PROJECT MAIN FEATURES

Project main features - according to the EIA guidelines Summary of information included in the report

General site information

Site location	
Farm	Weltevrede 681 IN
Portion	Reminder portion
Surveyor-general 21 digit site	T0IN00000000068100000
Local Municipality	Naledi
District Municipality	DR Ruth Segomotsi
Province	North West

Property details	
Extent	519.3247 hectares
Land Owner	MARTHINUS NEL STEYN
Diagram deed number	T973/1959
Title deed number	T1732/2006
Registration date	20060519
Current land use	grazing

Site data	
Latitude	26° 56' 30" S
Longitude	24° 54' 15" E
Altitude	1265 m m.s.l.
Ground slope	flat

PV power plant design specifications and connection to the Eskom grid

Project data	
Project name	CAROCRAFT SOLAR PARK
Technology	Photovoltaic power plant
Number of Phases	1
Maximum generating capacity at the delivery point	Up to 60 MW
Type of PV modules	Thin-film or Mono/Polycrystalline
Type of mounting system	fixed or horizontal single-axis trackers (SAT)
Average annual energy production (up to)(*)	up to 124.8 GWh/year with thin film modules mounted on fixed mounting system up to 138.7 GWh/year with mono/polycrystalline modules mounted trackers
Load factor (*)	0.217 with thin film modules mounted on fixed mounting system 0.245 with mono/polycrystalline modules mounted trackers
Full net equivalent hours (EOH) (*)	1900 h/year (Wh/Wp/y) with thin film modules mounted on fixed mounting systems 2150 h/year (Wh/Wp/y) with mono/polycrystalline modules mounted trackers

(*) calculated by PVSYST, simulation professional tool

Technical specifications	
Installed power capacity - AC side	up to 60 MW
Installed power capacity - DC side	up to 65,707,200 Wp with thin film modules up to 64,512,000 Wp with mono/polycrystalline modules
Number of PV modules	up to 486,720 with thin film modules of 135 Wp each up to 230,400 with mono/polycrystalline modules of 280 Wp each
Number of structures (PV arrays)	up to 12,480 fixed mounting systems up to 5,760 trackers (SAT)
Minimum structure height above ground level	1.0 m
Maximum structure height above ground level	3.1 m

Other information	
Footprint, including internal roads (fenced area)	up to 175 hectares
PV power plant lifetime	25 - 30 years
Construction camp (temporary)	10 hectares
Construction timeframe	15 months

Connection to the Eskom grid (**)	
Connection solution: description	<p>The connection to the Eskom grid will be done according to the Eskom connection solution which may require:</p> <p>(i) one small on-site high voltage substation with one or more high-voltage power transformers and a high-voltage bus bar (switching station) to be connected to the Eskom 88 kV power line called "Delareyville Munic/Vryburg 1", which crosses the project site;</p> <p>(ii) two new small sections of line (at 88 kV) allowing the Eskom "Delareyville Munic/Vryburg 1" 88 kV power line to loop in and out of the 88 kV busbar of the new on-site substation.</p> <p>The connection solution may also entail intervention on the Eskom grid and/or on Eskom "Delareyville Munic / Vryburg 1" 88 kV power line.</p>
Point of connection	Delareyville Munic/Vryburg 1+88 kV power line
Point of connection (farm, portion)	Reminder Portion of Weltevrede 681 IN
Delivery point: voltage level	88 kV (132 kV if the Eskom "Delareyville Munic / Vryburg 1" 88 kV power line will be upgraded to 132 kV by Eskom).
New sections of power line - overall length	2x100 m
New HV substation inside the property - footprint	approximately 4,000 m ²
Servitudes for new power lines	not required
(**) already included in the current EIA application	

Water requirements	
Water consumption	See on paragraph 4.2.5 - water requirements

Site maps and GIS information

<i>Status quo information - site</i>	<i>ESRI shape files - see CD-rom attached</i>
Site	Remainder Portion of Weltevrede 681 IN
Building and other structures	To be provided
Agricultural field	Not applicable

1. INTRODUCTION

CAROCRAFT Proprietary Limited (Reg. n. 2012/001615/07) is proposing the development of a renewable solar energy facility in a key strategic location in terms of the connection to the Eskom® grid and in terms of the favourable solar irradiation.

The proposed site is located on **the southern side (±190 hectares) of the Remainder Portion of the Farm Weltevrede 681 IN**, 519.3247 hectares in extent (Naledi Local Municipality, Dr Ruth Segomotsi Mompati District Municipality, North West Province) for the establishment of a solar energy facility with associated infrastructure and structures.

Site location: Remainder Portion of the Farm Weltevrede 681 IN

T	0	I	N	0	0	0	0	0	0	0	0	0	6	8	1	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

The name of the project is **CAROCRAFT SOLAR PARK** and it envisages a **photovoltaic (PV) power plant having a maximum generating capacity up to 60 MW**.

The **footprint** (fenced area) of the proposed development is up to **175 hectares** on an overall area measuring 190 hectares (lease portion), within the Remainder Portion of the Farm Weltevrede 681 IN (519.3247 in extent).

The Carocraft Solar Park is participating to the IPP Procurement Programme issued on 3 August 2011 by the DoE (Department of Energy).

The Carocraft Solar Park will be connected to the **Eskom's "Delareyville Munic/Vryburg 1" 88 kV power line**, which crosses the project site, through two new small sections of 88 kV power line, approximately 100 m long.

In order to develop the facility, Carocraft must undertake an Environmental Impact Assessment (EIA) process and acquire environmental authorization from the National Department of Environmental Affairs (DEA), in consultation with the North West Department of Economic Development, Environment, Conservation and Tourism (DEDECT) in terms of the EIA Regulations (2010) published in terms of Section 24(2) and 24D of the National Environmental Management Act (NEMA, Act No. 107 of 1998).

This project has been registered with the **DEA application reference number 14/12/16/3/3/2/374** and with **NEAS reference: DEA/EIA/0001304/2012**.

The EIA procedure of the Carocraft Solar Park **includes the connection to the Eskom grid**. Eskom is the entity which assessed the connection solution included and described in this Scoping Report. Eskom also coordinated the necessary liaising between the developer, Eskom Transmission, Eskom Distribution and Eskom Land & Rights Department.

It is important to highlight that all or part of the infrastructure required for the connection (all located inside the site) may be owned and/or operated by Eskom Distribution, this will depend on the Eskom grid code in relation to the IPPs (Independent Power Producers) and on the Connection Agreement to be finalized prior to or simultaneously with the conclusion of the PPA (Power Purchase Agreement) in respect of the options of retaining ownership of the connection works once completed.

The independent Environmental Assessment Practitioners (EAPs) which have been appointed for the undertaking of the detailed environmental studies in compliance with the 2010 EIA Regulations are **AGES (Pty) Ltd**.

With the aim of identifying and assessing all potential environmental impacts related to the development as well as suggesting possible mitigation measures and alternatives, AGES has appointed specialist sub-consultants to compile detailed reports and to study the activities necessary for the assessment of the specific impacts related to their field of expertise.

AGES and the other specialist consultants are in a position of independency from Carocraft; therefore they are not subsidiaries or affiliated to the latter. AGES and the specialist consultants have no secondary interest connected with the development of this project or of other projects which may originate from the authorization of the project.

The characteristics, the technology and the extent of the Carocraft Solar Park are defined and evaluated in this Final Scoping Report and its annexures.

2. MOTIVATION AND RATIONALE OF THE CAROCRAFT SOLAR PARK IN LIGHT OF THE IPP PROCURMENT PROGRAMME REQUIREMENTS

2.1. THE CHOICE OF THE NORTH WEST PROVINCE AND OF THE SITE LOCATION

The Carocraft Solar Park will be located in the North West Province. The North West Province has been identified by Carocraft as an ideal macro area for establishing a solar PV plant on the basis of several important considerations:

- solar resource is exceptionally high: the *global horizontal irradiation* of the site is 2,097.8 kWh/m²/year;
- there are few green projects currently under development in North West and it is clear that the %green energy quota+can be achieved mainly by means of solar projects, considering the high solar resources and the availability of desolate lands with low ecological and agricultural value;
- North West province and the local municipalities and communities are eager to start establishing an eco-green image in consideration of the burden of CO₂ emissions they have to bear.

In addition to these very favourable characters in terms of desirability of renewable solar energy projects in the North West province, the site of the Carocraft Solar Park has been chosen by Carocraft on the grounds of several considerations, in particular:

- the availability of an easy connection solution due to the presence of the Eskom's 88 kV power line called "Delareyville Munic/Vryburg 1", which crosses the project site;
- the flatness of southern side of the proposed project site;
- the low ecological sensitivity of southern side of the proposed project site.

Furthermore, in the light of the IPP procurement Programme requirements, the **Carocraft Solar Park** has been developed according to the following main characteristics:

- the installed capacity is within the %eligible capacity+defined by the rules of the RFP (from 1 MW to 75 MW);
- the construction phase will last approximately 15 months and the PV plant will be able in commercial operation before the end of 2016.

With specific reference to the Carocraft Solar Park, Eskom has indicated that the project does not interfere with Eskom's present and future developments and do not affect negatively the voltage in the area. Eskom, as an interested and affected party, recognized the positive outcome of the project in terms of the possibility of meeting the local growth of the energy consumption that is expected.

2.2. NEED AND DESIRABILITY OF THE PROJECT

South Africa currently relies principally on fossil fuels (coal and oil) for the generation of electricity. At the present date, Eskom generates approximately 95% of the electricity used in South Africa. On the other hand, South Africa has a largely unexploited potential in renewable energy resources such as solar, wind, biomass and hydro-electricity to produce electricity as opposed to other energy types (fuel or coal).

South Africa's electricity supply still heavily relies upon coal power plants, whereas the current number of renewable energy power plants is very limited. In the last few years, the demand for electricity in South Africa has been growing at a rate of approximately 3% per annum. These factors, if coupled with the rapid advancement in community development, have determined the growing consciousness of the significance of environmental impacts, climate change and the need for sustainable development. The use of renewable energy technologies is a sustainable way in which to meet future energy requirements.

The development of clean, green and renewable energy has been qualified as a priority by the Government of South Africa with a target goal for 2013 of 10,000 GWh, as planned in the Integrated Resource Plan 1 (IRP1) and with the Kyoto Protocol.

Subsequently the Department of Energy of South Africa (DoE) decided to undertake a detailed process to determine South Africa's 20-year electricity plan, called Integrated Resources Plan 2010-2030 (**IRP 2010**).

The IRP1 (2009) and the IRP 2010 (2011) outline the Government's vision, policy and strategy in matter of the use of energy resources and the current status of energy policies in South Africa. In particular, the IRP 2010 highlights the necessity of commissioning 1200 MW with solar PV technology by the end of 2015.

In order to achieve this goal, the DoE recently announced a renewable energy IPP (Independent Power Producers) Procurement Programme.

The IPP Procurement Programme, issued on 3rd August 2011, envisages the commissioning of 3725 MW of renewable projects (1450 MW with solar photovoltaic technology) capable of beginning commercial operation before the end of 2016.

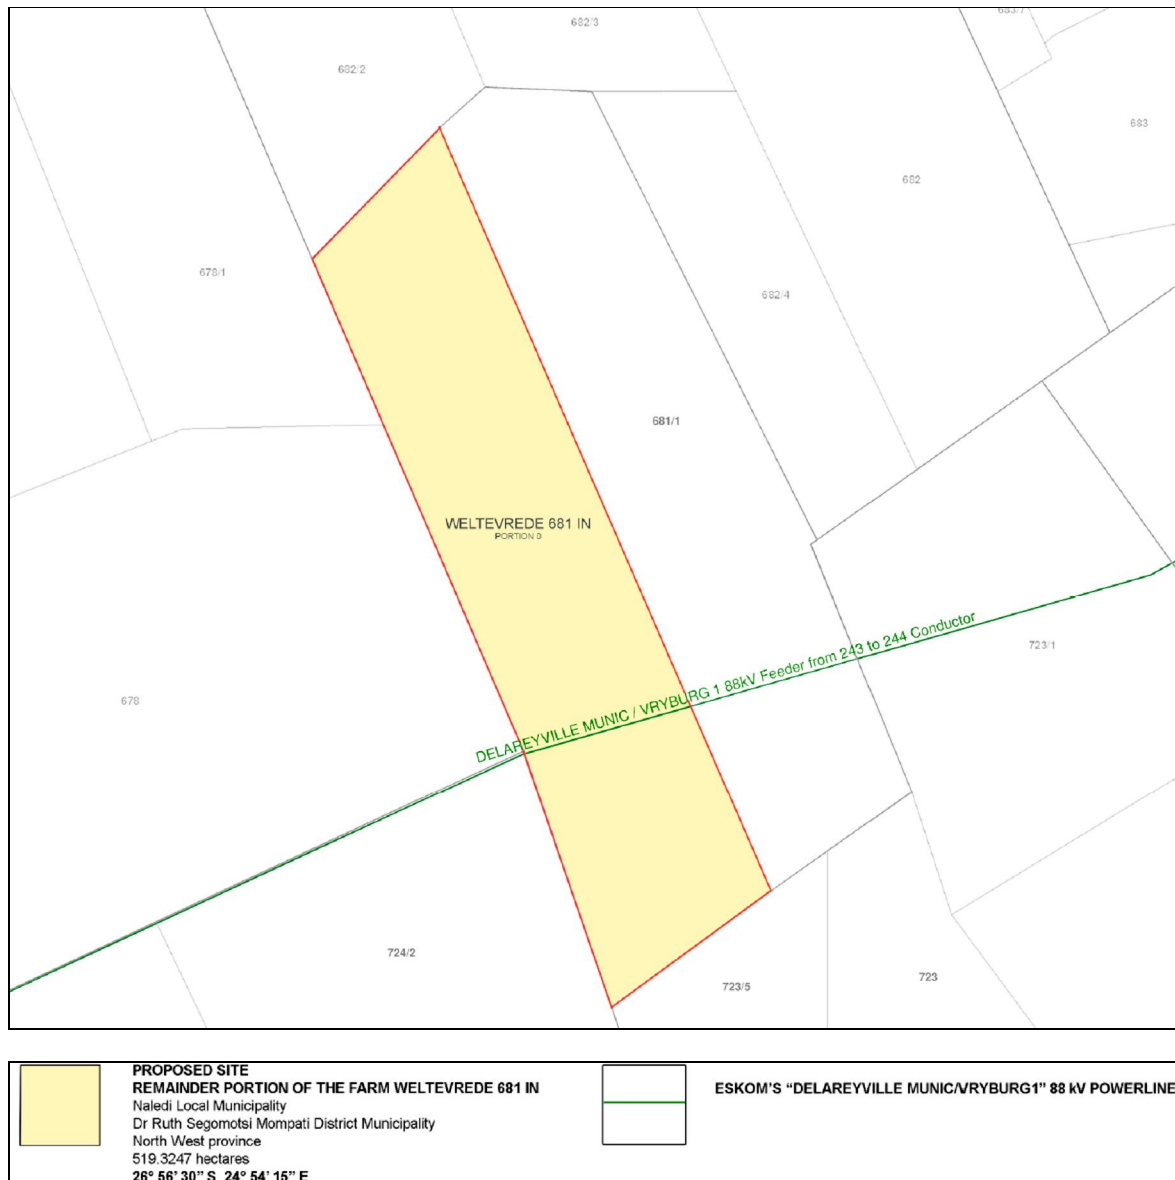

Therefore, the development of photovoltaic power plants will represent a key feature in the fulfilment of the proposed target goal and the reduction of CO₂ emissions.

The purpose of the Carocraft Solar Park is to add new capacity for the generation of renewable electric energy to the national electricity supply in compliance with the IPP Procurement Programme and in order to meet the %sustainable growth+of the North West province.

The use of solar radiation for power generation is considered as a non-consumptive use and a renewable natural resource which does not produce greenhouse gas emissions. The generation of renewable energy will contribute to the growth of South Africa's electricity market, which has been primarily dominated up to this date by coal-based power generation. With specific reference to photovoltaic energy, and the proposed project, it is important to consider that South Africa has one of the highest levels of solar radiation in the world.

The reasons for the location of the project in the selected area can be synthesized as follows:

- low requirement for municipal services;
- compliance with national and provincial energy policies and strategies;
- no impact on people health and wellbeing;
- no waste and noise;
- no impact on air quality;
- compatibility with the ecosystem and the surrounding landscape;
- likelihood of social and economic development of marginalized, rural communities; and
- attraction of environmentally aware (green) tourists to the area.

Figure 1 Locality map of the project site

3. AUTHORITIES, LEGAL CONTEXT AND ADMINISTRATIVE REQUIREMENTS

The legislative and regulatory framework of reference for the solar power plant project includes statutory and non-statutory instruments by which National, Provincial and Local authorities exercise control throughout the development of the same project.

The development and the environmental assessment process of a solar power plant project involve various authorities dealing with the different issues related to the project (economic, social, cultural, biophysical etc.).

3.1. REGULATORY AUTHORITIES

3.1.1. National Authorities

At national level, the main regulatory authorities and agencies are:

- *Department of Energy (DoE)*: the Department is competent and responsible for all policies related to energy, including renewable energy. Solar energy is contemplated and disciplined under the White Paper for Renewable Energy and the Department constantly conducts research activities in this respect;
- *Department of Environmental Affairs (DEA)*: the Department is competent and responsible for all environmental policies and is the controlling authority under the terms of NEMA and EIA Regulations. The DEA is also the competent authority for the proposed project, and is entrusted with granting the relevant environmental authorisation;
- *National Energy Regulator of South Africa (NERSA)*: the Regulator is competent and responsible for regulating all aspects dealing with the electricity sector and, in particular, issues the licence for independent power producers;
- *South African Heritage Resources Agency (SAHRA)*: the Agency is responsible for the protection and the survey, in association with provincial authorities of listed or proclaimed sites, such as urban conservation areas, nature reserves and proclaimed scenic routes under the terms of the National Heritages Resources Act (Act no. 25 of 1999);
- *South African National Roads Agency Limited (SANRAL)*: the Agency is responsible for all National road routes.

3.1.2. Provincial Authorities

At provincial level, the main regulatory authority is *North West Department of Economic Development, Environment, Conservation and Tourism (DEDECT)* and this Department is responsible for environmental policies and is the Provincial authority in terms of NEMA and the EIA Regulations. The Department is also the commenting authority for the proposed project.

3.1.3. Local Authorities

At a local level, the local and municipal authorities are the principal regulatory authorities responsible for planning, land use and the environment. In the North West province, Municipalities and District Municipalities are involved in various aspects of planning and the environment related to solar energy facilities development. The Local Municipality is the *Naledi Local Municipality* which is part of the *Dr Ruth Segomotsi Mompati District Municipality*.

Under the terms of the Municipal System Act (Act no. 32 of 2000), all municipalities are deemed to go through an Integrated Development Planning (IDP) process in order to devise a five-year strategic development plan for the area of reference.

The identification of priority areas for conservation and their positioning within a planning framework of core, buffer, and transition areas is the subject of bioregional planning. Priority areas are individuated and defined with reference to visual and scenic resources and their identification and protection is granted through visual guidelines drafted for the area included in bioregional plans.

Local authorities also provide specific by-laws and policies in order to protect visual and aesthetic resources with reference to urban edge lines, scenic drives, special areas, signage, communication masts etc.

Finally, there are also various non-statutory bodies and environmental groups, who are involved in the definition of various aspects of planning and the protection of the environment, which may influence in the development of the proposed project.

3.2. LEGISLATION, REGULATIONS AND GUIDELINES

A review of the relevant legislation involved in the proposed development is detailed in table 1 below.

Table 1 Review of relevant legislation

National Legislation	Sections applicable to the proposed project
Constitution of the Republic of South Africa (Act no. 108 of 1996)	<ul style="list-style-type: none"> • Bill of Rights (S2) • Rights to freedom of movement and residence (S22) • Environmental Rights (S24) • Property Rights (S25) • Access to information (S32) • Right to just administrative action (S33)
Fencing Act (Act no. 31 of 1963)	<ul style="list-style-type: none"> • Notice in respect of erection of a boundary fence (S7) • Clearing bush for boundary fencing (S17) • Access to land for purpose of boundary fencing (S18)
Conservation of Agricultural Resources Act (Act no. 43 of 1983)	<ul style="list-style-type: none"> • Prohibition of the spreading of weeds (S5) • Classification of categories of weeds & invader plants and restrictions in terms of where these species may occur (Regulation 15 of GN R0148) • Requirement and methods to implement control measures for alien and invasive plant species (Regulation 15E of GN R0148)
Environment Conservation Act (Act no. 73 of 1989)	<ul style="list-style-type: none"> • National Noise Control Regulations (GN R154 dated 10 January 1992)

R.546, 18 June 2010	14	<p><i>The clearance of an area of 5 hectares or more of vegetation where 75% or more of the vegetative cover constitutes indigenous vegetation, except where such removal of vegetation is required for:</i> <i>(i) purposes of agriculture or afforestation inside areas identified in spatial instruments adopted by</i></p>

		<p><i>the competent authority for agriculture or afforestation purposes;</i></p> <p><i>(ii) the undertaking of a process or activity included in the list of waste management activities published in terms of section 19 of the National Environmental Management: Waste Act, 2008 (Act No. 59 of 2008) in which case the activity is regarded to be excluded from this list;</i></p> <p><i>(iii) the undertaking of a linear activity falling below the thresholds in Notice 544 of 2010.</i></p> <p><i>a) In Eastern Cape, Free State, KwaZulu-Natal, Gauteng, Limpopo, Mpumalanga, Northern Cape, Northwest and Western Cape: All areas outside urban areas.</i></p> <p>The Photovoltaic Power Plant with associated infrastructure and structures will be constructed and operated on a footprint bigger than 20 hectares on an overall available area measuring approximately 519 hectares in size. The required footprint should be cleared from the existing trees.</p>
--	--	---

The current EIA procedure of the Carocraft Solar Park **includes the connection to the Eskom grid**. Furthermore, a part of the connection infrastructure (the 88 kV busbar of the in-site substation and the two new sections of power line) may be executed, owned and operated by Eskom.

Final layout and site plans already drafted by Carocraft will be completed once inputs, via public participation have been received, analysed and reviewed. All information acquired will be analysed in order to determine the proposed final development layout and site plans.

Such approach will ensure a holistic view of future requirements of the site and that resources are utilised to their full availability in terms of social and environmental sustainability. It must also be pointed out that this application and all other development applications, in the area, are considered together in order to ensure general sustainability in the Naledi Local Municipality and in the Dr Ruth Segomotsi Mompati District Municipality areas.

4. PROJECT DESCRIPTION AND FUNCTIONING

The project envisages the establishment of a solar power plant with a **maximum generation capacity at the delivery point up to 60 MW**.

The construction timeframe is estimated in approximately 15 months, whereas the commissioning date will depend on the IPP Procurement Programme timeframe.

The preferred technical solutions envisage:

- **thin-film modules mounted on fixed mounting systems**
- **polycrystalline modules mounted on horizontal 1-axis trackers.**

A combination of the abovementioned two solutions is also possible.

The estimated annual energy production is calculated in approximately:

- **1900 kWh/kWp/year** (load factor = 0.217), in the case of thin film modules mounted on fixed mounting systems; or
- **2,150 kWh/kWp/year** (load factor = 0.245) in the case of polycrystalline modules mounted on trackers.

Therefore, the Carocraft Solar Park will generate:

- up to **124.8 GWh per year** in the case of thin film modules mounted on fixed mounting systems; or
- up to **138.7 GWh per year** in the case of polycrystalline modules mounted on trackers

The calculation is made by the professional tool "PVSYST" and the simulation is done for 1 MWp (1 "PV field").

The site data (irradiation, temperature, etc.) charged on the database consists of hourly meteo-data registered by NASA satellites (NASA-SSE satellite data 1983-1993, release 6) and the simulation is made for the timeframe of 1 year.

The output (1900 kWh/kWp/year and 2,150 kWh/kWp/year) is also called **%all net equivalent hours**, which represent the average energy injected into the grid per 1 kWp of installed capacity.

The *global horizontal irradiation* of the site is 2,097.8 kWh/m²/year (NASA-SSE satellite data, 1983-1993, release 6).

The energy generated by the Carocraft Solar Park will reduce the quantity of pollutants and greenhouse gases emitted into the atmosphere. The reduced amount of CO₂ will be the emissions that would have been generated by a thermal power plant using fossil fuels for producing the same quantity of energy that it is produced by the Carocraft Solar Park.

The quantity of the avoided CO₂ is calculated as follows: the energy produced by the Carocraft Solar Park (up to 124.8 GWh/y) or 138.7 GWh/y) is multiplied by the Eskom's average emission factor which is 1.015 t CO₂/MWh (*source*: Energy Research Centre, University of Cape Town. (2009 *Carbon accounting for South Africa*).

This means that, in the case of the Carocraft Solar Park, the **avoided CO₂ emissions** are approximately **126,716 tons of CO₂ per year** in the case of thin film modules mounted on fixed mounting systems, or **140,781 tons of CO₂ per year** in the case of polycrystalline modules mounted on trackers.

Furthermore, considering that 1 kg of coal generates approximately 3.7 kWh (supposing a caloric value of 8000 kcal/kg and a coal plant efficiency of 40%), **the coal saved by the Carocraft Solar Park will be of approximately 33,742 tons of coal / year** in the case of thin film modules mounted on fixed mounting systems, or **37,487 tons of coal / year** in the case of polycrystalline modules mounted on trackers.

The detailed description of the characteristic and functioning of the plant and its connection is given in the following paragraphs.

4.1. PROJECT LAYOUT

The layout of the proposed development is the result of a comparative study of various layout alternatives and had been defined in consideration of the results of some specialists studies conducted during this scoping phase.

The PV plant is designed and conceived in order to minimize visual and noise impacts, as well as to operate safely and assuring a high level of reliability, with low water consumption and the need only for easy and quick maintenance and repair for approximately 25-30 years.

The main drives of the chosen layout were:

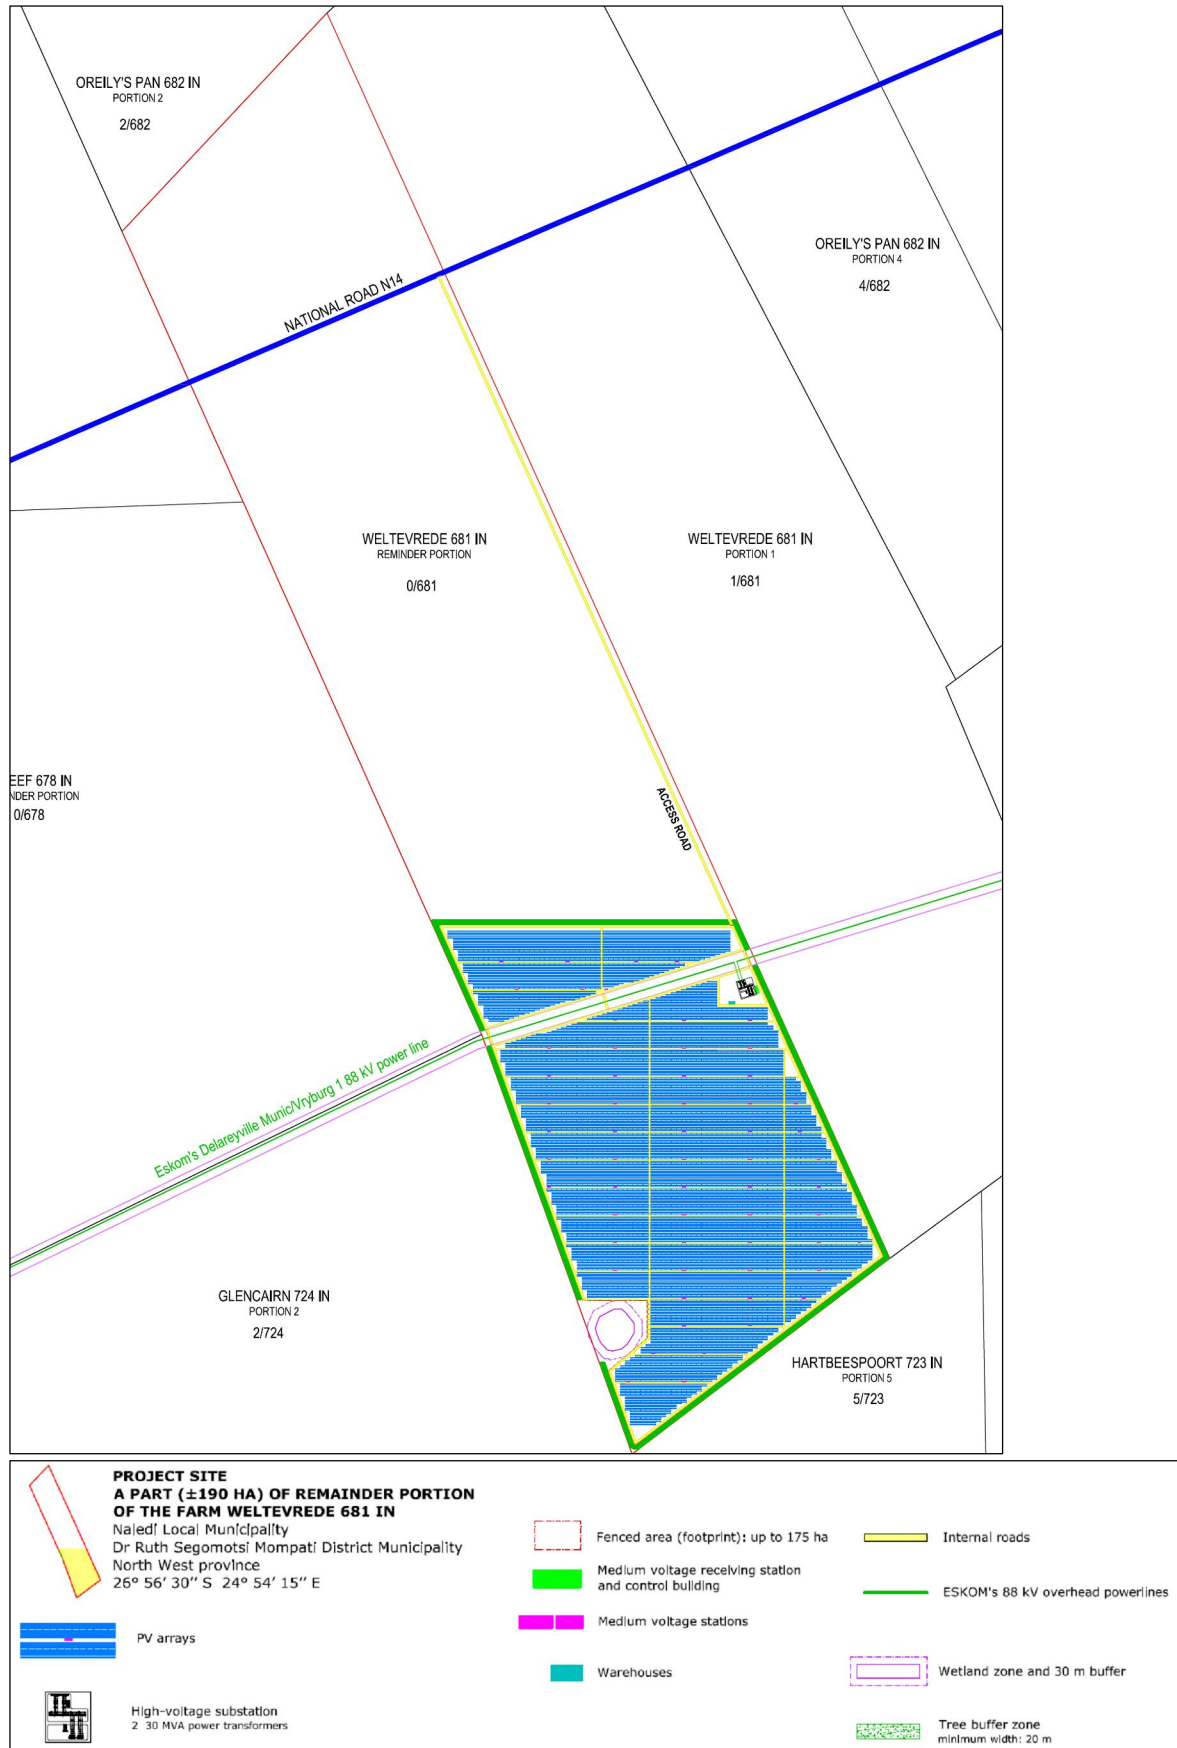

- to maximize the energy production and the reliability of the PV plant, by choosing proven solar technologies: horizontal 1-axis trackers with polycrystalline solar modules, or thin-film solar modules mounted on fixed mounting systems;
- to develop the PV power plant **on the southern side** (190 ha) of the Remainder Portion of the Farm Weltevrede 681 IN (519 ha), which is flat and has a moderate ecological sensitivity;
- to avoid the high sensitivity area (*drainage*) located on the south-western corner of the site, providing a buffer 30 m wide;
- furthermore, a tree buffer zone has been foreseen around the footprint, in order to minimise the visual impact of the proposed development.

The proposed layout plan (attached as Annexure A and also shown in the Figure 2 below) was drawn using thin-film modules mounted on fixed mounting systems; in the case of polycrystalline modules mounted on trackers, the layout plan will not change, except for the orientation of the PV arrays: north-south instead of east-west.

The required **footprint** - corresponding on the fenced area - will be the same: **up to 175 hectares**, and the maximum height of the structures (PV modules and support frames) will be approximately 3.1 m above the ground level. Therefore the impacts and mitigation measures will remain exactly the same.

The project layout and the other plant components are detailed in the following drawings:

- CRSP_01_DE_Rev.00/SR Layout of the PV power plant
- CRSP_02_DE_Rev.00/SR Mounting System . Alternative option 1: fixed mounting systems with thin film modules
- CRSP_03_DE_Rev.00/SR Mounting System . Alternative option 2: horizontal single-axis trackers with polycrystalline modules
- CRSP_04_DE_Rev.00/SR Medium-voltage stations
- CRSP_05_DE_Rev.00/SR Control building and medium-voltage receiving station
- CRSP_06_DE_Rev.00/SR High-voltage loop-in loop-out substation
- CRSP_07_DE_Rev.00/SR Warehouse

Figure 2 Layout of the Carocraft Solar Park

4.2. PRIMARY COMPONENTS

The Photovoltaic (PV) Power Plant together with its connection infrastructures and structures will require the installation of the following equipment:

- Photovoltaic modules
- Mounting systems (fixed or trackers) for the PV arrays
- Internal cabling and string boxes
- Medium voltage stations hosting DC/AC inverters and LV/MV power transformers
- Medium voltage receiving station & Control building, with offices and a small parking area
- Workshop & warehouse
- One small on-site high voltage loop-in loop-out substation with high-voltage power transformers, stepping up the voltage to the voltage of the Eskom's grid, and one high-voltage busbar with metering and protection devices (also called "switching station")
- two new small sections of high-voltage power line allowing the **Eskom's "Delareyville Munic / Vryburg 1" 88 (132) kV power line** to loop in and out of the 88 (132) kV busbar of the new on-site substation
- Electrical system and UPS (Uninterruptible Power Supply) devices
- Storm water collection system
- Lighting system
- Grounding system
- Access road and internal roads
- Fencing of the site and alarm and video-surveillance system
- water access point and water extraction on-site borehole(s) point, water supply pipelines, water treatment facilities (Lilliput systems).

4.2.1. Project functioning and connection of the solar park to the Eskom grid

Solar energy facilities using PV technology convert sun energy to generate electricity through a process known as the Photovoltaic Effect, which consists of the generation of electrons by photons of sunlight in order to create electrical energy.

The preferred technical solutions are:

- mono or polycrystalline modules mounted on horizontal 1-axis trackers, and,
- thin-film modules mounted on fixed mounting systems,

which at present represent the best performing options in terms of reliability and costs/efficiency.

The PV technology is in constant and rapid evolution, this means that the final choice of the type of solar modules (thin-film, monocrystalline or polycrystalline) and mounting system (fixed or tracker) can be taken at the time of the commission date, on the basis of the availability of PV modules and mounting systems, of the worldwide market and of the cost-efficiency curve.

In any case, the required footprint - corresponding on the fenced area - will be up to 175 hectares, and the maximum height of the structures (PV modules and support frames) will be approximately 3.1 m above the ground level. Therefore the impacts and mitigation measures will not change. For further reference please refer to section 5.2.

The following description is referred to both the preferred technical solutions (mono/polycrystalline modules mounted on horizontal single-axis trackers and thin film modules mounted on fixed mounting system or a combination of them).

The required **footprint** (including internal roads) will be **up to 175 hectares**.

PV modules will be assembled on zinc-coated steel or aluminium frames, to form PV arrays. The metal frames that sustain PV arrays are set to the ground by fixed support poles.

A) In the case of thin-film modules mounted on fixed mounting systems:

The PV generator will contain 486,720 thin-film PV modules of 135 Wp each, with a total peak power of **65,707,200 Wp DC side**, corresponding to **60,000,000 W AC side**.

Each mounting frame will host 39 PV modules along three parallel rows each consisting of 13 modules placed side by side, with the position of the panels northwards and a 26° tilt angle. The 3 rows are mounted horizontally one on top of the other, with an overall mounting structure height up to 3.1 meters above ground level.

The 486,720 thin-film PV modules are series-connected outlining strings made of 13 modules each. There will be 37,440 strings so that the string voltage fits into the voltage range of the inverters. Branch cables are designed to connect in parallel groups of three strings, to form 12,480 branch strings. Branch strings are set up in order to be connected to DC-connection boxes. Each String Box allows the parallel connection of 13 branch strings (also called %RV sub-field+).

Figure 3 Lateral views of PV arrays mounted on fixed mounting systems

Figure 4 Frontal view of PV arrays mounted on fixed mounting systems

For further details, Please refer to the Figures 3 and 4 above and to the drawing of the Annexure A:

- CRSP_02_DE_Rev.00/SR *Mounting System – Alternative option 1: fixed mounting systems with thin film modules*

B) In the case of mono/polycrystalline modules mounted on trackers:

The PV generator will contain 230,400 PV polycrystalline modules of 280 Wp each, with a total installed peak power of **64,512,000 Wp DC side**, corresponding to **60,000,000 W AC side**.

Each PV array is composed of 40 PV modules disposed along three parallel rows each consisting of 13 PV modules placed horizontally side by side; at the end of the PV array, one further module is placed in the vertical position.

Each tracker is composed by several PV arrays North-South oriented and linked by an horizontal axis, driven by a motor. The horizontal axis allows the rotation of the PV arrays toward the West and East direction, in order to follow the daily sun path.

Figure 5 Simulation views of the PV arrays mounted on horizontal 1-axis tracker

Figure 6 Frontal views of the PV arrays mounted on horizontal 1-axis tracker

For further details, see also the drawing of the Annexure A:

- CRSP_03_DE_Rev.00/SR *Mounting System – Alternative option 2: horizontal single-axis trackers with polycrystalline modules*

The 230,400 polycrystalline PV modules are series-connected, constituting strings made of 20 modules each. There will be 11,520 PV strings in order that the string voltage fits into the voltage range of the inverters. The strings are set up in order to be connected to DC-connection boxes. Each String Box allows the parallel connection of 12 PV strings (also called %RV sub-field+).

C) In both cases:

String Boxes monitor the currents in photovoltaic modules and can promptly diagnose faults. String boxes are also designed with a circuit breaker in order to disconnect the photovoltaic sub-fields from the inverters.

The PV sub-fields are thought to be linked to central inverters, located in **60 medium voltage stations**. Each station comprises two adjacent prefabricate buildings designed to host two **DC/AC inverters**, with a total nominal output AC power of 1,000 kW (16 parallel sub-fields), and two **medium voltage power transformers** of 500 kVA each. The DC/AC inverters are deemed to convert direct current (DC) into alternate current (AC) at low voltage (270 V); subsequently the AC will pass through a medium-voltage transformer in order to increase the voltage up to 22 kV (or 11 kV).

The medium-voltage stations are detailed in the drawing of the Annexure A:

- CRSP_04_DE_Rev.00/SR Medium-voltage stations

The energy delivered from the 60 medium voltage stations will be collected into one (or more) **medium voltage receiving station(s)**, parallel connecting all the 60 PV fields of the PV generator.

From the medium voltage receiving station, the energy will be delivered to two high-voltage power transformers (30 MVA each, plus one as spare), which will step up the electric energy from the medium voltage level (11 kV or 22 kV) to the Eskom required connecting voltage (i.e. 88 kV). The power transformers will be connected to an on-site 88 kV busbar (the so called %switching station+), to be equipped with protection and metering devices, according to the Eskom requirements.

The Carocraft Solar Park will be connected to the **Eskom's "Delareyville Munic/Vryburg 1" 88 kV power line**, which crosses the project site,

The Eskom's "Delareyville Munic/Vryburg 1" 88 kV power line will loop in and out of the 88 kV busbar (%switching station+) of a new on site substation through two new small sections of 88 kV power line, approximately 100 m long.

The new on-site HV loop-in loop-out substation will need to be equipped with circuit breakers upstream and downstream, in order to disconnect the PV power plant and/or the power line in case of failure or grid problems.

Furthermore, two **metering devices and related kiosks** are foreseen inside the layout: one for Eskom, close to the busbar, and one for Carocraft, close to the power transformers. The kiosks (2.4 x 4.8 x 3.2 m) will contain the peripheral protection and control cabinets and the metering devices.

The on-site HV loop-in loop-out substation, composed of the power transformers, the control building, the 88 kV busbar with protection and metering devices and the kiosks, will have a **footprint of approximately 4,000 m²**.

The new power line and the busbar (*switching station*) of the on-site HV loop-in loop-out substation will be owned and operated by Eskom Distribution.

The layout of the on-site high-voltage substation as well as of the control building and the subdivision between Eskom's side and Carocraft's side are detailed in the drawings included in Annexure A:

- CRSP_05_DE_Rev.00/SR *Control building and medium-voltage receiving station*
- CRSP_06_DE_Rev.00/SR *High-voltage loop-in loop-out substation*

In the case the Eskom's "Delareyville Munic / Vryburg 1" 88 kV power line would be upgraded to 132 kV by Eskom, the on-site HV loop-in loop-out substation will be upgraded at 132 kV accordingly.

The power generation capacity at the delivery point will be up to 60 MW.

4.2.2. Access road and internal roads

The access to the Carocraft Solar Park will be **from the national road N14** crossing the northern side of the project site.

Internal roads will consist of gravel roads designed in accordance with engineering standards. The roads will have a width of 8.0 meters allowing for the slow moving heavy vehicles.

Once the solar farm is in operation, the internal roads will mainly be used for maintenance and inspections.

The vertical alignment of the roads will not present significant challenges due to the flatness of the terrain. The entire development will be contained inside a fenced area and the roads are not intended for public use.

4.2.3. Lighting system

The lighting system will consist of the following equipment:

- Floodlight-towers: maximum 10 meters high, with 6x400W directional lamps, installed around the HV loop-in loop-out substation. Normal lighting: 15 lux; up to 40 lux in case of emergency.
- Street lighting along internal roads, for the stretch from the access point up to the HV substation inside the property: 1 streetlamp, maximum 5.5 meters high, every 20 meters, having a metal-haloids lamp of 400 W.
- 2x400 W spotlights (SAP type) mounted on the top of medium-voltage stations.

The lighting of the MV stations and of the on-site HV substation will be on only in case of intrusion/emergency or necessity to reach the MV stations / HV substation during the night.

During the night, the video-surveillance system will use infra-red (or micro-wave) video-cameras, which do not need a lighting system (which could reduce the functioning). Only streetlamps along internal roads, for the stretch from the main access from the road N14 up to the HV substation inside the property, may be switched on at night.

4.2.4. Stormwater collection system

The proposed storm water system, where required, will consist of open grass lined channels and possible nominal concrete pipe culverts. The excessive concentration of storm water will be avoided and the existing drainage patterns will be left undisturbed.

4.2.5. Water requirements

4.2.5.1. Water requirements during the construction phase

The construction phase will last approximately **15 months**.

A) Construction of internal gravel roads

- Water is necessary for the construction of internal gravel roads, in order to get the gravel compacted to optimum moisture content (OMC).
- The surface of internal gravel roads will be approximately 140,000 m².
- 50 liters of water / m² of internal of roads will be required.

B) Workers

- Each worker needs 50 liters / 8 working hours for sanitary use.
- Daily average number of workers on site is 100 (minimum 60, maximum 120).

C) Concrete production

- Concrete is necessary for the basements of the medium-voltage stations, the high-voltage loop-in loop-out substation, the control building and the warehouse and for the foundations of the mounting systems. The overall amount of concrete to be produced will be of approximately 10,000 m³
- 200 litres of water are needed for 1 cubic meter of concrete.

D) Vehicle cleaning

As mitigation measure, the cleaning of vehicles like excavators, mechanical diggers and pile rammers will be done once or twice per month and no during working days, also in order to not increase the water requirement during the construction activities.

Furthermore, in order not to waste a large amount of water, high pressure cleaners will be used. On the whole, the water requirement for cleaning activity is very low.

The overall and average water consumption during construction is detailed in the following table.

Table 3 Water consumption during the construction phase

WATER REQUIREMENT DURING THE CONSTRUCTION PHASE		
DESCRIPTION	UNIT	TOTAL
Timeframe of the construction activities	<i>months</i>	15
Overall water consumption for internal roads	<i>m³</i>	7000
Overall water consumption for sanitary use (over 15 months)	<i>m³</i>	1,650
Overall water consumption for concrete production	<i>m³</i>	2,000
Overall water consumption (over 15 months)	<i>m³</i>	10,650
DESCRIPTION	UNIT	AVERAGE
Daily water consumption over 30 days (average value over 15 months)	<i>m³/day</i>	23.7
Equivalent water flow over 30 days (average value over 15 months)	<i>l/s</i>	0.27

Storage tanks will be sized in order to provide a reserve of water of approximately 200 cubic meters.

4.2.5.2. Water requirements during the operational phase

During operation, water is only required for the operational team on site (sanitary use), as well as for the cleaning of the solar panels.

Further water consumption may be only for routine washing of vehicles and other similar uses.

A) Water for sanitary use

A maximum of 25 people will be employed during the operation phase of the PV power plant, which will have a lifetime of 25 - 30 years.

The Carocraft Solar Park will be in operation 7 days per week; therefore personnel will operate according to shifts. The surveillance team will be present during day-time, night-time and weekends. The average number of people working at the site on the same time will be of **12 people daytime and 4 people at night**.

The average daily water consumption for sanitary use is estimated to be **150 litres / day / person per 16 people** (12 people daytime and 4 people at night), The daily water consumption will be approximately **2,400 litres/day**.

B) Water consumption to clean the PV modules

The cleaning activities of the solar panels will take place **twice per year**.

We assumed that we need up to 2.0 liters per m² of PV panel surface.

Therefore, the amount of water for cleaning is up to 1,362,816 liters per cleaning cycle (**1,363 m³ per cleaning cycle and 2,726 m³ / year**).

PV modules cleaning activity can last less than 1 month. If the cleaning activity lasts approximately 4 weeks (22 working days), the daily water consumption will be approximately **61,946 liters/day, over 22 days**.

Conclusion

The daily water requirement will be approximately **2,400 liters/day** over 12 months for sanitary use (i.e. **72,000 l/month** and **876 m³/year**).

The water consumption will increase up to **64,346 liters/day** during the cleaning of the solar panels (61,946 liters/day for cleaning activity and 2,400 for sanitary use), which will last less than a month and will occur twice per year during the dry period. Indeed PV modules are conceived as self-cleaning with the rain.

It is further proposed that **90,000 l** of water will be stored in **storage tanks** for fire, emergency and washing of panels twice a year.

The overall and average water consumption during operation is detailed in the table below.

Table 4 Water consumption during the operational phase

WATER REQUIREMENT DURING THE OPERATIONAL PHASE		
DESCRIPTION	UNIT	TOTAL
Average daily water consumption for sanitary use	l/day	2,400
Average daily water consumption during cleaning activity (*)	l/day	64,346
Average monthly water consumption for sanitary use (over 30 days)	l/month	72,000
Annual water consumption for sanitary use	m³/year	876
Annual water consumption for PV modules cleaning activities (twice/year)	m³/year	2,726
ANNUAL WATER CONSUMPTION DURING OPERATION (average over 365 day)	m³/day	9.87
ANNUAL WATER CONSUMPTION DURING OPERATION	m³/year	3,602

(*) over 22 working days, twice per year

4.2.5.3. Water provision during construction and operation

The project site falls within the **Quaternary catchment C32C**, where **75 m³/ha/annum** of groundwater abstraction is allowed for under the DWA General Authorization. Remainder Portion of the Farm Weltevrede 681 IN is 519.3247 hectares in extent, therefore an abstraction up to **38,949 m³/year** is allowed under the General Authorizations. The water requirements of the Carocraft Solar Park are well below this threshold.

The water needed for both the construction phase (**10,250 m³ over 15 months**) and the operational phase (**3,602 m³/year**) will be provided from new or existing boreholes on the project site. A Geo-hydrological Study will be conducted in this respect, and will form part of the EIA Report.

A Water Use Licence application will be submitted to the Department of Water Affairs by Carocraft.

4.2.6. Sewerage

Considering that the proposed development will not include formal residential properties there is no need to connect the municipal sewer reticulation system. Sewer reticulation will be handled by the patented and commercially available Lilliput (or similar) sewer treatment system.

The sewer system will therefore consist of an installation to serve the offices of the control building. It is foreseen that the system will be installed in line with the requirements of the manufacturer.

Typical systems consist of a conservancy tank (built underground on site), and a patented digester. Most systems require electricity to power the pumps and fans used in aeration process, although some systems use wind power (whirlybird). The system could require chlorine tablets available commercially. The effluent from the Lilliput (or similar) system will be suitable for irrigation of lawns, or re-use in the dwellings as water for the flushing of toilets, or for fire fighting purposes. This could reduce the overall water requirement of the development substantially.

In this respect, a Water Use License application will be submitted to the Department of Water Affairs by Carocraft.

4.2.7. Refuse removal

Carocraft will enter into an agreement with the Naledi Local Municipality for the PV plant's refuse at the nearby municipal refuse site. No refuse will be buried or incinerated on site.

4.3. CONSTRUCTION SITE

The construction site (approximately 10 hectares) will be located on the northern side of the planned footprint, between the existing Eskom's power line and the planned fence - covering the area where the last 4 MWp are planned. Consequently, the construction site area will be gradually reduced at the completion of the last four PV fields (4 MWp), and at the end of the works all the construction area will be converted into the last PV arrays.

The optimal location of the construction site is an important element of the planning phase also in order to minimize impacts on the surrounding environment.

The site's location has been dictated by the nature of the works to be undertaken, specialist studies, site restrictions, town planning intended uses and access.

The area identified for the construction site had to meet the following requirements:

- sufficient size;
- proximity to existing roads;
- availability of water and energy;
- low environmental and landscape value;
- sufficient distance from residential areas; and
- proximity to the worksite.

In addition, to ensure environmental compatibility, the following factors have been considered:

- restrictions on land use (landscape, archaeological, natural, hydrological, etc.);
- terrain morphology;
- presence of high environmental value areas (e.g. wetlands); and
- sand & stone supply.

The establishment of the construction site will be divided into four distinct phases. The steps individuated hereinafter do not follow a time sequence, but it should be considered as overlapping and simultaneous events.

4.3.1. Phase I

The area will be fenced to prevent intrusion of animals and to protect against materials theft within the site. A video surveillance system will be provided.

4.3.2. Phase II

During the fencing operation as described in Phase I, the most valuable trees, if any, will be removed and placed temporarily in a safe location for future planting at the end of work. This procedure is required for environmental mitigation. The other low value tree species will be cut down and transferred to facilities for wood processing.

4.3.3. Phase III

At completion of the works defined in Phases I and II, the following step will be the site clearing and the construction of internal roads. The internal road network should ensure a two-way traffic of heavy goods vehicles in order to minimize trips. The road system is planned for a width of 8 meters. Roads will be of dry and compacted materials.

The facility will require constant access control, a weigh-house for heavy trucks, removable structures for the storage of yard tools and temporary storage areas.

During Phase III, the installation of MV/LV transformers connected to the Eskom grid is also planned, as well as the laying of underground electrical cables.

4.3.4. Phase IV

Temporary storage areas of materials and workshops will be constructed and used for:

- temporary storage of photovoltaic modules (covered with compacted dry material in order to avoid direct contact with the ground);
- temporary storage for frames and piles of the mounting systems of the PV arrays;
- storage and processing of building material for construction (sand, gravel, concrete batching and mixing plant, steel, etc.);
- drinking water storage for human consumption;

- worker care facilities and site management buildings;
- prefabricated housing modules for workers who may require accommodation inside the site (only key personnel should be allowed to stay overnight);
- technical cabins and management offices;
- medical care unit in a prefabricated module, in order to allow immediate first aid and minor surgical emergency;
- recreation area and canteen (prefabricated modules);
- parking lots for employees (located close to the staff housing), for visiting staff (located close to the offices area), and for trucks and work vehicles during inactivity;
- workshop and storage facilities on the site for contractors;
- electrical network for living units, offices and service structures;
- water supply for living units through polyethylene pipes connected to storage;
- Lilliput or similar sewer treatment system. The treated water will be used to moisten dusty areas and reduce dust gathering due to windy actions; and
- solid waste collection point.

All facilities present in the construction site will be covered with dry material in order to avoid mud formation in case of rain.

4.3.5. Earthworks

Earthworks will be required during the construction of internal roads. The vertical alignment of the roads will not present any significant challenges due to the flatness of the terrain so that no deep cuts or fills will be required.

Considering a road pavement thickness of 300 mm and an overall road surface of approximately 140,000 m², the amount of cut or fill is estimated to be approximately 42,000 m³.

Further items of earthworks would be required where temporary storage areas will be prepared for the storage of the photovoltaic modules and other equipment during construction of the solar park.

Small earthworks will be required for the installation of the PV modules and of the medium-voltage stations. None of these activities should require earthworks in excess of 500 mm cut or fill.

Only the foundation plate for the small high-voltage substation may require earthworks in excess of 500 mm cut or fill (the footprint will be up to 4000 m²).

The topsoil stripping will result in temporary spoil heaps which must be spread over the site upon completion of the project.

Concrete necessary for the basements of the medium-voltage stations, the high-voltage substation, the control building and the warehouse and will be manufactured using aggregate and sand from commercial sources in the vicinity of the development, or from a borrow pit to be exploited on the site.

Gravel necessary for the construction of internal roads may be provided from a borrow pit on site. Alternatively, gravel can be provided from the commercial sources in the vicinity of the development.

The material from this borrow pit will only be utilised for work on this particular site only. The position of this borrow pit is not yet finalized. The required area will be approximately 2 hectares.

4.4. TRAFFIC IMPACT OF THE PROPOSED DEVELOPMENT

4.4.1. Traffic impact – construction phase

During the construction phase of 15 months, there will be at least 60 workers on site.

An accommodation area with prefabricated buildings inside the work site may be foreseen, if accommodation facilities in Vryburg town are not sufficient to accommodate all workers.

Overall traffic to and from the work site will amount to approximately 800 heavy vehicle trips over the whole 15 months.

The provision of a fuelling area on the work site could reduce the load of heavy vehicles on public roads. The installation of two steel fuel tanks (capacity of 30,000 litres each) is envisaged.

4.4.2. Traffic impact – operation phase

The traffic impact during the operation phase will be insignificant, considering that about 25 people will work on the PV facility, in the following manner:

- during the daytime approximately 12 people;
- during the night-time, four people.

4.5. MANAGEMENT OF THE SOLAR PARK DURING OPERATION

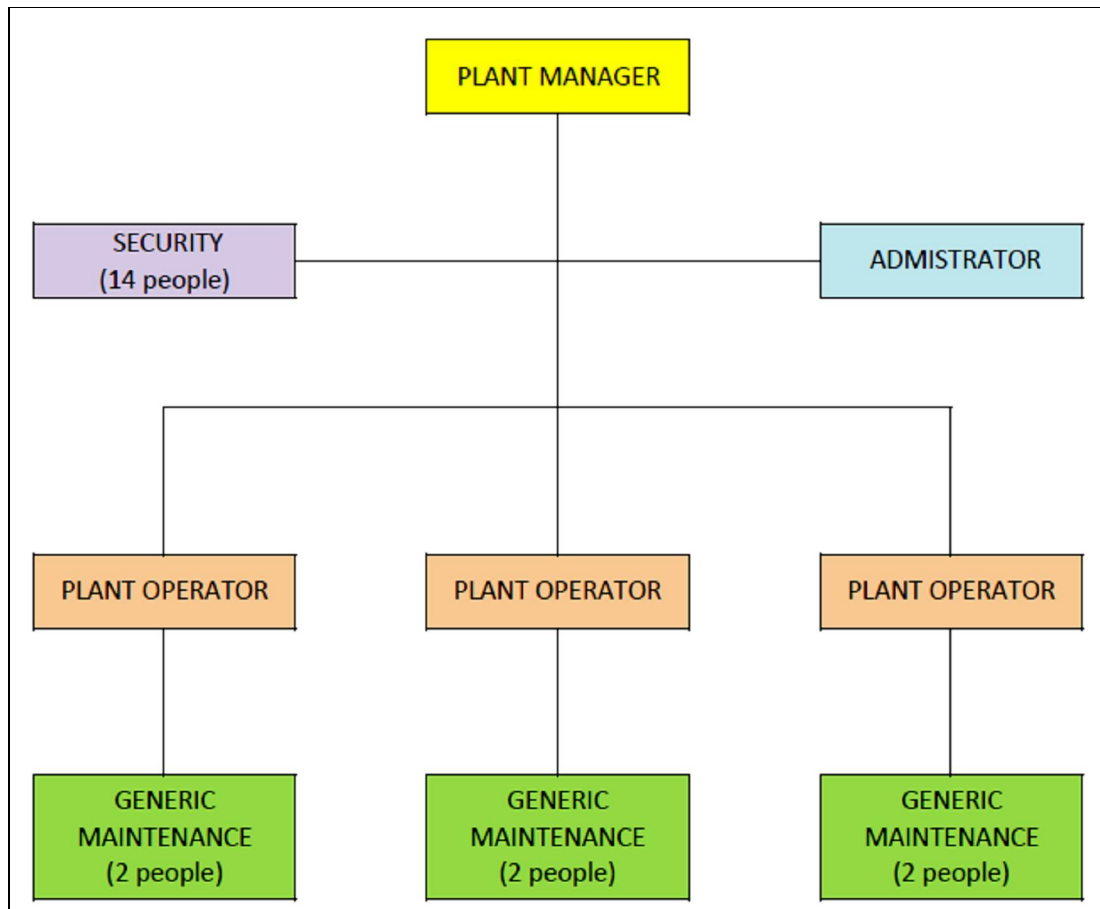

A maximum of 25 people will be employed during the operation phase of the PV power plant, which will have a lifetime of 25 - 30 years.

The Carocraft Solar Park will be in operation 7 days per week; therefore personnel will operate according to shifts. The surveillance team will be ensured during day-time, night-time and weekends.

The operational team will consist of the following people:

- 1 person as plant manager
- 1 person for administration
- 3 people as technicians / plant operators
- 6 people for electric and generic maintenance
- 14 people as guards

The **fire team** will comprise of people for generic maintenance, who will attend a comprehensive fire fighting training program. After this training programme, the fire team will be able to drive/use/manage properly the fire extinguishers and the fire fighting vehicle, that will be available on the site.

Figure 7 Organization chart of the operational staff

5. PROJECT ALTERNATIVES

The EIA Regulations, Section 28(1)(c) and NEMA, Section 24(4), require investigation and consideration of feasible and reasonable alternatives for any proposed development as part of the environmental impact assessment process. Therefore, a number of possible alternatives for accomplishing the same objectives must be identified and investigated.

In particular:

- the property on which, or location where, it is proposed to undertake the activity;
- the location within the current identified site;
- the type of activity to be undertaken;
- the design or layout of the activity;
- the technology to be used in the activity;
- the operational aspects of the activity (schedule, process);
- the sustainability of other alternatives, and
- the option of not implementing the activity (No Go Alternative).

5.1. SITE ALTERNATIVES

Several sites have been inspected in order to find out the best solution for the PV power plant. The following selection criteria were applied:

- Connection availability and proximity
- Land availability
- Proper land surface area (at least 175 hectares)
- Current land use
- Low environmental impact (low biodiversity)
- High solar radiance
- Socio-economic issues (land cost and local community unemployment)

The macro area of the Vryburg town and surrounding farms was investigated, due to the high value of solar irradiation and to the presence of an Eskom® HV power line (i.e. the Eskom® "Delareyville Munic/Vryburg 1" 88 kV power line).

Four sites - along the Eskom® "Delareyville Munic/Vryburg 1" 88 kV power line - were selected during the feasibility assessment, due to the flatness of the areas and the low-moderate ecological sensitivity:

- Portion 0 (Remaining Extent) of the Farm Weltevrede 681 IN (*preferred*)
- Portion 1 of the Farm Weltevrede 681 IN
- Portion 1 of the Farm Klipfontein Annex 625 IO
- Portion 7 of the Blaauwboshpan 622 IO

The only available site resulted to be the Remainder Portion of the Farm Weltevrede 681 IN, which is - therefore - the *preferred site*. Landowners of the other farm portions resulted not available for a purchase / lease agreement.

The location of the alternative sites is indicated in the Figure 8 below.

Figure 8 Location of the alternative sites

5.2. TECHNOLOGY ALTERNATIVES

5.2.1. PV Plant and Solar Thermal Power Plant

The alternative to PV for producing energy from the sun is the thermal solution.

There are different forms of this technology: linear fresnel, parabolic through or tower. These technologies can also be with or without thermal storage and they can use diathermic oils or, the more sophisticated ones can use water and/or molten salts.

The final choice is the PV option because these kinds of project result in:

- lower construction costs;
- lower operating and maintenance costs (O&M);
- it is a simpler, quicker and more experienced technology; and
- lower environmental impact, considering that, among other factors, the PV solution requires a minor quantity of water.

5.2.2. Solar Photovoltaic Technology – PV

The project envisages a photovoltaic power plant with a generating capacity up to 60 MW, on a footprint up to 175 hectares.

The preferred types of PV modules are:

- **monocrystalline or polycrystalline PV modules** and,
- **thin-film PV modules**,

which currently represent the best performing options in terms of reliability and costs/efficiency.

At present, mono/polycrystalline modules provide a higher solar conversion efficiency (14%), if compared to the thin-film /PV modules (9%).

On the other hand, thin-film modules (or amorphous silicon / Cd-Te as well) are cheaper and best performing at high temperatures, having an efficiency degradation of only 0.25 %/°C instead of 0.45 %/°C in the case of mono/polycrystalline modules.

However, it is important to consider the fact that the PV technology is in continuous evolution and it may be possible that thin-film (or amorphous silicon / Cd-Te as well) PV modules achieve a higher solar conversion efficiency in a very short time.

Furthermore, it should be taken into account the high volatility of prices of PV modules which depends on the worldwide availability of modules. Therefore the final choice will be taken at the commissioning date, on the basis of the prices and availability of mono/polycrystalline and thin-film / amorphous silicon / Cd-Te PV modules.

In any case, the development will not exceed the current planned footprint (approximately 175 hectares). Therefore, the final choice of the type of PV modules, whatever it is, will neither imply any additional visual or environmental impacts nor the necessity of specific or different mitigation measures.

5.2.3. Alternatives for the Mounting System of the PV Modules

The preferred technical solutions for the proposed solar park entails PV modules mounted on **fixed mounting systems** (*alternative option 1*) or on **horizontal single-axis trackers** (*alternative option 2*).

The tracking solution is the best performing in terms of efficiency, because its energy production is approximately 15% more if compared with fixed systems.

In spite of this, this type of technology is characterized by higher technical complexity and deeper installing and maintenance costs, if compared with the fixed mounting solution.

As previously mentioned, the selected tracking system is the horizontal single-axis tracker (SAT), which doesn't differ from the fixed system, except for the presence of the tracking devices and of the orientation of the rows of the PV arrays (north - south instead of west - east direction).

The technology of mounting systems is under continuous evolution. Consequently, the final decision about the mounting system technology will be taken only at the commissioning date: if addressed toward the fixed mounting system or toward horizontal single-axis trackers, the layout of the PV power plant will not imply any additional visual or environmental impacts nor the necessity of specific or different mitigation measures.

In any case, the development will not exceed the currently planned footprint (175 hectares) and the height of the structures (PV modules and support frames) will be maximum 3.1m above ground level.

Both fixed and horizontal single-axis tracking solutions grant the reversibility of the development in respect of the terrain's morphology, geology and hydrogeology. This means that at the end of the PV plant's lifetime, the site can easily be returned to its status prior to the establishment of the PV plant.

5.3. LAYOUT DESIGN AND CONNECTION ALTERNATIVES

The site chosen for the establishing of the proposed Carocraft Solar Park is the Remainder Portion of the Farm Weltevrede 681 IN. The PV power plant will have a generating capacity **up to 60 MW**, on a footprint up to 175 hectares.

Two layout alternatives have been considered:

- **Alternative location 1:** to locate the developed area - up to 190 hectares - on the northern side of the farm portion;
- **Alternative location 2:** to locate the developed area - up to 190 hectares - on the southern side of the farm portion.

The alternative location 1 is the *preferred one*, due to the flatness on the southern side of the farm portion and due to the presence of the Eskom "Delareyville Munic/Vryburg 1" 88 kV power line.

The alternative location 2 is *not feasible*, because the northern side of the farm portion is hilly and affected by a drainage line. Furthermore, the Eskom "Delareyville Munic/Vryburg 1" 88 kV power line only crosses the southern side of the farm portion.

As already mentioned in the paragraph 4.1 - *Project layout*, the main drives of the proposed layouts are:

- to maximize the energy production and the reliability of the PV plant, by choosing proven solar technologies: horizontal 1-axis trackers with polycrystalline solar modules, or thin-film solar modules mounted on fixed mounting systems;
- to develop the PV power plant **on the southern side** (190 ha) of the Remainder Portion of the Farm Weltevrede 681 IN (519 ha), which is flat and has a moderate ecological sensitivity;
- to avoid the high sensitivity area (*drainage*) located on the south-western corner of the site, providing a buffer 30 m wide;
- a tree buffer zone has been will be left around the footprint, in order to minimise the visual impact of the proposed development.

5.4. NO-GO ALTERNATIVE

The no-go alternative is the option of not establishing a Photovoltaic Power Plant on the site, or any of its alternatives. The environment will remain in its current state (*status quo*). This will not create any new employment opportunities, and therefore the anticipated economic benefits of the project will accrue to the study area (see the paragraph 6.4 *Socio-Economic Environment*).

Should this alternative be selected the socio-economic and environmental benefits related to the use of renewable energy resources will not be realised with prejudice to the development of the area. The benefits related to the establishment of a renewable energy power plant are for example analysed in detail in the REFIT Regulatory Guideline published by NERSA (March 2009):

- **Enhanced and increased energy security**: renewable energy plays an important role in terms of power supply, improving grid strength and supply quality and contemporarily reducing transmission and distribution costs and losses.
- **Resource economy and saving**: the energy production by coal fired plants consumes a significant amount of water, this amount of water could instead be saved if a renewable energy facility like the proposed one is put in operation. (the Energy White Paper envisages that the implementation of its targets will determine water savings of approximately 16.5 million kilolitres). This will be beneficial on the large scale for the water conservation measures that the country is currently undertaking.
- **Support of new technologies and new industrial sectors**: the development and establishment of renewable energy power plants contribute to the growth of new technologies and new industrial sectors with benefits for its economy.
- **Exploitation and capitalization of South Africa's renewable resources**: with the aim of increasing energy security.
- **Employment creation and career opportunities**: the construction and operation of a renewable energy power plant contributes to job creation and new career opportunities.
- **Pollution reduction**: the use of renewable energy resources decreases the demand and the dependence from coal and oil for electricity generation.
- **Contrast to Global warming and climate mitigation**: the development of renewable energy contributes to reduce global warming through the reduction of greenhouse gas (GHG) emissions.
- **Protection of natural foundations of life for future generations**: the development and establishment of renewable energy power plants offers the opportunity of consistently reducing the risks related to climate change caused by CO₂ and CO emissions, therefore preserving life for future generations.
- **Acceptability to society and community**: the use of renewable energy is largely accepted by society and community as a mean to reduce pollution concerns, improve human health and wellness, protect the environment, the ecosystem and climate;
- **Commitment to and respect of international agreements**: in particular in light of the possible commitment to the Kyoto Protocol.

6. STATUS QUO OF THE RECEIVING ENVIRONMENT

The receiving environment has been described using a combination of specialist inputs, on-site observations, a review of existing literature and utilizing Geographic Information Systems (GIS) planning tools.

6.1. PROPERTY DESCRIPTION AND CURRENT LAND USE

The proposed development will stretch over a part of the Remainder Portion of the Farm Weltevrede 681 IN.

Remainder Portion of the Farm Weltevrede 681 IN

Surveyor-general 21 digit site	T0IN00000000068100000
Local Municipality	Naledi
District Municipality	DR Ruth Segomotsi
Province	North West
Extent	519.3247 hectares
Land Owner	MARTHINUS NEL STEYN
Diagram deed number	T973/1959
Title deed number	T1732/2006
Registration date	20060519
Current land use	grazing

The site is located 17 km East of the town of Vryburg.

Adjacent farm portions are used for farming purpose.

6.2. ENVIRONMENTAL FEATURES

6.2.1. Climate

The study area is situated within the summer and autumn rainfall region with very dry winters and frequent to very frequent frost that occurs (40 days) during the colder winter months. The mean annual precipitation for the Ghaap Plateau Vaalbosveld vegetation type varies and is 400mm, while the mean annual temperature is 17.1°C. The monthly distribution of maximum and minimum temperatures for the Vryburg area ranges from 36.6°C in December to -5.5°C in July.

6.2.2. Topography

The topography across the site is almost flat with a very gentle northward slope. The highest point is the southern boundary at 1272m amsl and the lowest point is the northern boundary at 1232 m amsl.

6.2.3. Soils and geology

Geology is directly related to soil types and plant communities that may occur in a specific area (Van Rooyen & Theron, 1996). A Land type unit is a unique combination of soil pattern, terrain and macroclimate, the classification of which is used to determine the potential agricultural value of soils in an area. The land type unit represented within the study area include the Ae36 land type (Land Type Survey Staff, 1987) (ENPAT, 2001).

Soils associated with the site are mostly shallow Hutton or Glenrosa soils associated with limestone and dolomite.

A Geo-technical Study will be conducted and will form part of the EIA Report.

6.2.4. Ecology (fauna and flora)

An Ecological Impact Assessment (Annexure C) was conducted by AGES in order to describe the ecology (fauna and flora) present in the site, to assess its ecological sensitivity and to indicate the most suitable areas for the proposed development.

For this purpose, detailed ecological (fauna habitat & flora) surveys were conducted during July 2012 to verify the ecological sensitivity and ecological components of the site at ground level.

6.2.4.1. Vegetation types

The proposed development site on the southern section of the Remainder of the Farm Weltevreden 681 occurs on a slightly undulating landscape. The vegetation of the site represents typical shrubveld associated with the Ghaap Plateau Vaalbosveld that is mostly in a natural state with some signs of encroachment in isolated areas.

A small endorheic pan represents the Southern Kalahari Salt Pans vegetation type on site.

Three main vegetation units were identified on the site during the ecological surveys according to plant species composition, previous land-use, soil types and topography. The site is currently used as grazing for livestock.

The vegetation communities identified on the proposed development site during the ecological surveys are classified as physiographic physiognomic units, where physiognomic refers to the outer appearance of the vegetation, and physiographic refers to the position of the plant communities in the landscape. The physiographic-physiognomic units will be referred to as vegetation units.

The vegetation units of the proposed development site will be described in terms of its characteristics, and specific mentioning is made on the state of the vegetation (see attached ecological report). The aim of the study was to determine the suitability of the area from an ecological perspective for the proposed development of the Photovoltaic Power Plant. The survey focused on the proposed footprint areas.

The following vegetation units were identified as being part of the proposed development site:

- Tarchonanthus camphoratus . Grewia flava shrubveld
- Grewia flava shrubveld
- Endorheic saltpan

6.2.4.2. Fauna

A survey was conducted during August 2012 to identify specific fauna habitats, and to compare these habitats with habitat preferences of the different fauna groups (birds, mammals, reptiles, amphibians) occurring in the quarter degree grid.

The area represents shrubveld with some microhabitats such as rocks and pans that occur in the area. A detailed species list for the fauna of the area is included in the ecological report. According to the existing databases and field survey the following fauna species included in the

The recommendations and mitigating measures highlighted in the Ecological Impact Assessment (Annexure C) should be implemented to ensure the survival of these species other fauna habitats and feeding grounds.

6.2.4.3. Summary and results of the Ecological Impact Assessment

Detailed ecological (fauna habitat & flora) surveys were conducted during August 2012 to verify the ecological sensitivity and ecological components of the site at ground level.

Considering the results from the field surveys, mitigation needs to be implemented to prevent any negative impacts on the ecosystem, since most of the site is in a natural state. A sensitivity analyses was conducted to identify the most suitable site for the development of the Photovoltaic Power Plant. From these investigation and ecological surveys the following main observations was made:

- The most suitable area for the development of the project would be throughout most parts of the site, even though the site represents shrubveld. These shrubveld variations of the Ghaap Plateau Vaalbosveld have a moderate sensitivity. Limited mitigation is needed for the preservation of some sections of this natural vegetation entity, while a permit is needed for the eradication of the few protected camel thorn trees occurring in the area.
- The endorheic pan is a highly sensitive drainage feature and habitat type and needs to be preserved as a corridor on the proposed development site. A buffer zone of 30 meters should be placed around this habitat type.
- No red data plant species were found in other areas of the site due to the state of the vegetation and physical environment of the larger area mostly not being suitable for any of the red data plant species that may be found in the area.

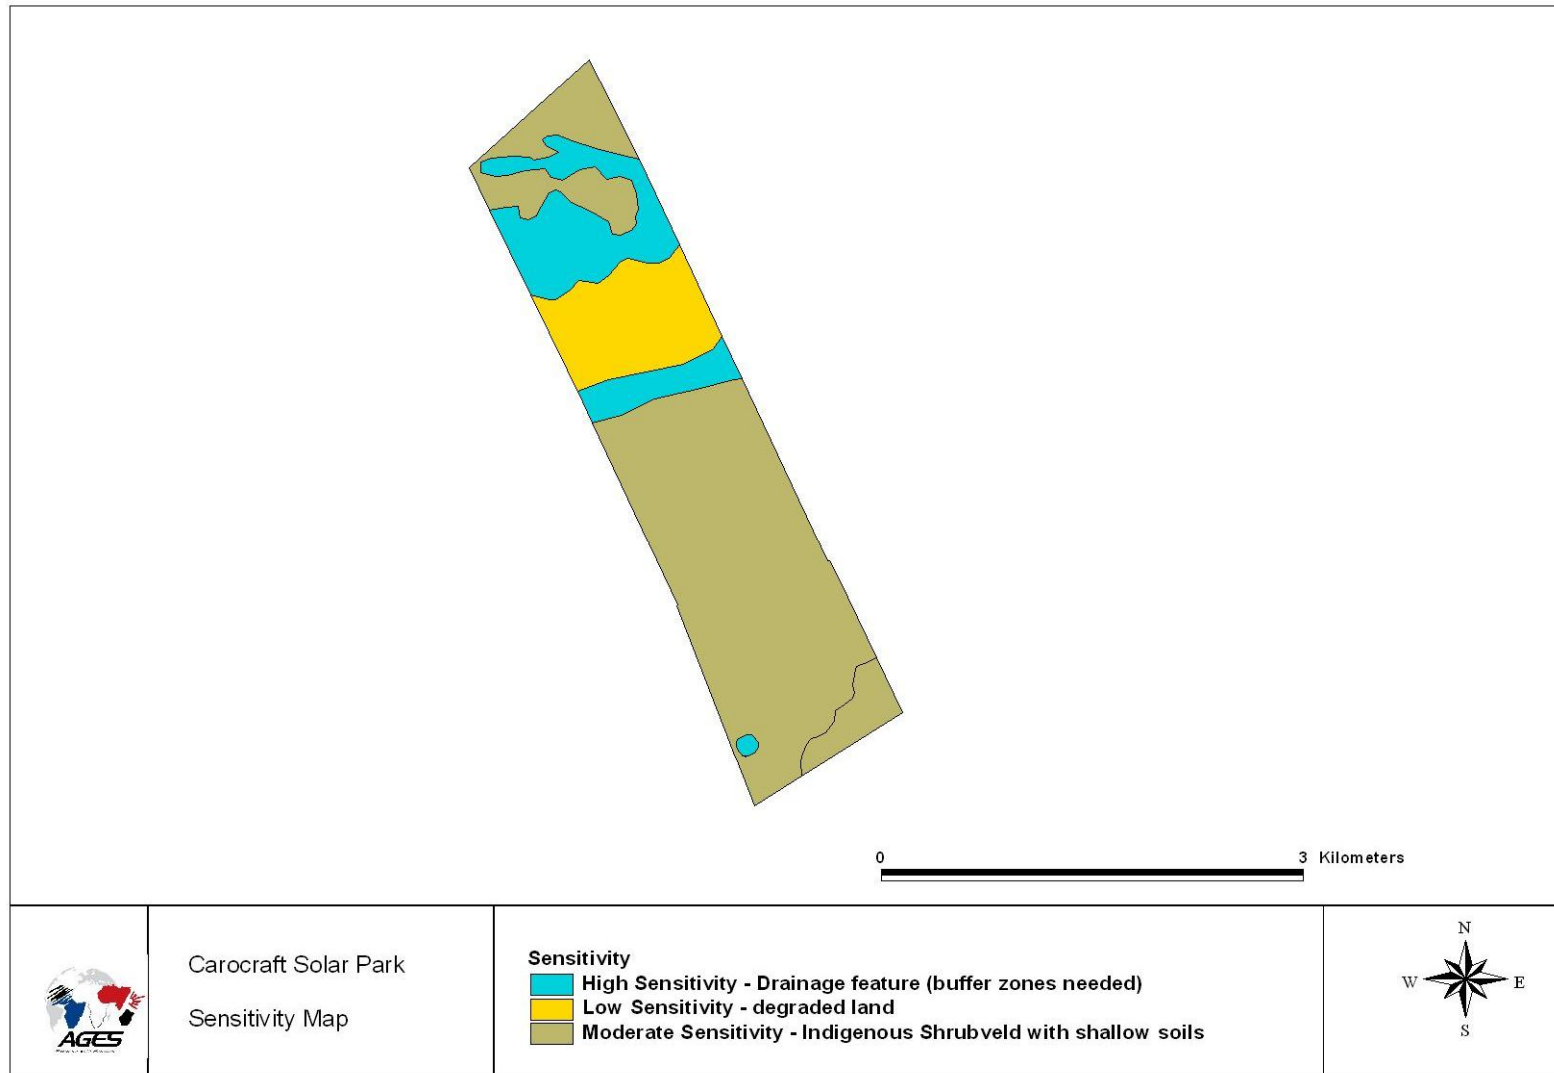

Some potential rare fauna may also occur in the area, and specific mitigation measures need to be implemented to ensure that the impact of the development on the species habitat will be low. Specific mitigation relating to red data fauna includes the following:

- Disturbances in close vicinity of the development (periphery) should be limited to the smallest possible area in order to protect species habitat;
- Corridors between the development zones are also important to allow fauna to move freely between the areas of disturbance.

A number of ecological potential impacts were identified and assessed. A few of these were assessed as having potentially medium or high significance, including the following:

- Destruction or disturbance to ecosystems leading to reduction in the overall extent of a particular habitat.
- Impairment of the movement and/or migration of animal species resulting in genetic and/or ecological impacts (habitat fragmentation).
- Increased soil erosion.
- Destruction/permanent loss of individuals of rare, endangered, endemic and/or protected species.
- Establishment and spread of declared weeds and alien invader plants
- Increased noise pollution leading to potential displacement of individuals

Mitigation measures are provided that would reduce these impacts from a higher to a lower significance. Provided that all mitigation measures and recommendations in the report are strictly adhered to, the proposed development would not significantly influence the potential rare habitats for flora and fauna on the site.

Figure 9 **Sensitivity map of the project site**

6.2.5. Avifauna

An Avifauna Impact Assessment (Annexure D) was conducted by AGES in order to determine whether the proposed development would have negative impact on avifauna.

A number of potential impacts were individuated and assessed:

- Direct habitat destruction
- Habitat fragmentation
- Electrocutions
- Collision
- Disturbance of human activities and noise.

A series of specific mitigation measures were individuated in respect of all the aforementioned potential impacts in the Avifauna Impact Assessment.

The Avifauna Impact Assessment concluded that the proposed development of the Photovoltaic Power Plant would not impact significantly over any avian habitats of high conservation value. Considering the layout and design of the proposed development as well as the impact assessment, the extent of the habitat that will be affected will be minimal. Provided that the mitigation measures and recommendations in this report are adhered to, it is unlikely that the proposed development will have a long-term, significant negative impact on the local avifauna.

6.2.6. Visual

A Visual Impact Assessment will be conducted to determine the visual impact of the proposed solar park and will form part of the Draft and Final EIA Reports.

Vegetation however plays a major role in screening the proposed intervention from adjacent and nearby sensitive viewers. A tree buffer zone 20 metres wide is foreseen along the perimeter of the area where the solar power plant will be developed, in order to avoid any visual impact also from close observation points.

The effect of the lighting at night will be low, considering that at night only streetlamps from the access point up to the loop-in loop-out substation on the property will be switched on. This is because video-surveillance system will use infra-red (or micro-wave) video-cameras, that do not need a lighting system, which could reduce its functioning.

6.3. SOCIO-ECONOMIC ENVIRONMENT

A report on the socio-economic considerations related to the proposed will be conducted and attached to the Draft and Final EIA Reports.

The following issues can be anticipated:

- The national and local economies will benefit from civil contractor work, labour and building materials that will be required on site. On the whole, a minimum share of approximately 30% of total CAPEX (investment costs) will be sourced locally. This share is likely to increase once there will be a specific and competitive industry in the Republic of South Africa able to supply PV modules and other technological components.
- After approval, the project will take approximately 15 months to be built and will have a lifetime of 25-30 years. Approximately 100 people are expected to be employed during the

construction period, although this number can increase to 120 for short spaces of time during peak periods.

- During operational phase, the power plant will require a permanent staff of approximately 25 people. That impact will be positive, also in consideration of the slowing down of the recruitment rate due to mining stabilization activities.
- Approximately 50% of the operation costs will have a local economic return (mostly for maintenance works by local sub-contractors), then the impact will also be positive during the operational phase (25-30 years).
- Furthermore, the project will comply to the Economic Development Requirements, as requested by the IPP Procurement Programme, issued on 3rd August by the DoE. This economic development programme identifies needs of the surrounding communities in order to have a positive socio-economic impact. In particular, Carocraft (Pty) Ltd is required to identify a **Local Community** for the purpose of entering into a partnership for the Project.

6.4. AGRICULTURAL POTENTIAL

An Agricultural Potential Impact Assessment on soils potential is attached as Annexure E.

The proposed area, earmarked for the development of a solar plant in the Vryburg area, North West Province can be classified as having moderate-low potential soils as a result of the following:

- The shallow and often sandy nature of the soil makes the potential to cultivate crops under arable conditions basically impossible, especially considering that the shallow soils would not allow ploughing of the topsoils. Therefore, the site should be classified as not suitable for arable agriculture due to its physical characteristics.
- The grazing capacity of the land would allow limited grazing of the area, and the proposed development will not reduce the grazing value of the land considering that only the woody layer will be impacted on, while the grass layer of the site will still be available underneath the solar panel mounts to small livestock.

Considering the fact that re-growth of grass will take place under the panels as the mounting systems are at least 1m above ground level, the grazing and agricultural potential of the land will not be lost since smaller livestock such as game, goats and sheep will still be able to utilize the grass layer underneath the panels. At the end of the lifetime of the solar plant, structures will be removed and natural vegetation will re-establish naturally.

6.5. CULTURAL AND HERITAGE RESOURCES

An archaeological-cum-heritage assessment will be conducted to ascertain whether there are any remains of significance in the area that will be affected by the proposed development. This specialist study will form part of the Draft and Final EIA Reports.

7. IMPACT IDENTIFICATION AND ASSESSMENT

A clear statement will be made, identifying the environmental impacts of the construction, operation, maintenance and management of the proposed project. As far as possible, the suite of potential environmental impacts identified in the study will be quantified and the significance of the impacts will be assessed.

Each impact will be assessed and rated. The assessment of the data, where possible will be based on broadly accepted scientific principles and techniques. In defect, judgements and assessments will be necessarily based on the consultant's professional expertise and experience.

As previously described, **construction activities** for the establishment of PV power plants include:

- land clearing activities necessary for preparation of the site and access routes;
- excavation and filling activities;
- transportation of various materials;
- construction of the storage structures;
- installation of the PV modules and construction of associated structures and infrastructure;
- construction of the on-site substation (if necessary), the construction of the new power line or underground cables - 100 m long - which will deliver the energy to the Eskom Vaalwater rural substation;
- The extension of the busbar in the Eskom substation (if necessary) and the equipment of a busbay.

EXTENT:

The extent of most of the construction activities is localized and impacts will only occur at the development site.

Some activities will extend to adjacent landowners as access roads will be used which will lead to an increase in the traffic in the area.

These will be further investigated and mitigations measures will be included in EIA report.

DURATION:

The impact of construction activities will only be for the duration of the construction phase, after which it will cease completely. (Construction period envisaged to be 15 months)

PROBABILITY:

The probability of impacts occurring during the construction is phase very high as there will be impacts on the vegetation as most will be removed to make way for the proposed development.

Please note that the evaluation of environmental impacts as a result of the proposed development will be discussed in detail in the EIA report.

Environmental impacts associated with the **operational phase** of a solar energy facility may include visual and other impacts.

The **decommissioning activities** of the PV plant mainly include the removal of the project infrastructure and the restoring of the site *status quo ante*.

The identification of impacts will be based on:

- legal and administrative requirements;
- the nature of the proposed activity;
- the nature of the receiving environment;
- specialist studies and
- issues raised during the public participation process.

Potential impacts may include:

- **Impacts on soils & agricultural potential;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Impacts on ground water;**
Extent: Limpopo Water Catchment
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Impacts on the road system and traffic;**
Extent: Surrounding and adjacent land
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Impacts on air quality and potential emissions;**
Extent: Regional
Duration: Life of the project (between 25 . 30 years)
Probability: Very Low
Significance: Very Low
- **Geological, soil and erosion impacts;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Impacts on avifauna;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Impacts on vegetation;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: High
Significance: Medium
- **Impacts on heritage resources;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Low
- **Noise impacts;**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Low
Significance: Very Low

- **Impacts on tourism;**
Extent: Regional
Duration: Life of the project (between 25 . 30 years)
Probability: Unknown
Significance: Unknown
- **Social impacts;**
Extent: Regional & Locally
Duration: Life of the project (between 25 . 30 years)
Probability: High
Significance: High - Positive
- **Visual impacts.**
Extent: Locally at the proposed site
Duration: Life of the project (between 25 . 30 years)
Probability: Definite
Significance: to be determined

Please note that the statements above with regard to potential impacts are preliminary and have not been analysed as all the information to do this accurately has not been obtained yet.

In the following section: the Plan of Study for EIA it is outlined which studies are to be conducted in order to evaluate the identified impacts and to propose mitigation measures.

The significance of the potential impacts can and will then be determined.

8. ENVIRONMENTAL IMPACT ASSESSMENT (EIA) PROCESS AND PUBLIC PARTICIPATION PROCESS

The environmental impact studies can be summarized in a two-phased approach:

- Phase 1: Environmental Scoping Study (ESS)
- Phase 2: Environmental Impact Assessment (EIA) and Environmental Management Program (EMP)

The scope of the EIA procedure is to provide an assessment of all impacts related to the proposed project in compliance with the EIA Regulations 2010.

8.1. SCOPING PHASE

The Scoping Phase aims to produce the following:

- a description of the proposed activity, the property and the receiving environment;
- the identification of potential significant positive and negative impacts;
- the identification of opportunities and constraints, alternatives and mitigation measures which need to be evaluated and investigated during the successive EIA phase, especially in order to prevent environmental fatal flaws and sensitive or no-go areas.

The Scoping Phase includes the Public Participation Process. The PPP has the aim to identify concerns and issues by the interested and affected parties (I&APs).

In particular, in the case of the proposed development, issues and concerns raised by the I&APs and key stakeholders during the Public Participation Process were collected, processed and addressed in the Comments and Response document which forms a part of this Final Scoping Report.

All issues and concerns identified during the Scoping Phase are documented in this Final Scoping Report, submitted to the DEA together with a Plan of Study for EIA.

8.2. EIA PHASE

The next step of the EIA process is the development of guidelines for execution of the impact assessment and the compilation of an Environmental Impact Assessment Report.

The database of the stakeholders and I&APs developed during the scoping process will be used as a reference to ensure that stakeholders are involved and participate in the second phase of the EIA process.

All relevant issues considered during the Scoping Phase will be further investigated and assessed during the EIA Phase of this project. The EIA will involve various specialist studies and should provide an overall assessment of the biophysical, social and economic environment affected by the proposed project.

A detailed assessment will be carried out in terms of environmental criteria and rating of significant impacts of all options identified in the scoping phase. Appropriate mitigation measures will be identified and recommended for all significant impacts. These measures should be included in an Environmental Management Program (EMP) to be submitted together with the Environmental Impact Assessment Report (EIAR) to the DEA.

During the EIA phase stakeholders and I&APs will be notified in writing of the continuation of the project to the EIA Phase and will be informed as to the way forward and where and when the Draft Environmental Impact Assessment Report will be made available for review. Comments from the stakeholders and I&APs on the Draft EIR and the Draft EMP will be incorporated into the final EIAR.

The stakeholders and I&APs will furthermore be informed of the final decision regarding the Environmental Authorization and the appeal process.

8.3. PUBLIC PARTICIPATION PROCESS

All relevant I&APs have been identified and involved in the public participation process from the beginning of the project as per sections 54, 55, 56 and 57 of the EIA regulations 2010.

The public participation process offers the opportunity to become actively involved through constant sharing of information. The main purposes of the public participation process are to ensure that:

- all relevant information in respect of the application is made available to I&APs for their evaluation and review;
- reasonable opportunity is given to I&APs to comment and to submit queries related to the proposed project;
- comments and queries by the I&APs to the Scoping Reports and to the EIA Reports are submitted and evaluated in a reasonable timeframe and in predetermined terms.

The initial informative stage of the public participation was done from 30 July 2011 until 27 August 2011.

The public was informed of the proposed development and a database of Interested and Affected parties was compiled.

In the enclosed Annexure B there is the list of all components of the public participation process.

The public was informed of the project by means of:

- site notices;
- delivery of Background Information Documents (BID) to all adjacent land owners;
- notices in local and national newspapers; and
- sending of BID to other possible interested and affected parties/stakeholders.

A data base of registered I&APs has been established to date and will be maintained and added to as required.

Site notices were put up on site in two different locations on the fence surrounding the proposed development area. This was done on Wednesday 27 July 2011.

Background Information Documents were sent to adjacent landowners. Proof of this is attached in Annexure B.

A number of these documents were also distributed to the relevant governmental departments including inter alia Department of Water Affairs, Agriculture etc.

Other identified interested and/or affected parties/stakeholders include Eskom, the Local municipality, the District municipality etc.

Proof of all correspondence is included in Annexure B.

A newspaper advertisement was published in the 25 July 2012 version of the Daily Sun, which is a national daily newspaper.

A newspaper advertisement was also published on 27 July 2012 in a local newspaper called Overvaal, which is published weekly.

Only one response was received during the public participation process and this response was recorded and included in a spread-sheet designed as a data base to be used during the public participation process.

The response received concerns mostly that the I&AP would like to be kept informed and up to date during the process. This will be done according to the requests of all other I&APs.

This spread-sheet is included in Annexure B.

A copy of the submitted Draft Scoping Report was made available for comment - for a 40 day period . (from 12 September 2012 . 22 October 2012) to all persons who registered as I&APs and who sent any correspondence as well as all identified relevant governmental departments and stakeholders.

Further steps in public participation process

To ensure a transparent and complete public participation process the following steps are still to be taken during the rest of the EIA process:

- Final Scoping Report is now submitted to the DEA but is also made available to comment on. Notifications of the submission of the Final Scoping Report will be sent out.
- Draft EIA Report will be made available for a commenting period of 40 days.
- After submission of Final EIA Report to DEA notifications will be sent out to inform all I&APs and governmental organizations that the final EIA report was submitted and is again available for comments.

9. PLAN OF STUDY FOR ENVIRONMENTAL IMPACT ASSESSMENT

Hereinafter there is a brief description of the approach that will be used in the EIA study. Assumptions and sources of information will be identified and the knowledge of local people will be incorporated in the final scoping study.

9.1. DESCRIPTION OF THE AFFECTED ENVIRONMENT

A description of the affected environment will be provided. It will also be provided an additional indication of the sensitivity of the affected environment. Sensitivity, in this context, refers to the ability of an affected environment to tolerate disturbance, for example, if disturbance of the natural habitat results in the permanent loss of its biodiversity. The affected environment could be categorised as having a low tolerance to disturbance and is, therefore, termed a highly sensitive habitat. Instead, if a habitat is able to withstand significant disturbance without a marked impact on its biodiversity, the affected environment could be categorised as having a high tolerance to disturbance (i. e. low sensitivity+habitat).

9.2. IMPACT IDENTIFICATION AND ASSESSMENT

A clear statement will be made, identifying the environmental impacts of the construction, operation, maintenance and management of the proposed project. As far as possible, the suite of potential environmental impacts identified in the study will be quantified and the significance of the impacts will be assessed. Each impact will be assessed and rated. The assessment of the data, whereas possible will be based on broadly accepted scientific principles and techniques. In defect, judgements and assessments will be necessarily based on the consultant's professional expertise and experience.

As previously described, **construction activities** for the establishment of PV power plants include:

- the land clearing activities necessary for preparation of the site and access routes;
- the excavation and filling activities;
- the transportation of various materials;
- the preparation of the temporary worksite;
- the installation of the PV modules and construction of associated structures and infrastructure;
- the construction of the in-site loop-in loop-out HV substation and of the new sections of power line - 100 m long - which will deliver the energy to the Eskom's "Delareyville Munic/Vryburg 1" 88 kV power line.

Environmental impacts associated with the **operational phase** of a solar energy facility may include visual and other impacts.

The **decommissioning activities** of the PV plant mainly include the removal of the project infrastructure and the restoring of the site *status quo ante*.

The identification of impacts will be based on:

- legal and administrative requirements;
- the nature of the proposed activity;
- the nature of the receiving environment;
- specialist studies;
- issues raised during the public participation process.

Potential impacts may include:

- Impacts on soils & agricultural potential;
- Impacts on ground water;
- Impacts on the road system and traffic;
- Impacts on air quality and potential emissions;
- Geological, soil and erosion impacts;
- Impacts on avifauna;
- Impacts on vegetation;
- Impacts on heritage resources;
- Noise impacts;
- Impacts on tourism;
- Social impacts;
- Visual impacts.

9.3. SPECIALIST STUDIES

Due to the nature of the project, a number of specialist studies are required in the EIA process in order to investigate the potential environmental impacts associated with the proposed development.

Detailed studies on potentially significant impacts will be carried out to address these impacts throughout the EIA process. The public participation process provides valuable information in the identification of issues requiring further and specific investigation throughout the EIA process.

The report takes into consideration that fact that not all the information is available at this stage but will be for the Draft and Final Environmental Impact Assessment Report (EIAR).

The following specialist studies were conducted by now and included in the Draft and Final Scoping Reports:

- Ecological Impact Assessment
- Avifauna Impact Assessment
- Agricultural Impact Assessment

The following specialist studies will be conducted and included in the EIAR:

- Services Report
- Geo-technical and Geo-hydrological Report
- Visual Impact Assessment
- Socio-economic Impact Assessment
- Heritage Impact Assessment
- Wetland Delineation Study

10. DECOMMISSIONING PHASE

Decommissioning activities of the PV plant mainly include removal of project infrastructure and restoring of the site *status quo ante*.

The decommissioning phase will start at the end of the PV power plant lifetime (25 - 30 years) and will last approximately 6 months, involving a team of 50 workers.

Decommission will be subject to a decommissioning plan once the project is nearing its operational life (25-30 years). Decommissioning will also be subject to an environmental authorization (Activity 27 of R544 of 18 June 2010).

10.1. SITE PREPARATION

In order to ensure a correct decommissioning of the site, the first step of the process will include adequate site preparation. Integrity of access points and of laydown areas will be confirmed and eventually re-established in order to accommodate equipment and to load vehicles.

10.2. DISASSEMBLE AND REPLACEMENT OF EXISTING COMPONENTS

All components will be disassembled. Silicon of the PV modules will be recycled, as well as mounting structures (aluminium or zinc-coated steel frames and piles) and cables (copper and/or aluminium conductor).

Non-recyclable components of inverter, transformers and electrical devices will be disposed in appropriate way, in compliance with applicable laws and international standards.

10.3. RESTORATION OF THE SITE

Adequate measures will be undertaken in order to restore the site by re-planting of indigenous plant species.

11. CONCLUSIONS AND RECOMMENDATIONS

This Final Scoping Report and Plan of Study for Environmental Impact Assessment (EIA) describe the activities that will be undertaken for the proposed development of the Carocraft Solar Park and give indications to DEA related to the EIA which will be conducted.

A detailed assessment of the status quo of the receiving environment was conducted, in order to ensure that all pertinent environmental aspects were correctly identified and addressed.

A comprehensive public participation process has been conducted during the Scoping Phase (details of the public participation process are enclosed under Annexure B). All issues and questions raised will be noted and addressed during the EIA phase.

On the basis of the results of this Scoping Study it is requested and suggested that this Final Scoping Report be accepted by the competent authority.

It is also requested that the Authority Review Process+ be expedited - any additional information that might be required by DEA for review purposes should be requested from the EAP when the PoS for EIA is approved.
