decided at the time of undertaking the transport study which manufacturers will be contracted for the solar PV components, all possible haulage routes were included into this study.

The potential transport related impacts for the construction and operation phases for the proposed Bloemsmond Solar 4 Development were assessed.

- The construction phase traffic, although significant, will be temporary and impacts are considered to have a **low significance**.
- During operation, it is expected that staff and security will periodically visit the facility. Approximately 30 full-time employees will be stationed on site. The traffic generated during this phase will be minimal and will not have an impact on the surrounding road network.

The potential mitigation measures mentioned in the construction phase are:

- Dust suppression
- Component delivery to/ removal from the site can be staggered and trips can be scheduled to
 occur outside of peak traffic periods.
- The use of mobile batch plants and quarries near the site would decrease the impact on the surrounding road network.
- Staff and general trips should occur outside of peak traffic periods.
- A "dry run" of the preferred route.
- Design and maintenance of internal roads.
- If required, any low hanging overhead lines (lower than 5.1m) e.g. Eskom and Telkom lines, along the proposed routes will have to be moved to accommodate the abnormal load vehicles.

The construction and decommissioning phases of a development are the only significant traffic generators and therefore noise and dust pollution will be higher during these phases. The duration of the phases is short term, i.e. the impact of the traffic on the surrounding road network is temporary and solar energy facilities, when operational, do not add any significant traffic to the road network.

Access Option 1 is deemed the preferred access alternative as it can safely be implemented and already has SANRAL approval (in principle).

The development is supported from a transport perspective provided that the recommendations and mitigations contained in this report are adhered to.

The impacts associated with Bloemsmond Solar 4 Development are acceptable with the implementation of the recommended mitigation measures and can therefore be authorised.

Annexure A - ASSESSMENT METHODOLOGY

ASSESSMENT METHODOLOGY

Impacts were assessed in term of the following Assessment Criteria:

- The **nature**, which shall include a description of what causes the effect, what will be affected and how it

will be affected.

The **extent**, wherein it will be indicated whether the impact will be local (limited to the immediate area or

site of development) or regional, and a value between 1 and 5 will be assigned as appropriate (with 1

being low and 5 being high):

The **duration**, wherein it will be indicated whether:

- the lifetime of the impact will be of a very short duration (0–1 years) – assigned a score of 1;

- the lifetime of the impact will be of a short duration (2-5 years) - assigned a score of 2;

- medium-term (5–15 years) – assigned a score of 3;

- long term (> 15 years) - assigned a score of 4; or

- permanent - assigned a score of 5;

- The consequences (magnitude), quantified on a scale from 0-10, where 0 is small and will have no effect

on the environment, 2 is minor and will not result in an impact on processes, 4 is low and will cause a slight

impact on processes, 6 is moderate and will result in processes continuing but in a modified way, 8 is high

(processes are altered to the extent that they temporarily cease), and 10 is very high and results in

complete destruction of patterns and permanent cessation of processes.

- The **probability** of occurrence, which shall describe the likelihood of the impact actually occurring.

Probability will be estimated on a scale of 1-5, where 1 is very improbable (probably will not happen), 2 is

improbable (some possibility, but low likelihood), 3 is probable (distinct possibility), 4 is highly probable

(most likely) and 5 is definite (impact will occur regardless of any prevention measures).

the significance, which shall be determined through a synthesis of the characteristics described above and

can be assessed as low, medium or high. The significance is calculated by combining the criteria in the

following formula:

S=(E+D+M)*P

S = Significance weighting

E = Extent

D = Duration

M = Magnitude

P = Probability

33

The **significance weightings** for each potential impact are as follows:

- < 30 points: Low (i.e. where this impact would not have a direct influence on the decision to develop in the area),</p>
- 30-60 points: Medium (i.e. where the impact could influence the decision to develop in the area unless it is effectively mitigated),
- > 60 points: High (i.e. where the impact must have an influence on the decision process to develop in the area).
- the status, which will be described as either positive, negative or neutral.
- the degree to which the impact can be reversed.
- the degree to which the impact may cause irreplaceable loss of resources.
- the degree to which the impact can be mitigated.
