BASIC ASSESSMENT REPORT

And

ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT

SUBMITTED FOR ENVIRONMENTAL AUTHORIZATIONS IN TERMS OF THE NATIONAL ENVIRONMENTAL MANAGEMENT ACT, 1998 IN RESPECT OF LISTED ACTIVITIES THAT HAVE BEEN TRIGGERED BY APPLICATIONS IN TERMS OF THE MINERAL AND PETROLEUM RESOURCES DEVELOPMENT ACT, 2002 (MPRDA) (AS AMENDED).

NAME OF APPLICANT:	Pro Power Resources Pty Ltd
TEL NO:	078 031 8162
FAX NO:	086 516 2833
CONTACT PERSON:	Mr Mukwevho Tshilidzi Marcel
POSTAL ADDRESS:	6061a Fudo Street, Diepkloof, Soweto, 1864
PHYSICAL ADDRESS:	6061a Fudo Street, Diepkloof, Soweto, 1864
EMAIL ADDRESS:	marcelmukwevho@yahoo.com

FILE REFERENCE NUMBER SAMRAD: LP 30/5/1/1/2/ 14120 PR

IMPORTANT NOTICE

In terms of the Mineral and Petroleum Resources Development Act (Act 28 of 2002 as amended), the Minister must grant a prospecting or mining right if among others the mining “will not result in unacceptable pollution, ecological degradation or damage to the environment”.

Unless an Environmental Authorisation can be granted following the evaluation of an Environmental Impact Assessment and an Environmental Management Programme report in terms of the National Environmental Management Act (Act 107 of 1998) (NEMA), it cannot be concluded that the said activities will not result in unacceptable pollution, ecological degradation or damage to the environment.

In terms of section 16(3)(b) of the EIA Regulations, 2014, any report submitted as part of an application must be prepared in a format that may be determined by the Competent Authority and in terms of section 17 (1) (c) the competent Authority must check whether the application has taken into account any minimum requirements applicable or instructions or guidance provided by the competent authority to the submission of applications.

It is therefore an instruction that the prescribed reports required in respect of applications for an environmental authorisation for listed activities triggered by an application for a right or a permit are submitted in the exact format of, and provide all the information required in terms of, this template. Furthermore, please be advised that failure to submit the information required in the format provided in this template will be regarded as a failure to meet the requirements of the Regulation and will lead to the Environmental Authorisation being refused.

It is furthermore an instruction that the Environmental Assessment Practitioner must process and interpret his/her research and analysis and use the findings thereof to compile the information required herein. (Unprocessed supporting information may be attached as appendices). The EAP must ensure that the information required is placed correctly in the relevant sections of the Report, in the order, and under the provided headings as set out below, and ensure that the report is not cluttered with un-interpreted information and that it unambiguously represents the interpretation of the applicant.

OBJECTIVE OF THE BASIC ASSESSMENT PROCESS

The objective of the basic assessment process is to, through a consultative process—

- (a) determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context;
- (b) identify the alternatives considered, including the activity, location, and technology alternatives;
- (c) describe the need and desirability of the proposed alternatives,
- (d) through the undertaking of an impact and risk assessment process inclusive of cumulative impacts which focused on determining the geographical, physical, biological, social, economic, heritage, and cultural sensitivity of the sites and locations within sites and the risk of impact of the proposed activity and technology alternatives on these aspects to determine:
 - (i) the nature, significance, consequence, extent, duration, and probability of the impacts occurring to; and
 - (ii) the degree to which these impacts—
 - (aa) can be reversed;
 - (bb) may cause irreplaceable loss of resources; and
 - (cc) can be managed, avoided or mitigated;
- (e) through a ranking of the site sensitivities and possible impacts the activity and technology alternatives will impose on the sites and location identified through the life of the activity to—
 - (i) identify and motivate a preferred site, activity and technology alternative;
 - (ii) identify suitable measures to manage, avoid or mitigate identified impacts; and
 - (iii) identify residual risks that need to be managed and monitored.

IMPORTANT NOTICE	i
OBJECTIVE OF THE BASIC ASSESSMENT PROCESS	ii
TABLE OF CONTENTS.....	iii
LIST OF TABLES	xii
LIST OF FIGURES.....	xiii
PART A	1
SCOPE OF ASSESSMENT AND REPORT.....	1
1 Contact Person and correspondence address.....	1
1.1 Details of the EAP.....	1
1.2 Expertise of the EAP.....	1
2 Project Locality	2
2.1 Location of the overall activity	2
2.2 Locality map.....	3
3 DESCRIPTION OF THE SCOPE OF THE PROPOSED OVERALL ACTIVITY.....	5
3.1 Listed and specified activities	5
3.2 Description of the activities to be undertaken	6
3.2.1 The description of the proposed prospecting activities.....	7
3.2.1.1 Phase 1: Literature review and Field Mapping	8
3.3 Activities associated with the proposed prospecting	9
3.3.1 Site Access	9
3.3.2 Access roads	10
3.3.3 Drill station establishment.....	10
3.3.4 Core Drilling	10
3.4 Project scheduling	10
3.5 Equipment and/or Technology to be used	11
4 POLICY AND LEGISLATIVE CONTEXT	12

5	Need and desirability of the proposed prospecting activities	18
5.1	Securing ecological sustainable development and use of natural resources ..	19
5.1.1	How will this development (and its separate elements/aspects) impact on the ecological integrity of the area?	19
5.1.2	How will this development disturb or enhance ecosystems and/or result in the loss or protection of biological diversity?.....	20
5.1.3	How will this development pollute and/or degrade the biophysical environment?	20
5.1.4	What waste will be generated by this development?	20
5.1.5	How will this development disturb or enhance landscapes and/or sites that constitute the nation’s cultural heritage?.....	20
5.1.6	How will this development use and/or impact on non-renewable natural resources?	21
5.1.7	How will the ecological impacts resulting from this development impact on people’s environmental right?.....	21
5.2	Promoting justifiable economic and social development	21
5.2.1	What is the socio-economic context of the area	22
5.2.2	What will the socio-economic impacts be of the development (and its separate elements/aspects), and specifically also on the socio-economic objectives of the area?.....	22
5.2.3	How will this development address the specific physical, psychological, developmental, cultural and social needs and interests of the relevant communities?.....	22
5.2.4	Will the development result in equitable (intra- and inter-generational) impact distribution, in the short- and long-term? Will the impact be socially and economically sustainable in the short- and long-term?	22
5.2.5	In terms of location, describe how the placement of the proposed development will result in the creation of residential and employment opportunities in close proximity to or integrated with each other and reduce the need for transport of people and goods	23

5.2.6	How were a risk-averse and cautious approach applied in terms of socio-economic impacts?	23
5.2.6.1	What are the limits of current knowledge?	23
5.2.6.2	What is the level of risk associated with the limits of current knowledge? ..	23
5.2.6.3	Based on the limits of knowledge and the level of risk, how and to what extent was a risk-averse and cautious approach applied to the development?	23
5.2.7	How will the socio-economic impacts resulting from this development impact on people’s environmental right in terms following:	23
5.2.8	What are the positive impacts & what measures were taken to enhance positive impacts?	24
5.2.9	Considering the linkages and dependencies between human wellbeing, livelihoods and ecosystem services, describe the linkages and dependencies applicable to the area in question and how the development’s socio-economic impacts will result in ecological impacts (e.g. over utilisation of natural resources, etc.)?.....	25
5.2.10	What measures were taken to pursue the selection of the “best practicable environmental option” in terms of socio-economic considerations?	25
5.2.11	What measures were taken to pursue environmental justice so that adverse environmental impacts shall not be distributed in such a manner as to unfairly discriminate against any person, particularly vulnerable and disadvantaged persons (who are the beneficiaries and is the development located appropriately)	26
5.2.12	What measures were taken ensure transparent and effective participation of all interested and affected parties	26
5.2.13	What measures were taken to ensure that the environment will be held in public trust for the people, that the beneficial use of environmental resources will serve the public interest, and that the environment will be protected as the people’s common heritage.....	26
5.2.14	Are the mitigation measures proposed realistic and what long-term environmental legacy and managed burden will be left?.....	27

5.2.15	Measures taken to ensure that impact management costs are paid for by those responsible for harming the environment?	27
5.2.16	How the alternatives identified resulted in the selection of the best practicable environmental option in terms of socio-economic considerations?	27
6	Motivation for the overall preferred site, activities and technology alternative	28
6.1	Preferred Site	28
6.2	Preferred Activities	28
6.3	Full description of the process followed to reach the proposed preferred alternatives within the site.	28
6.3.1	The property on which or location where it is proposed to undertake the activity;	29
6.3.2	The type of activity to be undertaken;	29
6.3.2.1	Geophysical Survey/ aeromagnetic survey	29
6.3.2.2	Core Drilling.....	29
6.3.2.3	Trenching and soil sampling	30
6.3.3	The design or layout of the activity;	30
6.3.4	The technology to be used in the activity;	30
6.3.4.1	Local geological strata	30
6.3.4.2	Rock Strength.....	30
6.3.5	The operational aspects of the activity	31
6.3.6	Other operational aspects:	31
6.4	The option of not implementing the activity	31
7	DETAILS OF THE PUBLIC PARTICIPATION PROCESS FOLLOWED	33
7.1	IAP and Stakeholder identification, registration and the creation of an electronic database	33
7.2	Formal notification of the application to key Interested and Affected Parties (adjacent landowners) and other stakeholders	34

7.2.1	Newspaper advertisement	34
7.2.2	Site notice placement	34
7.2.3	Written notification	34
7.2.6	Telephonic conversations	34
7.3	Summary of issues raised by Interested and Affected Parties	35
8	The Environmental attributes associated with the alternatives.	36
8.1	Topography	36
8.2	Climate	37
8.2.1	Evaporation	37
8.2.2	Precipitation and Temperature	37
8.2.2.1	<i>Wind</i>	38
8.3	Air Quality	39
8.4	Geology	40
8.4.1	Regional Geology	40
8.4.1.1	The Aasvoelkop Formation.....	40
8.4.1.2	The Makgabeng Formation.....	40
8.5	Ground and Surface Water	43
8.5.1	Groundwater.....	43
8.6	Surface Water	43
8.6.1	Watercourses and Wetlands	44
8.6.2	Water Resource Management.....	45
8.7	Biodiversity	45
8.7.1	Regional Vegetation and Habitats	46
8.7.2	The POSA Search	47
8.7.3	Site Avifauna	47
8.7.4	Site Ecological Sensitivity.....	47
8.7.4.1	2013 Limpopo Conservation Plan version 2	47

8.7.4.2	Mining and Biodiversity Guideline (MBG) 2013.....	48
8.7.4.3	National Freshwater Ecosystem Priority Areas.....	49
8.8	Social Characteristics of the Study Area and Surrounds	51
8.9	Heritage Resources	51
8.10	Description of the current land uses.	51
8.11	Description of specific environmental features and infrastructure on the site	52
8.12	Environmental and current land use map	54
9	Impacts and risks identified including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts can be reversed.	55
9.1	Methodology used in determining and ranking the nature, significance, consequences, extent, duration and probability of potential environmental impacts and risks	61
9.2	The positive and negative impacts that the proposed activity (in terms of the initial site layout) and alternatives will have on the environment and the community that may be affected.....	65
9.2.1	Positive Impacts	65
9.2.2	Negative Impacts	65
9.3	The possible mitigation measures that could be applied and the level of risk	68
9.4	Motivation where no alternative sites were considered.....	69
9.5	Statement motivating the alternative development location within the overall site.....	70
10	Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site	71
10.1	Stakeholder consultation.....	71
10.2	Desktop study	71
10.3	Site Visit.....	72
10.4	Impacts assessment, rating and management.....	72
11	Assessment of each identified potentially significant impact and risk.....	73

11.1	Assessment of all identified impacts and risks	73
11.2	Summary of specialist reports	78
11.2.1	Studies identified by the Screening Tool	78
11.3	Environmental impact statement.....	81
11.4	Final Site Map	83
11.5	Summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;	84
11.5.1	Positive Impacts	84
11.5.2	Negative Impacts	84
11.6	Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;	87
11.6.1	Impact management objectives:	87
11.6.2	Impact management Outcome	88
11.7	Aspects for inclusion as conditions of Authorisation	88
11.8	Description of any assumptions, uncertainties and gaps in knowledge	89
11.9	Reasoned opinion as to whether the proposed activity should or should not be authorised.....	89
11.10	Conditions that must be included in the authorisation	90
11.11	Period for which the Environmental Authorisation is required	92
12	Undertaking.....	92
13	Financial Provision	92
13.1	Explain how the aforesaid amount was derived.	92
13.2	Confirm that this amount can be provided for from operating expenditure ...	92
14	Specific Information required by the competent Authority	92
14.1	Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). The EIA report must include the:-	92
14.1.1	Impact on the socio-economic conditions of any directly affected person. ...	92

14.1.2	Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act.	92
14.2	Other matters required in terms of sections 24(4) (a) and (b) of the Act.	93
PART B		95
ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT		95
1	Details of the EAP.....	95
2	Description of the Aspects of the Activity	95
2.1	Composite Map.....	95
3	Description of Impact management objectives including management statements.....	96
3.1	Determination of closure objectives.....	96
3.2	Volumes and rate of water use required for the operation.....	96
3.2.1	Has a water use licence has been applied for?	96
4	Impacts to be mitigated in their respective phases, the Impact Management Outcomes and Management Actions	97
5	Financial Provision	101
5.1	Determination of the amount of Financial Provision	101
5.1.1	Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under the Regulation.	101
5.1.2	Confirm specifically that the environmental objectives in relation to closure have been consulted with landowner and interested and affected parties.	102
5.1.3	Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main mining activities, including the anticipated mining area at the time of closure.	102
5.1.3.1	Borehole capping	102
5.1.3.2	Rehabilitation of created internal access roads	104
5.1.3.3	Re-vegetation.....	104
5.1.4	Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives	104

5.1.5	Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline.	105
5.1.6	Confirm that the financial provision will be provided as determined.	106
5.2	Mechanisms for monitoring compliance with and performance assessment against the environmental management programme and reporting thereon, including, Monitoring of Impact Management Actions, Monitoring and reporting frequency, Responsible persons, Time period for implementing impact management actions, Mechanism for monitoring compliance.....	106
5.2.1	Indicate the frequency of the submission of the performance assessment/environmental audit report.	110
5.3	Environmental Awareness Plan	110
5.3.1	Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work	110
5.3.2	Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment	110
5.3.2.1	Delegation of a Project Environmental Officer	110
5.3.2.2	Notice of Commencement	110
5.3.2.3	Environmental Documents.....	110
5.3.2.4	Environmental Monitoring.....	111
5.3.2.5	Environmental Training.....	111

SCOPE OF ASSESSMENT AND REPORT

1 Contact Person and correspondence address

1.1 Details of the EAP

Names of Practitioners:	Phathu Mugagadeli	Khuliso V Ramulondi (Pr.Sci.Nat; REG. EAP)
Qualifications	BSc in Environmental Sciences Bachelor of Science Honours in Geography	Bachelor of Earth Sciences in Mining and Environmental Geology
Tel	012 012 5580	
Cell No.:	073 796 6769	081 312 3951
Fax No. :	086 560 5316	
e-mail address:	phathu@mielelani.co.za/ mugagadelip@gmail.com	khuliso@mielelani.co.za/ ramufhi@outlook.com
	info@mielelani.co.za/	

1.2 Expertise of the EAP.

The EAP (Phathutshedzo) has a Bachelor of Environmental Sciences from University of Venda and Bachelor of Science Honours in Geography (UNISA).

Summary of the EAP's past experience

Mr Mugagadeli Phathutshedzo has a solid 05 years' experience in Conducting EIAs. He has conducted EIAs for various projects including but not limited to Construction, Agricultural, Prospecting and Mining as well as Waste Management. His exposure to different working environment has greatly advanced his technical ability in identifying and assessing impacts as well as providing mitigation thereof, from this role he has learnt the best practical strategies to manage and mitigate impacts. The EAPs' CVs are attached as Appendix 02.

Mr. Ramulondi is a registered EAP with Environmental Assessment Practitioners Association of South Africa (EAPASA) and a registered Natural Professional Scientist with SACNASP. He has over five years of experience in conducting Environmental Impact Assessments (EIAs). He has conducted EIAs for various projects including but not limited to Construction, Agriculture, Prospecting and Mining as well as Waste Management.

2 Project Locality

2.1 Location of the overall activity

Farm Name:	Portion 01 – 05, 07 & 09 of Farm Marseilles 07 LP				
Application area (Ha)	Approximately 1480.24 Hectare				
Magisterial district:	Waterberg District, Limpopo Province.				
Distance and direction from nearest town	The proposed prospecting area is located approximately about 85 km West of Lephalale Town.				
21 digit Surveyor General Code for each farm portion	Farm Name	Farm_No	Maj_Region	Portion	SG_Code
	Marseilles	7	LP	00005	T0LP00000000000700005
	Marseilles	7	LP	00002	T0LP00000000000700002
	Marseilles	7	LP	00001	T0LP00000000000700001
	Marseilles	7	LP	00003	T0LP00000000000700003
	Marseilles	7	LP	00004	T0LP00000000000700004

3 DESCRIPTION OF THE SCOPE OF THE PROPOSED OVERALL ACTIVITY

3.1 Listed and specified activities

Table 3-1: Listed Activities

Name of Activity	Aerial Extent of the Activity Ha Or M ²	Listed Activity (Mark With An X)	Applicable Listing Notice	Waste Management Authorisation (Mark With An X)
Any activity which requires a prospecting right in terms of section 16 of the Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002).	Extent of application area: 1480.24 Ha	X	GNR 983 – Listing 1: Activity 20	N/A
The clearance of an area of 1 hectare or more, but less than 20 hectares of indigenous vegetation. The clearance will be to make way for: <u>Drill pad areas and temporary storage area</u>	≤ 1 ha	X	GNR 983 – Listing 1: Activity 27	N/A
Drill sites (All 13 Drill Sites)	1.44 ha			
Ablution facility (mobile hired toilets closer to each drill site)	100 m ²			
Access route (Pre-existing access routes will be used)	<1 ha			

3.2 Description of the activities to be undertaken

Pro Power Resources (Pty) Ltd proposes to undertake prospecting activities for Diamonds, Diamonds (Alluvial, General and in Kimberlite) on Portion 01 – 05, 07 & 09 of Farm Marseilles 07 LP, Waterberg District, Limpopo Province. The application was accepted by the Department of Mineral Resources on the 01st of September 2021.

What is mineral prospecting?

Prospecting is the search of clues that indicates that there are diamond deposits beneath the surface. It is generally the search of diamond rich ore bodies to determine if they are mineable at a profit. The confidence of mineral deposit is gained through using maps and historical data, geophysics, ground truthing, geochemistry which are considered non-invasive activities.

When the local geology is understood, siting for drilling can then be undertaken. Drilling is done with fairly large machinery that use diamond-tipped, hollow drill 'bits' which produce varying amounts of 'core' depending on the extensiveness of the drill program. Diamond-tipped bits are used because they can go through the hardest of rock, and the core produced is cylindrical and not typically more than a couple inches in diameter. The details of each drill hole (including direction and depth) are recorded in much detail, each meter of core is marked with the depth that it came from and which hole, if there's been multiple drilled.

Once core has been obtained, samples are then sent to a laboratory facility to be 'assayed', which is essentially assessing the ore body physical and chemical properties in the rock. Using this data from the assaying, along with the records of where the assayed drill core came from, the data is re-interpreted to determine subsequent phases of follow-up drilling. If drilling continues, different drilling techniques are used to build confidence in the deposit by determining the size and grade of the 'strike' and 'dip'.

The objective will be to produce a 3D resource model of where and how the ore body is located underground. All this information is used to complete an 'official resource estimate', which is a non-biased report that is required to have been developed by a 'Qualified Person' (QP). The 'Official Resource Estimate' will outline the categories of mineral resources (inferred, indicated, and measured) as well as the quantity and grade of each resource category.

Prospecting activities will be undertaken in five different phases of which each is dependent on the preceding phase. Each phase will provide information that will determine whether the prospecting activities should be continued or abolished.

3.2.1 The description of the proposed prospecting activities

Prospecting activities will be undertaken in different phases of which each is dependent on the preceding phase. Each phase will provide information that will determine whether the prospecting activities should be continued or abolished.

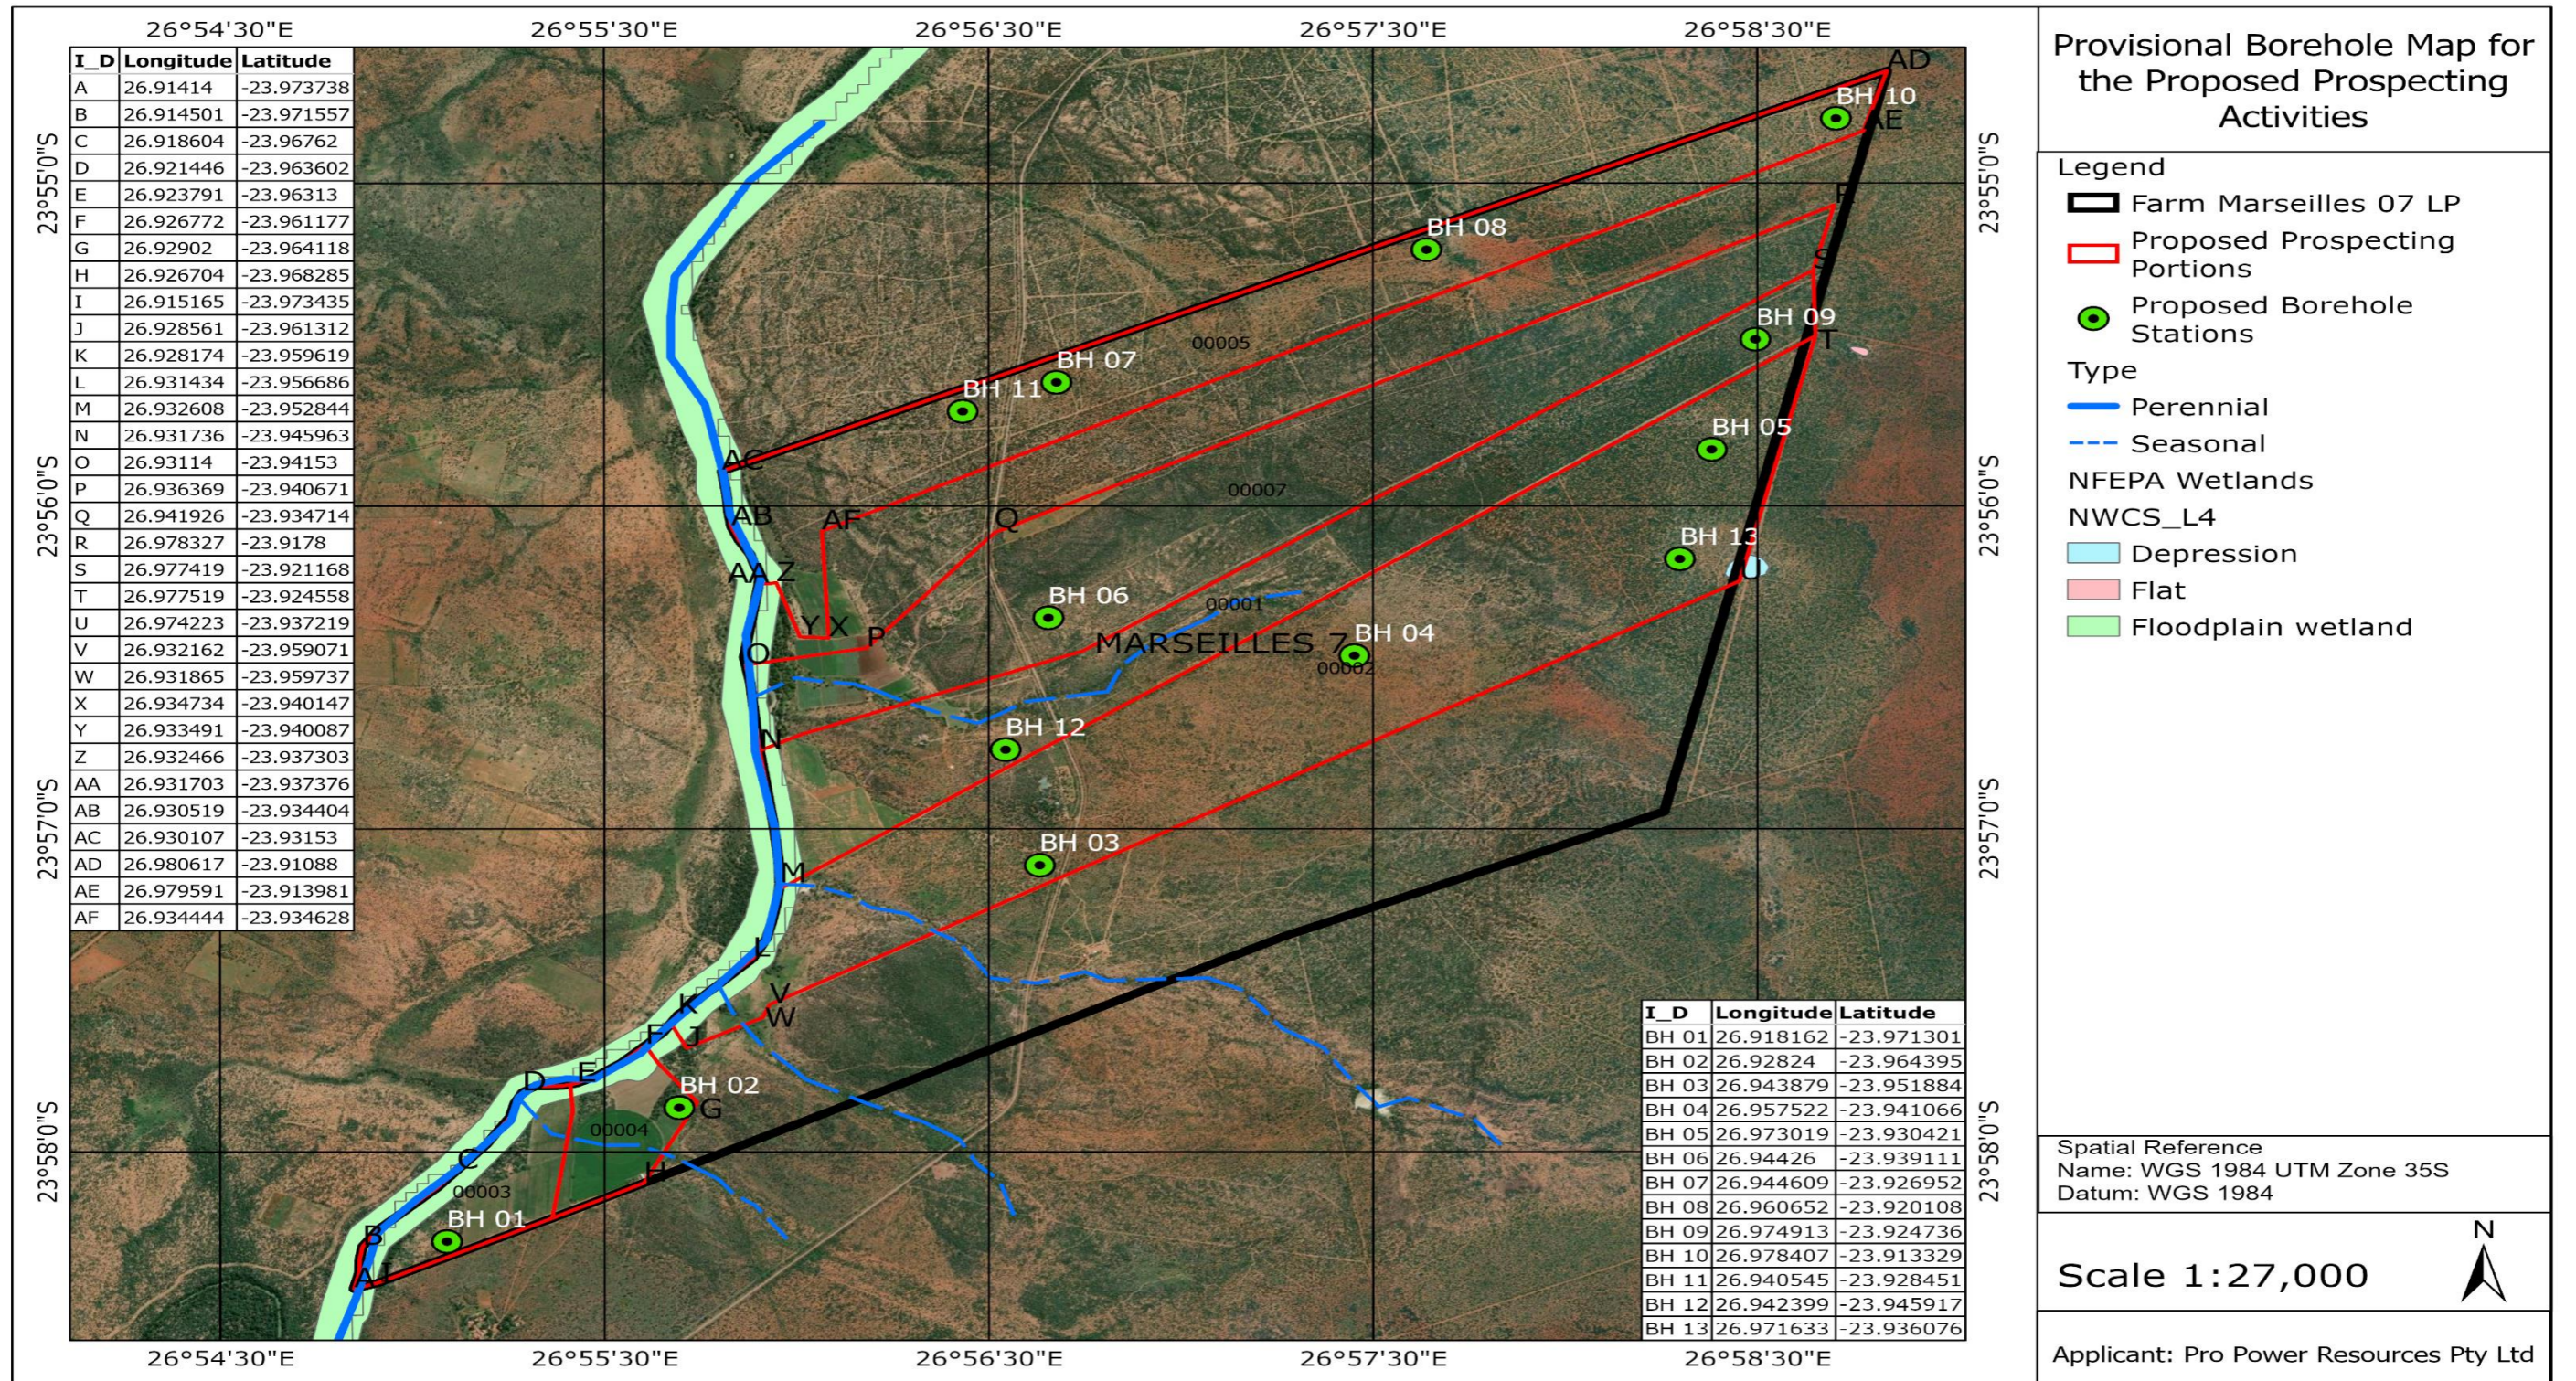

Figure 3-1: Provisional Site Layout Plan

3.2.1.1 Phase 1: Literature review and Field Mapping

(a) Literature Review

Phase 1 will include the collection and interpretation of all available data and the compilation of a Geographic Information Systems (GIS) database. The information to be collected will include aerial photos, Orthophoto, aeromagnetic data, Topo-cadastral maps, and geological maps, results of historic exploration programmes and any other published literature and maps. The desktop study will aid in compiling a preliminary geological model of the area to be utilized in the planning geological mapping and sighting of drill holes. It also includes accruing results from the companies that has already worked on the area. This provides information such as geological setting, biodiversity as well as water management.

(b) Mapping

Generally mapping involves the geologist walking the area and making observations which are then recorded on a map. To enhance the quality and reliability of geological maps data obtained during geophysical surveys will be used. Mapping is completed that meaningful structural and geological data may be derived from it and to confirm that the desktop study is accurate.

3.2.1.2 Phase 2: Geophysical Survey

The applicant will undertake aeromagnetic surveys to map the subsurface lithology without undertaking invasive prospecting activities. The aeromagnetic survey is critical for locating ore deposits. Once the position of the deposit is known the drilling sites can then be sited. A provisional drill sites have been positioned based on available literature. The provisional plan will be updated based on the outcome of the geophysical surveys.

3.2.1.3 Phase 3: Discovery Drilling and Sampling

The results of the Phase 1 and 2 will be used to assist in the ideal location diamond drill holes at maximum depth of 250 m. Cores will be sampled and prepared for laboratory analysis. This phase is aimed at establishing if there are diamond deposits within the proposed site.

3.2.1.4 Phase 4: Sample analysis/ Assaying

The assaying will be conducted to determine the mineral content for each core at a South African National Accreditation System (SANAS) accredited laboratory. Sample

analysis will inform if there are diamond deposits within the proposed site. Should there be diamond deposits on site, preliminary economic assessment will be conducted.

3.2.1.5 Phase 5: Preliminary economic assessment

A preliminary economic assessment is a study conducted to determine whether a project has the potential to be viable. At this stage, the mineralization, regardless of its quantity and quality, is always considered to be a mineral resource. This study is generally based on industry standards rather than derived from detailed site-specific data.

3.2.1.6 Phase 6: Resource drilling and sampling

Subsequent to Phase 3 drilling, the results will be used to design a systematic drill holes to define the site resource. This drilling programme will be more focussed on parts on which the diamond deposits were intersected. At this point the position of the systematic drill holes is provisional and subjected to change based on outcomes of various phases. A maximum of 15 boreholes will be drilled.

3.2.1.7 Phase 7: Pre-feasibility study

The pre-feasibility and feasibility studies are more detailed. By the time a decision is made to proceed with a pre-feasibility study, a preliminary mineral resource report has been finalized and an orebody model demonstrating its shape, tonnes, and grade is available. A resource cannot be converted to a reserve unless it backed up by at least a pre-feasibility study. Their results will show with more certainty whether the project is viable. At this point, the mineral resource, or a portion thereof, becomes a mineral reserve. The activities associated with the Prospecting Work Programme will be scheduled over a period of five years

3.3 Activities associated with the proposed prospecting

3.3.1 Site Access

The undertaking of prospecting activities will require access into privately owned properties. Access into these properties must be through access agreements contracts signed between each property owner and Pro Power (Pty) Ltd. The access agreements will be a legal document effective from the date of signing until the exit contract is signed off. The access agreement contracts will detail specific conditions relevant to each property owner.

3.3.2 Access roads

There are internal farm access roads from the main local routes to the proposed drill stations, however to access some of the drill stations new roads will be created. The creation of access roads are not mapped at this time as drilling positions are provisional. The impact assessment and management details how the roads must be created and managed. Key aspects for creation of access roads are the following:

- ✓ Where access roads are created through ploughing fields, the loss of crops and/or arable land will be compensated for the duration of disturbance, calculated at the most recent selling price for each specific crop;
- ✓ Streams and wetlands crossing will be prohibited;
- ✓ Sensitive areas will be marked a “no-go” area, e.g. wetlands, etc.

3.3.3 Drill station establishment

The establishment of the drill stations will chiefly be dictated to by the underlying geology, however sensitive features must be protected at all times. The provided drill stations layout map is provisional and subjected to change based on outcomes of other preceding phases.

3.3.4 Core Drilling

The primary objective is to obtain drill cores for assaying. The affected parties must be consulted and informed of the drilling programme which details the duration of the proposed activities and their input be incorporated into the programme.

3.4 Project scheduling

The department of Mineral Resources and Energy allows for a maximum of five (5) years to conduct prospecting activities. The five years' period will include project planning and sourcing of the required materials and equipment. At least 5 working days will be required at each drill station and a maximum of 13 boreholes are proposed and as such an uninterrupted drilling programme can be completed in five months.

It is recommended to undertake the proposed prospecting activities during the dry periods after harvest to reduce impact on crops and water resource.

3.5 Equipment and/or Technology to be used

- ✓ 1 drill rig mounted on a 10-tonne truck or trailer;
- ✓ 1 X 2 200 Litres water tanker; and
- ✓ 2X (4X2) Bakkie.

4 POLICY AND LEGISLATIVE CONTEXT

Table 4-1: Policy and Legislative Context

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
Constitution of South Africa, specifically section 24(a), (b)(i) - (iii).	Impact assessment and management; and Public Participation Process.	The prospecting activities will only proceed after effective consultation to protect the Rights of interested and affected parties.
Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002) section 16(1)(a)-(c).	This EIA is undertaken as a requirement for the granting of the Right.	The application for prospecting right was lodged and all required documents submitted.
National Environmental Management Act (107; 1998) section 23(1) & (2), 24(1); & 24(4)(b)(i) - (vii).	Impact Assessment, Financial Provision, Mitigation Measures and Public Participation.	<ul style="list-style-type: none"> ✓ The receiving environment was thoroughly assessed; ✓ Probable impacts were identified and their mitigation measures and monitoring mechanisms developed; ✓ Financial Provision for rehabilitation was determined and the applicant will pay the amount before the right is issued; ✓ Affected and Interested Parties will be engaged and given opportunities to get involved in the proposed project.
NEMA Environmental Impact Assessment (EIA) Regulations, 2014 as amended; GNR 326 and GNR 327.	Entire document	<ul style="list-style-type: none"> ✓ All triggered listed activities have been identified and applied for; ✓ The Basic Assessment Report and the Environmental Management Programme were compiled in terms of Appendix 1 and 4 of GNR 326. ✓ The public participation was done as per the said Regulations.

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
National Environmental Management: Waste Act	Used as guidance for mitigation measures as no listed activities were triggered.	The project activities do not trigger a waste management license but proper waste management measures will be addressed in the EMPr.
Limpopo Environmental Management Act 2003, Act 7 Of 2003	The Act was consulted when drafting management strategies to minimise potential impacts and to identify protected species in terms of this Act.	The proposed prospecting activities are of short duration and will impact relatively small area. The impacted areas will be fully rehabilitated. The EIA recommends species identification before removal.
Section 38 of the National Heritage Resources Act (Act No. 25 of 1999).	Part A Section 8.7	There are no identified heritage significance site and artefacts on site. However, this does not absolve the client from exercising caution when conducting invasive activities.
The National Environmental Management Biodiversity Act (NEM:BA), 2004 (Act No. 10 of 2004), provides for:	Impact Assessment and Baseline Description	<p>There are no protected species on site that would require permits to remove and/ or manage;</p> <p>Alien invasive species will be controlled and monitored;</p> <p>Impacts on the biodiversity have been identified and mitigation has been provided.</p>
National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004);	Impact assessment & Management	As part of the EMPr dust suppression methods will be used.
The National Water Act (NWA) (Act No. 36 of 1998)	Impact Assessment	<ul style="list-style-type: none"> ✓ No water use license is required for this application; ✓ Impacts on water resource will be prevented; and

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
		✓ Any water required for drilling activities will be obtained from a legal source within the area and brought to site by a tanker.
National Water Act, 1998 (Act No. 36 Of 1998). Regulation 704 (GN 704) Regulations on use of water for mining and related activities	Impact Assessment & Management	All water sources have been identified and water usage for prospecting activities will be controlled in line with the NWA and its regulations.
Mine Health and Safety Act, 1996 (Act No. 29 of 1996);	Impact assessment and management	Activity based risk assessment will be conducted prior undertaking the site prospecting activities.
Guideline document for the evaluation of the quantum of closure-related financial provision provided by a mine; 2005.	Financial Provision &	The rehabilitation costs were calculated based on this guideline.
National Freshwater Ecosystems Priority Areas (NFEPA, Nel et al., 2011);	Impact Assessment & Description of receiving environment	The Limpopo River which borders the site is a FEPA watercourse. The proposed activities will be undertaken at least 100 metres away from the river. Wetlands will be demarcated as no-go areas.
Mining and Biodiversity Guidelines 2013	Impact Assessment & Description of receiving environment	The proposed site lies within an unmapped area in term of the MBG of 2013.
National Development Plan 2030	Baseline environment description	The plan is aimed at reducing poverty and inequality. Should prospecting be successful a mine will be developed that will contribute to the local socio-economy.

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
		The mining sector is one of the greatest contributor to the South African GDP and labour force.
White Paper on Environmental Management Policy, 1997	Impact management, sustainable development, consultation.	Impact management is provided for all identified impacts
Limpopo Conservation Plan v.2.	Baseline environment description and impact assessment	The proposed site is largely located on CBA 1 & 2. On completion of the prospecting activities the impacted site will be restored to its original state.
National Climate Change Response White Paper; 2011: Climate change will compound the pressures on already stressed ecosystems that have resulted from the unsustainable use and inadequate management of many of South Africa's ecosystems and so potentially reduce the quantity and quality of the services that ecosystems currently provide.	Baseline environment description and impact assessment	The water resources will be protected to ensure supply to local users is not interrupted due to the proposed prospecting which is already under stress due to various factors including Climate Change and over extraction
	Biodiversity and ecosystems	The proposed site is largely located on "other" areas. Sections of ESA and CBA are located just outside the site to the north. The site ecology will be rehabilitated on completion of the proposed prospecting activities.
White Paper On Integrated Pollution waste Management for South Africa; 2000	Impact Assessment and Management	The prospecting activities will minimise generation of wastes on site and waste disposal will be at a registered facility.
White Paper on Environmental Management Policy for South Africa; 1998	Impact Assessment and Management	Sustainable resource usage will be promoted throughout the prospecting duration. Ecologically sensitive areas have been identified and mapped and considered a "no-

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
		go" areas. This is to ensure Biodiversity is conserved.
		No activity will take place within 100 metres buffer of water sources (rivers and wetlands) to ensure water is available to other users at an acceptable quality.
White Paper on the Conservation and Sustainable Use of South Africa' s Biological Diversity, 1997	Impact Assessment and Management	Ecologically sensitive areas have been identified and mapped and considered a "no-go" areas. This is to ensure Biodiversity is conserved.
World Heritage Convention Act, 1999	Description of Heritage Resources on site	There are no identified heritage significance sites within the proposed site.
National Forests Act 84 of 1998	Baseline environment description and impact assessment	There are no protected plant species identified within the site.
National Environmental Health Policy, 2013 Ensure the right to an "environment that is not harmful to the health and wellbeing of South Africans".	Impact assessment and Management	The prospecting activities will be undertaken taking into cognisance the health and safety of the general public which also include its crew, farm workers and farmers.
Thabazimbi Local Municipality Integrated Development Plan 2021 - 2022		The plan note the contribution made by the mining sector to the Municipality GDP. The proposed prospecting activities are a decision making tool for mining industries and have little significance in terms of socioeconomic returns.

Applicable legislation and guidelines used to compile the report	Reference where applied	How does this development comply with and respond to the legislation and policy context.
Guideline on Need and Desirability, Department of Environmental Affairs; 2017	The Need and Desirability for the proposed project	The Need and Desirability for the proposed project was investigated, assessed and reported in terms of the guideline.
Stakeholder Engagement, Integrated Environmental Management, Information Series 3; 2002	Public Participation Report (Appendix 05)	The public Participation Process was undertaken in terms of this guideline and the 2017 EIA Regulations.
Scoping, Integrated Environmental Management, Information Series 2, Department of Environmental Affairs and Tourism (DEAT), Pretoria; 2002		The project environmental scoping was undertaken in terms of the guidelines. The scoping process was undertaken to ensure that all key aspects of the proposed activities were understood and investigated.
Guideline 5: Assessment of Alternatives and Impacts in support of the Environmental Impact Assessment Regulations, 2006	Alternative assessment	The impact assessment was undertaken as informed by the guidelines and other relevant materials

5 Need and desirability of the proposed prospecting activities

The need and desirability of the proposed prospecting activities were investigated and assessed based on the DEA (2017), Guideline on Need and Desirability. According to this guideline the concept of “need and desirability” can be explained in terms of the general meaning of its two components in which need primarily refers to time and desirability to place (i.e. is this the right time and is it the right place for locating the type of land-use/activity being proposed?), “need and desirability” are interrelated and the two components collectively can be considered in an integrated and holistic manner. The “need” relates to the interests and needs of the broader public.

Addressing the need and desirability of a development is a way of ensuring sustainable development – in other words, that a development is ecologically sustainable and socially and economically justifiable – and ensuring the simultaneous achievement of the triple bottom-line. The 2017 Need and Desirability Guideline sets out a list of questions which should be addressed when considering need and desirability of a proposed development. These are divided into questions that relate to ecological sustainability and justifiable economic and social development.

The questions that relate to ecological sustainability include how the development may impact ecosystems and biological diversity; pollution; and renewable and non-renewable resources. When considering how the development may affect or promote justifiable economic and social development, the relevant spatial plans must be considered, including Municipal Integrated Development Plans (IDP), Spatial Development Frameworks (SDF) and Environmental Management Frameworks (EMF). The assessment reports will need to provide information as to how the development will address the socio-economic impacts of the development, and whether any socio-economic impact resulting from the development impact on people’s environmental rights. Considering the need and desirability of a development entails the balancing of these factors.

In the National Spatial Development Perspective (NSDP) (2003 and updated in 2006) it is highlighted that, to achieve the goal of stimulating sustainable economic activities and to create long-term employment opportunities, it is required that spending on economic infrastructure is focused in priority areas (“spatial targeting”) with potential for economic development, with development to serve the broader societies’ needs equitably.

The New Growth Path (NGP) (2010) in turn highlights the need to focus on facilitating growth in sectors (“sectorial targeting”) able to create employment on a large scale, while not neglecting more advanced industries that are crucial for sustained long-run growth, and encouraging stronger investment by the private and public sectors to grow employment-creating activities rapidly while maintaining and incrementally improving South Africa’s core strengths in sectors such as capital equipment for construction and mining, metallurgy, heavy chemicals, pharmaceuticals, software, green technologies and biotechnology.

The National Development Plan 2030 (NDP) (2012) stresses that the threat to the “environment and the challenge of poverty alleviation are closely intertwined” and as such environmental policies should not be framed as a choice between the environment and economic growth. The NDP states that: South Africa faces urgent developmental challenges in terms of poverty, unemployment and inequality, and will need to find ways to “decouple” the economy from the environment, to break the links between economic activity, environmental degradation and carbon-intensive energy consumption.

The aspects of need and desirability of the proposed prospecting project are discussed below in subsection (5.1) and (5.2)

5.1 Securing ecological sustainable development and use of natural resources

5.1.1 How will this development (and its separate elements/aspects) impact on the ecological integrity of the area?

The site assessment conducted to date has established that there are no protected or threatened ecosystems within the proposed site. According to the Limpopo Conservation Plan, the proposed site is located on *Critical Biodiversity Area 1 & 2*. According to the South African National Vegetation Map (Mucina & Rutherford 2006), the proposed site is located within the *least threatened SVcb 19 Limpopo Sweet Bushveld* of the Central Bushveld Bioregion. The Limpopo River bordering South Africa and Botswana is the western border of the proposed site. The River according to the NFEPA assessment of 2011 has a river condition of **Class C: Moderately Modified**.

Prospecting activities are of short duration and conducted over a small area and impacts are highly manageable and reversible. The principle of Prevent, Avoid, Manage and Reverse will be applied to the proposed project. The disturbances will be limited to active areas and sensitive areas will all be marked as a “No-Go”. The identified ecological sensitive areas are the wetlands. Although the drilling positions as indicated in this report are provisional, should they be relocated they will not be established within 100

metres buffers of wetlands areas. The Access roads in cases where they should be created will also be outside sensitive features buffers. Pre-site-clearing for establishment of drill pads tree species will be identified and recorded to avoid removal of species of conservation concern, the EIA did not identify any species of concern, however their presence is not ruled out.

5.1.2 How will this development disturb or enhance ecosystems and/or result in the loss or protection of biological diversity?

The proposed prospecting project will have negative impact on the ecosystem as the natural environment will be disturbed to make way for the establishment of drill stations and access roads. Prospecting activities are chiefly dictated to by the location of mineralised zones and can only be undertaken where a potential for mineral deposits exists. Although the ecosystems will be disturbed, the impact can be greatly reversed as the disturbed area will be limited to creation of access roads and establishment of drill stations (20m X 20m). Full impact assessment is provided in Part A, Section 9 & 11 and Part B, Section 4 of this report.

5.1.3 How will this development pollute and/or degrade the biophysical environment?

There is a potential to pollute underground water resource during drilling, soil contamination, wetlands destruction and loss of flora and fauna. The prospecting activities will be undertaken on a relatively small area affecting minimal biophysical environment. Impact management strategies have been provided in this report to prevent, mitigate and manage probable impacts from the proposed prospecting activities.

5.1.4 What waste will be generated by this development?

The prospecting activities are expected to generate general wastes, and small quantities of hazardous and sewage waste. All the waste to be generated will be disposed of at registered waste facilities and disposal certificates will be kept on site. Hazardous waste will result from spills and leakages of hydrocarbons from operating equipment and vehicles.

5.1.5 How will this development disturb or enhance landscapes and/or sites that constitute the nation's cultural heritage?

According to the consultation, site assessment and GIS reviews conducted there are no Heritage significance sites and objects within the proposed site. However, this does not

absolve the contractor from excusing due diligence before undertaking any of the site invasive activities.

5.1.6 How will this development use and/or impact on non-renewable natural resources?

The project is aimed at prospecting for non-renewable mineral resources. The operating machineries and equipment will also make use of non-renewable in the form of hydrocarbons. The project is not expected to excessively use non-renewable in such a way that it can affect other users. The proposed prospecting activities will not promote dependency on non-renewable energy.

5.1.7 How will the ecological impacts resulting from this development impact on people's environmental right?

The ecological impacts will not largely impact on people's right, there are no natural resource harvesting in the area. The impacts on water resources are highly avoidable and will therefore have little significance.

5.2 Promoting justifiable economic and social development

Prospecting is the research, planning and development phase of a mining project. The evaluation of a project aims to determine whether mineralization occurs and if so, does it occur in economically extractable quantities. Initially these are measured in tonnage and grade. While geological studies are integral to prospecting, prospecting also includes, amongst others, infrastructural, environmental, socio-economic, financial evaluation and metallurgical studies thereby encouraging the national research and educational sectors.

The main activities in the area are agriculture, both the cultivation and livestock farming and farm houses. The proposed prospecting is not expected to bring halt to current site activities as they can be undertaken concurrently.

A successful prospecting project will result in an establishment of mine depending on the feasibility study conducted. Mining operations on their own are a sustainable development that contribute largely to the South African GDP and creates a large number of employment opportunities. It would be premature to compare the already sustainable agricultural activities and a possible mine. Should the prospecting activities established a mineable deposit on site, relevant studies which will include socioeconomic study will be commissioned.

5.2.1 What is the socio-economic context of the area

The proposed site is located outside about 80 km from Lephalale and on the border of South Africa and Botswana. There are sparse farm houses within the proposed site. The IDPs of both the local and the District Municipalities acknowledges the presence of mineral deposits in the area.

The site is mainly used for agricultural purposes for both the crop and livestock farming. There are game farms within the proposed area.

There are existing and closed mining operations within the region. The local economy input is mainly agriculture and tourism. There are no high density communities located within the proposed properties and their surroundings.

5.2.2 What will the socio-economic impacts be of the development (and its separate elements/aspects), and specifically also on the socio-economic objectives of the area?

Prospecting activities are of short duration and are not considered an economic activity. The socio-economic input is very limited, the number of employment opportunities to be created for locals is usually less than five and very little support is required from local businesses. It should however be noted that prospecting is a predecessor of mining which on its own have significant social and economic impacts.

5.2.3 How will this development address the specific physical, psychological, developmental, cultural and social needs and interests of the relevant communities?

The proposed activities will not have significant impacts on the local natural and built/human environment. The current site activities can be undertaken concurrently with prospecting activities. There will be a small loss of agricultural land when establishing access roads and drill stations. The impacts from the two invasive activities can be reversed through rehabilitation, and the loss of crops can be avoided by scheduling prospecting activities after harvesting period.

5.2.4 Will the development result in equitable (intra- and inter-generational) impact distribution, in the short- and long-term? Will the impact be socially and economically sustainable in the short- and long-term?

The proposed prospecting activities are of short term and it is unknown at this stage if mineable diamond deposit are present on site. Prospecting activity on its own will not have any benefit for the local communities, benefits will only be realised if the

prospecting activities are successful and a mine is established. In such a case, a social and economic impact study will be commissioned and a social labour plan will be drafted which will benefit the local communities.

5.2.5 In terms of location, describe how the placement of the proposed development will result in the creation of residential and employment opportunities in close proximity to or integrated with each other and reduce the need for transport of people and goods

Prospecting activities are not labour intensive and will also not attract any other secondary activities. The prospecting activities are aimed only at determining if there are feasibly mineable ore body on site.

5.2.6 How were a risk-averse and cautious approach applied in terms of socio-economic impacts?

5.2.6.1 What are the limits of current knowledge?

It has not been physically proven if there are diamond deposit on site as no drilling has been conducted previously. The resource modelling software were used to correlate the ore body from the nearby explored properties. It is therefore possible that diamond deposit may be absent on site, and/or be of poor quality.

5.2.6.2 What is the level of risk associated with the limits of current knowledge?

Since the prospecting activities are not an economic activity, targeted on less sensitive areas and affect relatively smaller areas, the risk associated with undertaking the prospecting activities have low – medium significance and highly reversible. The prospecting activities raise expectations of the vulnerable and poor communities and should the prospecting activities be unsuccessful the local communities will be distraught as the prospect of a mine establishment will be lost.

5.2.6.3 Based on the limits of knowledge and the level of risk, how and to what extent was a risk-averse and cautious approach applied to the development?

The probable impacts were identified, assessed and mitigation measures provided.

5.2.7 How will the socio-economic impacts resulting from this development impact on people's environmental right in terms following:

Health – The proposed project will generate dust during driving on gravel access roads and during drilling. Dust particles will be scattered within the immediate area and although to a less significant scale affect the air quality and to people with respiratory

diseases. The dust generation must be monitored during operation and controlled through watering and use of biodegradable dust control chemical agents;

Noise – The proposed site is a quiet agricultural area; the drilling machinery will generate noise nuisance. The farm dwellers must be informed of the drilling schedule as the noisy cannot be completely be prevented. The drilling must only be undertaken during the day i.e. 07h00 to 17h00;

Loss of arable land: the drill stations and their access roads will be created on agricultural field resulting in temporary loss of agricultural land. The prospecting activities must be scheduled after harvesting period, and the disturbed areas must be fully rehabilitated on completion of prospecting activities at each drill station;

Water contamination: The prospecting activities have the potential to contaminate both the underground and the surface water, through spillage of hydrocarbons, interception of aquifers and driving through streams and/or wetlands. The surface water must be clearly delineated on the project layout plan and marked as “no-go” areas and buffers created around each surface water area. Should the groundwater be intercepted the during drilling, a borehole report will be drafted for submission to the Department of Water and Sanitation which will include the depth at which the water was intercepted and the water quality as tested in a controlled laboratory;

Safety: Site access by the prospecting crew may attract opportunist criminals into the private properties. The prospecting crew must at all times carry with them identification cards.

5.2.8 What are the positive impacts & what measures were taken to enhance positive impacts?

The prospecting process is not an economic activity and does not generate any income. It is however necessary to establish whether there is a mineable deposit on site which could then result in a mine development.

The obtained geological knowledge will contribute to South African geological data pool and mapping of the South African deposits.

South Africa faces illegal mining challenge where local knowledge exists about buried economic deposits. The illegal activities does not only result in loss of revenue but the reckless mining methods have higher significant environmental impact and have no commitments to improving the societal living standards. Should prospecting be

successful, a legally operating mine will be developed operating within all mining related regulations including the requirements of a social labour plan.

5.2.9 Considering the linkages and dependencies between human wellbeing, livelihoods and ecosystem services, describe the linkages and dependencies applicable to the area in question and how the development's socio-economic impacts will result in ecological impacts (e.g. over utilisation of natural resources, etc.)?

- ✓ The proposed prospecting will not create competition for natural resources with the locals;
- ✓ The proposed activities will not result in net loss of naturally resources such that other land users and members of the public are affected.

5.2.10 What measures were taken to pursue the selection of the "best practicable environmental option" in terms of socio-economic considerations?

The current activities undertaken on site are agricultural activities with medium impact on ecological diversity as larger areas must be cleared to make way for cultivation and increased suspended loads in the riverine system due to nutrients from the fields and also over grazing by game animals and livestock. The proposed prospecting activities will also have medium impact on the environment when compared to the current agricultural activities. The proposed activities will not create social challenges or use-up available natural resources.

The proposed site is also largely used for game farming practice which promotes ecological conservation. Invasive Prospecting activities will be undertaken over a smaller extent area disturbing as little area as possible. The functioning of local ecology will be least impacted by the proposed prospecting activities.

The assessment conducted will be provided to the registered interested and affected parties including land owners.

5.2.11 What measures were taken to pursue environmental justice so that adverse environmental impacts shall not be distributed in such a manner as to unfairly discriminate against any person, particularly vulnerable and disadvantaged persons (who are the beneficiaries and is the development located appropriately)

The prospecting site is chiefly dictated to by the geological setting of the area, the impacts will not discriminate against anyone on site. The local farmers are the directly impacted group as they will temporarily lose their agricultural land.

The development is located appropriately as there are no high density communities nearby that may be affected by the proposed activities. The proposed activities can be undertaken without impacting the sparse residential areas within the proposed properties. However, current land uses which are agriculture and game farming will be moderately impacted. The impacts will not discriminate against anyone and will be mainly on the directly affected areas as dictated to by the local geology

5.2.12 What measures were taken ensure transparent and effective participation of all interested and affected parties

- ✓ This is discussed in Public Participation Process Section of this report and Appendix 05: Public Participation Report;
- ✓ In summary a newspaper advert was placed in Platinum Weekly Newspaper on the 29th of October 2021, and site notices were placed on the affected properties, major access roads (26 – 27 October 2021). The landowners were identified through deed search, and will also be invited through site notices, their comments will be incorporated into this report. All registered IAPs will be provided with the draft report for review and a public meeting has been requested.

5.2.13 What measures were taken to ensure that the environment will be held in public trust for the people, that the beneficial use of environmental resources will serve the public interest, and that the environment will be protected as the people's common heritage

- ✓ The IAPs will be informed of the application outcome by the DMRE,
- ✓ Should prospecting establish a mineable resource, the IAPs will be fully engaged through EIA process and Social Labour Plans through which the public interest will be protected.

5.2.14 Are the mitigation measures proposed realistic and what long-term environmental legacy and managed burden will be left?

The proposed mitigation measures are realistic and practical and will ensure that the land will be restored to its original state. The remaining will be the borehole capping made of cement. This disturbance will be less than 500 m² at each drill station.

5.2.15 Measures taken to ensure that impact management costs are paid for by those responsible for harming the environment?

The cost of managing the impacts was calculated using the Department of Mineral Resources (DMR)' Guidelines document for the evaluation of the quantum of closure-related financial provision provided by a mine. The calculated rehabilitation fee will be paid to the DMRE before the Environmental Authorization is issued.

5.2.16 How the alternatives identified resulted in the selection of the best practicable environmental option in terms of socio-economic considerations?

- ✓ The proposed site for invasive activities (drilling and access roads) will be located such that sensitive areas are avoided to ensure access to natural resources is not affected.
- ✓ The water resources were avoided to prevent contamination and disruption of water supply to other users.
- ✓ The proposed activities will not result in net loss of ecological diversity ensuring equitable access by others, rehabilitation will be undertaken to restore pre-prospecting conditions.
- ✓ The proposed prospecting activities will not prohibit the use of land in future for other unrelated activities as the site will rehabilitated.

6 Motivation for the overall preferred site, activities and technology alternative

6.1 Preferred Site

The choice for the preferred site was based on the following aspects about the site:

Site geology: the site is underlain by sedimentary rocks of Matlabas Strata of the Waterberg Subgroup. According to desktop studies there is high potential for Diamond deposit in the area and possible intrusion of kimberlite pipes as well.

Site Sensitivity: the site does not contain any protected areas, according to Limpopo Conservation Plan, however there are Critical Biodiversity Areas within the proposed site.

6.2 Preferred Activities

There are various methods of Diamond prospecting which can be either intrusive or non-intrusive in nature. For this project both the non-invasive and invasive method will be used. Invasive methods, that is trenching, drilling and core sampling provides highly reliable data which would be a true reflection of what is to expect on site. Non-invasive methods (desktop study, site walk & geological mapping) rely only outcrops to model site geology whereas in drilling the cores of the substrata are obtained and analysed. The analysis provide data on the grade of ore deposits and its economic viability. Using the drilling technique, the prospecting will successfully determine how viable the mining for ore bodies is and how long, at what rate the can be mined.

6.3 Full description of the process followed to reach the proposed preferred alternatives within the site.

Alternatives were chosen based on the consideration of intended outcome, environmental and geological attributes as well as the current land uses within the proposed site. Geological attributes were determined with the use of geological maps. The local geology determines the type of technology to be used depending on the rock strength and burial depth. A comparison of cost-benefit of alternatives chosen was done to choose the most cost-effective methods that are environmentally sound. Existing infrastructure was also considered. Areas that need protection would be excluded from the targeted sites in the demarcation process. Existing infrastructure that could be of use was also considered such as farm roads to ensure minimal impact on the environment.

6.3.1 The property on which or location where it is proposed to undertake the activity;

The proposed site was preferred based on the historical geological data which from the desktop standpoint acknowledges the potential presence of diamond deposit and intrusion of Kimberlite pipes underneath the proposed properties.

NO OTHER SITES WERE ASSESSED.

6.3.2 The type of activity to be undertaken;

There were three alternatives assessed for this project, geophysical survey, diamond drilling, soil sampling through trenches and a combination of geophysical and any of the other two.

6.3.2.1 Geophysical Survey/ aeromagnetic survey

A geophysical survey is a method of collecting information about the physical properties of underground rocks and sediments without tunnelling or digging. The method uses equipment that detects anomalies between buried rock formations. The ore body would have different conductivity or electromagnetic properties from the surrounding rocks and will be detected through the anomaly. The short coming of this method is its unreliability on the grade and quantity of the ore body. A mining decision cannot be taken solely based on geophysical method. The method has been used for detection of Kimberlite pipes and siting of boreholes.

6.3.2.2 Core Drilling

Core drilling a solid core is extracted from depth, for examination on the surface. The drill uses a diamond encrusted drill bit to drill through the rock. The bit is mounted onto a core barrel which is attached to the drill stem, which is connected to a rotary drill. Water is injected into the drill pipe, so as to wash out the rock cuttings produced by the bit and also to reduce the heat produced due to friction which causes less wear and tear of the bits. The core is brought to the surface in a tube with diameter ranging between 27 – 85 mm, the thicker the core the more expensive it is.

The obtained core is a true representative of the underground lithology. From the core burial depth and grade can be determined. Multiple cores will establish the thickness of the diamond containing ore body, the dip and strike directions. A full resource estimate and mine feasibility study can be determined through core sampling and laboratory assessments. Core drilling is highly informative and can reach the depth of 300 metres.

6.3.2.3 Trenching and soil sampling

Trenches are dug using electric shovels for sampling and/or exposing ore containing deposit. This method is preferred for near surface deposits and alluvial sampling for minerals such as diamonds. Trench digging have higher significance environmental impact as compared to core drilling as the disturbance area is much extensive.

All three of the above discussed methods will be used for this project. Geophysical will be used to site drill stations, and trenching will be used for alluvial diamond prospecting, lastly Core Drilling will be used for site geological modelling.

6.3.3 The design or layout of the activity;

The design of the activity in this project refers to the locations of drilling stations and trenches. The intrusive areas are located away from sensitive features, and also determined by the distribution and extent of the ore body pipes. The drilling points will be located such that site wetlands and streams as well as the settlement areas are protected and marked as "No-Go" Areas. For the application the drilling areas will be based on geology, topography and environmental sensitivity.

6.3.4 The technology to be used in the activity;

Technology was assessed to determine that which would bring reliable and desirable results. The following factors were evaluated when considering technology:

6.3.4.1 Local geological strata

The geological settings (rock types) and depth of burial determines the type of geophysical methods that are most likely to be successful therefore the technology that goes with such methods.

6.3.4.2 Rock Strength

The drilling equipment must be able to cut through site geological strata to reach buried ore deposits, therefore for instance a diamond drilling will be preferred where rock strength is very high.

The diamond drilling is the preferred technology because of its ability to cut through hard rock materials.

6.3.5 The operational aspects of the activity

The prospecting activities are carried out in phases with each subsequent phase dependant on the success predecessor. Therefore, a strict operational scheduling must be adhered to.

6.3.6 Other operational aspects:

Water requirement: The prospecting activities (excluding human usage) will require six (6) litres of water per 40 metres drilled, thus 37 litres per proposed 250 metres. The water requirement can be met through sourcing water from the local municipality connection or from the local registered boreholes. No new boreholes will be drilled on site for water sourcing. A consent will be obtained from the municipality for water usage. The water usage onsite is not expected to trigger the NWA Listed activities which would require water use application.

Waste Management: The principle of Reduce, Re-use and Recycle must be implemented at all times. The waste must be separated at source and disposed at an appropriate waste management facility.

Access Roads: The existing access tracks on site will be used to access drilling points. No new roads will be developed without prior communication with the landowner.

6.4 The option of not implementing the activity

The option of not implementing the activity also referred to as a “No-Go” option ensures that the current status quo remains i.e. the site activities continue as they are. There will be no disturbances as a result of prospecting activities.

However, it should be noted that prospecting activities are of short term duration with a maximum of five years. The impacts created by diamond prospecting can be managed and mitigated, and current site activities can be undertaken simultaneously with the prospecting programme. The prospecting activities will disturb less than 05 ha of the total area under this application.

The aim of the proposed prospecting is to establish the presence, extent and grade of diamond deposit on site and should the activity be not implemented this information will remain unknown.

The literature review indicates that there is potential for diamond bearings deposits, this information is readily available to the public and future applications for diamond mineral in the area will always be expected. This proposed application will establish if there are

diamond deposit on site and establish if the diamond is mineable without economic loss. The geological data obtained through full prospecting process will then be submitted to the council of geoscience for safe keeping and evidence based mapping of South Africa.

7 DETAILS OF THE PUBLIC PARTICIPATION PROCESS FOLLOWED

This section of the report provides an overview of the tasks undertaken for the PPP to date. All PPP undertaken is in accordance with the requirements of the EIA Regulations (2014). It further provides an outline of the next steps in the PPP and makes recommendations for tasks to be undertaken during the environmental assessment phase of the environmental authorisation process. A full Public Participation Process (PPP) report will be attached as **Appendix 05**.

Land owners were identified through a search conducted via online search engines accessing the Title Deed office database. In addition to land owner's other relevant organisations were identified and notified of the application. This includes municipal and State departments with jurisdiction in the area and Non-Governmental Organisations (NGOs) with an interest.

The PPP tasks conducted for the proposed project to date include:

- 1) Identification of Interested and Affected Parties (affected and adjacent landowners) and other stakeholders (organs of state and other parties);
- 2) Formal notification of the application to Interested and Affected Parties (all adjacent landowners) and other stakeholders;
- 3) Consultation and correspondence with I&AP's and Stakeholders and the addressing of their comments; and
- 4) Newspaper advert and site notices.

7.1 IAP and Stakeholder identification, registration and the creation of an electronic database

Public Participation is the involvement of all parties who are either potentially interested and or affected by the proposed development. The principle objective of public participation is to inform and enrich decision-making.

Interested and Affected parties (IAPs) representing the following sectors of society has been identified:

- ✓ National, provincial and local government;
- ✓ Agriculture, including local landowners;
- ✓ Community Based Organisations;
- ✓ Non-Governmental Organisations;
- ✓ Water bodies;
- ✓ Tourism;
- ✓ Industry and mining;
- ✓ Commerce; and
- ✓ Other stakeholders.

7.2 Formal notification of the application to key Interested and Affected Parties (adjacent landowners) and other stakeholders

The interested and affected parties will be informed about the project as follows:

7.2.1 Newspaper advertisement

Newspaper Advert will be published in Platinum Weekly on the 29th October 2021.

7.2.2 Site notice placement

In order to inform surrounding communities and adjacent landowners of the proposed development, site notices will be placed on site and at visible locations close to the site (26 - 27 October 2021).

7.2.3 Written notification

IAPs and other key stakeholders were notified of the project. Background information document was sent out to the identified and registered I&AP's. Letters indicating the announcement of the Basic Assessment Process, a Background Information Document (BID) and a comment and registration form will be sent to all identified IAPs. This communication was sent electronically via email as well as via hand to public places. Copies of the documents mentioned above can be seen as Appendix. The IAPs database will be attached as Appendix 05.

7.2.4 Meetings

No meetings were held to date.

7.2.5 Review of draft reports

This report will be released to the public for review and comment from the 29th of October 2021. All registered IAPs will be notified of the report's availability for comment for 30 days. Additionally, electronic and or hard copies were made available to interested and affected parties who request for them. Hardcopies of the report will also be submitted to affected organs of state and relevant authorities.

7.2.6 Telephonic conversations

Where necessary telephonic conversations were held prior to sending out information. This also included WhatsApp and Text Messages.

7.3 Summary of issues raised by Interested and Affected Parties

Interested and Affected Parties	Date Comments Received	Issues raised	EAPs response to issues as mandated by the applicant	Section and paragraph reference in this report where the issues and or response were incorporated.

8 The Environmental attributes associated with the alternatives.

Key aspects of the baseline environment that are likely to impact on the scope of the impact assessment and management measures that are implemented as well as project decisions regarding alternatives are listed below.

8.1 Topography

The topography of the region is a gently undulating to moderately undulating landscape. The altitude ranges between 860 to 895 metres above mean sea level (mamsl). The north-south topographical orientation is has an extruding centre resulting in both south and north facing slopes. The east-west topographical orientation is sloping towards the west to the Limpopo River, at an average slope of 1.3% and an elevation loss of 76.9 metres.

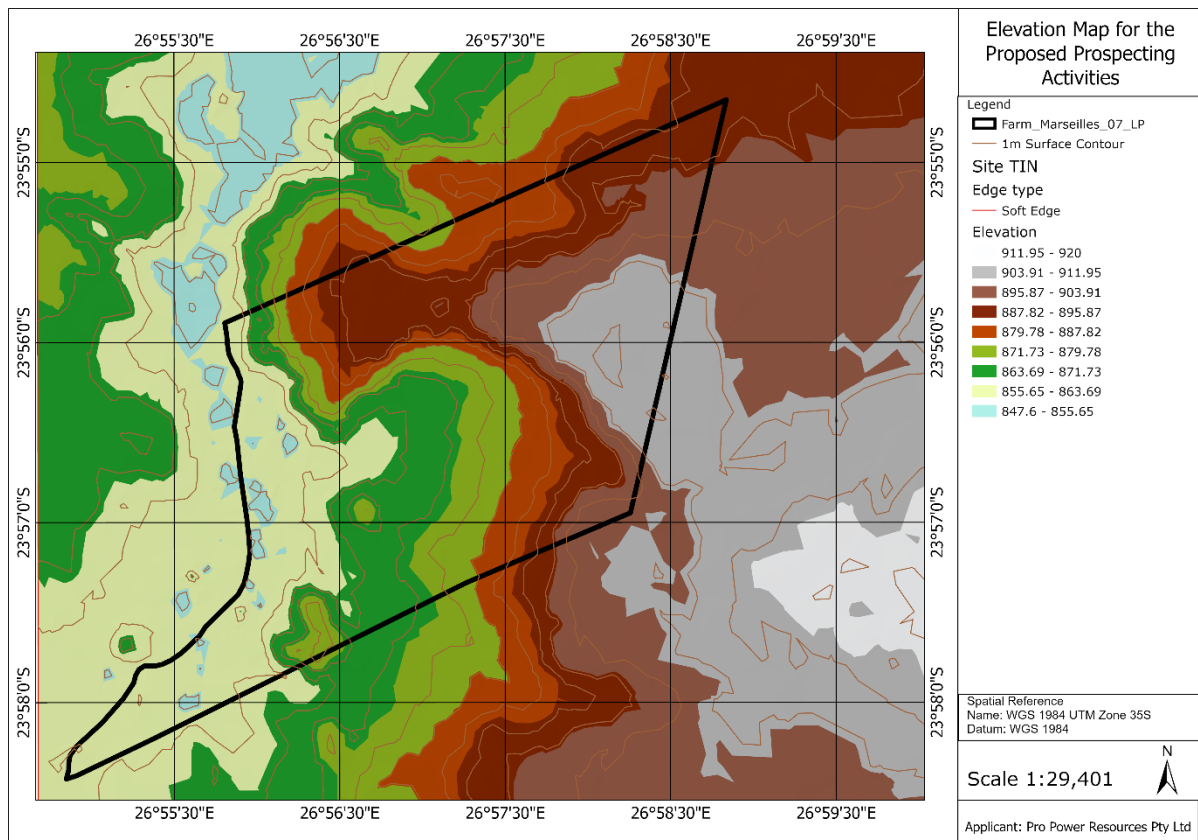

Figure 8-1: Elevation Map

8.2 Climate

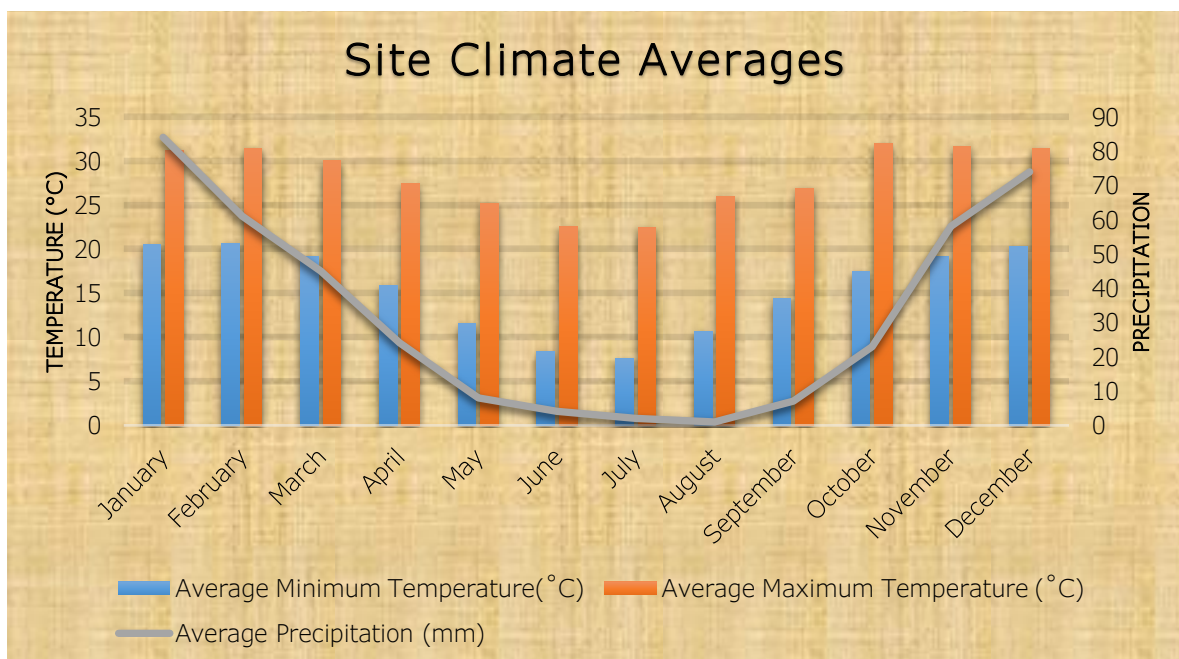

8.2.1 Evaporation

The proposed site is located in Evaporation Zone 1D, the WR90 project recorded the evaporation to range between 1800-2000 mm. The apan mean annual evaporation for the site is 2200-2600 mm. A-pan mean annual evaporation is measured as the average depth of water (in millimetres (mm)) evaporating from the pan.

8.2.2 Precipitation and Temperature

The site climate can best portrayed in terms of two seasons, which are the cool dry season and the warm rainy season rather than summer, autumn, winter and spring. The proposed site is within the rain zone A4B with mean annual precipitation (MAP) of 500 mm. The wet months (summer) period is from October to February of the following year, and the driest months are June and July which are also the coldest. The site receives the least rainfall (0 mm) in June and July and the highest precipitation (128 mm) in January.

The summer period which is from September of the previous year to early March of following year is the hottest period in the area and late March to August is the cold period. The site is coldest in July when the temperatures reaches an average low of 7.6°C and an average high of 22.4°C. The site records its highest temperature in January when temperature is at an average low of 20.5°C and an average high of 32°C.

Source: Meteoblue website

Figure 8-2: Site Climatic Background

8.2.2.1 Wind

The most prevalent wind direction at the site is from the north-east. The windy period is from August to January of the following year with wind speed reaching a high of 38 km/h.

Source: Meteoblue website

Figure 8-3: Site wind rose

8.3 Air Quality

The main objective of the Air Quality Impact Assessment is to determine the potential impact of emissions from the operational activities associated with the proposed prospecting project on ambient air quality. The proposed project area and surrounding where mainly utilised for Livestock farming and cultivation. Sources identified as possibly impacting the air quality in the region include, but are not limited to:

- ✓ **Fugitive dust:** This includes fugitive dust from paved and unpaved roads, agricultural activities (land preparation and harvesting) and wind erosion from open areas, which generates fugitive dust and PM10;
- ✓ **Stack emissions:** stack emission include the release of Sulphur dioxide (SO₂) and heavy metals from surrounding nearby mining operation;
- ✓ **Biomass burning biomass:** burning emissions include with carbon monoxide (CO), methane (CH₄) and nitrogen dioxide (NO₂) gases;
- ✓ **Household fuel combustion:** It is likely that households within the local utilize wood for cooking and space heating (during winter) purposes. Emissions from domestic burning include PM10, carbon dioxide (CO₂), Sulphur dioxide SO₂ and carbon monoxide (CO).
- ✓ **Vehicle tailpipe emissions:** Significant primary pollutants include carbon dioxide (CO₂), carbon (C), Sulphur dioxide (SO₂), oxides of nitrogen (mainly NO), particulates and lead. Secondary pollutants include NO₂, photochemical oxidants such as ozone, Sulphur acid, sulphates, nitric acid, and nitrate aerosols (particulate matter).

The proposed prospecting project that we are proposing will also contribute to the above mentioned sources. Below are some of the impact prevention, mitigation and control to address air quality concerns:

- ✓ **Household fuel combustion**-regarding this, we can advise people to wear warm clothes during winter than burning of woods to warm the space or using electric heaters.
- ✓ **Fugitive dust** – On this issue we will make sure that the dust is being suppressed all the time -Reduced unnecessary trips; and
 - Vehicles low speed will be implemented

- ✓ **Vehicle tailpipe emissions**-all vehicles should be serviced and always be in a good condition to avoid producing unnecessary smoke.
- ✓ **Biomass burning**-the drilling team will be advised not to start any fire on site to avoid burning of the bush but then if this happens the EAP will be informed and call fire fighters to end the fire.

8.4 Geology

The proposed site is located within the Waterberg Supergroup deposited about 2050 million years ago during the Kheisian Period, Mokolian era of the Proterozoic Eon. The Waterberg Basin is located in the Limpopo Province with exposures extending into the eastern Botswana. The Waterberg Group rest unconformably on the rocks of the Transvaal Supergroup, granites and mafic rocks of the Bushveld Complex, and Archaean gneisses and granites of the Kaapvaal Craton (Johnson, et al; 2006).

The Waterberg Group is currently divided into three subgroups which are the Nylstroom, Matlabas and the Kransberg Subgroups. The rocks of the Waterberg Group are typically dark greyish red. The red colour appears to be due to haematite coatings which formed early in the diagenetic history of the rocks, implying an oxidising environment.

8.4.1 Regional Geology

The proposed site located within in the Aasvoelkop and Makgabeng Formations of the Matlabas Subgroup a subdivision of the Waterberg Group. The Formations are described below as adopted from the Geology of South Africa by Johnson Et al, 2006.

8.4.1.1 The Aasvoelkop Formation

The Formation coarsens upwards from arenaceous lutites at the base to sublithic and lithic arenites and rudaceous arenites higher up in the sequence. The beds are up to 1.5 metres thick. The lutites usually contain a small percentage of fine areninte. Symmetrical ripple marks occur locally, as do mudcracks and raindrop imprints. Lutites near the base of the formation vary from massive to laminated with “vesicles” and lutite intraclasts present in places. The arenites are typically fine grained, immature and horizontally laminated in places. Trough cross-bedding indicates a palaeocurrent direction towards the west-southwest.

8.4.1.2 The Makgabeng Formation

The formation consist of fine to medium gained arenites which display very large-scale, planar, wedge shaped and subordinate through cross-bedding. The arenites contain

subrounded to well-rounded grains, are moderately to well sorted, have little or no matrix and have either small voids or intergranular silica cement. Cross-bed sets are usually 8 metres or more thick. Cosets are occasionally overlain by a massive arenite (Meinster & Tickell, 1975). The Arenites with large-scale cross-bedding are of inferred aeolian origin.

The multimodal palaeocurrent are of inferred pattern which has been recognised is possibly indicative of longitudinal dunes, complicated by the influence of seasonal wind patterns and subordinate barchanoid dunes. The ripple marks, interference ripple marks, adhesion warts and desiccation cracks indicate interdune and localised playa lake deposits (Erikson, et al., 2000).

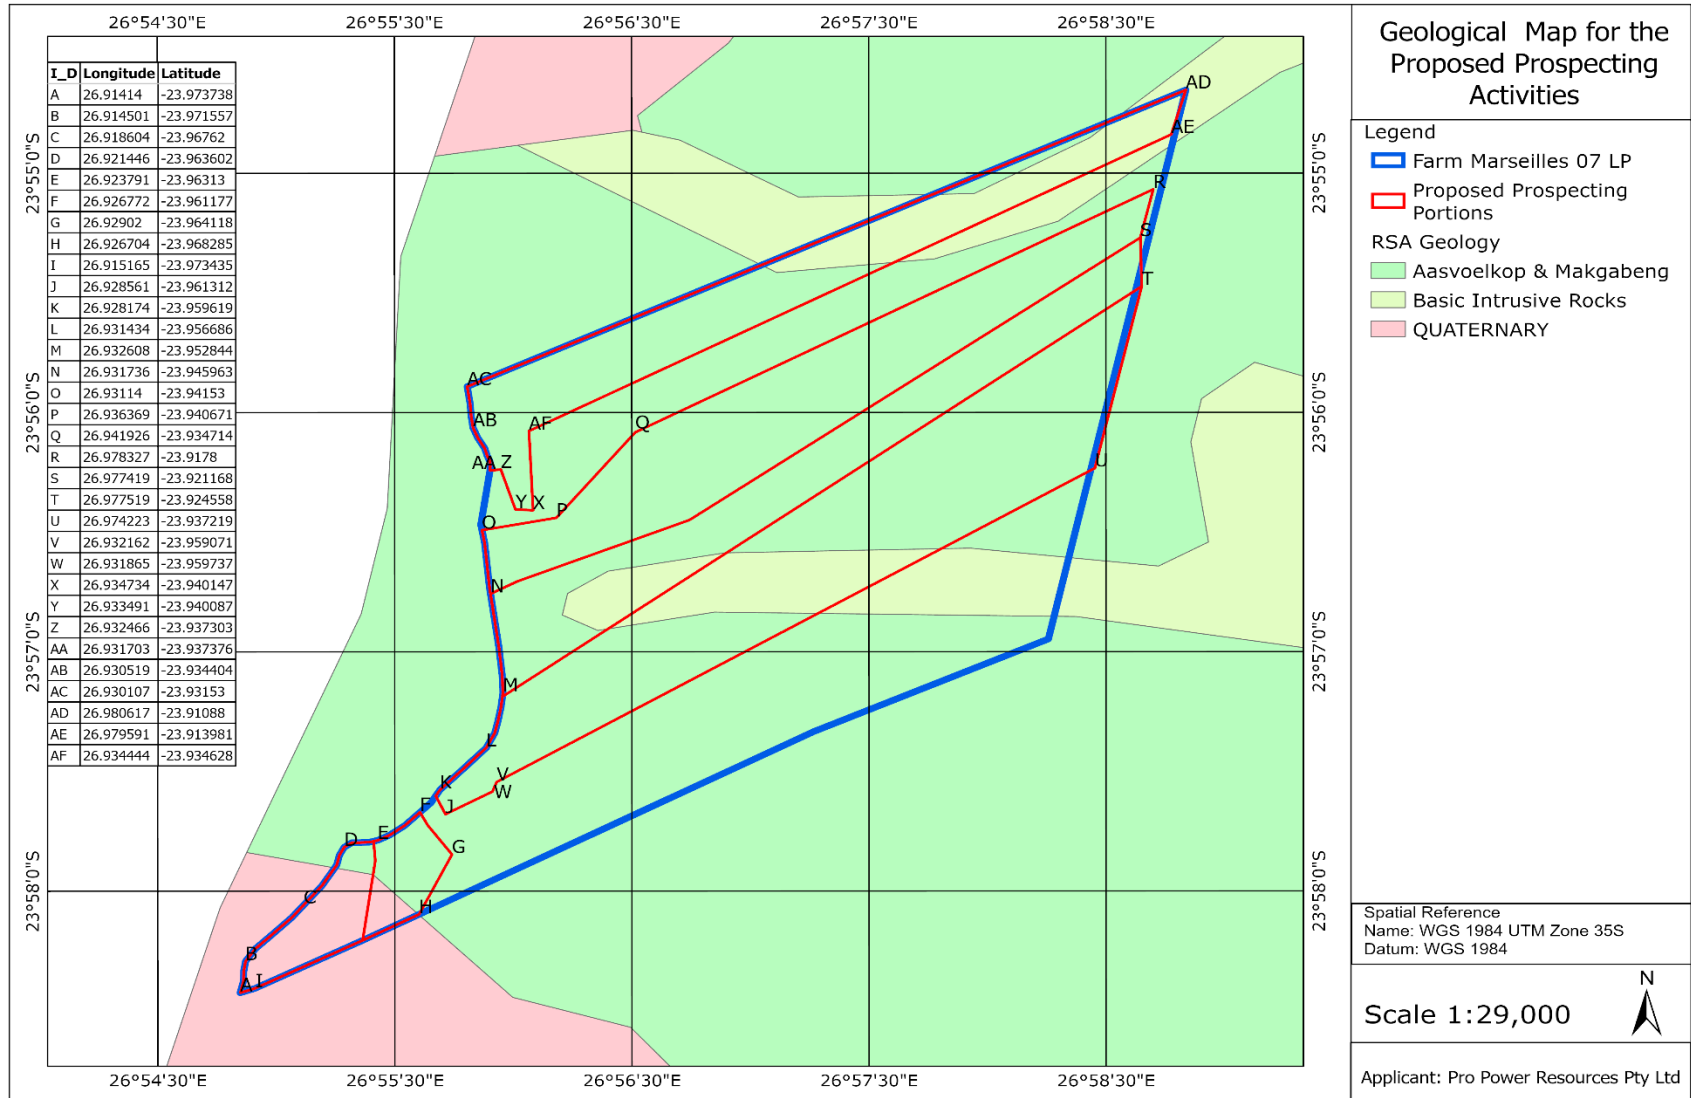

Figure 8-4: Site Geology

8.5 Ground and Surface Water

8.5.1 Groundwater

Groundwater resources in the area can be divided into two distinct aquifers, namely a shallow perched aquifer in the weathered zone followed by a deeper fractured hard rock aquifer. The fractured rock aquifer occurs as transmissive fractures in consolidated bedrock of either the Karoo sediments or the basement granite that underlies the Karoo sediments. A third, deeper aquifer in the underlying basement granite can also occur. Little information is however available for this aquifer, though it will also be a secondary fractured rock type.

It is further estimated that the long term recharge of the aquifers in the Region is estimated at between 3 and 5 % of the mean annual precipitation. Surface water features like dams (tailings, slurry, process water, storm water, return water etc.) will also usually increase the recharge to the aquifer but compacted or concrete surfaces and roads will decrease the recharge.

The proposed site is located within region 6: Waterberg Plateau of the Vegter's Groundwater Region. The site is underlain by the compact, dominantly arenaceous strata of Ecca Gp, with borehole yield ranging between 0.5 - 2.0 l/s. The local transmissivity as determined by Vegter ranges between 70 - 300 mS/m.

According to the aquifer classification map (2013), the proposed site is within the **minor** aquifer region. The site aquifers are **least** vulnerable according to the Aquifer Vulnerability Map of South Africa which indicates the likelihood for contamination to reach a specified position in the groundwater system after introduction at some location above the uppermost aquifer.

The site aquifer susceptibility is considered **Low** according to the SA Aquifer Susceptibility Map of South Africa which indicates the qualitative measure of the relative ease with which a groundwater body can be potentially contaminated by anthropogenic activities and includes both aquifer vulnerability and the relative importance of the aquifer in terms of its classification

8.6 Surface Water

The site falls within quaternary catchment A41D, and is within the Limpopo Water Management area in which the main rivers draining the area are Limpopo, Matlabas, Mokolo, Lephalala, Mogalakwena, sand and Nzhelele.

8.6.1 Watercourses and Wetlands

The main stream in the area is the Limpopo River which is part of the western site boundary. The Limpopo River borders South Africa and Botswana at the on the north west of South Africa. There are no other streams within the proposed site.

The Limpopo River is situated to the south (5km in distance) and is considered a FEPA system with a Class C: Moderately Modified Status. A single pan is located on the eastern boerder of the proposed site.

River Name	PES	River/ Wet Condition
Limpopo River	Class C: Moderately Modified	C
Limpopo River Floodpalin Wetland	Class AB: Largely Natural	AB
Pan	Class AB: Largely Natural	AB

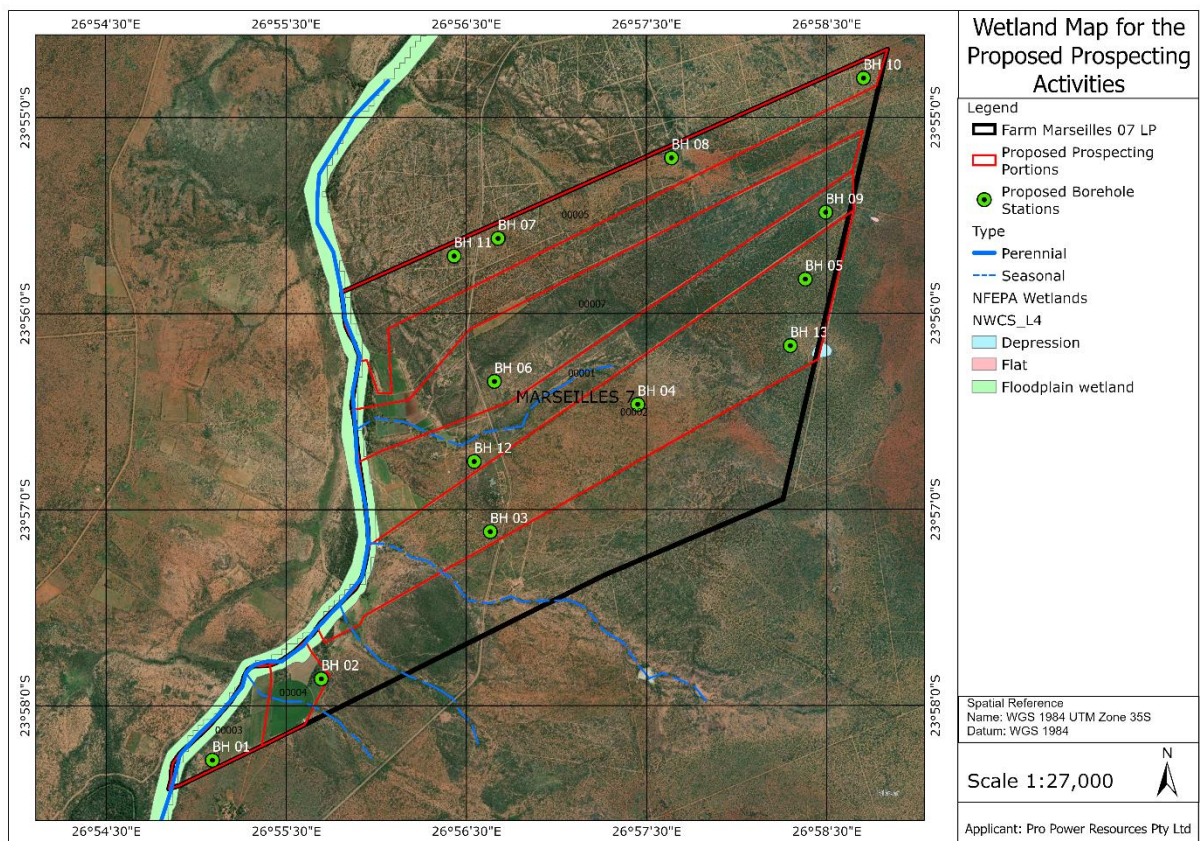

Figure 8-5: NFEPA Wetlands Map

8.6.2 Water Resource Management

- ✓ The drilling positions will be located such that sensitive areas (wetlands and streams and their buffers) are avoided;
- ✓ A 100 metres buffer zone must be applied to all water features on site;
- ✓ Water extraction from site sources will not be permitted, this includes rivers and boreholes without consent from the owners in case of private water sources and consent from the Municipality where water will be sourced from municipal connections;
- ✓ Stream crossings must be through existing crossings;
- ✓ The applicant will appoint an independent environmental officer to preside over the prospecting activities protecting the integrity of the natural environment which includes biodiversity and water resource;
- ✓ The applicant must make available site notices during operation communicating the boundaries of the buffer zones of the water sources;
- ✓ The management and control of probable impacts is further discussed in section 9 and 11 of this report.

8.7 Biodiversity

The proposed site is within the Savanna Biome. The savanna vegetation of South Africa and Swaziland constitutes the southernmost extension of the most widespread biome in Africa. It represents 32.8% of South Africa (399 600 km²) and 74.2% of Swaziland (12 900 km²). It extends beyond the tropics to meet the Nama-Karoo Biome on the central plateau, the Grassland Biome at higher altitudes towards the east and extends down the eastern seaboard interior and valleys where it grades into Albany Thicket in the Eastern Cape. More specifically, savanna occupies most of the far-northern part of the Northern Cape, the western and north-eastern parts of North-West Province, extreme western parts of the Free State Province, northern Gauteng with more isolated occurrences in the south of this province, almost the entire Limpopo Province, north western and north-eastern Mpumalanga, most of central and eastern Swaziland, low-altitude parts of the eastern seaboard, inland of the Indian Ocean Coastal Belt in

KwaZulu-Natal and the Eastern Cape Provinces, and with the southernmost extension abutting Albany Thicket of the Komga to Albany Districts.

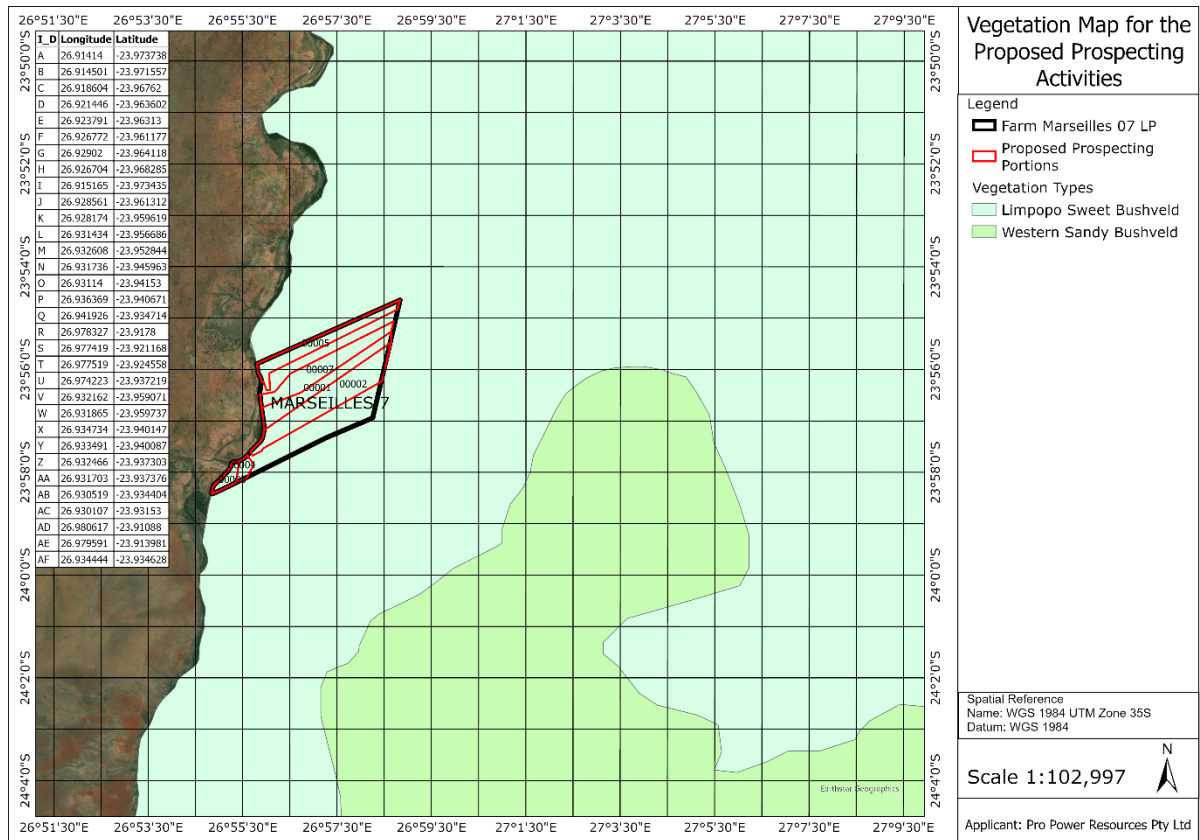

Figure 8-6: Site Vegetation Map

8.7.1 Regional Vegetation and Habitats

The proposed site is located within the Limpopo Sweet Bushveld of the Savanna Biome (Figure 8-6). The Limpopo Sweet Bushveld is distributed in Limpopo Province extending from the lower reaches of the Crocodile and Marico Rivers around Makoppa and Derdepoort, respectively, down the Limpopo River Valley including Lephalale and into the tropics past Tom Burke to the Usutu border post and Taaiboschgroet area in the north. The unit also occurs on the Botswana side of the border. The unit’s Important Taxa are as follows:

Tall Trees: *Acacia robusta* (d), *A. burkei*.

Small Trees: *Acacia erubescens* (d), *A. fleckii* (d), *A. nilotica* (d), *A. senegal* var. *rostrata* (d), *Albizia anthelmintica* (d), *Boscia albitrunca* (d), *Combretum apiculatum* (d), *Terminalia sericea*.

Tall Shrubs: *Catophractes alexandri* (d), *Dichrostachys cinerea* (d), *Phaeoptilum spinosum* (d), *Rhigozum obovatum* (d), *Cadaba aphylla*, *Combretum hereroense*,

Commiphora pyracanthoides, *Ehretia rigida* subsp. *rigida*, *Euclea undulata*, *Grewia flava*, *Gymnosporia senegalensis*.

Low Shrubs: *Acacia tenuispina* (d), *Commiphora africana*, *Felicia muricata*, *Gossypium herbaceum* subsp. *africanum*, *Leucosphaera bainesii*.

Graminoids: *Digitaria eriantha* subsp. *eriantha* (d), *Enneapogon cenchroides* (d), *Eragrostis lehmanniana* (d), *Panicum coloratum* (d), *Schmidtia pappophoroides* (d), *Aristida congesta*, *Cymbopogon nardus*, *Eragrostis pallens*, *E. rigidior*, *E. trichophora*, *Ischaemum afrum*, *Panicum maximum*, *Setaria verticillata*, *Stipagrostis uniplumis*, *Urochloa mosambicensis*.

Herbs: *Acanthosicyos naudinianus*, *Commelina benghalensis*, *Harpagophytum procumbens* subsp. *transvaalense*, *Hemizygia elliotii*, *Hermbstaedtia odorata*, *Indigofera daleoides*.

Succulent Herbs: *Kleinia fulgens*, *Plectranthus neochilus*.

BIOGEOGRAPHICALLY IMPORTANT TAXON (Central Bushveld endemic)

Succulent Herb: *Piarranthus atrosanguineus*.

8.7.2 The POSA Search

The Plant of South Africa website quarter degree did not return any plant species.

8.7.3 Site Avifauna

8.7.4 Site Ecological Sensitivity

8.7.4.1 2013 Limpopo Conservation Plan version 2

According to the Limpopo Conservation Plan, there are no protected areas within the proposed site and 5 km radius. Critical Biodiversity Area covers approximately 90% of the proposed site. There are small cultivated areas within the proposed site.

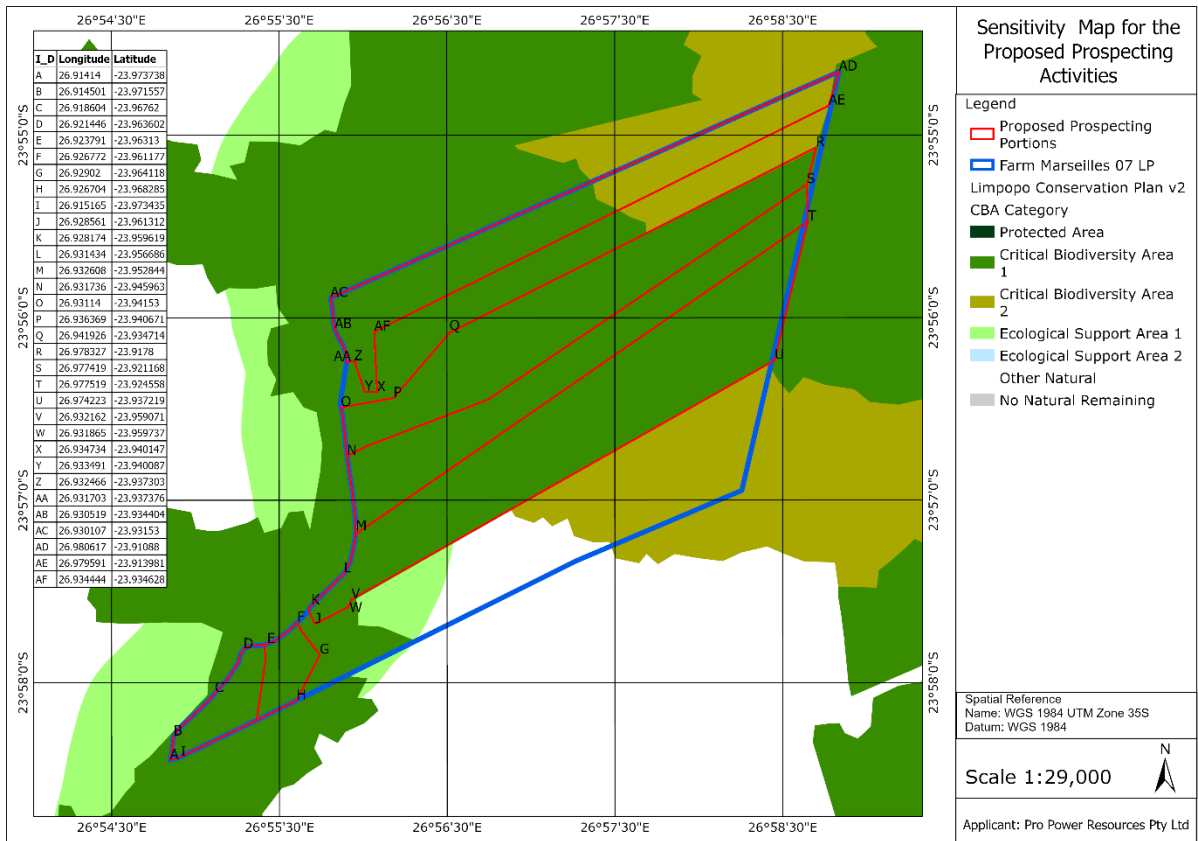

Figure 8-7: Site CBA Map in terms of the Limpopo Conservation Plan v2

8.7.4.2 Mining and Biodiversity Guideline (MBG) 2013

According to MBG, the proposed site is located in an area with High to Highest Sensitivity to mining. This is in line with the Provincial Conservation Plan. The floodplains along the Limpopo River is considered to have highest risk to mining activities.

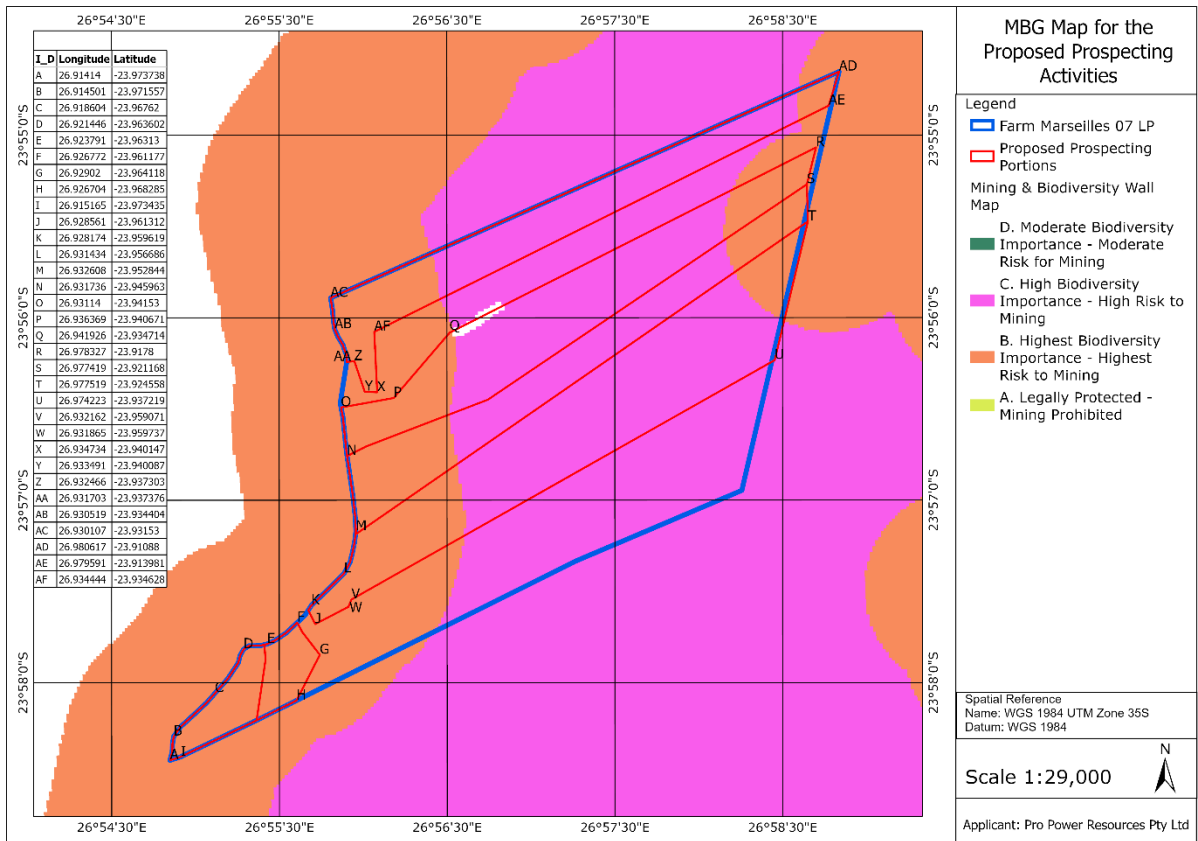

Figure 8-8: Site Mining and Biodiversity Map

8.7.4.3 National Freshwater Ecosystem Priority Areas.

According to NFEPA there are two FEPA wetlands identified on site, which are the Limpopo River floodplain and the pan on the east border of the site. These wetlands will be marked as No Go area and a 100 metres buffer zone will be created.

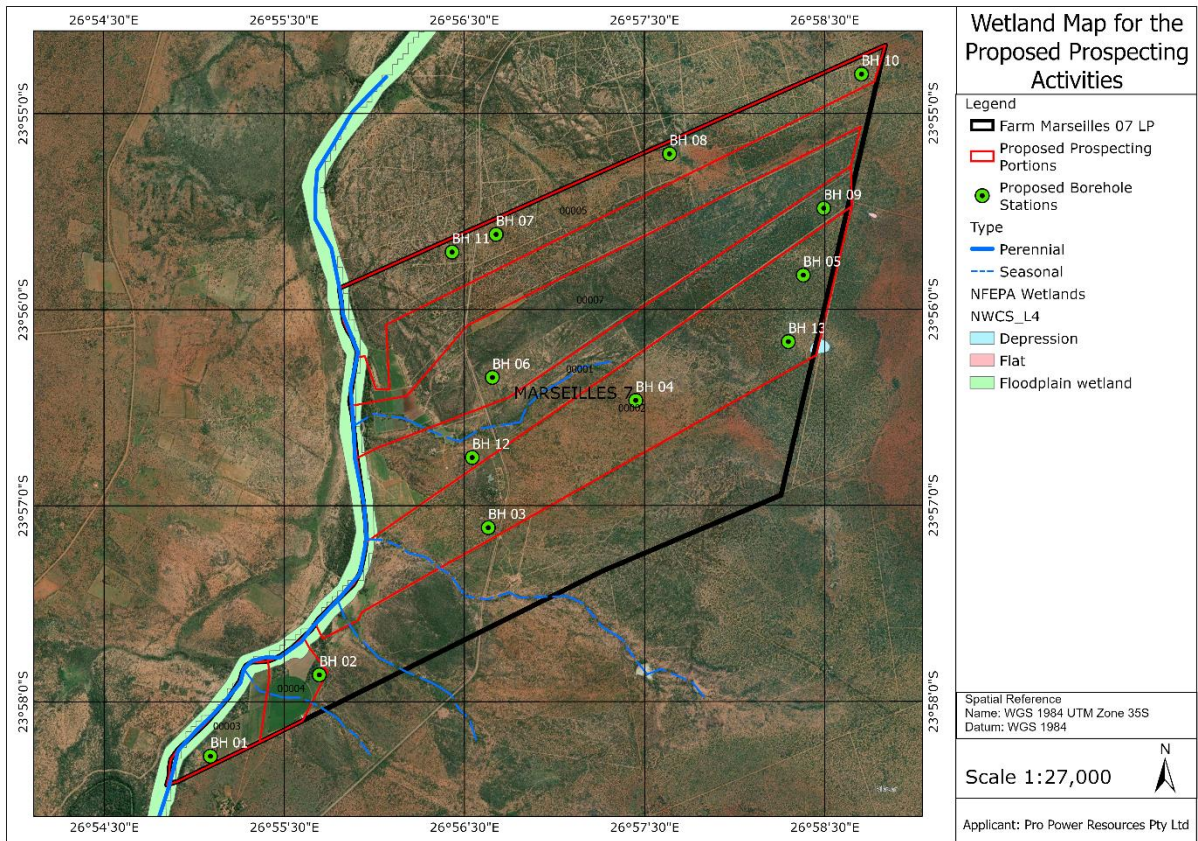

Figure 8-9: Site Sensitivity Map

8.8 Social Characteristics of the Study Area and Surrounds

The proposed site is within Thabazimbi Local Municipality of the Waterberg District Municipality in the Limpopo Province. The Thabazimbi Local Municipality is bordered by the Republic of Botswana on the west, Lephalale Local Municipality on the North, Modimolle/Mookgophong Local Municipality and Bela-Bela Local Municipality on the east, and North West Province on the south.

The proposed site is located approximately 85 kilometres west of Lephalale and approximately 90 km north west of Thabazimbi. The proposed site is located outside town in the farming area with communities comprised of very few members primarily the farm owners and workers.

Although there are active crop farming activities, the region is considered dry, the crop farming activities are concentrated along the Limpopo River for irrigation water sourcing. Groundwater is the primary water source in the area.

The farms' house steads are located far apart, rarely with no services from the Municipality. The local farming community is self-sustained.

Locally the main employer is the agricultural sector, and there are few tourism facilities hosting few tourists at a time.

8.9 Heritage Resources

A Heritage Impact Assessment was not undertaken for the project, based on desktop review, consultation and available Geographic Information System data, there were no identifiable heritage and cultural sites and features within the prospecting area. However, this does not absolve the contractor from exercising due diligence before undertaking any of the site invasive activities.

The site is largely in its natural state and the potential for unearthing heritage resources exists. The screening tool also identifies the site to have a low heritage and planetology sensitivity.

8.10 Description of the current land uses.

- ❖ The main economic land use in the proposed site is agriculture both the cultivation, the livestock farming and game farming;

Figure 8-10: Aerial View of the cultivated area

- ❖ A network of gravel access roads exists within the proposed site, the roads are used for access between farm portions and also to access the farm houses; the same roads will be used to access drill points avoiding creation of new stream crossings.

8.11 Description of specific environmental features and infrastructure on the site

- ❖ Farm houses: there are few scattered houses within the proposed site;

Figure 8-11: Farm House aerial view

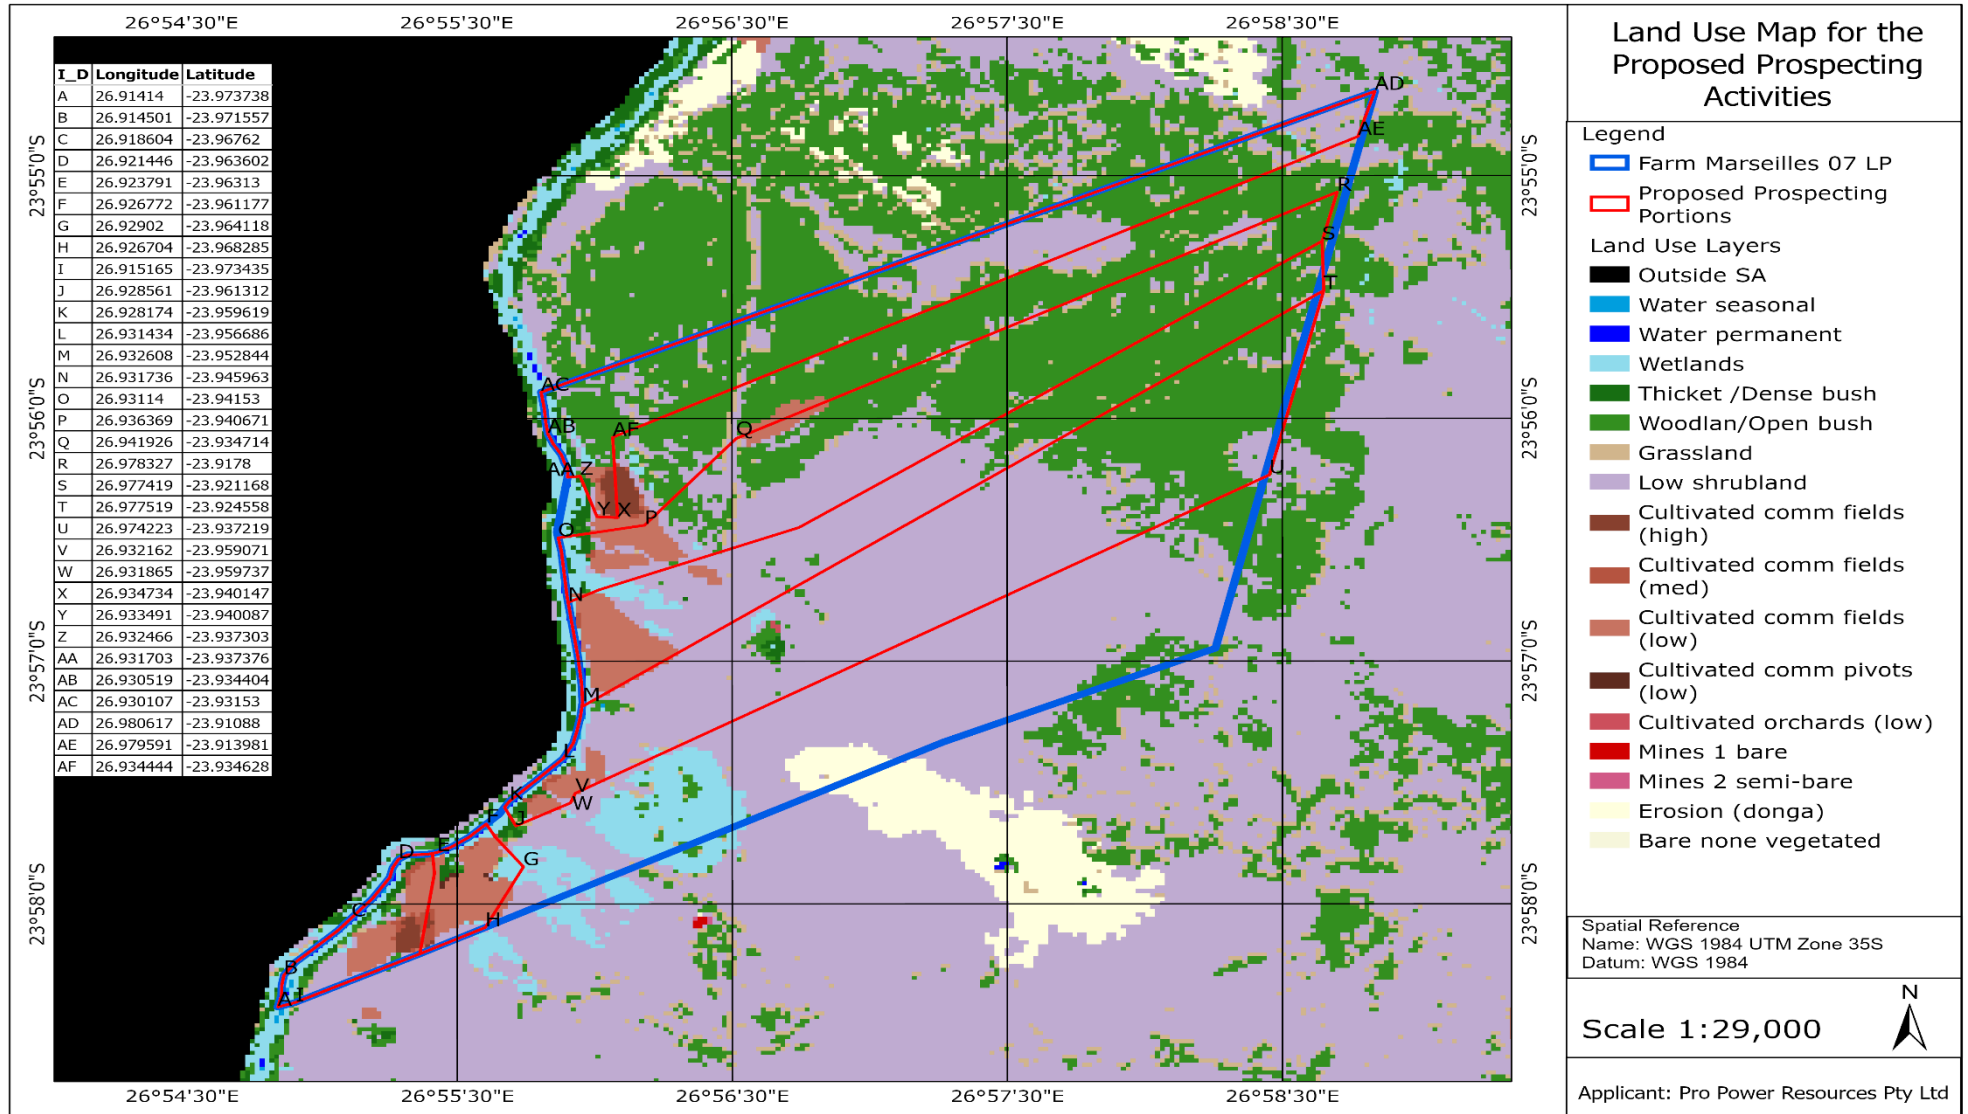

- ❖ Cumberland SAPS is located at 400 metres to the south of the portion 03;

Figure 8-12: Aerial View of the SAPS

- ❖ A water pan is located on the east boundary extending outside the site;
- ❖ D1173 road traverses through the site to connect various properties along the Limpopo River;

8.12 Environmental and current land use map

9 Impacts and risks identified including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts can be reversed.

Here a list of possible impacts will be provided, a full impact analysis which includes the significance of the impacts, their nature, extent, duration and probability of the impacts, the degree impacts reversibility and irreplaceable loss of resources has been provided in section 11 of Part A on page 73 as per the assessment criteria provided in section 9.1 of Part A on page 61.

E = Extent, D = Duration, I = Intensity, R = Impact Reversibility, L = Irreplaceable Loss of Resources, P = Probability of occurrence

9.1 Methodology used in determining and ranking the nature, significance, consequences, extent, duration and probability of potential environmental impacts and risks

The potential environmental impacts associated with the project will be evaluated according to its nature, extent, duration, intensity, probability and significance of the impacts, whereby:

Extent: The area over which the impact will be expressed. Typically, the severity and significance of an impact have different scales and as such bracketing ranges are often required. This is often useful during the detailed assessment phase of a project in terms of further defining the determined significance or intensity of an impact. For example, high at a local scale, but low at a regional scale;

Duration (D): Indicates what the lifetime of the impact will be;

Intensity (I): Describes whether an impact is destructive or benign;

Impact Reversal (R): The probability and the degree of reversing the activity impact;

Irreplaceable Loss (L): Loss of resources that cannot be replaced; and

Probability (P): Describes the likelihood of an impact actually occurring;

Cumulative: In relation to an activity, means the impact of an activity that in itself may not be significant but may become significant when added to the existing and potential impacts eventuating from similar or diverse activities or undertakings in the area.

The significance of each risk/impact will be identified as follows:

Impact Significance = Probability (P) X Consequence (C), where

$$C = E + I + D + R + L$$

Table 9-1: Criteria Used for Rating of Impacts

CRITERIA	DESCRIPTION			
Extent	<p>National (4)</p> <p>The whole of South Africa</p>	<p>Regional (3)</p> <p>Provincial and parts of neighbouring provinces</p>	<p>Local (2)</p> <p>Within a radius of 2 km of the construction site</p>	<p>Site (1)</p> <p>Within the construction site</p>
Duration	<p>Permanent (4)</p> <p>Mitigation either by man or natural process will not occur in such a way or in such a time span that the impact can be considered transient</p>	<p>Long-term (3)</p> <p>The impact will continue or last for the entire operational life of the development, but will be mitigated by direct human action or by natural processes thereafter. The only class of impact which will be non-transitory</p>	<p>Medium-term (2)</p> <p>The impact will last for the period of the construction phase, where after it will be entirely negated</p>	<p>Short-term (1)</p> <p>The impact will either disappear with mitigation or will be mitigated through natural process in a span shorter than the construction phase</p>
Intensity	<p>Very High (4)</p> <p>Natural, cultural and social functions and processes are altered to extent that they permanently cease</p>	<p>High (3)</p> <p>Natural, cultural and social functions and processes are altered to extent that they temporarily cease</p>	<p>Moderate (2)</p> <p>Affected environment is altered, but natural, cultural and social functions and processes continue albeit in a modified way</p>	<p>Low (1)</p> <p>Impact affects the environment in such a way that natural, cultural and social functions and processes are not affected</p>

CRITERIA	DESCRIPTION			
Impact Reversal	<p>Highly Impossible (4)</p> <p>Impact reversal will certainly be impossible</p>	<p>Moderate (3)</p> <p>Impact can be reversed to some extent with loss of natural resources</p>	<p>Possible (2)</p> <p>High possibility of impact reversal</p>	<p>Definite (1)</p> <p>Impact can be totally reversed</p>
Loss of irreplaceable resources	<p>Definite (4)</p> <p>Resources definitely be lost</p>	<p>Highly Probable (3)</p> <p>Most likely that resources will be lost</p>	<p>Possible (2)</p> <p>Resources may be lost</p>	<p>Improbable (1)</p> <p>Loss of resources is highly unlikely</p>
Probability Of Occurrence	<p>Definite (4)</p> <p>Impact will certainly occur</p>	<p>Highly Probable (3)</p> <p>Most likely that the impact will occur</p>	<p>Possible (2)</p> <p>The impact may occur</p>	<p>Improbable (1)</p> <p>Likelihood of the impact materialising is very low</p>

Significance is determined through a synthesis of impact characteristics. Significance is also an indication of the importance of the impact in terms of both physical extent and time scale, and therefore indicates the level of mitigation required. The total number of points scored for each impact indicates the level of significance of the impact.

Table 9-2: Criteria for Rating of Classified Impacts

		Impact Significance (Consequence * Probability)															
Probability ↑	4	20	24	28	32	36	40	44	48	52	56	60	64	68	72	76	80
	3	15	18	21	24	27	30	33	36	39	42	45	48	51	54	57	60
	2	10	12	14	16	18	20	22	24	26	28	30	32	34	36	38	40
	1	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
		5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
		Consequence (Extent + Intensity + Duration + Reversibility + Irreplaceable Loss) →															

Table 9-3: Impact consequence class description

Score	Description	Colour Code
Negligible (0 -10 points)	A negligible impact that can be easily managed and avoided.	Light Green
Low impact/ Minor (11 -20 points)	A low impact has no permanent impact of significance. Mitigation measures are feasible and are readily instituted as part of a standing design, construction or operating procedure.	Green
Medium impact/ Moderate (21 - 30 points)	Mitigation is possible with additional design and construction inputs.	Yellow
Critical (31 - 50 Points)	The design of the site may be affected. Mitigation and possible remediation are needed during the construction and/or operational phases. The effects of the impact may affect the broader environment.	Red
Catastrophic (51 - 80 points)	Permanent and important impacts. The design of the site may be affected. Intensive remediation is needed during construction and/or operational phases. Any activity which results in a “very high impact” is likely to be a fatal flaw.	Dark Red
Status	Denotes the perceived effect of the impact on the affected area.	
Positive (+)	Beneficial impact.	
Negative (-)	Deleterious or adverse impact.	

The suitability and feasibility of all proposed mitigation measures is included in the assessment of significant impacts. This was achieved through the comparison of the significance of the impact before and after the proposed mitigation measure is implemented.

9.2 The positive and negative impacts that the proposed activity (in terms of the initial site layout) and alternatives will have on the environment and the community that may be affected

9.2.1 Positive Impacts

Prospecting activities are precursor activities to mining, they evaluate the possibilities of mine establishment. There are very limited returns from prospecting activities. The returns from prospecting activities can only be realised after a successful prospecting project. It has not been proven that diamond bearing ore body are presence on site and if presence whether they can be sustainable be mined. The very limited benefits from the proposed activities are:

Ore Reserve quantification: The presence of diamond containing ore deposits on site will be verified and thereafter the economic value of the ore will be determined which could ultimately lead to the establishment of a mine. The mine itself have significant socioeconomic value. In the event that a viable reserve is confirmed, there would be high degree of positive impacts such as employment of large number of local residents, socio-economic balance of the local community and on the National and Provincial scale mining contribute highly to the Gross Domestic Product (GDP).

Contribution to South African geological data: The practical geological results obtained through this prospecting will be submitted to the South African Council of Geoscience for comprehensive mapping of South Africa based on proven data.

SMME and Street Vendor Support: The prospecting team will require basic services from the local community which would mainly be provided by the Small businesses and street vendors.

9.2.2 Negative Impacts

Commencement of listed activities in terms of NEMA, NWA and other Legislations without authorisation: A potential always exist that unauthorised undertaking of listed activities may take place on site in the form of project scope expansion and disregard of Authorisations' conditions. This could for example be increasing the number of authorised boreholes and impacting watercourses without water use license;

Loss of agricultural land and alternative land use conflicts: The site is not zoned for mining/industrial activities. This will create a parallel demand for land as successful prospecting activities will results in the establishment of a mine. There are active

agricultural practices (Crop and livestock) on site that will be directly affected by the proposed prospecting activities. Establishment of access roads and drill stations in agricultural areas will result in temporary loss of agricultural land for the duration of prospecting;

Loss of privately owned properties and infrastructures: The proposed site is characterised by various economic activities which include livestock, crop farming and game farms. There are established infrastructures which include irrigation systems, trucking, etc. The applicant will gain access into the property and so may the opportunistic criminals do resulting in theft.

Loss, contamination and compaction of fertile soil: Access roads and drill station establishment will result in removal/compaction of topsoil resulting in reduced fertility. The driving and parking of vehicles also create potential for hydrocarbon contaminations;

Soil erosion: Establishment of access roads and drill station disturbs soil cohesion increasing the potential for soil erosion;

Loss of biodiversity, natural corridors and habitats: There are Critical Biodiversity Areas (CBAs) just outside the proposed site and a potential exists for disturbances of this areas, with the loss of vegetation, habitats are also lost;

Loss of species of concern: The EIA process did not identify any red listed species within the proposed site. It should be noted that the proposed site is within the vulnerable grassland, and there are sections of CBAs and areas with high sensitivity to mining in terms of the Mining and Biodiversity Guidelines of 2013. The presence of species of concern cannot be ruled out;

Introduction of alien invasive plants: Invasive plants flourish where there is disturbances and ecological imbalances. The clearing of vegetation to establish drill stations and access roads has the potential to introduce and facilitate spread of invasive alien plants;

Degradation of Wetlands, streams and other water sources: There are numerous wetlands and water pods within the proposed site, there is high potential for impacting on the wetlands when crossing to access drilling points, should management measures be ignored;

Contamination of underground water resource: The drill activity has the potential to contaminate the underground water resource, introducing contaminants through the drill hole;

Contamination of surface water: Flow of stormwater from contaminated areas into the local watercourses;

Generation of waste: The prospecting activities will generate both the general and hazardous wastes. The waste will be managed using the “triple R” principle, Reduce, Reuse and Recycle;

Dust Generation: The vehicles and machinery movement on gravel roads will generate dust. The dust generation potential is considered low, the housing units on site to be affected by the dust are sparsely distributed hence the dust will have lower significance;

Fire breakout: There are potentials for fire breakout from the activities sites, smoking is a significant contributor to fire breakouts. A fire breakout will have huge implications in the area burning the CBAs and crops;

Health and safety risks: The operating machinery, equipment and vehicles, and excavations and undertaking activities in the wild create health and safety risks to the prospecting crew and the local community;

Criminal activities: Crime in South Africa is a social challenge faced by almost everyone, the presence of prospecting machinery and equipment on site will attract criminals who would seek to steal and sell such equipment;

Poor housekeeping: The site activities will generate wastes and proper waste management and site cleaning will be required to prevent the “dirty” site visuals;

Disturbance and/or destruction of cultural and heritage resources: The EIA Process did not identify any cultural and heritage significance sites and resources, however the possibility of unearthing heritage and cultural resources is not ruled out;

Noise Generation: There are few farm houses within the proposed site that would be impacted by the generated noise.

9.3 The possible mitigation measures that could be applied and the level of risk

The mitigation measures have been thoroughly discussed in Part A section 11 and Part B section 4. Below a summative impact/risk management is provided.

Commencement of listed activities in terms of NEMA, NWA and other Legislations without authorisation: It must be ensured that all activities undertaken are authorised in terms of the relevant legislations and the conditions of the authorisations must be upheld at all times;

Loss of agricultural land and alternative land use conflicts: The activities must be scheduled after harvesting period, topsoil be preserved and site rehabilitated after the prospecting activities;

Loss of private property: The applicant must ensure no unauthorised personnel gains access into privately owned property. A designated access control person must be designated for the duration of the prospecting activities. Access control method statement must be developed and communicated with affected land owners before access is granted. Access gates must remain locked at all times or as per the access agreement contract.

Loss, contamination and compaction of fertile soil: The topsoil must be preserved, and no multiple roads must be created to access the same station. The access roads must be ripped to loosen the soil;

Soil erosion: Prospecting activities must be scheduled during the dry season, and storm water must be controlled;

Loss of biodiversity, natural corridors and habitats: The disturbance must be limited to active areas and the site be rehabilitated as soon as the prospecting activities are completed at each station;

Loss of species of concern: The appointed ECO and EO must record all cleared/removed species and indigenous species must be reintroduced to the disturbed sites;

Introduction of alien invasive plants: An alien invasive plants control and management programme must be developed and adhered to;

Degradation of Wetlands, streams and other water sources: All surface water areas are no-go areas and no activity must take place within these areas and their buffers;

Contamination of underground water resource: Drill holes must be rehabilitated and plugged as soon as they are out of use, and a record of ground water monitoring before, during and after prospecting activities must be kept and any deviation from the pre-activities water condition must be attended to;

Contamination of surface water: Any flow from contaminated areas must be controlled and contained. The wet areas (wetlands and watercourses) are no-go areas;

Generation of waste: The waste will be managed using the “triple R” principle, Reduce, Reuse and Recycle. Waste bins must be provided for storage of wastes separately.

Dust Generation: A minimum speed limit of 40 km/h must be maintained on all internal gravel roads, dust generation must be monitored and controlled;

Fire breakout: Designated smoking areas must be provided, and firefighting equipment must be provided at all drill stations;

Health and safety risks: All operators must have operating competence certificates, handling of wild life must be done by trained personnel, and all openings must be barricaded;

Criminal activities: Access into the properties must be controlled, no hiring must be done on site and the farmers must be informed of the prospecting schedule and the crew;

Poor housekeeping: The site must be kept clean at all times;

Disturbance and/or destruction of cultural and heritage resources: Should any cultural and heritage resources be discovered, the work must be stopped, the SAPS and the Heritage Agency be notified; and

Noise Generation: The operating machinery and vehicles must be kept in good working conditions and the affected communities must be kept abreast of any activity with high noise generation potential.

9.4 Motivation where no alternative sites were considered

- ❖ The proposed prospecting area is targeted as the desktop studies as conducted by Pro Power Resources (Pty) Ltd, suggest that there is high possibility of diamond deposit.
- ❖ There is sufficient open area with no human settlements that could possibly create conflicts with the land owners;

- ❖ Although there are several wetlands identified, these can be avoided and prospecting be undertaken on dry areas with 100 metres buffer zones to all surface water areas applied.
- ❖ The site agricultural activities can be undertaken concurrently with the proposed prospecting activities; and
- ❖ There were no historical sites identified within the proposed site.

9.5 Statement motivating the alternative development location within the overall site

The site layout is mainly influenced by the distribution of the targeted geological stratum, however the drilling site is also influenced by the accessibility and environmental sensitivity. Thus, the drilling sites are located away from all watercourses and wetlands area.

The drill pads layout out will largely be dependent on the outcome of the aeromagnetic survey which will determine the possible locations of the diamond bearing deposits.

10 **Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site**

In order to identify the potential impacts associated with the proposed prospecting activities the following steps were undertaken:

10.1 Stakeholder consultation

The stakeholder consultation process will be undertaken in a manner to be interactive, providing landowners and identified stakeholders with the opportunity to provide input into the project. This was a key focus, as the locals are aware of their environment and can provide site specific information, which may not be available in desktop research material. Stakeholders were requested to provide their views on the project and any potential concerns which they had. All comments and concerns were captured and formulated into the impact assessment.

10.2 Desktop study

A detailed desktop investigation was undertaken to determine the environmental setting in which the project is located. Based on the desktop investigations various resources were used to determine the significance and sensitivity of the various environmental considerations. The desktop investigation involved the use of:

- ❖ South African National Biodiversity Institute (SANBI) Biodiversity Geographic Database LUDS system; SANBI Plants of South Africa; and SANBI Important Birds Area;
- ❖ Geographic Information System base maps and Google Earth;
- ❖ Department of Water Affairs and Sanitation's information documents such as the ground water vulnerability report;
- ❖ Department of Environmental Affairs (DEA) land use map;
- ❖ Mining and Biodiversity Guidelines;
- ❖ Review of Journals, Books and unpublished papers;
- ❖ Limpopo Conservation Plan V2;
- ❖ Local and District Municipality Integrated Development Plan;
- ❖ Local and District Municipality Strategic Development Framework;
- ❖ Relevant Provincial, National and International Policies, Regulations & Acts.

10.3 Site Visit

A site visit was conducted to ensure that the information gathered as part of the Desktop investigation reflects the current status of the land. The site visit was conducted on 19 – 21 October 2021.

10.4 Impacts assessment, rating and management

The ratings of the identified impacts were undertaken in a quantitative manner as provided in Impact Assessment Section. The ratings were undertaken in a manner to calculate the significance of each of the impacts. The EAP also assesses and rate the outcomes of the calculation to determine whether the outcome reflects the perceived and the actual views; The identification of management measures is done based on the significance of the impacts and measures that have been considered appropriate and successful, specifically as Best Practical and Economical Options.

11 Assessment of each identified potentially significant impact and risk

11.1 Assessment of all identified impacts and risks

Table 11-1: Impact Assessment

E = Extent, D = Duration, I = Intensity, R = Impact Reversibility, L = Irreplaceable Loss of Resources, P = Probability of occurrence							Where (E + D + I + R + L) X P = Significance				
Potential Impact	Phase	Impact Description	Rating Before Mitigation					Significance Before Mitigation	Mitigation Measures	Significance After Mitigation	
			E	D	I	R	L				P
Legal requirements											
Delayed and/or disrupted prospecting operations	Site Establishment & Construction	<ul style="list-style-type: none"> ✓ Disregarding Environmental Authorisation conditions; ✓ Disregarding access agreement conditions; ✓ Disregarding mining & prospecting legislative requirements; Partial compliance to EMP. 	2	3	4	4	4	4	-68	<ul style="list-style-type: none"> ✓ A copy of each operational license/permit must be kept on site; ✓ All site personnel must be inducted on all legislative requirements pertaining to site activities; ✓ The site personnel must be informed and provided with copies of access agreements between Yugaset and land owners; and ✓ In cases where amendments are required the existing conditions are binding until legally amended. 	0
Legal liabilities	Site Establishment & Operational	<ul style="list-style-type: none"> ✓ Property owners suing for damages and /or unapproved access into their properties; ✓ Legal penalties for failing to comply with site operational licenses/authorisations/permit. 	1	3	2	3	3	3	-36	<ul style="list-style-type: none"> ✓ All permits/ authorisations /licenses must be fully reviewed before work can be undertaken to ensure that required resources are made available; ✓ The site personnel must be informed and provided with copies of access agreements between Yugaset and land owners; ✓ A complaint register must be established to record all complaints from land owners and other affected parties also reflected measures taken to address the complaints and dates. 	-6
Soil											
Leakages and spillage of hazardous chemicals from storage areas.	Site Establishment & construction	<ul style="list-style-type: none"> ✓ Leakages of hydrocarbons from site vehicles and operating equipment; ✓ Leakages and spillage of hazardous chemicals from storage areas. 	1	3	1	1	1	2	-14	<ul style="list-style-type: none"> ✓ All site vehicles and equipment must be properly maintained regularly and daily inspection sheet be kept with each truck; ✓ There must be no storage of fuel on site, ✓ A drip tray must be placed under stationery machineries; ✓ Servicing of vehicles and machinery must be done off site; ✓ Leakages and Spillages must be attended to as soon as they are noticed and the contaminated soil must be placed in designated plastic bags/bins to be cleaned or disposed of at registered appropriate waste site. 	-6
Soil Compaction	Site Establishment & Construction	Compaction of soil by site moving vehicles reducing vegetation growing capabilities;	1	2	1	1	1	4	-24	<ul style="list-style-type: none"> ✓ Vehicle and machinery movements must be restricted to approved corridors; ✓ No new access roads must be developed without the approval of site ECO and the consent of land owners; ✓ Access plan must be provided to all affected land owners; ✓ Created access roads no longer in use must be ripped for vegetation regrowth. 	-10

Land Pollution	Site Establishment & Construction	General waste littering by site team	1	3	2	1	1	3	-24	<ul style="list-style-type: none"> ✓ All site personnel will be inducted on reduce, reuse and recycle concept; ✓ Temporary chemical toilets must be provided. These toilets must be made available for all site staff. The construction of "long drop" toilets is forbidden; ✓ Under no circumstances may open areas or the surrounding bush be used as a toilet facility. ✓ Waste must be separated and stored in marked bins; ✓ Waste disposal certificates must be kept on-site; ✓ A clean-up campaign must be undertaken every second Friday; 	-7
Compromised safety and security	Site Establishment & Construction	The site activities will result in influx of people to site creating security risks for workers and property owners'.	1	3	2	3	3	4	-48	<ul style="list-style-type: none"> ✓ Land owners must be provided with prospecting schedule; ✓ No hiring must be done on site; ✓ All site personnel must have identification card; ✓ Criminal activities must be reported to SAPS immediately; ✓ Access gates must remain locked and access be authorised; and ✓ All activities must remain within the approved site. 	-24
Heritage Resources											
Destruction of Heritage Resources	Site Establishment & Construction	Unearthing of heritage significance artefacts during drilling activities; Destruction of site graves.	1	1	1	1	1	2	-10	<ul style="list-style-type: none"> ✓ There are no historically or heritage resources known to be on site; ✓ All site graves must be clearly marked on the final layout plan to be provided to the Land owners; ✓ No graves must be disturbed and a 10m buffer must be demarcated around each grave; ✓ Should any paleontological or cultural artefacts be discovered work at the point of discovery must stop, the location be clearly demarcated and SAHRA contacted immediately. Work at the discovery site may only be recommenced on instruction from SAHRA. 	-10
Health and Safety											
Bodily injuries	Site Establishment & Operational	<ul style="list-style-type: none"> ✓ Injuries arising from erratic operations or mechanical failures of site machinery and vehicles; ✓ Fall into excavations either by personnel or general public; ✓ Chipping of outcrops to obtain outcrop samples; ✓ Encounter with dangerous wild animals during site survey; 	1	3	1	2	2	3	-27	<ul style="list-style-type: none"> ✓ The site machinery must be kept in good working conditions; ✓ All machinery operators must have permit/license to operate; ✓ Excavations must be demarcated and marked with visible tape; ✓ First aid kits must be made available on site and a trained Safety, Health and Environment Representatives be assigned for each team; ✓ Each chemical on site must have material storage and handling sheet (MSDS); ✓ During prospecting activities all employees must be provided with Protective clothing; ✓ All site personnel must have a working cell phone to communicate in case of emergency during survey phase. 	-12

11.2 Summary of specialist reports

List of Studies Undertaken	Recommendations of Specialist Reports	Specialist Recommendations that have been included in the EIA Report	Reference to Applicable Section of Report where Specialist Recommendations have been Included.
<p>No specialist studies was undertaken. Several studies were identified by the Screening Tool which have not been undertaken. The motivation for not undertaking the studies as identified by the Screening Tool is provided below.</p>			

11.2.1 Studies Identified by the Screening Tool

Specialist Study	Theme Sensitivity	Exclusion Motivation
1. Agriculture Theme	Very High	<p>The site is primarily used for agriculture, the EIA process has established. The proposed prospecting activities can be undertaken concurrently with the agricultural activities. The proposed prospecting activities will also employ non-invasive techniques including aeromagnetic survey which will identify targeted areas and reduce areas of disturbance by invasive drilling activities.</p> <p>The invasive activities (drilling and establishment of drill station) will disturb only targeted areas and each drill station will be approximately 25 m², of the proposed extensive development footprint less than a hectare will be disturbed for establishment of drill pads.</p> <p>The existing internal access roads will be used as far as practicably, this will largely restrict disturbances to already disturbed areas conserving the agricultural areas.</p> <p>On cessation of the prospecting activities the drill holes will be backfilled and rehabilitated according to an approved method statement, re-establishing pre-existing agricultural conditions.</p>

Specialist Study	Theme Sensitivity	Exclusion Motivation
2. Animal Species Theme	Medium	The proposed prospecting activities will be undertaken in privately owned properties used for both game farming and crop farming. The site animal species are known to the land owners, the animal species will therefore be protected from harm during the prospecting activities.
3. Aquatic Biodiversity Theme	Very High	The proposed activities will be undertaken away from water resources and will therefore have insignificant impact on the aquatic ecosystem. A 100 m buffer will be implemented on all water all surface water resources. The EIA process have identified the site water resources, and created a 100 m buffer around them which will be implemented during the prospecting phase.
4. Archaeological, Paleontology and Cultural Heritage Theme	Low	The theme is low. The site is used for agricultural practices which are also invasive in nature. Should there be resources on site, they were more likely to be unearthed. However, the proponent will exercise care during undertaking of invasive activities and should any heritage resource be unearthed, the activities will be stopped and relevant authorities notified.
5. Civil Aviation Theme	Medium	The proposed activities will not impact civil aviation.
6. Defence Theme	Low	There are no base for the Department of Defence or any of their resources to be disturbed by the proposed activities.
7. Plant Species Theme	Low	The theme has low sensitivity. There were no species of conservation concern identified through desktop resources (literature, GIS and SANBI Plants of South Africa Website) and the field surveys.
8. Terrestrial Biodiversity Theme	Very High	The site in terms of the Provincial Spatial Plan has high sensitivity mainly because there are some areas with pristine vegetation cover especially farms used for game farming. However, it must be noted that

Specialist Study	Theme Sensitivity	Exclusion Motivation
		<p>the plan (also taking its completion date into consideration) has been somewhat outdated due to expansion of cultivated fields.</p> <p>The areas considered ecological sensitive are private game farms with controlled ecological activities there is an open season for hunting. Furthermore, the invasive activities (drilling and establishment of drill station) will disturb only targeted areas and each drill station will be approximately 25 m², of the proposed extensive development footprint less than a hectare will be disturbed for establishment of drill pads.</p> <p>The existing internal access roads will be used as far as practicably, this will largely restrict disturbances to already disturbed areas conserving the agricultural areas.</p> <p>On cessation of the prospecting activities the drill holes will be backfilled and rehabilitated according to an approved method statement, re-establishing pre-existing agricultural conditions.</p>

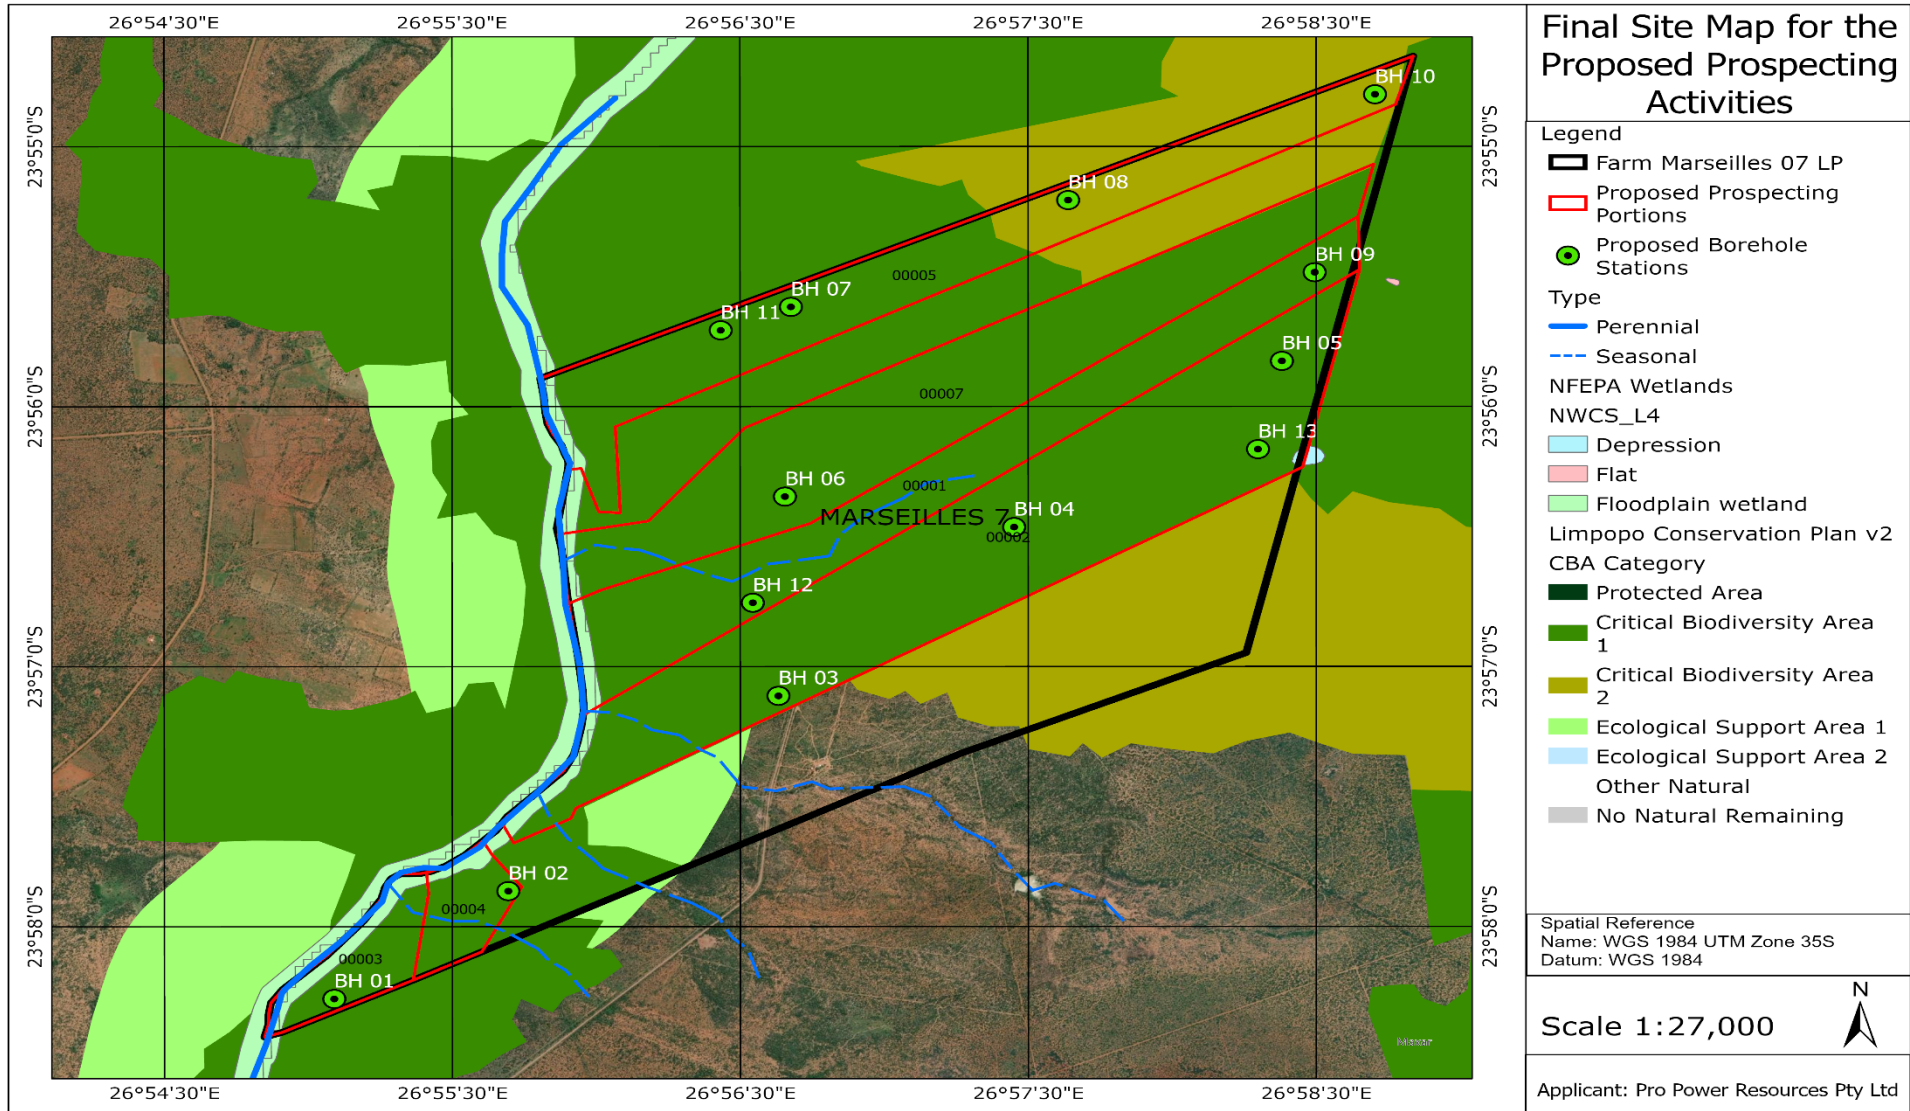

11.3 Environmental impact statement

- ✓ The site lies within the Savanna Biome, and more specifically, Limpopo Sweet Bushveld Vegetation;
- ✓ The site is largely on CBA1 and CBA2 according to the Limpopo Conservation Plan V2 of 2013;
- ✓ There are no protected areas within the proposed site and no red listed species were identified;
- ✓ According to the Mining and Biodiversity Guidelines (MBG) of 2013, the site is has high to highest biodiversity Importance;
- ✓ Floodplain wetland and a pan were identified within the proposed site;
- ✓ There are no known cultural and heritage significance sites within the proposed site, however their presence cannot be completely ruled out;
- ✓ The main land use on site is agriculture with few scattered farm houses within the proposed site;
- ✓ The proposed prospecting activities are of short duration and can be completed in a period of a year to a maximum of 5 years;
- ✓ The prospecting activities are non-complex and mostly mechanised requiring skilled professionals, as such less than four people will be hired to provide support to the project team, the proposed project will not have significant impact on the local socioeconomic conditions;
- ✓ The driving and drilling activities are expected to generate noise nuisance affecting the few farm residents and fauna. The Noise nuisance cannot be prevented and will only be managed through limiting the activities to day time;
- ✓ Driving gravel roads and drilling activities will generate dust pollution which can be managed by controlling limiting vehicle speed on gravel road and applying dust suppression methods (watering and/or biodegradable dust suppression agent);
- ✓ Accidents may happen between site vehicles and wild life resulting in loss of life and/or mobility of the fauna, the noise generated will also create stress for the local fauna;
- ✓ The proposed activities will have minimal impact on water resource as they will be located on dry lands and water usage is expected to be low at a rate of 6 litres per 40 m drill hole;

- ✓ The agricultural activities will be temporarily affected where drill stations and access roads will be established, however this will be done immediately after harvesting season to reduce the significance of the impact and the affected land users will be consulted throughout;
- ✓ Prospecting activities are not labour intensive and will therefore not have any significant impact on the socioeconomic status of the local community;

Prospecting activities will affect relatively small area in relation to the application area, approximately less than 3 ha of the application area will be disturbed. The disturbances will be of short duration as the project will not exceed 5 years. The sensitive ecological areas will be avoided and drill stations and access roads will be located on less sensitive areas. The wet areas (Wetlands and streams) are considered a no-go area and no activity will take place within their 100 metres buffer. Overall the proposed project will not have major significant impacts should the EMPr be implemented.

11.4 Final Site Map

11.5 Summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;

11.5.1 Positive Impacts

Prospecting activities are precursor activities to mining, they evaluate the possibilities of mine establishment. There are very limited returns from prospecting activities. The returns from prospecting activities can only be realised after a successful prospecting project. It has not been proven that diamond containing ore body are presence on site and if presence whether they can be sustainable be mined. The very limited benefits from the proposed activities are:

Diamond deposit quantification: The presence of diamond containing ore body on site will be verified and thereafter the economic value of the seams will be determined which could ultimately lead to the establishment of a mine. The mine itself have significant socioeconomic value. In the event that a viable reserve is confirmed, there would be high degree of positive impacts such as employment of large number of local residents, socio-economic balance of the local community and on the National and Provincial scale mining contribute highly to the Gross Domestic Product (GDP).

Contribution to South African geological data: The practical geological results obtained through this prospecting will be submitted to the South African Council of Geoscience for comprehensive mapping of South Africa based on proven data.

SMME and Street Vendor Support: The prospecting team will require basic services from the local community which would mainly be provided by the Small businesses and street vendors.

11.5.2 Negative Impacts

Commencement of listed activities in terms of NEMA, NWA and other Legislations without authorisation: A potential always exist that unauthorised undertaking of listed activities may take place on site in the form of project scope expansion and disregard of Authorisations' conditions. This could for example be increasing the number of authorised boreholes and impacting watercourses without water use license;

Loss of agricultural land and alternative land use conflicts: The site is not zoned for mining/industrial activities. This will create a parallel demand for land as successful prospecting activities will results in the establishment of a mine. There are active agricultural practices (Crop and livestock) on site that will be directly affected by the

proposed prospecting activities. Establishment of access roads and drill stations in agricultural areas will result in temporary loss of agricultural land for the duration of prospecting;

Loss of privately owned properties and infrastructures: The proposed site is characterised by various economic activities which include livestock, crop farming and game farms. There are established infrastructures which include irrigation systems, trucking, etc. The applicant will gain access into the property and so may the opportunistic criminals do resulting in theft.

Loss, contamination and compaction of fertile soil: Access roads and drill station establishment will result in removal/compaction of topsoil resulting in reduced fertility. The driving and parking of vehicles also create potential for hydrocarbon contaminations;

Soil erosion: Establishment of access roads and drill station disturbs soil cohesion increasing the potential for soil erosion;

Loss of biodiversity, natural corridors and habitats: There are Critical Biodiversity Areas (CBAs) within the proposed site and a potential exists for disturbances of this areas, with the loss of vegetation, habitats are also lost;

Loss of species of concern: The EIA process did not identify any red listed species within the proposed site. It should be noted that the proposed site is within the vulnerable grassland, and there are sections of CBAs and areas with high sensitivity to mining in terms of the Mining and Biodiversity Guidelines of 2013. The presence of species of concern cannot be ruled out;

Introduction of alien invasive plants: Invasive plants flourish where there is disturbances and ecological imbalances. The clearing of vegetation to establish drill stations and access roads has the potential to introduce and facilitate spread of invasive alien plants;

Degradation of Wetlands, streams and other water sources: There are numerous wetlands and artificial dams within the proposed site, there is high potential for impacting on the wetlands when crossing to access drilling points, should management measures be ignored;

Contamination of underground water resource: The drill activity has the potential to contaminate the underground water resource, introducing contaminants through the drill hole;

Contamination of surface water: Flow of stormwater from contaminated areas into the local watercourses;

Generation of waste: The prospecting activities will generate both the general and hazardous wastes. The waste will be managed using the “triple R” principle, Reduce, Reuse and Recycle;

Dust Generation: The vehicles and machinery movement on gravel roads will generate dust. The dust generation potential is considered low, the housing units on site to be affected by the dust are sparsely distributed hence the dust will have lower significance;

Fire breakout: There are potentials for fire breakout from the activities sites, smoking is a significant contributor to fire breakouts. A fire breakout will have huge implications in the area burning the CBAs and crops;

Health and safety risks: The operating machinery, equipment and vehicles, and excavations and undertaking activities in the wild create health and safety risks to the prospecting crew and the local community;

Criminal activities: Crime in South Africa is a social challenge faced by almost everyone, the presence of prospecting machinery and equipment on site will attract criminals who would seek to steal and sell such equipment;

Poor housekeeping: The site activities will generate wastes and proper waste management and site cleaning will be required to prevent the “dirty” site visuals;

Disturbance and/or destruction of cultural and heritage resources: The EIA Process did not identify any cultural and heritage significance sites and resources, however the possibility of unearthing heritage and cultural resources is not ruled out; and

Noise Generation: The site is largely natural and there are also residential units within the proposed properties, the operation of drilling machinery will create noise that will easily reach the local residents.

11.6 Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;

Impact management objectives are described in terms of the Mitigation Hierarchy of the ERM Impact Assessment Standard. The mitigation hierarchy is as follows:

Avoid at Source: Reduce at Source: avoiding or reducing at source through the design of the Project (e.g., avoiding by siting or re-routing activity away from sensitive areas or reducing by restricting the working area or changing the time of the activity).

Abate on Site: add something to the design to abate the impact (e.g., pollution control equipment, traffic controls, perimeter screening and landscaping).

Abate at Receptor: if an impact cannot be abated on-site then control measures can be implemented off-site (e.g., noise barriers to reduce noise impact at a nearby residence or fencing to prevent animals straying onto the site).

Repair or Remedy: some impacts involve unavoidable damage to a resource (e.g. agricultural land and forestry due to creating access, work camps or materials storage areas) and these impacts can be addressed through repair, restoration or reinstatement measures.

Compensate in Kind; Compensate Through Other Means: where other mitigation approaches are not possible or fully effective, then compensation for loss, damage and disturbance might be appropriate (e.g., planting to replace damaged vegetation, financial compensation for damaged crops or providing community facilities for loss of fisheries access, recreation and amenity space).

11.6.1 Impact management objectives:

- ❖ Provide sufficient information to strategically plan the prospecting activities as to avoid unnecessary social and environmental impacts
- ❖ Provide sufficient information and guidance to plan the prospecting activities in a manner that would reduce impacts (both social and Environmental) as far as practicable.
- ❖ Ensure an approach that will provide the necessary confidence in terms of environmental compliance.
- ❖ Provide a management plan that is effective and practical for implementation

11.6.2 Impact management Outcome

- ✓ Risk assessment must be conducted before any site activity is undertaken and management measures are available and understood by everyone involved;
- ✓ Site access agreements between the affected parties and Pro Power Resources (Pty) Ltd must be signed before any work is conducted;
- ✓ No invasive activity must be undertaken within 100 metres buffer of surface water (Streams and water bodies);
- ✓ The activities are restricted to approved area;
- ✓ Soil erosion must be prevented and monitored;
- ✓ Vegetation clearance must be restricted to active areas;
- ✓ Invasion by alien invasive plants must controlled and monitored;
- ✓ Wastes must be disposed at registered facilities and disposal certificates be kept on site;
- ✓ The site activities must be restricted to day time;
- ✓ No new stream crossing must be created and water contamination must be prevented

11.7 Aspects for inclusion as conditions of Authorisation

- ✓ EA final site layout map detailing the drilling locations should be submitted to the relevant landowners to prior to the commencement of these activities;
- ✓ The land owners must be notified about the project scheduling;
- ✓ Environmental Control Officer appointment,
- ✓ Storm water management;
- ✓ Provision of PPE;
- ✓ Total number of boreholes to be drilled;
- ✓ Opening and maintenance of complaints register;
- ✓ Access control into the prospecting property;
- ✓ Activity based environmental risk assessment;
- ✓ Daily toolbox talks;

- ✓ Emergency preparedness plan
- ✓ Impact monitoring programme;
- ✓ Project environmental auditing;
- ✓ Annual review of financial provision; and
- ✓ Closure certificate.

11.8 Description of any assumptions, uncertainties and gaps in knowledge

- ✓ The confidence for presence of diamond ore body is based on desktop studies;
- ✓ The entire site was not traversed for protected species identification, the identification was aided by desktop studies and as such care should be exercised when removing vegetation;
- ✓ The absence of Heritage significance areas and artefacts was based on desktop studies using pre-existing literature and GIS Software Programs;
- ✓ To date the report was based on desktop assessments.

11.9 Reasoned opinion as to whether the proposed activity should or should not be authorised

It is the opinion of the EAP that the activity be authorised.

- ✓ Based on the desktop studies the site lies within the sedimentary deposit of the Waterberg subgroup intruded by volcanic formations and therefore diamond deposits are more likely; prospecting activities must be undertaken to confirm the diamond deposits;
- ✓ The disturbance on water resources will be very minimal as prospecting activities will be undertaken on dry lands;
- ✓ The disturbance on biodiversity can be full reversed once the prospecting activities ceases;
- ✓ The site agricultural activities can be undertaken simultaneously with the proposed prospecting activities (Can also be scheduled after harvesting season) and the disturbance will only be limited to active area which will be less than 3 ha.

- ✓ The available literature in the absence of proven data (through prospecting) will always attract mining interest companies, should this prospecting be approved, the evidence based geological data will become available in support or against mining establishment in the area; and
- ✓ The acquired geological knowledge will contribute significantly to the academic world towards mapping of South African geology based on drilling results.

11.10 Conditions that must be included in the authorisation

- ❖ The applicant (Pro Power Resources) must engage with the affected parties upon issuing of the Prospecting Right, the two parties must develop a legally binding resolute and exhaustive access agreement contracts which will detail the following (inter alia):
 - The duration of the prospecting crew on site and operation times;
 - The number of personnel to access the site at any given time;
 - Compensation for losses resulting from prospecting activities (e.g. loss of crops and arable land);
 - Activity scheduling in respect to site activities such as game hunting; and
 - Any matter deemed necessary during the access consultation process.
- ❖ No activities can take place within the 100 metre buffers of any water source;
- ❖ All wastes generated must be disposed of at an appropriate registered landfill and disposal certificate be kept on site; the site temporary storage skips and bins must be closed at all times to prevent scavenging and smell nuisance;
- ❖ An annual performance must be undertaken throughout the duration of the prospecting activities;
- ❖ The financial provision must be reviewed annually to determine if it's still appropriate to site activities;
- ❖ Ground water monitoring must be conducted using existing boreholes on site;
- ❖ A complaints register must be kept on site, recording each complaint and how it was addressed;

- ❖ The EA does not negate the responsibility of the holder to comply with any other statutory requirements that may be applicable to undertaking of the prospecting activities;
- ❖ The EA does not grant authorisation to National Water Act Section 21, any water listed water use in terms of this Act must be applied for with the Department of Water Affairs and Sanitation (DWS);
- ❖ The EA will only be effective in the event that the corresponding prospecting right is issued in terms of the MPRDA and none of the listed activities commence without the corresponding prospecting right;
- ❖ The impact management and mitigation measures as described in this report are mandatory.
- ❖ A person is guilty if that person fails to comply or contravene a condition of the EA;
- ❖ A copy of the EA must be kept on site where the activity will be undertaken;
- ❖ The conditions of the EA and the EMPr must be made known to all personnel to be directly involved in the prospecting activities;
- ❖ The applicant must provide site personnel with personal protective equipment (PPE);
- ❖ The applicant must appoint an independent Environmental Control Officer who will also conduct annual environmental audits for submission to the department;
- ❖ Activity based environmental risks must be conducted before any site activity is undertaken;
- ❖ A monitoring programme must be budget for and implemented for the duration of the impact as directed by the EMPr;
- ❖ Storm water must be effectively managed to prevent contamination and erosion;
- ❖ A closure certificate must be applied for in terms of the MPRDA within 180 days of the occurrence of lapsing, cancellation, cessation, relinquishment and completion of prospecting activities; and
- ❖ Only indigenous plants can be used for rehabilitation.

11.11 Period for which the Environmental Authorisation is required

The Prospecting Right has been applied for a period of five years. The Environmental Authorisation should therefore allow for the five years of prospecting and one year for decommissioning and rehabilitation.

12 Undertaking

An undertaken by the EAP and the client is provided for in Section 2 of the EMPr.

13 Financial Provision

A rehabilitation fee will be calculated to be **R 85,772.93**;

13.1 Explain how the aforesaid amount was derived.

The rehabilitation fee was calculated using the Department of Mineral Resource and Energy guideline document for the evaluation of the quantum of closure-related financial provision provided by a mine.

13.2 Confirm that this amount can be provided for from operating expenditure

It is hereby undertaken that the calculated amount will be provided to DMRE in the form of a bank guarantee for rehabilitation purposes as required in terms of section 24P (1) of the NEMA, will be provided to the DMR upon granting of the requested prospecting right.

14 Specific Information required by the competent Authority

14.1 Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). The EIA report must include the:-

14.1.1 Impact on the socio-economic conditions of any directly affected person.

The directly impacted person are the land owners and/or occupiers within the proposed site. These will include the sparse households on site and agricultural area. All the affected parties will be identified and consulted before the report is finalised.

14.1.2 Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act.

The site has been disturbed previously by other activities i.e. agriculture and no heritage significance objects were found on site during the undertaking of such activities. It is presumed that there are no artefacts or sites of heritage importance on site.

14.2 Other matters required in terms of sections 24(4) (a) and (b) of the Act.

The requirements of the Act in terms of section 24(4) (b) (i) – (vii) as guided by section 24(4A) are provided below with sections in which they have been addressed:

- (i) Investigation of the potential consequences or impacts of the alternatives to the activity on the environment and assessment of the significance of those potential consequences or impacts, including the option of not implementing the activity:
 - ✓ **Part A section 9:** *impacts and risks identified including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts;*
 - ✓ **Part A section 9.2:** *The positive and negative impacts that the proposed activity (in terms of the initial site layout) and alternatives will have on the environment and the community that may be affected;*
 - ✓ **Part A section 11:** *Assessment of each identified potentially significant impact and risk;*
 - ✓ **Part B section 4:** *Impacts to be mitigated in their respective phases.*
- (ii) Investigation of mitigation measures to keep adverse consequences or impacts to a minimum:
 - ✓ **Part A section 11:** *Assessment of each identified potentially significant impact and risk;*
 - ✓ **Part A section 11.5:** *Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;*
 - ✓ **Part B section 4:** *Impacts to be mitigated in their respective phases.*
- (iii) Investigation, assessment and evaluation of the impact of any proposed listed or specified activity on any national estate referred to in section 3(2) of the National Heritage Resources Act, 1999 (Act No. 25 of 1999), excluding the national estate contemplated in section 3(2)(i)(vi) and (vii) of that Act;
 - ✓ **Part A section 8.9:** *Heritage Resources.*
- (iv) Reporting on gaps in knowledge, the adequacy of predictive methods and underlying assumptions, and uncertainties encountered in compiling the required information:
 - ✓ **Part A section 11.8:** *Description of any assumptions, uncertainties and gaps in knowledge*
- (v) Investigation and formulation of arrangements for the monitoring and management of consequences for or impacts on the environment, and the assessment of the effectiveness of such arrangements after their implementation;

- ✓ **Part B section 5.2:** *Mechanisms for monitoring compliance with and performance assessment against the environmental management programme and reporting thereon, including, Monitoring of Impact Management Actions, Monitoring and reporting frequency, Responsible persons, Time period for implementing impact management actions, Mechanism for monitoring compliance.*
- (vi) Consideration of environmental attributes identified in the compilation of information and maps contemplated in subsection (3);
- ✓ **Part A section 8:** *The Environmental attributes associated with the alternatives.*

PART B

ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT

1 Details of the EAP

The requirement for the provision of the details and expertise of the EAP are included in PART A, section 1(a).

2 Description of the Aspects of the Activity

The requirement to describe the aspects of the activity that are covered by the draft environmental management programme is already included in PART A, section (1) (h).

2.1 Composite Map

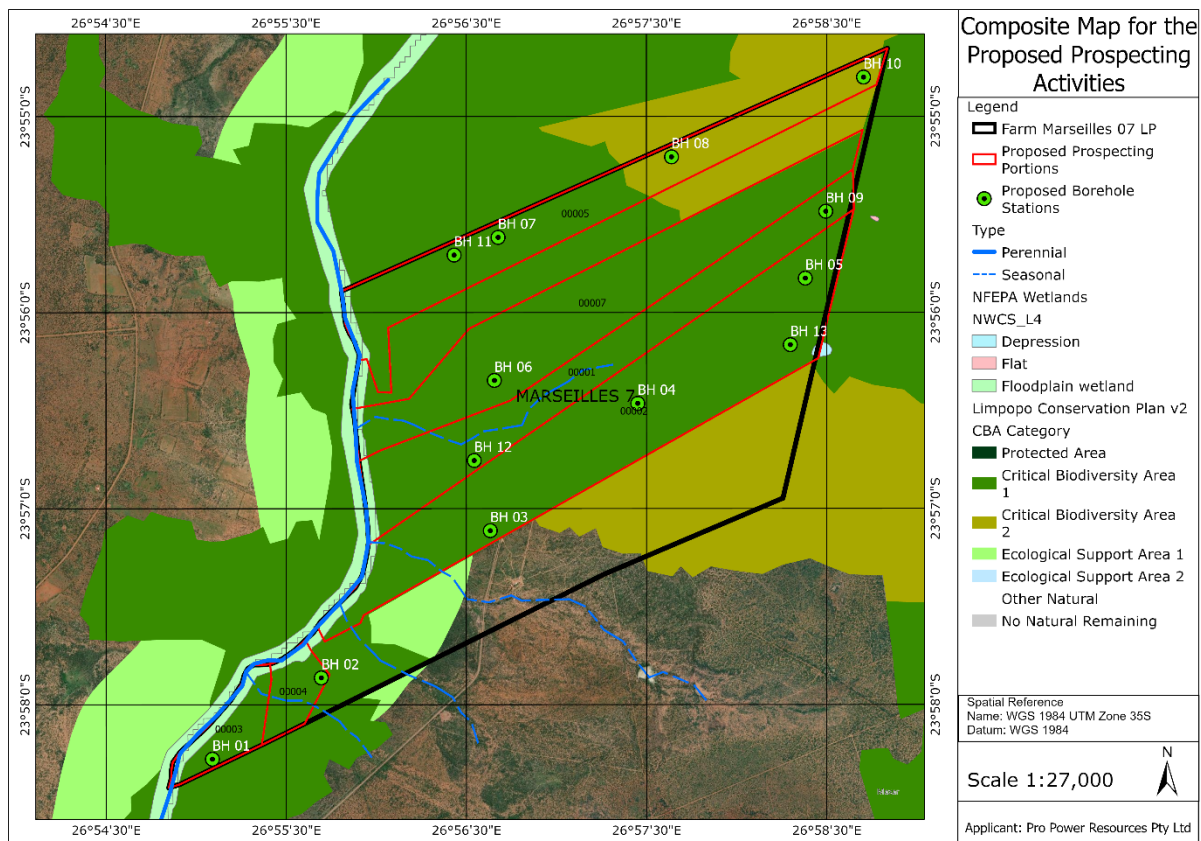

Figure 2-1: Site Composite

3 Description of Impact management objectives including management statements

3.1 Determination of closure objectives

The closure objectives thus are as follows:

- ❖ Eliminate any safety risk associated with drill holes and sumps through adequate drill hole capping and backfilling.
- ❖ Remove and / or rehabilitate all pollution and pollution sources such as waste materials and spills;
- ❖ To loosen the hardened surfaces which were used temporary site camp or access roads and re-vegetate with indigenous species.
- ❖ Establish rehabilitated area which is not subjected to soil erosion which may result in the loss of soil, degradation of the environment and cause pollution of surface water resources;
- ❖ Restore disturbed area and re-vegetate these areas with indigenous vegetation to restore the ecological function of such areas as far as is practicable.

3.2 Volumes and rate of water use required for the operation.

The operational machinery and equipment is expected to use less than 60 litres of water per day for cooling and dust suppression. The water usage will not trigger the National Water Act (36;1998) listed water uses.

3.2.1 Has a water use licence has been applied for?

A water use licence is not required for this project but should any NWA water uses be triggered a water use license will be applied for. The Government Notice (GN) 704 will be adhered to throughout the prospecting duration.

4 Impacts to be mitigated in their respective phases, the Impact Management Outcomes and Management Actions

Measures to rehabilitate the environment affected by the undertaking of any listed activity and the description of impact management outcomes, identifying the standard of impact management required for the aspects, and description of impact management actions, identifying the manner in which the impact management objectives and outcomes will be achieved.

Table 4-1: Impacts Assessment & Mitigation

IMPACT ASSESSMENT AND MANAGEMENT								
Potential Impact	Phase	Disturbance Scale	Aspects Affected	Mitigation Type	Mitigation Measures	Standard to be Achieved	Compliance with Standards	Time Period for Implementation
Desktop Study								
No Impact	Planning	None	None	None	None	Protect sensitive site	Locate sensitive and protected areas such as rivers)	N/A
Creation of access roads (Access to drill points)								
Creation of access roads within streams/rivers and alteration of river beds	Construction	1 ha	Water Supply	Control through planning and design; Control through avoidance	<ul style="list-style-type: none"> ✓ Stream crossings must be through existing tracks; ✓ The altered river beds must be rehabilitated and alien invasive plants be monitored and all foreign materials be removed from the stream courses. 	Protect water resources;	Access roads created in dry lands;	Through the project
Introduction of Alien invasive species	Construction	1 ha	Biodiversity	Control through rehabilitation; Control through monitoring;	<ul style="list-style-type: none"> ✓ All possible alien invasive plants must be identified and be communicated with site management team for control; ✓ Alien invasive plants must be removed as soon as they are identified; ✓ A post closure monitoring programme must be established. 	Control listed invasive plants	Alien invasive plants will be identified, removed and regrowth monitored.	Through the project
Loss of agricultural land	Construction	1 ha	Socioeconomic	Control through consultation with property owners.	The disturbance area must be limited to drill pads and access roads only; All affected property owners must be fully consulted and access agreement be established and signed by both parties.	Preserve economic agricultural area	Land owners will be consulted and compensated for loss of developed agricultural land.	Through the project
Establishment and preparation of drill pads/area								
Unauthorised access into private property	Construction	14490.9 ha	Private Property	Control through consultation with property owners.	<ul style="list-style-type: none"> ✓ Access agreements must be signed by the land owners; and ✓ All site personnel must have identification cards. 	Protection of private properties.	Consult all land owners	Before and after accessing site.
Clearing of vegetation to establish survey stations and access roads.	Construction Phase	500 m ²	<ul style="list-style-type: none"> ✓ Biodiversity; ✓ Soil; ✓ Humans; and ✓ Water. 	<ul style="list-style-type: none"> ✓ Remedy through rehabilitation; ✓ Conduct site walks; ✓ Limiting disturbance areas; and 	<ul style="list-style-type: none"> ✓ Site walk must be done before vegetation clearing is undertaken and should there be protected species, they must be marked and must not be removed without permit; ✓ Clearing of vegetation must be limited to drill areas only; 	Biodiversity conservation	<ul style="list-style-type: none"> ✓ Species will be identified before clearing; ✓ Disturbance will be limited 	Throughout the Prospecting Period

IMPACT ASSESSMENT AND MANAGEMENT

Potential Impact	Phase	Disturbance Scale	Aspects Affected	Mitigation Type	Mitigation Measures	Standard to be Achieved	Compliance with Standards	Time Period for Implementation
				<ul style="list-style-type: none"> ✓ Control through implementing activity methods statement. 	<ul style="list-style-type: none"> ✓ New access roads must be created in consultation with the land owners and must not disturb drainage lines; ✓ Multiple tracks must not be created to access a single point; ✓ No fires are allowed on site; and ✓ All disturbed areas must be rehabilitated as soon as they are out of use; ✓ The site must be monitored for invasion by invasive alien plants and they must be removed as soon as they are identified. 			
Destruction of habitats when clearing vegetation	Construction	1 ha	Fauna	<ul style="list-style-type: none"> ✓ Control through search and rescue; and ✓ Limiting disturbance area. 	<ul style="list-style-type: none"> ✓ Before vegetation is cleared in each drill station, search and rescue must be ensured that there is no fauna; ✓ Where fauna are present they must be moved to undisturbed adjacent areas; 	Biodiversity conservation	Search and rescue	Throughout the Prospecting Period
Contamination and erosion of topsoil and stockpiles before, during removal and stockpiling	Construction	500m ²	Soil	<ul style="list-style-type: none"> ✓ Control through storm water diversion beams; ✓ Control through implementing activity methods statement; 	<ul style="list-style-type: none"> ✓ Contamination of soil from any leaks, spillages of hydrocarbons and any other hazardous substances must be cleaned as soon as they occur; ✓ Topsoil stockpiles must be located away from any chemical substance storage; ✓ Site vehicles, machinery and equipment must always be in good working conditions and daily inspections be conducted before they are used and a checklist be kept onsite; ✓ No vehicles and equipment maintenance must be done on site and faulty equipment must be taken off site. ✓ Topsoil stockpiles must be located away from drainage lines to prevent erosion; 	Rehabilitation standard	Topsoil will be preserved and protected from contamination and erosion for later use during rehabilitation	Throughout the Prospecting Period
Core drilling								
Disturbance of local sewage and water pipes connections	Construction	500m ²	Services supply	<ul style="list-style-type: none"> ✓ Control through consultation with local municipality; 	<ul style="list-style-type: none"> ✓ Obtain a layout plan for local connections to determine if there are any in the proposed site; and ✓ Should any pipe damage occur, the relevant authority must be notified immediately. 	Preservation of private properties	Local connections layout plan will be reviewed to determine best possible area for drilling	Throughout the Prospecting Period

IMPACT ASSESSMENT AND MANAGEMENT

				✓ Control through implementing activity methods statement.				
Water contamination emanating from site soil contaminations, and drainage lines crossings.	Construction	150m ²	Water; and soil	<ul style="list-style-type: none"> ✓ Control through environmental awareness training; ✓ Control through implementing activity methods statement; ✓ Control through daily inspection of site machinery and equipment; 	<ul style="list-style-type: none"> ✓ Littering must be controlled on site; ✓ Soil contamination from hazardous substances must be attended to as soon as they occur; ✓ All major water contamination must be reported to the Department of Water Affairs; ✓ Site vehicles, machinery and equipment must always be in good working conditions and daily inspections be conducted before they are used and a checklist be kept onsite; ✓ No vehicles and equipment maintenance must be done on site and faulty equipment must be taken off site. 	Protection of water sources and water quality	<ul style="list-style-type: none"> ✓ Contaminations will be prevented and when they occur they will be reported to DWS; ✓ Daily inspections will be conducted. 	Throughout the Prospecting Period
Disturbance, contamination of aquifers' in both quality and quantity	Construction	2 ha	Water	<ul style="list-style-type: none"> ✓ Control through implementing activity methods statement; ✓ Control through daily inspection of site machinery 	<ul style="list-style-type: none"> ✓ Before drilling is undertaken ground water detection must be done to avoid water bearing lithologies; and ✓ Drilling holes must be capped overnight to prevent dirt and any impurities to get underground; ✓ The drilling machineries must be kept in good working conditions to prevent leakages of hydrocarbons; 	Protection of water sources and water quality	Presence of aquifers will be tested before drilling.	Before drilling at each drilling station.
Unearthing of heritage significance artefacts	Construction	500m ²	Heritage Artefacts	Conduct site walks	<ul style="list-style-type: none"> ✓ The site walk conducted during the EIA and the history of site land uses ruled out the possibility of heritage artefacts on site; ✓ However, should any heritage significance artefacts be unearthed work at that area must be stopped immediately and the Police as well as SAHRAS be notified immediately. 	Preservation of heritage sites and objects	Site assessment was done	The site team must remain alert throughout the prospecting period
Generation of dust	Construction	1 ha	Air Quality	Control through dust suppression	<ul style="list-style-type: none"> ✓ Should the activities create significant, the working areas must be watered to prevent generation of dust 	<ul style="list-style-type: none"> ✓ Air Quality standards; ✓ Health and Safety 	Dust suppression	During prospecting activities
Generation of noise as the site is located at less than 6 km from the town.	Construction	1 Ha	Noise	<ul style="list-style-type: none"> ✓ Maintain through servicing of site equipment; and ✓ Consultation with affected parties. 	<ul style="list-style-type: none"> ✓ All site machineries must be kept in good working conditions; ✓ Faulty machineries must be taken off site for service 	Noise standards	Consult affected parties	During prospecting activities

IMPACT ASSESSMENT AND MANAGEMENT								
Potential Impact	Phase	Disturbance Scale	Aspects Affected	Mitigation Type	Mitigation Measures	Standard to be Achieved	Compliance with Standards	Time Period for Implementation
Health and safety risks arising from machinery operations and human errors.	Construction	50 m ²	Health and safety	Control through implementation of activity based methods statements;	<ul style="list-style-type: none"> ✓ Each machine operator must have a certificate of competence for that specific machinery; ✓ All site machineries must be kept in good working conditions; ✓ All excavations must be clearly marked with a reflective tape and barricaded overnight; 	Health and safety standards	Machinery kept in good working conditions;	Throughout the Prospecting Period
Site Rehabilitation								
Soil Erosion	Post Closure	500 m ²	Soil; Water; and Biodiversity	Control through storm water control beams;	<ul style="list-style-type: none"> ✓ Where necessary storm water control beams must be used to control erosion along rehabilitated access roads; ✓ Rehabilitation materials including topsoil must be free of contaminants such as hydrocarbons; ✓ Topsoil must not be compacted but care should be given to prevent erosion; 	Erosion prevention	Control erosion	During and after prospecting period
Invasion by Alien invasive plants	Post Closure	1 ha	Biodiversity	Control through monitoring and removal.	<ul style="list-style-type: none"> ✓ Invasive alien plants must be monitored during and after prospecting activities; ✓ All invasive plants must be removed once identified and a follow-up be developed. 	Preserving biodiversity	Invasive species will be monitored and cleared.	During and after prospecting period
Other Impacts								
Failing to meet local community expectations especially job creation	Construction	-	Social	Control through consultation	<ul style="list-style-type: none"> ✓ Consultations must be done with local leaders and the number of people to be employed and how they will be employed be communicated; ✓ No unauthorised personnel must be allowed into prospecting site 	Engage local community	Community will be engaged through its elected leaders	Before undertaking prospecting activities
Property theft for both the land owners/users and applicant	Planning and Construction	-	Social and Security	Implement a working security system to control site access and personnel identification.	<ul style="list-style-type: none"> ✓ All authorised personnel must have identification card; ✓ No unauthorised personnel must be allowed on site. 	Safety and Security	Ensure safety of site personnel	During prospecting activities.

5 Financial Provision

5.1 Determination of the amount of Financial Provision

5.1.1 Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under the Regulation.

The baseline environment as described in Section 8 of Part A of this report is mainly an agricultural area with sections of Critical Biodiversity Areas and Wetlands. The closure objectives will ensure that the disturbed natural environment (which was established to be sensitive) is restored. The objectives will also ensure that the soil erosion is prevented and soil fertility in disturbed agricultural areas is restored. The closure objectives are as follows:

- a) The facilitation of the re-establishment of agricultural activities and soil capability in disturbed areas;
- b) Removal of all infrastructure and material introduced to site;
- c) Removal of all wastes and their disposal;
- d) Promotion of the rapid re-establishment of the natural vegetation and the restoration of the site ecology. The disturbed areas shall be rehabilitated to ensure that:
 - ❖ The biodiversity habitat restored after prospecting;
 - ❖ Eliminate any safety risk associated with drill holes and sumps through adequate drill hole plugging and backfilling;
 - ❖ Environment and resources are not subjected to physical and chemical deterioration;
 - ❖ The site is reversed to almost its original state;
 - ❖ The after-use of the site is beneficial and sustainable in a long term;
- e) Removal, control and monitoring of alien invasive plants; and
- f) Monitoring of rehabilitation progress

5.1.2 Confirm specifically that the environmental objectives in relation to closure have been consulted with landowner and interested and affected parties.

This Basic Assessment Report and Environmental Management Programme was made available to each registered stakeholder for review and comment for a period of 30 days. This included the closure objectives as outlined in this report.

5.1.3 Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main mining activities, including the anticipated mining area at the time of closure.

Due to the nature of the activities, the impacts will be very limited and of short duration. The management plan is provided in such a manner as to ensure concurrent rehabilitation. The drill stations areas and access roads will be the main area experiencing impacts. In this event the activities will be temporary in nature, and a detailed management plan has been provided to address potential impacts associated with these activities. The main only rehabilitation activities will be required is borehole capping, rehabilitation of access roads and drill stations, and restoration of soil fertility in disturbed agricultural areas:

5.1.3.1 Borehole capping

Drill holes must be permanently capped as soon as is prospecting activities are completed at that particular borehole. Figure below provides the prepared procedure for the secure plugging of exploration drill holes.

It will be crucial to ensure that the boreholes are free from all obstructions that may interfere with the sealing of the hole. All foreign materials must be removed, together with any other infrastructure (dip tubes etc). The condition of any borehole casing and grout must be examined to ascertain whether its retention in the hole would prejudice any of the objectives of the abandonment.

The ground will be restored as closely as possible to its pre-drilled condition. The borehole will be backfilled with clean (washed), uncontaminated, or excavated materials so that the permeability of the selected materials are similar to the properties of the geological strata against which they are placed. The backfilled borehole will then mimic the surrounding natural strata and groundwater flow and quality will be protected.

The materials used to backfill must be clean, inert and non-polluting. Suitable materials include pea gravel, sand, shingle, concrete, bentonite, cement grout and uncontaminated rock.

N.B. UNDER NO CIRCUMSTANCES SHOULD MATERIALS WHICH ARE LIKELY TO CAUSE POLLUTION BE USED AS INFILL.

For artesian boreholes, the rehabilitation process will aim to confine the groundwater to the aquifer from which it came – in order to prevent loss of confining pressure and the loss of water resources to the surface or other formations. The first step is to control the artesian flow through

- ❖ Extending the casing above ground level beyond the elevation to which water will rise in the borehole (the potentiometric surface).
- ❖ Introducing a pre-cast plug at an appropriate level within the hole.

In order to prevent potentially contaminated surface run-off or other liquids entering the backfilled borehole, it is necessary to complete the backfilling of all boreholes with an impermeable plug and cap. The top two metres (or two metres below plough depth in agricultural areas) should be filled with cement, concrete or bentonite grout. A concrete cap of suitable strength, with a diameter at least one metre greater than the width of the backfilled borehole (see Fig. 1), should then be installed.

Figure 5-1: *Capping of Boreholes*

5.1.3.2 Rehabilitation of created internal access roads

The internal access roads that were created solely for prospecting activities will be ripped to facilitate vegetation regrowth. The rehabilitation of access roads will be done in consultation with the land owners and the roads will not be ripped should they want to continue using the access roads. This will be done within the limitations of all the relevant Legislations.

5.1.3.3 Re-vegetation

It is recommended that a standard commercial fertilizer high in the standard elements is added to the soil before re-vegetation, at a rate of 10 -20 kg/ha (application rate to be confirmed based on input from a suitably qualified specialist). The fertilizer should be added to the soil in a slow release granular form. A suitably qualified ecologist will be appointed to determine the appropriate veld grass mix for hand seeding.

Re-vegetation efforts will be monitored every second month for a period of six months after initial seeding. An effective vegetation cover of 45% must be achieved. Re-seeding will be undertaken if this cover has not been achieved after six months.

5.1.4 Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives

The closure objectives aim at restoring the site to its original state, i.e. conditions that were existing before the prospecting activities were undertaken. The rehabilitation measures will achieve the object, the created access roads will be ripped, boreholes capped and vegetation regrowth will be facilitated where necessary. Once all the rehabilitation activities are completed the site will be fully restored to its original state thus the closure objectives will be met.

5.1.5 Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline.

Rehabilitation	Erosion;	<ul style="list-style-type: none"> ✓ Rehabilitation rate and success ✓ Vegetation regrowth 	Applicant/ Site EO/ ECO	Post closure and findings submitted to DMRE

5.2.1 Indicate the frequency of the submission of the performance assessment/environmental audit report.

Annual performance assessments must be undertaken on the EMPr. These reports must also include the assessment of the financial provision. The reports should be submitted to the DMRE as per the requirement of section 24P(3) of NEMA (107;1998).

5.3 Environmental Awareness Plan

5.3.1 Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work

All the employees including visitors will undergo an environmental induction to ensure that all potential impacts, best practice guidelines and policies are communicated. The induction process will be conducted as per the attached Awareness Program (**Appendix 03**). The induction will cover amongst others the following:

- ❖ Legal requirements for the site i.e. EA and EMPr;
- ❖ Waste management;
- ❖ Incident and accident Management; and
- ❖ Emergency Response Procedure.

5.3.2 Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment

The following steps will be undertaken to ensure that risks are identified at the earliest and ensure that they are avoided:

5.3.2.1 Delegation of a Project Environmental Officer

An Environmental Officer (EO) must be appointed before any activity can be undertaken on site. The officer must be a qualified environmental Practitioner.

5.3.2.2 Notice of Commencement

Limpopo Province Department of Mineral Resource and Energy must be notified in writing 2 weeks before the prospecting activities are undertaken.

5.3.2.3 Environmental Documents

Prior to commencement of work on site, the EO is to ensure that the following documents are available on site:

- ❖ The Environmental Authorisation;

- ❖ The final approved Environmental Management Programme (EMPr); and
- ❖ Method statements for different site activities

5.3.2.4 Environmental Monitoring

The EO is to undertake monthly internal environmental compliance audits and prepare monthly environmental audit reports during the construction period. The internal environmental audit must include the following information:

- (i) An assessment of the Contractor's compliance with:
 - ❖ The relevant conditions of all permits: EA, WUL, etc.;
 - ❖ The approved Environmental Management Programme;
 - ❖ The approved Construction Site Plan.
 - ❖ The approved Construction Method Statements.
- (ii) Provide feedback on:
 - ❖ Environmental training undertaken;
 - ❖ Any environmental incidents or complaints;
 - ❖ Waste type quantities recycled and disposed;
 - ❖ Any environmental issues identified;
 - ❖ The results of any environmental investigations;
 - ❖ Actions undertaken from previous audits; and
 - ❖ Recommended actions to be undertaken.

5.3.2.5 Environmental Training

Prior to working on site, every person that will be undertaking any retrofit activities must receive training on the relevant environmental management requirements. The EO is to ensure that the environmental training includes the relevant requirements from:

- ❖ All site authorisations; and
- ❖ The final approved Environmental Management Programme.

5.3.2.6 Development of procedures and checklists

The following procedures will be developed and all staff and workers will be adequately trained on the content and implementation thereof.

Emergency Preparedness and Response: The procedure will be developed to specifically include risk identification, preparedness, response measures and reporting. The procedure will specifically include spill and fire risk, preparedness and response

measures. The appropriate emergency control centers (fire department, hospitals) will be identified and the contact numbers obtained and made available on site. The procedure must be developed in consultation with all potentially affected land owners. In the event that risks are identified which may affect adjacent landowners (or other persons), the procedure will include the appropriate communication strategy to inform such persons and provide response measures to minimize the impact.

Incident Reporting Procedure: Incident reporting will be undertaken in accordance with an established incident reporting procedure to (including but not limited to):

- ✓ Provide details of the responsible person including any person who: (i) is responsible for the incident; (ii) owns any hazardous substance involved in the incident; or (iii) was in control when the incident occurred;
- ✓ Provide details of the incident (time, date, location);
- ✓ The details of the cause of the incident;
- ✓ Identify the aspects of the environment impacted;
- ✓ The details corrective action taken, and
- ✓ The identification of any potential residual or secondary risks that must be monitored and corrected or managed.

Environmental and Social Audit Checklist: An environmental audit checklist will be established to include the environmental and social mitigation and management measures as developed and approved as part of the Environmental Management Plan. Non- conformances will be identified and corrective action taken where required.

6 Specific information required by the Competent Authority

No specific information was required by the Competent Authority.

7 UNDERTAKING

The EAP herewith confirms

- a. The correctness of the information provided in the reports
- b. The inclusion of comments and inputs from stakeholders and I&APs;
- c. The inclusion of inputs and recommendations from the specialist reports where relevant; and
- d. That the information provided by the EAP to interested and affected parties and any responses by the EAP to comments or inputs made by interested and affected parties are correctly reflected herein.

APPENDIX 02: EAP CV

APPENDIX 03: ENVIRONMENTAL AWARENESS PLAN

1. Introduction

Legislation requires that a prospecting company who prepares an environmental management program must develop an environmental awareness plan describing the manner in which the company intends to inform his or her employees of any environmental risks which may result from their work and the manner in which the risks must be dealt with in order to avoid pollution or the degradation of the environment. In recognition of the need to protect our environment, environmental management should not only be seen as a legal obligation but also as a moral obligation.

1.1. The Environmental Awareness Plan (EAP)

The EAP forms part of the EMPr and is intended to create the required awareness and culture with personnel and contractors/service providers on environmental safety and health issues associated with the prospecting activities.

1.2. The applicant's policy on environmental awareness

This Environmental Awareness Plan (EAP) will serve as the basis for the induction of all new employees (as well as contractors pending the nature of their work on site) on matters as described herein and read in conjunction with the EMPr. The Plan will also be used to hone awareness of all employees on a continuous basis. Specific environmental awareness performance criteria will also form part of the job descriptions of employees, to ensure diligence and full responsibility at all levels of the organisational work force.

1.3. Fostering environmental awareness

General environmental awareness will be fostered among the project's workforce to encourage the implementation of environmentally sound practices throughout its duration. This will ensure that environmental accidents are minimized and environmental compliance maximized.

Environmental awareness will be fostered in the following manner:

- a) Induction course for all workers on site, before commencing work on site.
- b) Refresher courses as and when required
- c) Daily toolbox talks at the start of each day with all workers coming on site, where workers can be alerted to particular environmental concerns associated with their tasks for that day or the area/habitat in which they are working.

- d) Taking part in national and international environmental campaigns like National Marine Week, National harbour day, National Wetlands day exacta.
- e) Displaying of information posters and other environmental awareness material in the general assembly points.

1.4. Training and environmental awareness

The company accepts that environmental awareness training is critical for the workforce to understand how they can play a role in achieving the objectives specified in the EMPr and ensure that the actions specified in the EMPr are implemented effectively and efficiently. It is vital that all personnel are adequately trained to perform their designated tasks to an acceptable standard.

2. The environmental awareness training course

All employees should attend the course, regardless of position, status or level of responsibility. With a background of basic environmental awareness and an understanding of basic environmental issues and sensitivities, personnel may be motivated and empowered to do their share in helping to maintain the integrity of the environment on the prospecting site through environmental impact management.

The goal of this course is therefore to enable a shared understanding and common vision of the environment, the impact of a prospecting operation on the environment (and why this is important) and the role of prospecting personnel in terms of environmental management and compliance.

The induction course will compose of the following steps:

- The first step will include background discussion of the environment concept: of what it comprises and how we interact with it.
- The second step will be a description of the components and phases of the specific Prospecting operation.
- The third step will be a general account of how the Prospecting operation and its associated activities can affect the environment, giving rise to what we call Environmental Impacts.
- The fourth and most important step will be a discussion of what staff can do in order to help prevent the negative environmental impacts from degrading our environment. This is known as Environmental Impact Management.

3. Course content

The following can be seen as draft course content as it will be building on as specific needs arises and will be supplemented with the handout of reading material and extracts of the EMPr on which the course will be based.

3.1. The environment

The environment consists essentially of the living environment, the non-living environment and the man-made environment. The living environment consists of our plant and animal resources. The non-living environment includes the soil, water and geological resources. The man-made environment comprises our infrastructure, social, cultural and archaeological resources.

These environments depend on one another, and man depends on them all for his survival. Damage to one will be felt by so we must try to protect the as well as their interactions with one another as they occur in nature.

When undertaking a Prospecting operation or any other form of development this concept must be kept in mind. Development must be implemented in such a way that we benefit today without compromising the ability of future generations to benefit as well. Employees should understand this concept of sustainability and sustainable development.

3.2. Description of the components and phases of the operation

The project description should be explained as part of induction together with the main components or activities that can affect the environment, giving rise to what we call environmental impacts. The Prospecting operation consists of a number of different components

3.3. Description of Environmental Impacts

A general account of how the Prospecting operation and associated activities can affect the environment must be explained. This is basically a description of concept of environmental impacts.

a) What is an Environmental Impact?

An environmental impact is the result, either good or bad, of man's actions on the natural environment This results in one or many changes in the environment may also affect the availability of resources and the environment's capacity to function.

Impacts can occur either as a result of:

- The use of a resource;
- Or the pollution of a resource.

In addition, impacts can be categorised as the following:

- Foreseen, such as the necessary clearing of the vegetation before Prospecting begins, or Unforeseen, such as the flooding of an area following heavy rains;
- **Avoidable**, such as the unnecessary spillage of diesel during refuelling- or **Unavoidable**, such as the disturbance created during drilling; **Simple**- such as litter untidying the prospecting site, or **Cumulative** which is a collective impact from different existing activities.

a) Environmental Impacts

Typical environmental impacts anticipated on a Prospecting site include the following:

The loss of plants; The loss of animals; Soil pollution; Dust liberation; Soil compaction and erosion; and Water pollution;

b) Causes of environmental impacts

These environmental are caused primarily by inadequate planning & not adhering to the EMPr Specifications'.

- The inadequate planning & preparation of the Prospecting site;
- The uncontrolled expansion of the Prospecting site footprint;
- The uncontrolled activity of Prospecting staff;
- The injudicious removal / disturbance of vegetation and habitat;
- The unnecessary loss of soil;
- Uncontrolled vehicular movement & circulation;
- The haphazard storage of vehicles, equipment and material;
- The uncontrolled servicing, repair and refuelling of vehicles;
- Unclear policy on solid waste management;
- Unclear policy on waste water;
- The uninformed use, storage and disposal of hazardous material;
- The erosive power of storm water and runoff;
- Unintentional fires;

3.4. Description of Environmental Impacts Mitigation

The fourth and most important step of an induction course will be a discussion of what staff can do in order to help prevent the negative environmental impacts from degrading their environment. This is known as Environmental Impact Management and is also described in the Environmental Management Programme. The course discussion should also include general environmental code of conduct practices such as:

Impact management: Prospecting site establishment (general):

- Do not cross any site fences;
- Do not walk, drive or store material in rehabilitating areas;
- Report any access into fenced off areas to the foreman environmental manager;
- Use only areas designated for certain construction activities;
- Do not access any stream or water body without permission;
- Report any headstones, graves or human remains you may find to the foreman environmental manager;

Impact management: Construction phase (general):

- Only eat, cook, sleep and recreate in the areas designated on site;
- Do not bathe anywhere except in the designated areas on site;
- Always use the toilet facilities provided;
- Only use the water provided on site- do not collect water from or dispose water into a natural water course;
- Always make use of the specified Prospecting site safety measures;
- Do not hunt, kill or injure any animals anywhere on site;
- Inform the foreman environmental of any dangerous or problem
- Do not leave any food or rubbish where scavengers can get at it. Impact management: Health and safety (general):
- Always use the toilet & hand washing facilities provided.
- Only use the water provided on site - do not collect water from or dispose water into a natural water course.
- Make use of the specified protective gear for noisy and dusty conditions.
- Always wear proper protective head and foot gear while on site.
- Know where to find a list of emergency numbers in the event of one.
- Report accidents, injuries and unsafe site conditions to the Safety Officer.

Impact management: Vegetation clearing (general):

- Do not damage, destroy or remove any significant tree that has been marked;
- No firewood may be harvested without permission;
- Newly planted trees may not be disturbed in any way;
- Do not excavate beneath the crown of any tree that has been marked;
- No conserved tree may be used to support or hang anything in;
- Report to the foreman environmental manager any damage to any significant tree that has been marked.

Impact management: Top Soil removal and storage (general):

- Only excavate soil, gravel, rock etc. from designated areas;
- Stockpile soil only as instructed and at the time it is instructed;
- Do not make new stockpiles without permission;
- Do not use soil or remove soil from any stockpile without permission;
- Do not walk, drive or store any equipment, machinery or material on any stockpile.

Impact management: Access and transport (general):

- Only drive on designated roads and tracks;
- Move obstacles out of the way rather than drive around them;
- Only cross drainage lines at designated points;
- Always drive within the specified speed limit.

Impact management: Storage of vehicles, equipment and material (general):

- Do not leave machinery and equipment standing around if not in use;
- Only park vehicles in designated areas;
- Do not park heavy vehicles or store equipment under or near trees
- Do not store machinery, vehicles or materials in undisturbed or rehabilitating areas.

Impact management Servicing, repair and refuelling of vehicles (general):

- Only service machinery and vehicles in designated areas;
- Regularly check your vehicle for fuel and oil leaks;
- Inform the foreman environmental manager of leaking vehicles and machinery so that he can schedule repairs;
- Only refuel by means of a pump and on the bund created for that purpose;

- Immediately clean any accidental fuel and oil spills - do not hose spills into the natural environment;
- Dispose of contaminated soil as hazardous waste in the correct location on site.

Impact management: Solid waste management (general):

- Do not litter - make use of refuse bins provided;
- Concrete may only be mixed in designated areas and not directly on the ground;
- Do not hose spills into the natural environment - inform the foreman environmental manager of spills you are unable to clean yourself;
- Dispose of construction rubble only in specified storage areas - if in doubt, ask;
- Do not bury, hide or burn any waste of any nature;
- Inform the foreman of any illegal litter or dumping site that you encounter.
- Impact management: Waste water management (general):
- Do not use any natural water course to wash machinery, vehicles or equipment;
- Only wash machinery, vehicles or equipment in designated areas;
- Conserve water and report any leaks and overflow to the foreman,

Impact management: Management of hazardous material (General):

- Make sure that you know how to handle all hazardous substances;
- Do not access stores for hazardous substances without permission;
- Immediately clean any minor accidental spills and leaks;
- Do not hose any leaks or spills into the natural environment;
- Dispose of all hazardous waste in specified storage areas - if in doubt, ask;
- Immediately report any major leaks and spills to the foreman environmental manager.

Impact management: Fire management (General)

- Do not make open fires except in permitted areas and at permitted times;
- Do not leave any fires unattended. Extinguish these before you leave the area;
- All cooking is to be done on gas / electric stoves and only in the areas provided;
- Ensure that you know where firefighting equipment is located.

APPENDIX 04: SCREENING REPORT
