External surface of the entire building to be prepared and painted to DoH requirements and specifications. Prepare all painted surfaces and repaint to specifications.

DAMP-PROOFING

Evidence of rising damp shall be further investigated, exposed and treated by the contractor. New internal wall that supports the new slab shall be provided with damp-proofing (DPC) and vapour barrier installations to protect the wall against rising damp and the interior of the building against ingress of moisture from abutting ground. On existing Walls, The Contractor will need to engage a damp specialist to locate the problem areas. Once this has been done, an effective chemical substitute and concrete layer will need to be reinforced to prevent rising damp. It is recommended that a Safeguard Chemicals range of Chemical DPC injection to create a chemical DPC be used once it has diffused into the brick and mortar - this will halt the rising damp. The affected areas should be replastered with salt retardant additives (to eliminate hygroscopic salts), and once this has cured, the substrate can be restored and re-decorated.

CEILING

1. Carefully remove all existing light fittings, store away as directed and prepare for new installations as specified.
2. Inspect, repair accordingly all damaged and cracked slab soffit, apply new paint and make good the works.
