His experience also includes the completion of Section 24G applications, Environmental Management Plans, EMPR's for prospecting and mining right applications, environmental audit reports, acting as an Environmental Control Officer (ECO) compiling monthly environmental compliance audits for construction sites, implementing and maintaining ISO 14 001 Environmental Management Systems and acting as an external ISO 14001 auditor. Due to the wide variety of projects he has been involved in, he has gained experience in a wide range of environmental disciplines.</p>

1. INTRODUCTION

The proposed Nachtwach prospecting project is located in the Kwa-Zulu Natal Province. The project falls within the Emadlangeni Local Municipality under Amajuba District Municipality. The project area is located 33km East of Volksrust, refer to Figure 1. K201826860 (South Africa) (Pty) Ltd proposes to prospect for Coal, Pseudo coal and anthracite on the remainder of the Farm Dagwatch 17093, remainder of the Farm Rietvallei 351, Remainder of the Farm Residue 416 and Remainder of the Farm 18359

The prospecting activities will include the following activities:

- Literature survey- which will be a comprehensive review of published and unpublished work from secondary data sources. Time will be spent reviewing books, journals, government publications etc.
- Geological Mapping will be conducted such that accurate and meaningful structural and geological data may be derived from it and to communicate information gathered from the desktop study with mapping results.
- Borehole planning will involve drilling program design and implementation procedures to ensure that drilling is conducted as safe and economic as possible. This phase will include cooperation between the drilling contractor, services contractors, geologists and other technical specialists. The planning process will also ensure that the health and safety of all working on the drilling sites and the environment are protected.
- All core samples collected throughout drilling will be submitted to a SANAS-accredited laboratory for comprehensive analyses and metallurgical recovery tests aimed at determining coal quality. The coal samples will be analysed for moisture, ash, volatile matter, fixed carbon, calorific value and sulphur.
- Geophysical wireline logging: Down hole geophysics will be conducted on specific boreholes to allow for stratigraphic correlation, for core recovery calculations and to aid in the interpretation and sampling of the various coal seams. Wireline logging is performed by lowering a 'logging tool' on the end of a wireline into a borehole and recording physical properties using a variety of sensors.
- Geological 3D modelling: After the extent and development of the coal seams are investigated by drilling, the acquired data will be modelled using geological modelling software. Geological 3D modelling includes integration of diverse types of observations

into 3D geo-models using geological mapping data, borehole data and interpretations and any other field data.

- Environmental management and rehabilitation: Environmental management will include the maintenance and improvement of the state of the environment to ensure that the ecosystem is protected and maintained for equitable use by future human generations, and also, maintain ecosystem integrity. Rehabilitation on the other hand includes returning the land to some degree of its former state after drilling.

These proposed prospecting activities requires an environmental authorization in terms of the National Environmental Management Act (Act No. 107 of 1998) (NEMA as amended) and will follow a Basic Assessment Process in terms of NEMA Regulations 982 (as amended). The NEMA Regulations Pertaining to the Financial Provision for Prospecting, Exploration, Mining or Production Operation (GNR 114) requires that a final rehabilitation, decommissioning and mine closure plan is developed which includes the determination of financial provision to guarantee the availability of sufficient funds to undertake rehabilitation and remediation of the adverse environmental impacts of mining.

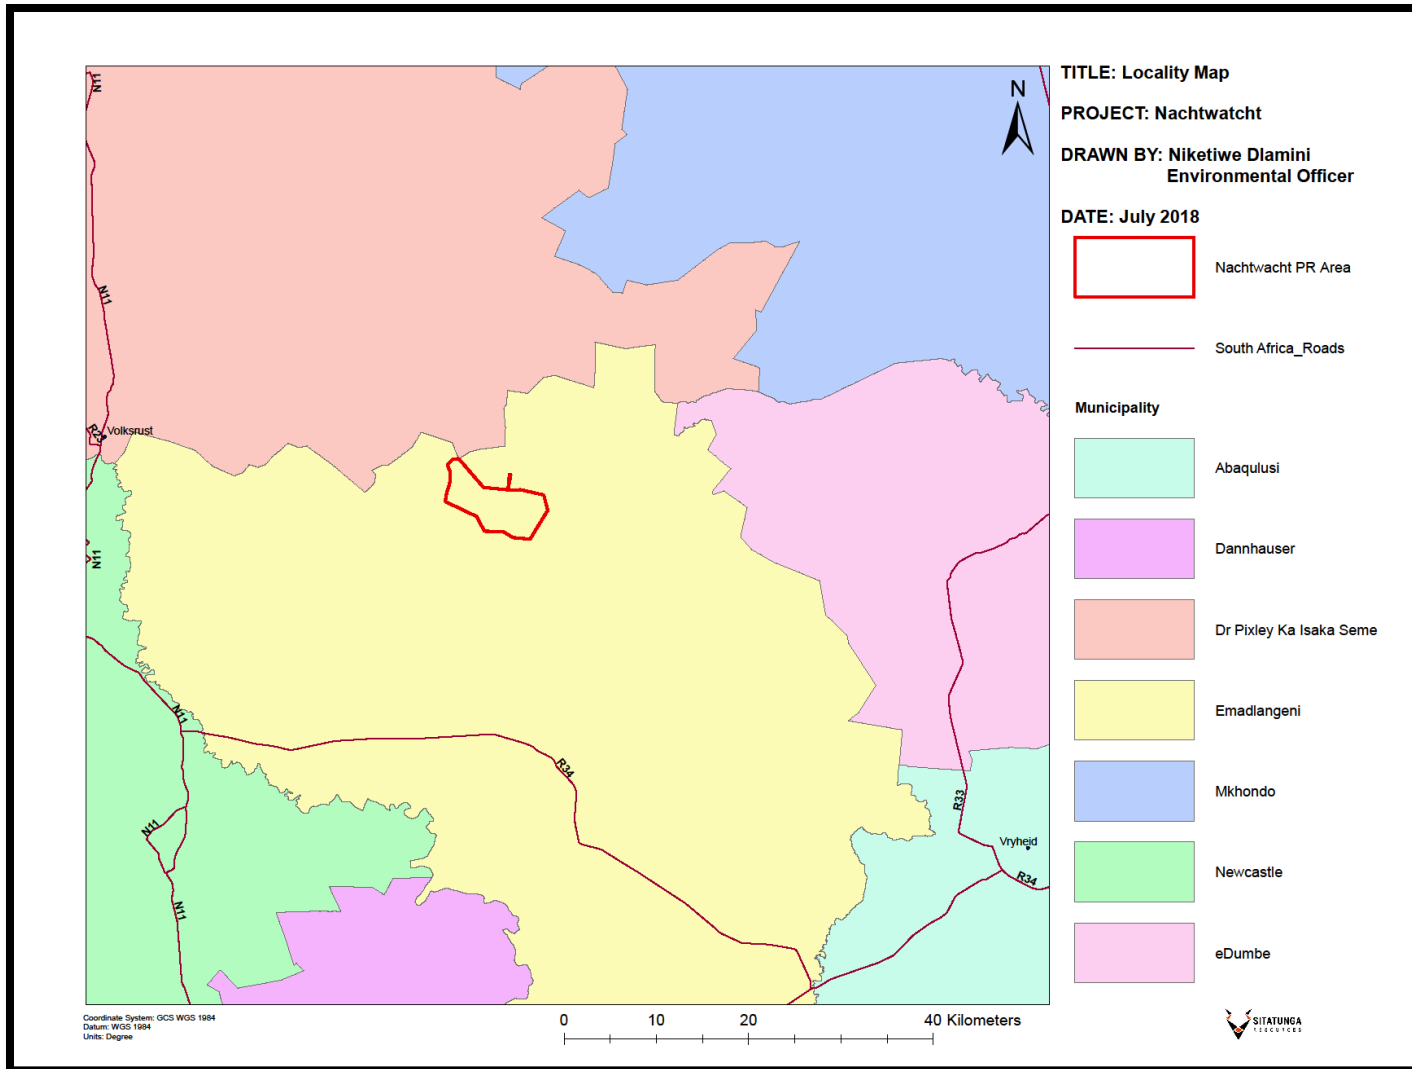

Figure 1 Locality map

1.1 Closure Objectives

Prospecting activities are anticipated to last for over a period of three years. The objective of this document is to present the final rehabilitation, decommission and closure plan for the proposed project. This closure plan therefore covers the footprint area of the proposed activities associated with the prospecting activities.

This report provides a plan that is measurable and auditable for K2018268260 (South Africa) (Pty) Ltd and to the Department of Mineral Resources (DMR). A plan that takes into consideration the final land-use of the site, indicating what infrastructure and activities will ultimately be decommissioned, closed, removed and remediated and indicating monitoring, auditing and reporting requirements.

The objectives of the rehabilitation, decommissioning and closure plan are to:

- provide the vision, objectives, targets and criteria for final rehabilitation, decommissioning and closure of the project;
- explain the risk assessment approach and outcomes and link closure activities to risk rehabilitation;
- detail the closure actions that clearly indicate the measures that will be taken to mitigate and/or manage identified risks and describes the nature of residual risks that will need to be monitored and managed post closure;
- commit to a schedule, budget, roles and responsibilities for final rehabilitation, decommissioning and closure of each relevant activity or item of infrastructure;
- detailing the full closure costs for the life of project; and
- outlining monitoring, auditing and reporting requirements.

2 REGULATORY REQUIREMENTS

There are a number of legal and regulatory frameworks with which K2018268260 must comply with, the following are key legislation which could materially affect rehabilitation and closure:

Table 1 legislation and its Implications to the Closure Plan

LEGISLATION	IMPLICATIONS FOR CLOSURE
<p>The Constitution of the Republic of South Africa. In terms of Section 24 of the Constitution “Everyone has the right to an environment that is not harmful to their health or well-being; and to have the environment protected, for the benefit of present and future generations.”</p>	<p>Constitutional requirement to ensure that the Plan includes measures that protect the rights of people to an environment that is not harmful to health or well-being post closure.</p>
<p>National Environment Management Act (Act 107, 1998) Sections 28 (1) and (3) of NEMA set out the duty of care principle, which is applicable to all types of pollution and must be taken into account in considering any aspects of potential environmental degradation. Every person who causes, has caused or may cause significant pollution or degradation of the environment must take reasonable measures to prevent such pollution or degradation from occurring, continuing or recurring, or, in so far as such harm to the environment is authorised by law or cannot reasonably be avoided or stopped, to minimise and rectify such pollution or degradation of the environment.</p>	<p>The measures required in terms of subsection (1) may include measures to - Investigate, assess and evaluate the impact on the environment; Inform and educate employees about the environmental risks of their work and the manner in which their tasks must be performed to avoid causing significant pollution or degradation of the environment; Cease, modify or control any act, activity or process causing the pollution or degradation; Contain or prevent the movement of pollutants or the causes of degradation; Eliminate any source of the pollution or degradation; or Remedy the effects of the pollution or degradation</p>
<p>Environmental Impacts Assessment Regulations, 2014 These regulations were developed for the preparation, evaluation, submission, processing and consideration of, and decision on, applications for environmental authorisations.</p>	<p>Any new EIAs or BAs for mining activities will be required to consider closure during planning and to include a closure plan and closure estimate to support an authorisation application.</p>
<p>National Environment Management: Waste Act (Act 59 of 2008) Part 8 of Chapter 4 of the Act indicates the requirement to identify the status and risk of contaminated sites and provides a legal mechanism for remediation activities to be instigated and controlled.</p>	<p>Contamination resulting from operational activities will require remediation, with the final soil quality meeting requirements as specified in the Acts Regulations.</p>
<p>NEMA Regulations pertaining to the Financial Provision for Prospecting, Exploration, Mining or Production Operations. The purpose of these Regulations is to regulate and determine financial provision as contemplated in the Act for the costs associated with the undertaking of management, rehabilitation and remediation of environmental impacts from prospecting, exploration, mining or production operations through the lifespan of such operations and latent or residual environmental impacts that may become known in the future. The Regulations also include detailed descriptions of the wording required in the documentation to support the provisioning for liability using Bank Guarantees and Trust Funds. Finally, the legislation also provides detailed on the information to be contained in the following plans: Annual rehabilitation plan Final rehabilitation, decommissioning and mine closure plan Environmental risk assessment report Care and maintenance plan</p>	<p>Closure planning process will need to be expanded to include Annual rehabilitation plan, Final rehabilitation, decommissioning and mine closure plan, Environmental risk assessment report Care and maintenance plan.</p>

<p>The National Environment Management: Air Quality Act, 2004. This Act regulates atmospheric pollution. The Act came into full effect on 1 April 2010 and entrusts the Department of Environmental Affairs with the task of preventing pollution and ecological degradation, while at the same time promoting justifiable economic and social development. Metropolitan and District Municipalities are charged with issuing atmospheric emission licenses for certain listed activities. It must be shown that the best practical means are being employed to limit air pollution before these certificates will be issued. Penalties and criminal sanctions are imposed for noncompliance with the National Management: Air Quality Act.</p>	<p>Other aspects of the NEMAQA such as monitoring and application of management/mitigation measures may apply during closure.</p>
<p>The National Environmental Management: Biodiversity Act, 2004: The Act seeks amongst other things, to manage and conserve biological diversity, to protect certain species and ecosystems, to ensure the sustainable use of biological resources and to promote the fair and equitable sharing of benefits arising from bio-prospecting involving those resources. The NEM: BA includes a Regulation related to the management of threatened and protected species. A similar Regulation is applied to Threatened Ecosystems. NEM: BA has a set of norms and standards for the development of management plans for both species (e.g. Threatened or Migratory Species) and ecosystems (Endangered or Critically Endangered).</p>	<p>If relevant species or threatened ecosystems are presence on the mine concession, a management plan must be developed in alignment with these norms and standards.</p>
<p>National Water Act Section 19 of the NWA sets out the principles for “an owner of land, a person in control of land or a person who occupies or uses land” to:</p> <ul style="list-style-type: none"> • Cease, modify or control any act or process causing pollution; • Comply with any prescribed waste standard or management practice; • Contain or prevent the movement of pollutants; • Eliminate any source of pollution; • Remedy the effects of the pollution; and • Remedy the effects of any disturbance to the bed and banks of a watercourse 	<p>This places the obligation to mitigate any aspects that cause or have caused pollution as well as to remediate any residual contaminated water at closure.</p>
<p>Mine Health and Safety Act, 1996: This Act deals with the protection of the health and safety of persons in the mining industry but has some implications for environmental issues due to the need for environmental monitoring within mine operations and maintenance of mine residue deposits.</p>	<p>All closure activities will have to be undertaken in a safe manner where the Health and Safety of all workers involved in closure activities is protected.</p>

3 DESCRIPTION OF THE RECEIVING ENVIRONMENT

3.1 Geology

The Highveld Coalfield is located in south eastern Mpumalanga Province, immediately south of the Witbank Coalfield. The width of the Coalfield is some 95km, stretching from Nigel in the west to Davel in the east, and is, in a N-S direction, about 90km long, from just north of Kriel to beyond Standerton in the south and covers an area of approximately 7 000km². After the Witbank Coalfield, the Highveld Coalfield is the next largest producing Coalfield in South Africa.

The Coalfield is host to up to five coal seams within the middle Ecca Group sediments of the Karoo Supergroup. The Karoo Supergroup comprises sediments ascribed to deposition in glacial to fluvio-glacial and from shallow marine to fluviodeltaic environments. The Karoo Supergroup comprises the following Groups (in decreasing age), although not all Groups are completely represented in the Highveld Coalfield to the present-day erosion surface: Dwyka, Ecca, Beaufort, Stormberg and Drakensberg.

The five identified coal Seams contained in the Vryheid Formation (middle Ecca Group) are named, from the base up, as follows: No.1 Seam; No.2 Seam; No.3 Seam; No.4 Seam and No.5 Seam.

In certain areas of the Coalfield, both the No.4 and No.2 Seams are split by clastic partings into the No.4 upper and No.4 lower units. The Coalfield is characterized by the fact that in the northern regions, all the coal seams, with the exception of the No.3

Seam, attain mineable thicknesses with economic potential, while in the southern regions, only the No.4 Seam, and in very localised areas, the No.2 and No.5 Seams, attain mineable dimensions of economic importance.

The depth to the coal seams increases in a southerly direction, e.g. the No.4 Seam can be mined by opencast in the Kriel (northern) district, while it occurs at a depth of around 200m in the Standerton (southern) district. The coal seams are generally flat-lying to gently undulating with a slight regional dip to the south..

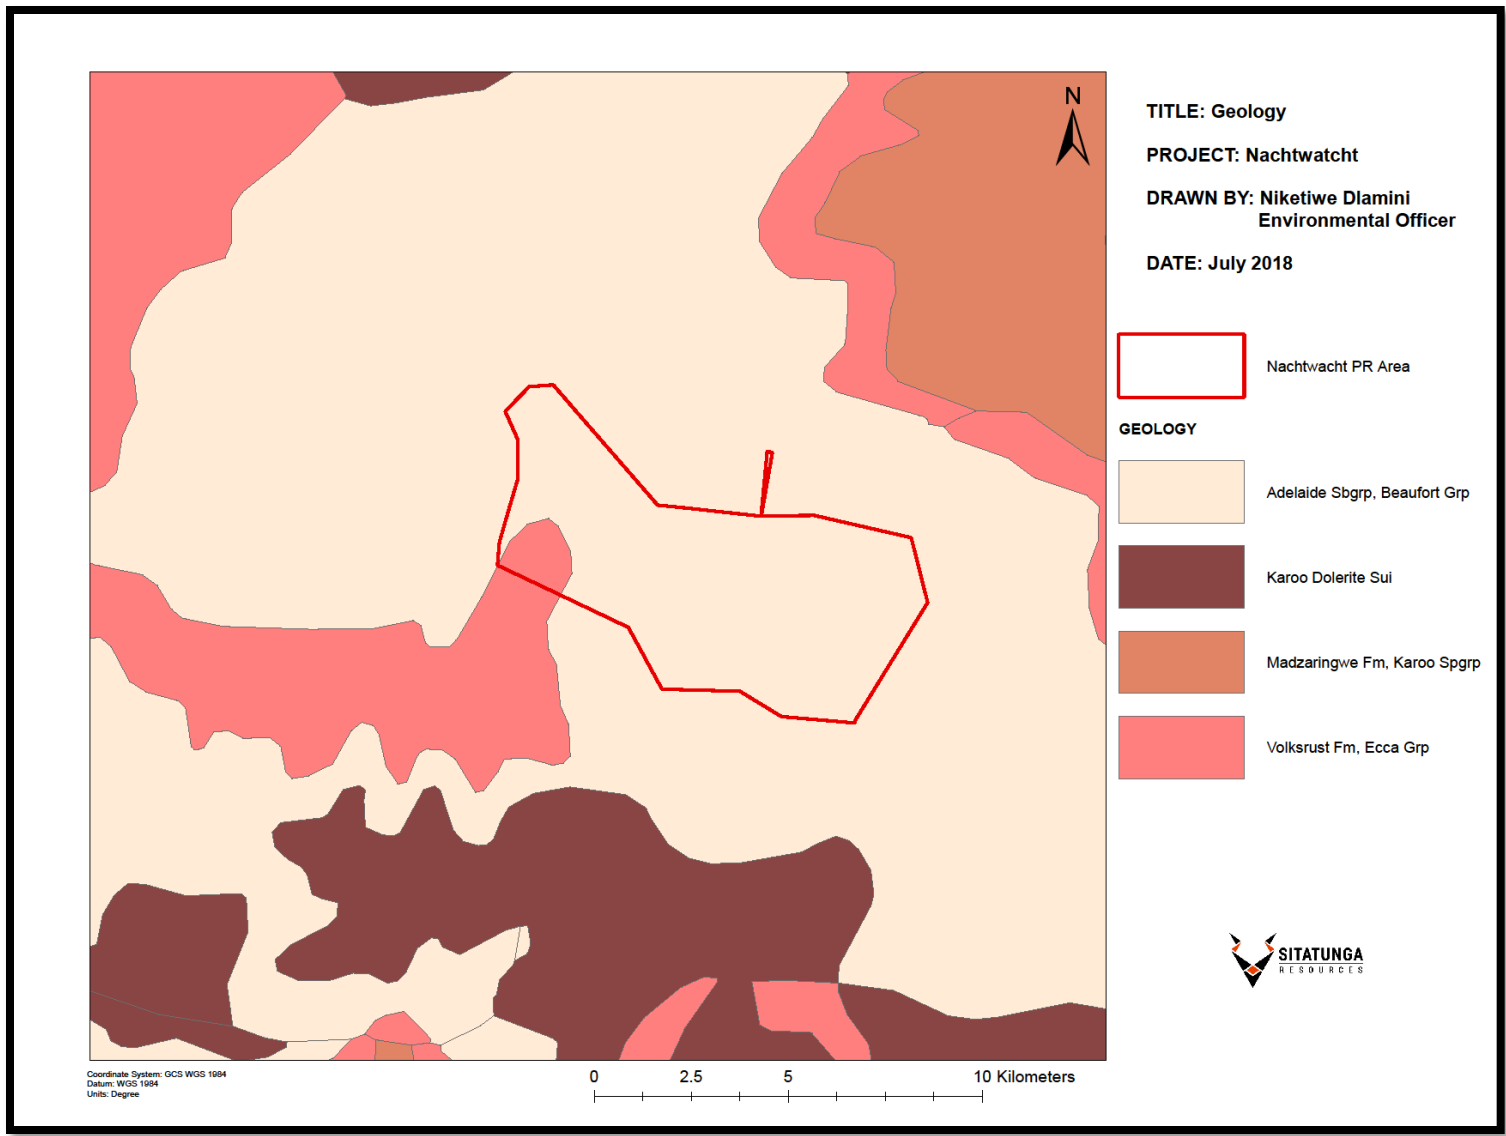

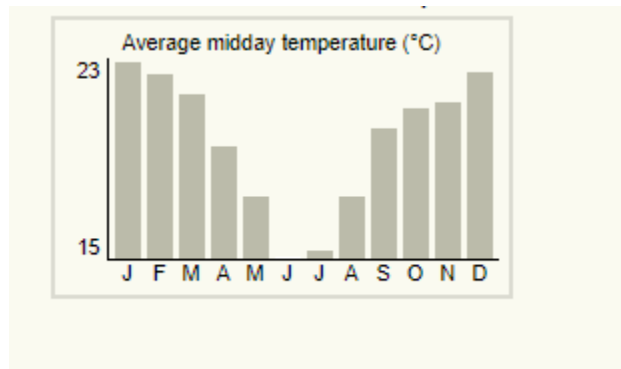

Figure 2 Geology of the Site

3.2 Climate

The site is located 10km south of Wakkerstroom, which normally receives about 690mm of rain per year, with most rainfall occurring during summer. The chart below (lower left) shows the average rainfall values for Wakkerstroom per month. It receives the lowest rainfall (2mm) in June and the highest (132mm) in January. The monthly distribution of average daily maximum temperatures (centre chart below) shows that the average midday temperatures for Wakkerstroom range from 15°C in June to 22.8°C in January. The region is the coldest during June when the mercury drops to 0.5°C on average during the night. Consult the chart below (lower right) for an indication of the monthly variation of average minimum daily temperatures.

3.3 Topography

The area associated with the proposed prospecting area is characterized as having flat/slightly undulating areas in the north with a ridge that runs through the middle of the property. Drainage lines to streams also influence the topographical profile of the site. There are no extreme and/or extraordinary topographical features present as seen in below.

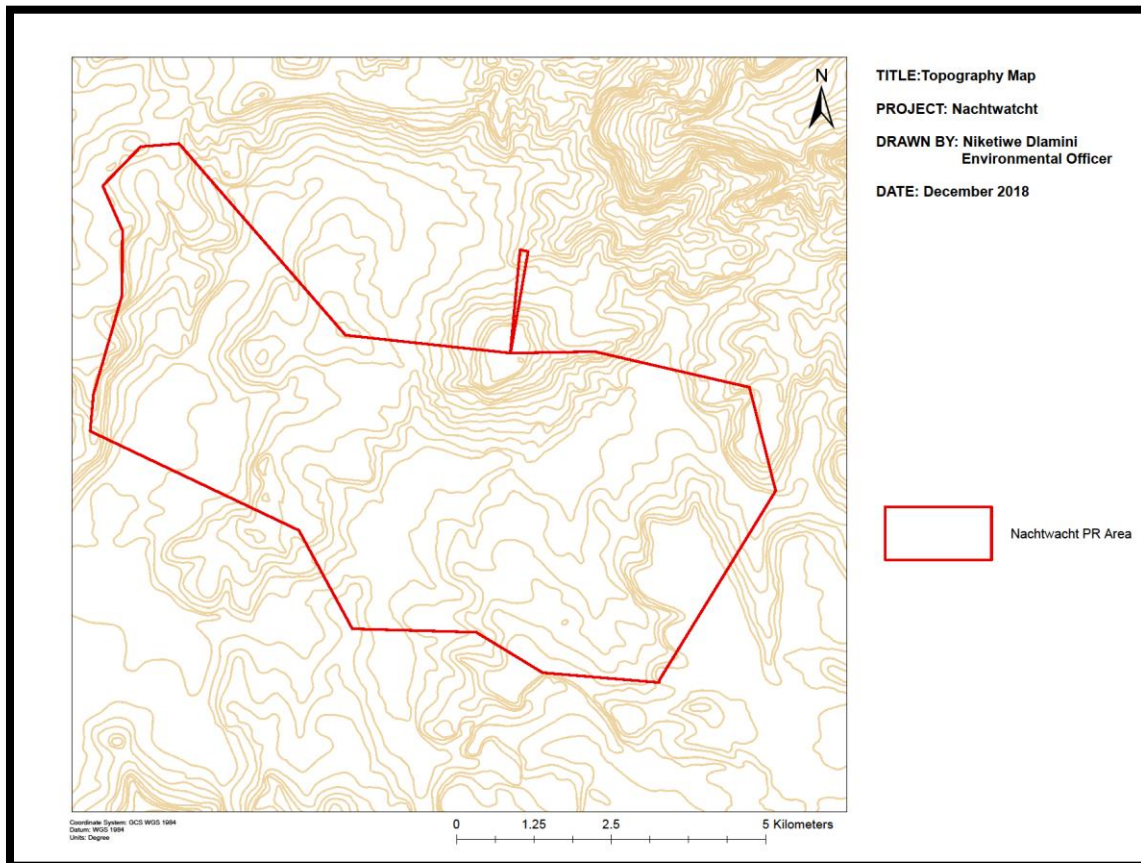

Figure 3 Site Topography

3.4 Soils & Land Capability

The land capability has not been described specifically for the area as the impact of prospecting will not significantly affect the land capability of the area. Land use in and around the prospecting area is mainly cultivation and natural lands. The proposed prospecting area is associated with grasslands and agricultural activities.

The land Capability for the Prospecting Area was determined using the EIA Screening Tool and is characterized as being “Very High”, “High” and “Medium” “and Low” in terms of Agriculture Theme Sensitivity.

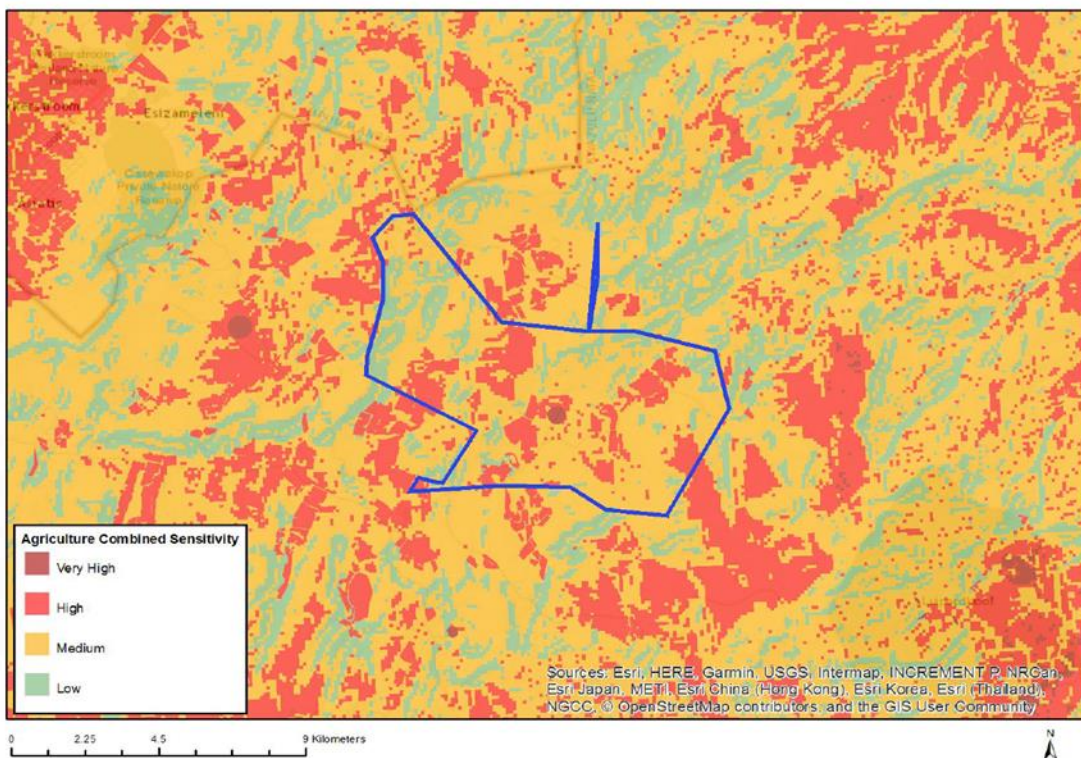

Figure 4 Agriculture Combined Sensitivity

Table 2 Agriculture Sensitivity

Sensitivity	Feature(s)
High	Land capability;09. Moderate-High/10. Moderate-High

3.5 Natural vegetation

The prospecting area is situated in the grassland biome. The grassland biome, occupying 26% of South Africa, is centrally located in the country. Environmental gradients exist, causing the floristic composition, vegetation dynamics and ecosystem functioning to vary considerably across this biome, despite the relatively uniform vegetation structure. These gradients include a rainfall gradient ranging from 400 to >1200 mm per year, a temperature gradient from frost free to snow in winter and altitude ranging from sea level to 3300 m (O'Connor & Bredenkamp 2003). Grasslands are important to the livestock industry, and agricultural scientists historically produced considerable research on this biome

Vegetation Unit

The vegetation in the study area is characterised by grasslands, wetlands and riparian vegetation. The grasslands comprise natural grasslands that are grazed, secondary grasslands in fallow lands and pasture grasslands. Where the grassland is in a natural state, it should support a high diversity of species. However, in the majority of grassland areas, the grazing pressure and annual or bi-annual burning maintains a largely dominant stand of *Themeda triandra* (Red Grass), while the forb diversity is relatively low.

Figure 5 Vegetation Map

3.6 Fauna

The fauna expected observed in the study area are, for the most part, typical grassland species and representative of grassland animal communities that are widespread in the regional areas. Faunal SCC are expected to occur within the region surrounding the study area, therefore should any prospecting activities take place, care should be taken to minimise habitat disturbance and avoid collision with this specie during invasive prospecting activities.

As there are a number of water resources within the Prospecting Area, it is likely that a number of amphibian species will be present. As the land use within the prospecting area has been largely transformed it is likely that only a limited number of reptile and amphibian species will occur on site. The data for the NFEPA wetlands on site does not indicate that there are any sensitive amphibian species associated with those wetlands.

3.7 Surface water

The proposed project site is situated within the Tugela River Catchment Area. This is within Quaternary Catchment V31A. There are 25 natural wetlands found on site and one FEPA category B river that cuts cross the site in the South. These wetlands and rivers have been buffered off and no prospecting activity will occur within these buffers.

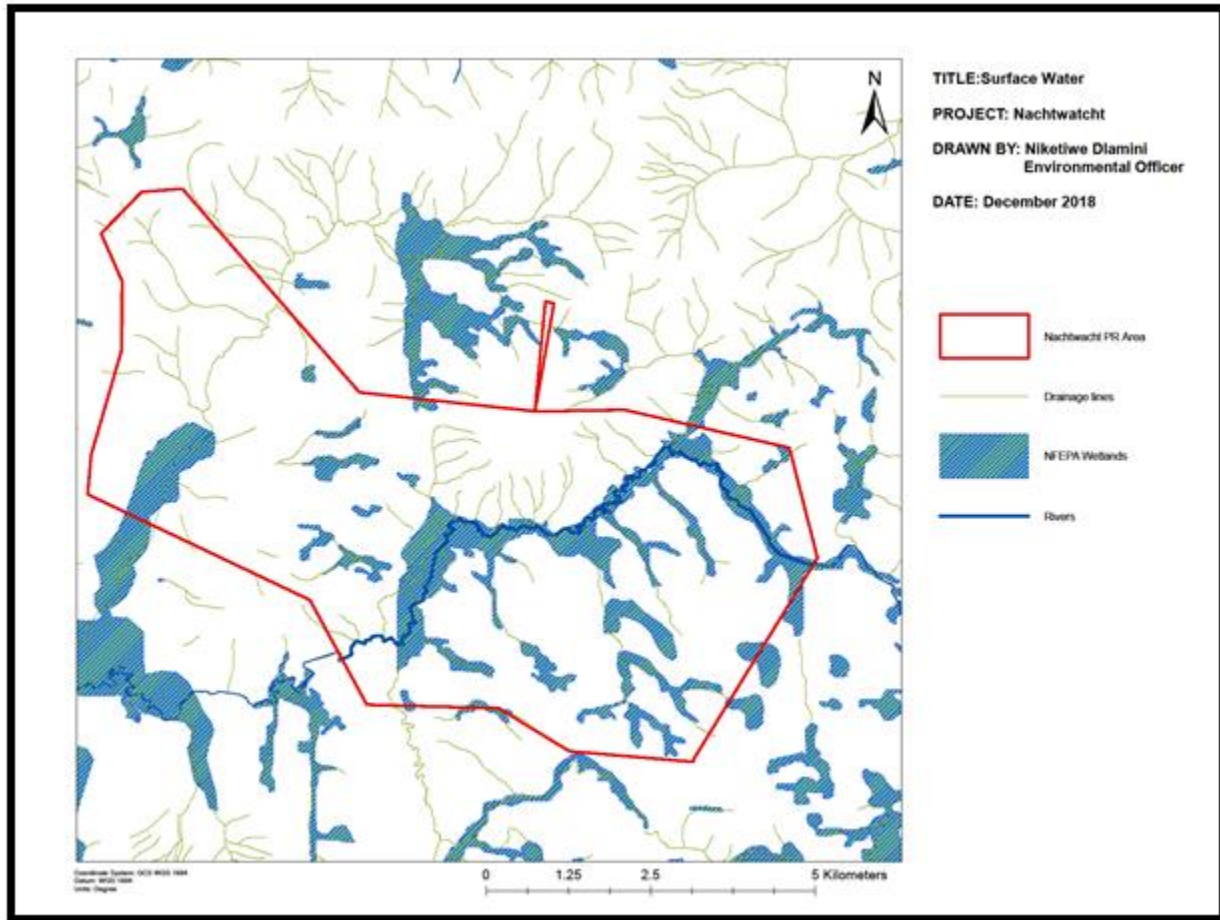

Figure 6 Surface Water on site

3.8 Groundwater

There is a data deficiency for groundwater studies in the area, therefore the exact status of groundwater availability is not known. Groundwater is an essential resource for rural and farming communities for consumption, agriculture and other domestic purposes.

3.9 Regional socio-economic structure

EMadlangeni Municipality (KZN 253) is one of three local municipalities within Amajuba District Municipality. It is the largest local municipality in the District in terms of geographical size measuring at 3 539 Km². The municipality covers the central regions of Amajuba District on the north-western parts of KwaZulu-Natal. The major transportation route within the municipality is the R34. The N11, which borders a small section of the municipality on the western portion, connects the municipality to outer areas of Newcastle and Volksrust. The R34 runs through the district and divides the municipality into north and south regions. The northern region includes Utrecht, Groenvlei and Blue Mountain while the southern region includes Kingsley. The R34 further connects to the R33 on the south linking the municipality with Dundee.

As of August 2016, EMadlangeni municipality comprises of 6 wards as indicated on Map 3. The municipality has 5 traditional councils namely; Ndlamlenze Traditional council, Amantungwa Traditional Council, Thekwani Traditional Council, Mgundeni Traditional Council and Mbatha Traditional Council.

3.10 Location, Population and distribution

In 2011, EMadlangeni's population was approximated at a total of about 34 442 people. According to the 2016 community survey, the total population in the municipality was recorded at approximately 36 869 people. According to the Census 2011 data, the number of households in EMadlangeni was 6252, which increased by 415 households to 6667 households in 2016. This indicates that as the number of households increase so does the average number of households. This is could be a result of in migration into the area due to job transfers or a new dwelling for the household.

According to the Statistics South Africa 2016 Community Survey data, the age structure of the population reveals a generally young population with a large portion falling below the age of 35 being 74.38%. The needs of this generally young population thus become important and it has implications on the provision of educational facilities, social welfare and the stimulation of the economy to provide job opportunities and economic development for the economically active portion of the population.

Figure 7 Age Distribution

EMadlangeni’s population is also characterised by a predominant female population, representing 51.93% of the total population. In 2011, the gender distribution within the municipality comprised slightly of more males than females where males accounted for 50.77% of the population. Between 2001 and 2011 majority of the households in EMadlangeni were male-headed at 67.45% and 61.24%, respectively. Although there are more male-headed households, efforts should be aimed at assisting and empowering women as the number of female-headed household increases.

Figure 8 Gender Distribution

3.11 Major economic activities and sources of employment

A socio-economic profile of the municipality is very critical in assisting a municipality with how to plan and properly utilise its resources. It also assists developers in identifying gaps in the local municipality and where their focus should be in terms of social responsibility projects. A socio-economic profile is an important tool that provides data on three primary areas of concern, i.e. Social Services, Economic Services and Spatial/Development. The table below shows eMadlangeni's comparative advantage in terms of GDP contribution. The municipality's most competitive sector is government services. Personal services, Manufacturing and Wholesale, Retail & Motor Trade/Tourism show marginal contribution.

DESCRIPTION OF SECTOR	NATIONAL – GDP	PROVINCIAL – GDP CONTRIBUTION TO NATIONAL GDP	EMADLANGENI LOCAL MUNICIPALITY CONTRIBUTION TO GDP
Agriculture	2.3%	3.4%	0.001%
Mining	7.7%	1.7%	0.012%
Manufacturing	13%	15.9%	0.01%
Electricity & Water / Utilities	2.4%	3.6%	0
Construction	3.4%	4.1%	0
Wholesale, Retail & Motor Trade / Tourism	13.7%	13.9%	0.01%
Transport, Storage & Communications	8.4%	12.3%	0
Finance, Real Estate & Business Services	19.4%	15.6%	0.001%
Government Services	15.1%	14%	99,98%
Personal Services	5.4%	5.6%	0.01%

3.12 Employment

Emadlangeni's economically inactive population contributes approximately 25.68% of the total population within the municipality. The Census 2011 data further reveals that only 16.89% of the

municipality's population is employed. Unemployment within the municipality was recorded at 10.18%. This indicates that municipality is facing challenges in the generation of employment opportunities and a possible lack of necessary skills and education to participate in the economy may be lacking within the municipality.

In addition to low employment levels, 11857 people within the municipality earn no income, accounting for 34.43% of the population. Notable, 10447 people in EMadlangeni earn between R 1-R 400 which contributes 30.33% of the total population. This income bracket includes government grant recipients and thus indicative of a state-dependent section of the population. More worrisome is that 49.69% (17114) of income earners earn below R1600 per month. Consequently, suggesting a large portion of the population living in poverty with low levels of disposable income.

4 CLOSURE VISION, OBJECTIVES AND TARGETS

The closure vision for the proposed project is to establish a safe, stable and non-polluting post-prospecting landscape that can facilitate integrated, self-sustaining and value generating opportunities, thereby leave a lasting positive legacy. This plan is aimed at achieving the following targets:

- Creating a safe, physically stable rehabilitated landscape that limits long-term erosion potential and environmental degradation;
- Sustaining long term catchment yield and water quality;
- Focusing on establishing a functional post-prospecting landscape that enables self-sustaining agricultural practices where possible;
- To encourage, where appropriate, the re-instatement of terrestrial and aquatic wetland biodiversity

5 ALTERNATIVES CONSIDERED

Considering that this is a prospecting application, the proposed Welkom prospecting project is not complex and the risks associated with prospecting are understood and can be mitigated at

closure. Alternative options for closure are limited. There are only two options that have been considered as activity alternatives for the closure plan:

Preferred Alternative: Closure/ Backfill of boreholes with overburden removed during drilling

Alternative 1: To Leave boreholes open, in-order to allow for groundwater recharge by surface run-off.

5.1 Preferred Alternative: Rehabilitation/ Backfill of boreholes

Rehabilitation is the restoration of a disturbed area that has been degraded as a result of activities such as mining, road construction or waste disposal, to a land use in conformity with the original land use before the activity started. This also includes aesthetical considerations, so that a disturbed area will not be visibly different to the natural environment. This also involves maintaining physical, chemical and biological ecosystem processes in degraded environments, hence the preferred option of backfilling the boreholes with the overburden removed during development and cover with growth medium to establish vegetation. This option has several advantages as discussed below:

Advantages

- The site will be aesthetically acceptable;
- The site will blend in with the environment;
- The site will go back to being a suitable habitat for fauna and flora;
- The site will be safe and pollution free;
- Revegetating the site will ensure that the site is non-erodible.

Opting for alternative 1, which is to leave boreholes without backfilling poses a risk in that, these boreholes may fill in with water, which may become attractive to wildlife and communities leading to drowning and the risk of being trapped in the declines. To mitigate these risks, it is necessary to backfill. Treatment technologies should be used to prevent decanting.

6 CLOSURE ASSUMPTIONS

This closure plan has been developed based on limited available information including environmental data. Some of the information currently available may need to be supplemented during the operational period. Therefore, a number of assumptions were made about general conditions, and closure and rehabilitation of the facilities at the site to develop the proposed closure actions. As additional information is collected during operations, these assumptions will be reviewed and revised as appropriate.

The assumptions used to prepare this plan include the following:

- The closure period will commence once the last planned weight of coal has been extracted from the site for laboratory testing;
- The proposed prospecting sites will be adhered to minimize the potential impacts;
- Vegetation establishment will be in line with a project area's indigenous vegetation
- Water management infrastructure developed for the operational phase will be retained for closure /end of the life of the project as necessary;
- There are limited opportunities for any infrastructure to be built on site and if any infrastructure is built, it will be of limited benefit to the community. Therefore, all buildings will be demolished;
- All hazardous and domestic waste will be transported offsite for disposal in licensed landfills;
- No roads are anticipated to be constructed to access the site, existing roads will be used as far as possible. Where access tracks have been developed in cases where there are no roads, these will be rehabilitated and closed as part of normal closure actions.

7. FINAL LAND USE

Post closure land use, will return to being agricultural activities. This will include livestock farming, cultivation and plantations. The built-up environment on these farms will not be disturbed during prospecting activities and these will continue to exist post closure.

8. CLOSURE AND REHABILITATION ACTIVITIES

The rehabilitation actions intended to be undertaken at the end of the life of the proposed prospecting activities are described below. These actions are designed to comply with the objectives of this plan which are derived from NEMA GN 1147.

8.1 Infrastructure

All infrastructures will be decommissioned and the footprints rehabilitated for the establishment of vegetation. Material inventories will be managed near the end of prospecting activities to minimize any surplus materials at closure. Where practicable, equipment and materials with value not needed for post-closure operations will be sold and or removed from the site. Equipment with scrap or salvage value will be removed from the site and sold to recyclers.

A soil contamination investigation will be conducted on completion of demolition activities. The purpose of this is to identify areas of possible contamination and design and implement appropriate remedial measures to ensure that the soil contaminants are removed.

Closure actions will include:

- All power and water services to be disconnected and certified as safe prior to commencement of any decommissioning works;
- All remaining inert equipment and decommissioning waste will be disposed to the nearest licensed general waste disposal facility;
- Salvageable equipment will be removed and transported offsite prior and during decommissioning;
- All tanks, pipes and sumps containing hydrocarbons to be flushed or emptied prior to removal to ensure no hydrocarbon/chemical residue remains;

8.2 Boreholes

Closure of boreholes will entail backfilling with overburden stripped ahead of prospecting activities. All overburden should be replaced into the void and the final surface reshaped to simulate surrounding topography while ensuring that the surface is free draining.

Once backfilling is complete a growth medium cover will be placed and vegetation will be established. There may be a requirement to include sacrificial erosion protection measures on the surface while vegetation is being established.

8.3 Roads and parking areas

Existing roads will be used as far as possible. Closure actions concerning roads and parking areas will include:

- Removal of all signage, fencing, shade structures, traffic barriers, etc.;
- All 'hard top' surfaces to be ripped along with any concrete structures;
- All potentially contaminated soils are to be identified and demarcated for later remediation; and
- All haul routes that have been treated with saline dust suppression water need to be treated, with the upper surface ripped and removed to designated contaminant disposal areas.

8.4 Remediation of Contaminated Areas

All soil, contaminated with hydrocarbons, will be identified, excavated, if possible to at least 200 mm below the contaminated zone and then treated.

- All tanks, pipes and sumps containing hydrocarbons will be flushed or emptied;
- Removed soils will be managed as determined by the nature and extent of the contamination;
- Liquid storage tanks will be emptied, the structure removed/demolished and sub-surface holes filled; and
- All equipment in which chemicals have been stored or transported will be cleaned and disposed of in a suitable disposal facility.

8.5 Vegetation

Successful revegetation will help control erosion of soil resources, maintain soil productivity and reduce sediment loading in streams utilizing non-invasive plants that fit the criteria of the habitat

(e.g. soils, water availability, slope and other appropriate environmental factors). Invasive species will be avoided and the area will be managed to control the spread of these species.

To counter the effects of erosion, naturally occurring grassland species will be planted on slopes. These species will provide soil holding capacity and reduce runoff velocity. The flatter areas will be re-vegetated with the objective of creating a sustainable ecosystem. The occurrence of protected plant species will need to be determined before vegetation is removed and the required permits will be obtained for either destruction or relocation.

8.6 Waste Management

Waste management activities will include:

- Hazardous waste will be managed as per the Minimum Requirements for Handling, Classification and Disposal of Hazardous Waste.
- Non-hazardous will be disposed in the nearby licensed landfill site;
- Scrap and waste steel will be sold to recyclers.
- It may be necessary to fence temporary salvage yards for security reasons, particularly where these are located close to public roads.

9. ENVIRONMENTAL RISK ASSESSMENT

Risks associated with the closure of the prospecting activities are described and a determination was taken to assess the nature of the risk and then risk is ranked according to predetermined criteria for probability and consequence. Five categories were considered to describe the nature of the risk. The nature of the risk was assessed to fall into one of the following categories:

- Health and Safety
- Environment
- Financial
- Legal and regulatory obligations
- Reputational, Social or Community

Once the risks had been captured the probability of the risk occurring as well as the consequence of the risk occurring were rated according to the criteria presented below. A matrix listing the

probability and consequence is then used to numerically rank the risk and determine whether the risk level is: High, Moderate to high, Moderate, Moderate to low or Low.

Table 3 Significance rating

Score out of 100	Significance
1 to 20	Low
21 to 40	Moderate to Low
41 to 60	Moderate
61 to 80	Moderate to high
81 to 100	High

Table 4 Methodology

The status of the impact		
Status	Description	
Positive:	a benefit to the holistic environment	
Negative:	a cost to the holistic environment	
Neutral:	no cost or benefit	
The duration of the impact		
Score	Duration	Description
1	Short term	Less than 2 years
2	Short to medium term	2 – 5 years
3	Medium term	6 – 25 years
4	Long term	26 – 45 years
5	Permanent	46 years or more
The extent of the impact		
Score	Extent	Description
1	Site specific	Within the site boundary
2	Local	Affects immediate surrounding areas
3	Regional	Extends substantially beyond the site boundary
4	Provincial	Extends to almost entire province or larger region
5	National	Affects country or possibly world
The reversibility of the impact		
Score	Reversibility	Description
1	Completely reversible	Reverses with minimal rehabilitation & negligible residual affects
3	Reversible	Requires mitigation and rehabilitation to ensure reversibility
5	Irreversible	Cannot be rehabilitated completely/rehabilitation not viable
The magnitude (severe or beneficial) of the impact		
Score	Severe/beneficial effect	Description
1	Slight	Little effect - negligible disturbance/benefit
2	Slight to moderate	Effects observable - environmental impacts reversible with time
3	Moderate	Effects observable - impacts reversible with rehabilitation
4	Moderate to high	Extensive effects - irreversible alteration to the environment
5	High	Extensive permanent effects with irreversible alteration
The probability of the impact		
Score	Rating	Description
1	Unlikely	Less than 15% sure of an impact occurring
2	Possible	Between 15% and 40% sure of an impact occurring
3	Probable	Between 40% and 60% sure that the impact will occur
4	Highly Probable	Between 60% and 85% sure that the impact will occur
5	Definite	Over 85% sure that the impact will occur
The Consequence		= Magnitude + Spatial Scale + Duration + Reversibility.
The Significance		= Consequence x Probability.

Table 5 Outcome of Risk Assessment

Where Significance = Consequence x Probability															
RISK ISSUES DURING CLOSURE	WHAT IS THE ROOT CAUSE OF THE HAZARD?	WHAT ARE THE CONSEQUENCE S?	BEFORE IMPLEMENTATION OF CLOSURE STRATEGY					SIGNIFICANCE RATING	CONCEPTUAL CLOSURE STRATEGY	AFTER IMPLEMENTATION OF CLOSURE STRATEGY					SIGNIFICANCE RATING
			E	D	R	M	P			E	D	I	R	P	
HEALTH AND SAFETY															
Boreholes or excavations which are not properly backfilled may pose health and safety risks such as injuries to animals and local community members accessing the site during post closure activities	Leaving excavations opened	Injuries and loss of livestock	1	2	1	3	3	Negative Moderate Low risk (21)	Once prospecting activities are completed, backfilling should be undertaken as soon as practicable possible	1	2	1	3	2	Negative Low risk (14)
ENVIRONMENTAL															
Operational and decommissioning activities may result in soil being contaminated.	Dismantling of oil storage tanks, and oil drips from machinery.	Change in soil properties	1	2	1	3	3	Negative Moderate low risk (21)	Operational impacts will be remediated as far as possible during operation phase. During closure, contaminated soils with coal particulates and hydrocarbon will be removed and disposed	1	2	1	3	2	Negative low risk (14)

										according to regulatory requirements.						
FINANCIALS																
Delaying closure once prospecting activities are complete may allow for vandalism and interference of infrastructure which may lead to costlier remedial measures being implemented when closure actions are undertaken.	Poor security on site	Loss of equipment	1	2	3	3	3	Negative Moderate low risk (27)	Appropriate security measures will be retained to secure infrastructure until infrastructure can be demolished.	1	2	3	3	2		Negative low risk (18)
Closure material balance not sufficient to implement closure actions leading to environmental impacts remaining unmitigated.	Poor storage of subsurface material	Loss of indigenous backfill material	1	2	3	3	3	Negative Moderate low risk (27)	Material designated for closure will be protected within the operational foot print of the site. However, in the event that insufficient closure material is available, alternative sources will be investigated.	1	2	3	3	2		Negative low risk (18)
Underestimating the closure quantum resulting in insufficient funds to mitigate impacts at closure. This may result in legal obligations not being met.	Underestimating impacts	Poor rehabilitation of site	1	2	2	3	3	Negative Moderate low risk (24)	K2018268260 will continually evaluate closure liability and will adjust estimates as more information becomes available relating to operational impacts	1	2	2	3	2		Negative low risk (16)

																		requiring mitigation, residual and latent closure risks, closure actions and rates for the implementation of the closure actions.									
REPUTATION, SOCIAL OR COMMUNITY																											
Risk that labour expectations are not achieved if there are no livelihood replacement opportunities, leading to unrest of those who loose employment.	Closure of project	Loss of livelihood	2	2	3	2	2			Negative Low risk (18)	Continual engagement with internal stakeholders will be undertaken as described in the Social Labour Plan to assist with the transition to the post closure period.	2	2	3	2	1											Negative low risk (9)

10. CLOSURE COST ESTIMATION

The liability for closure of the aspects associated with the prospecting activities has been determined using the approach advocated by the Department of Mineral Resources (DMR) Guideline Document for the Evaluation of the Quantum of Closure-Related Financial Provisions (2005). The approach to calculating the closure quantum as specified in the DMR Guideline which was utilised in this assessment is as summarized in Table 12 below.

Table 6 Closure Quantum

No.:	Description:	Unit:	A Quantity	B Master rate	C Multiplication factor	D Weighing factor 1	E=A*B*C*D Amount (Rands)
			Step 4.5	Step 4.3	Step 4.3	Step 4.4	
3	Access Roads	m ²	0	R34.05	1	1.1	R0.00
10	General Surface Rehabilitation	ha	0.5	R105372.05	1	1.1	R57954.62
		Subtotal 1	Weighing factor 2 (step 4.4)			1.05	R60852.36
			According to Peri-urban				
		(Sum of total items 3 and 10 multiplied by weighing factors)					
1	Preliminary and General	Add 12% of Subtotal 1 if Subtotal 1 is less than R100,000,000.00					R7302.28
2	Contingencies	10% of Subtotal 1					R6085.24
		Subtotal 2					R74239.88
		VAT (15%)					R11 135.98
		(Subtotal plus VAT)				GRAND TOTAL	<u>R85 375.86</u>

11. MONITORING AND AUDITING

In terms of auditing and monitoring the following will be conducted:

- Internal monitoring, auditing and reporting – a review undertaken by K2018268260 to update the plan to account for changes to the environment and risk profile and to update the liability assessment to reflect liability at that point in time;
- External monitoring, auditing and reporting – a review undertaken by the financial auditors as part of the annual financial/accounting audit to determine that the plan is appropriate and that the quantum of the liability is included in the operations provisions;
- Legislated audits – these are the auditing requirements of the Act, Regulation, EMPr and EA. Pertinent aspects relating to closure, such as changes to the risk assessment, changes in closure options and changes in the quantum of the liability will be reported

The findings from the various audits will be captured in the company's Environmental Management System (EMS) and responsibilities and timelines allocated to the rectification of the findings, as practical. Once addressed, these findings will be closed out, only after a second party has assessed that the finding is appropriately addressed.

The objective of the monitoring programme will be to track the recovery of the site in accordance with the overall closure objectives. The anticipated monitoring will include:

- Surface water: Quality monitoring against parameters as required by DWS
- Groundwater: Quality monitoring of aquifers against the parameters required by DWS
- Erosion monitoring: This will take the form of developing a representative reference site on the disturbed footprints and undertaking visual and topographic assessments to determine erosion rate.
- Vegetation establishment: Vegetation condition will be monitored using standard field techniques to determine whether the vegetation has been established with a species composition and density similar to that of the site prior to prospecting activities.
- Photographic records should be maintained together with findings, follow up actions and close out records as part of the company's Environmental Management System.

12. CONCLUSIONS

K2018268260 (Pty) Ltd will provide for the closure liability associated with the project through the purchase of a Bank Guarantee as allowed by the Financial Provision for Prospecting, Exploration, Mining or Production Operations Regulations, with the Bank Guarantee provided to the DMR following authorisation of the project.
