Issue Date	15 <sup>th</sup> February 2019

#### **INDEMNITY**

Although Afzelia Environmental Consultants (Pty) Ltd exercises due care and diligence in rendering services and preparing documents, the Consultants do not accept any liability, and the Client by receiving this document, indemnifies the Consultants (directors, managers, agents and employees) against all actions, claims, demands, losses, liabilities, costs, damages and expenses arising from or in connection with services rendered directly or indirectly by the Consultants and by the use of the information contained in this document.

Project information provided by the Client (Proponent/Applicant), Engineers and other Specialists will be deemed to be correct and thruthful by Afzelia Environmental Consultants (Pty) Ltd. Afzelia cannot be held liable for incorrect or falsified information received from such parties and subsequently used in project assessments.

# **Executive Summary**

#### INTRODUCTION

Afzelia Environmental Consultants were appointed by Umgeni Water to undertake the Basic Assessment process for the proposed EJ Smith Dam Gauging Weir in accordance with the National Environmental Management Act (Act No. 107 of 1998) and the 2014 Environmental Impact Assessment Regulations, as amended (07 April 2017).

#### **BASIC ASSESSMENT PROCESS**

The proposed EJ Smith Dam gauging weir will entail certain activities that require authorisation in terms of the National Environmental Management Act (Act No. 107 of 1998). The process for seeking authorisation is undertaken in accordance with the 2017 Environmental Impact Assessment Regulations (Government Notice No. R 324, R 325, R 326 and R 327 (07 April 2017), promulgated in terms of Chapter 5 of National Environmental Management Act (Act No. 107 of 1998).

Based on the types of activities involved which include activities that are listed in Government Notice 324 and 327 of the Environmental Impact Assessment Regulations, as amended in 2017, the requisite environmental assessment for the project is a **Basic Assessment Process**.

#### **PROJECT OVERVIEW**

The on-going El Niño phenomenon has caused poor rainfall which is combination with above average temperatures, has resulted in severe drought in South Africa. This combined with the increasing demand on the already scarce water resource amplify the importance of accurate hydrological information and necessitate that existing water be conserved and managed effectively.

KwaZulu-Natal in particular has been affected significantly by the recent drought. Due to this the low river levels causes severe disruption to life cycles of aquatic organisms on the downstream side. To ensure accurate monitoring of the environmental release particularly during dry seasons. Therefore, Umgeni Water proposed to construct a Gauging weir for the EJ Smith Dam.

The EJ Smith dam is located within the Ugu District Municipality which lies south of Durban, in KwaZulu-Natal. The dam supplies communities in Shayamoya, Ifafa mission Umzinto Heights, Hazelwood and Nkonka areas and surrounds.

#### IMPACT ASSESSMENT

This Basic Assessment Report focuses on the pertinent environmental impacts that could be caused by the proposed EJ Smith Dam Gauging weir and abstraction works during the pre-construction, construction and operation phases of the project.

The on-going El Niño phenomenon has caused poor rainfall which in combination with above average temperatures, has resulted in severe drought in South Africa. This combined with the increasing demand on the already scarce water resource amplify the importance of accurate hydrological information and necessitate that existing water be conserved and managed effectively.

KwaZulu-Natal in particular has been affected significantly by the recent drought. Due to this the low river levels causes severe disruption to life cycles of aquatic organisms on the downstream side. To ensure accurate monitoring of the environmental release particularly during dry seasons. Therefore, Umgeni Water proposed to construct a Gauging weir for the EJ Smith Dam.

The EJ Smith dam is located within the Ugu District Municipality which lies south of Durban, in KwaZulu-Natal. The dam supplies communities in Shayamoya, Ifafa mission Umzinto Heights, Hazelwood and Nkonka areas and surrounds.

Afzelia Environmental Consultants were appointed by Umgeni Water to undertake the Basic Assessment process for the proposed EJ Smith Dam Gauging Weir and abstraction works in accordance with the National Environmental Management Act (Act No. 107 of 1998) and the 2014 Environmental Impact Assessment Regulations, as amended (07 April 2017).

Based on the location and nature of the proposed development, the following environmental specialist studies were conducted:

- 1. Aquatic Assessment; and
- 2. Wetland Delineation and Risk Assessment.

According to the Aquatic Assessment, the results of the Present Environmental Situation (PES) assessment derived largely modified (class D) conditions in the river reach that was considered in the assessment. The modified conditions were largely attributed to cumulative habitat and water quality level impacts which has resulted in the modification of instream habitat, invertebrate and fish communities.

The results of the risk assessment derived predominantly low risk for the proposed project. However, due to the permanent presence of the weir, the risk rating for the operation and maintenance of activity of the V-Notch structure were determined to be moderate. It is however anticipated that the overall impact of the proposed project will be low when considering the recommended mitigation measures are the nature of the proposed project.

The baseline environment indicated largely tolerant aquatic biology. In addition, the proposed project will be located approximately 20m downstream of the existing EJ Smith Dam wall. Considering the location of the proposed project, the cumulative impact on fish migration and loss of aquatic habitat is considered negligible.

Considering the status of the aquatic ecosystems, and the nature and requirements of the project, the proposed project has the potential to negatively affect local ecology. However, should the proposed mitigation actions be implemented, the impacts may be reduced. In light of the above mentioned, it is the opinion of the specialist that no significant fatal flaws could be identified through the completion of this aquatic ecology study.

The wetland assessment identified only one wetland unit within a 500m radius of the EJ Smith Dam gauging weir site. The location of the wetland above the EJ Smith Dam wall indicates that it will not derive any impacts from the proposed gauging weir construction and operation, which therefore alleviates the requirement for an impact or risk assessment.

## RECOMMENDATIONS

Based on the information that is contained in this report and also taking into account the outcome of the impact assessment, the opinions and recommendations included in the specialist studies as well as all supporting documentation, it is the recommendations of the practitioner that and Environmental Authorisation (EA) be granted by the Department of Environmental Affairs for the proposed EJ Smith Dam gauging weir.

The following key recommendations, which may also influence the conditions of the EA (where relevant), accompany the Basic Assessment (BA) for he proposed Basic Assessment Report (BAR) for the EJ Smith Dam gauging weir:

- 1) The Layout Option for the Proposed EJ Smith Dam gauging weir is accepted;
- 2) Appointment of an Environmental Control Officer (ECO) to monitor compliance with the EA and the approved Environmental Management Programme (EMPr);
- 3) As discussed in the EMPr, various forms of monitoring are required to ensure that the receiving environment is suitably safeguarded against the identified potential impacts, and to ensure that the environmental management requirements are adequately implemented and adhered to during the execution of the project.

The types of monitoring to be undertaken include:

- a) Baseline Monitoring needs to be undertaken to determine the pre-construction state of the receiving environment, and serve as a reference to measure the residual impacts of the project by evaluating the deviation from the baseline conditions and the associated significance of the adverse effects;
- b) Environmental Monitoring entails checking, at pre-determined frequencies, whether thresholds and baseline values for certain environmental parameters are being exceeded; and
- c) Compliance Monitoring and Auditing for the independent ECO to monitor and audit compliance against the EMPr and EA, if granted.
- 4) All mitigation measures provided in the Specialist Studies in Appendix C of the BAR are to be adhered to, specifically the following:
  - Restrict construction activities to the project footprint area;
  - The recommended buffer zones shall be strictly adhered to during the construction phase of the project, with exception of the activities and structures required to traverse a watercourse;
  - In order to facilitate the movement of fish species, a fish ladder is recommended as the mitigation action;
  - Quarterly vegetation rehabilitation surveys must be conducted of the vegetation within the project footprint;
  - An alien invasive plant management plan shall be compiled and approved prior to construction commencing. Implementation of the plan shall continue throughout the contract period to control and prevent the spread of invasive aliens;
  - Riparian habitat provides migratory corridors and in order to protect the habitat, a buffer around riparian habitats is required;
  - All areas to be affected by the proposed project will be rehabilitated after construction;
  - All waste generated by the construction activities must be removed to an appropriately licensed landfill site. Waste may be stored in a temporary demarcated storage area on site prior to disposal.

## **PUBLIC PARTICIPATION**

The Basic Assessment Report provides a full account of the public participation process that was followed for the proposed project.

A 30-Day Authority and Public Review of the draft Basic Assessment Report will take place from the**15 February 2019 to 15 March2019**. A copy of the report will be placed in public venues within the study area, and a link to Dropbox containing the electronic Draft Basic Assessment Report will be available to all registered Interested and Affected Parties upon request. In addition, hard copies of the report will be submitted to commenting and decisionmaking authorities.

# **GLOSSARY OF TERMS**

Activity – an activity identified in any notice published by the minister or MEC in terms of Section 24D(1)(a) of the Act as a listed activity or specified activity.

**Alternative** – in relation to a proposed activity, means different way of meeting the general purpose and requirements of the activity, which may include alternatives to the: property or location; type of activity; design or layout; technology used; operational aspects of the activity and includes the option of not implementing the activity.

**Applicant** – the project proponent or developer responsible for submitting an environmental application to the relevant environmental authority for environmental authorisation.

**Biodiversity** – the diversity of animals, plants and other organisms found within and between ecosystems, habitats, and the ecological complexes.

**Buffer** – A buffer is seen as an area that protects adjacent communities from unfavourable conditions. A buffer is usually an artificially imposed zone included in a management plan.

**Construction** – means the building, erection or establishment of a facility, structure or infrastructure that is necessary for the undertaking of a listed or specified activity but excludes any modification, alteration or expansion of such a facility, structure or infrastructure and excluding the reconstruction of the same facility in the same location, with the same capacity and footprint.

Crump weir - A form of weir with a precise triangular profile often used for discharge monitoring.

**Cumulative Impacts** – impacts that result from the incremental impact of the proposed activity on a common resource when added to the impacts of other past, present or reasonably foreseeable future activities to produce a greater impact or different impacts.

**Direct Impacts** – impacts that are caused directly by the activity and generally occur at the same time and at the same place of the activity. These impacts are usually associated with the construction, operation or maintenance of an activity and are generally quantifiable.

**Ecological Reserve** – the water that is necessary to protect the water ecosystems of the water resource. It must be safeguarded and not used for other purposes. The Ecological Reserve specifies both the quantity and quality of water that must be left in the national water resource. The Ecological Reserve is determined for all major water resources in the different water management areas to ensure sustainable development.

**Ecosystem** – a dynamic system of plant, animal (including humans) and micro-organism communities and their non-living physical environment interacting as a functional unit. The basic structural unit of the biosphere, ecosystems are characterised by interdependent interaction between the component species and their physical surroundings. Each ecosystem occupies a space in which macro-scale conditions and interactions are relatively homogenous.

**Environment** – In terms of the National Environmental Management Act (NEMA) (Act No 107 of 1998) (as amended), "Environment" means the surroundings within which humans exist and that are made up of:

- a) the land, water and atmosphere of the earth;
- b) micro-organisms, plants and animal life;

c) any part or combination of (a) or (b) and the interrelationships among and between them; and d) the physical, chemical, aesthetic and cultural properties and conditions of the foregoing that influence human health and wellbeing.

**Environmental Assessment**– the generic term for all forms of environmental assessment for projects, plans, programmes or policies and includes methodologies or tools such as environmental impact assessments, strategic environmental assessments and risk assessments.

**Environmental Authorisation (EA)** – an authorisation issued by the competent authority in respect of a listed activity, or an activity which takes place within a sensitive environment.

**Environmental Assessment Practitioner (EAP)** – the individual responsible for planning, management and coordination of environmental impact assessments, strategic environmental assessments, environmental management programmes or any other appropriate environmental instrument introduced through the EIA Regulations.

**Environmental Impact** – a change to the environment (biophysical, social and / or economic), whether adverse or beneficial, wholly or partially, resulting from an organisation's activities, products or services.

**Environmental Impact Assessment (EIA)** – the process of identifying, assessing and reporting environmental impacts associated with an activity and includes basic assessment and S&EIR.

**Environmental Issue** – a concern raised by a stakeholder, interested or affected parties about an existing or perceived environmental impact of an activity.

**Environmental Management** – ensuring that environmental concerns are included in all stages of development, so that development is sustainable and does not exceed the carrying capacity of the environment.

**Environmental Management Programme** – A detailed plan of action prepared to ensure that recommendations for enhancing or ensuring positive impacts and limiting or preventing negative environmental impacts are implemented during the life cycle of a project. This EMPr focuses on the construction phase, operation (maintenance) phase and decommissioning phase of the proposed project.

**Expansion** – means the modification, extension, alteration or upgrading of a facility, structure or infrastructure at which an activity takes place in such a manner that the capacity of the facility or the footprint of the activity is increased.

Fatal Flaw – issue or conflict (real or perceived) that could result in developments being rejected or stopped.

**General Waste** – household water, construction rubble, garden waste and certain dry industrial and commercial waste which does not pose an immediate threat to man or the environment.

Hazardous Waste - waste that may cause ill health or increase mortality in humans, flora and fauna.

**Indirect Impacts** – indirect or induced changes that may occur as a result of the activity. These types if impacts include all of the potential impacts that do not manifest immediately when the activity is undertaken, or which occur at a different place as a result of the activity.

**Integrated Environmental Management** – a philosophy that prescribes a code of practice for ensuring that environmental considerations are fully integrated into all stages of the development and decision-making process. The IEM philosophy (and principles) is interpreted as applying to the planning, assessment, implementation and management of any proposal (project, plan, programme or policy) or activity – at local, national and international level – that has a potentially significant effect on the environment. Implementation of this philosophy relies on the selection and application of appropriate tools for a particular proposal or activity. These may include environmental assessment tools (such as strategic environmental assessment and risk assessment), environmental management tools (such as monitoring, auditing and reporting) and decision-making tools (such as multi-criteria decision support systems or advisory councils).

**Interested and Affected Party** – for the purposes of Chapter 5 of the NEMA and in relation to the assessment of the environmental impact of a listed activity or related activity, means an interested and affected party contemplated in Section 24(4)(a)(v), and which includes – (a) any person, group of persons or organisation interested in or affected by such operation or activity; and (b) any organ of state that may have jurisdiction over any aspect of the operation or activity.

**Method Statement** – A method statement is a written submission by the Contractor to the Engineer in response to the specification or a request by the Engineer, setting out the plant, materials, labour and method the Contractor proposes using to carry out an activity, identified by the relevant specification or the Engineer when requesting a Method Statement. It contains sufficient detail to enable the Engineer to assess whether the Contractor's proposal is in accordance with the Specifications and/or will produce results in accordance with the Specifications.

**Mitigate** – the implementation of practical measures designed to avoid, reduce or remedy adverse impacts or enhance beneficial impacts of an action.

**No-Go Option** – in this instance the proposed activity would not take place, and the resulting environmental effects from taking no action are compared with the effects of permitting the proposed activity to go forward.

**Pollution** – The National Environmental Management Act, No. 107 of 1998 defines pollution to mean any change in the environment caused by – substances; radioactive or other waves; or noise, odours, dust or heat emitted from any activity, including the storage or treatment of waste or substances, construction and the provision of services, whether engaged in by any person or an organ of state, where that change has an adverse effect on human health or well-being or on the composition, resilience and productivity of natural or managed ecosystems, or on materials useful to people, or will have such an effect in the future.

**Rehabilitation** – a measure aimed at reinstating an ecosystem to its original function and state (or as close as possible to its original function and state) following activities that have disrupted those functions.

**Re-use** – To utilise articles from the waste stream again for a similar or a different purpose without changing the form of properties of the articles.

Sensitive Environment - any environment identified as being sensitive to the impacts of the development.

Significance – significance can be differentiated into impact magnitude and impact significance. Impact magnitude is the measurable change (i.e. magnitude, intensity, duration and likelihood). Impact significance is the value placed on the change by different affected parties (i.e. level of significance and acceptability). It is an anthropocentric concept, which makes use of value judgements and science-based criteria (i.e. biophysical, social and economic).

**Species of Conservation Concern** – species that have a high conservation importance in terms of preserving South Africa's high biological diversity. If a subpopulation of a species of conservation concern is found to occur on a proposed development site, it would be one indicator that development activities could result in significant loss of biodiversity

**Stakeholder Engagement** – the process of engagement between stakeholders (the proponent, authorities and I&APs) during the planning, assessment, implementation and/or management of proposals or activities.

**Sustainable Development** – development which meets the needs of current generations without hindering future generations from meeting their own needs.

#### Watercourse - means:

- a) a river or spring;
- b) a natural channel or depression in which water flows regularly or intermittently;
- c) a wetland, lake or dam into which, or from which, water flows; and
- any collection of water which the Minister may, by notice in the Gazette, declare to be a watercourse as defined in the National Water Act, 1998 (Act No. 36 of 1998) and a reference to a watercourse includes, where relevant, its bed and banks.

**Weir** - An artificial obstruction in any watercourse that results in increased water surface level upstream for some, if not all flow conditions. A structure in a river, stream, canal or drain over which free-surface flow occurs. May be used variously for control of upstream water levels, diversion of flow, and/or measurement of discharge.

**Wetland** – means land which is transitional between terrestrial and aquatic systems where the water table is usually at or near the surface, or the land is periodically covered with shallow water, and which land in normal circumstances supports or would support vegetation typically adapted to life in saturated soil.

# PURPOSE OF THE BASIC ASSESSMENT

The purpose of this report is to:

- Determine the policy and legislative context within which the activity is located and how the activity complies with and responds to the said policy;
- Provide a description of the receiving environment that would be affected by the proposed activity;
- State the need and desirability of the proposed activity;
- Provide a summary of specialist studies that have been conducted as part of the BA process;
- Identify, assess and rank the significant impacts and risks that the activity will impose on the preferred site;
- Identify suitable measures to avoid, reverse, mitigate or manage identified impacts;
- Outline the Public Participation Process that was undertaken;
- Provide recommendations for the competent authority to make an informed decision.

# 1. Introduction and Project Description

# 1.1. Project Background

Afzelia Environmental Consultants were appointed by Umgeni Water to undertake the Basic Assessment Process for the proposed EJ Smith Dam gauging weir that is located in the Umdoni Local Municipality, within the Ugu District Municipality, within the KwaZulu-Natal Province in accordance with the National Environmental Management Act (Act No. 107 of 1998) (NEMA) 2014 Environmental Impact Assessment (EIA) Regulations, as amended (07 April 2017).

The on-going El Niño phenomenon has caused poor rainfall which, in combination with above-average temperatures, has resulted in a severe drought in South Africa. This combined with the increasing demand on the already scarce water resource amplify the importance of accurate hydrological information and necessitate that existing water be conserved and managed effectively. KwaZulu-Natal in particular has been affected significantly by the recent drought. Due to this the low river levels cause severe disruption to life cycles of aquatic organisms on the downstream side. To ensure accurate monitoring of the environmental release particularly during dry seasons, the proposal is that a gauging weir is constructed downstream of the EJ Smith Dam.

The EJ Smith Dam is located within the Ugu District Municipality which lies south of Durban. The Dam supplies communities in Shayamoya, Ifafa Mission Umzinto Heights, Hazelwood and Nkonka areas and the surrounds. The proposed project is located approximately 2km to the south of the town of Umzinto and is located in the Pongola – Mtamvuna Water Management Ares (WMA), within the U80H quaternary catchment. The closest Sub Quaternary Reach (SQR) to the project is U80H-5120 SQR. This river reach is a portion of the Mzimayi River System. The geographical co-ordinates of the proposed location of the weir structure is **30°19'28.35''S**, **30°40'16.92''E**. (Refer to Figure 1: Locality Map)

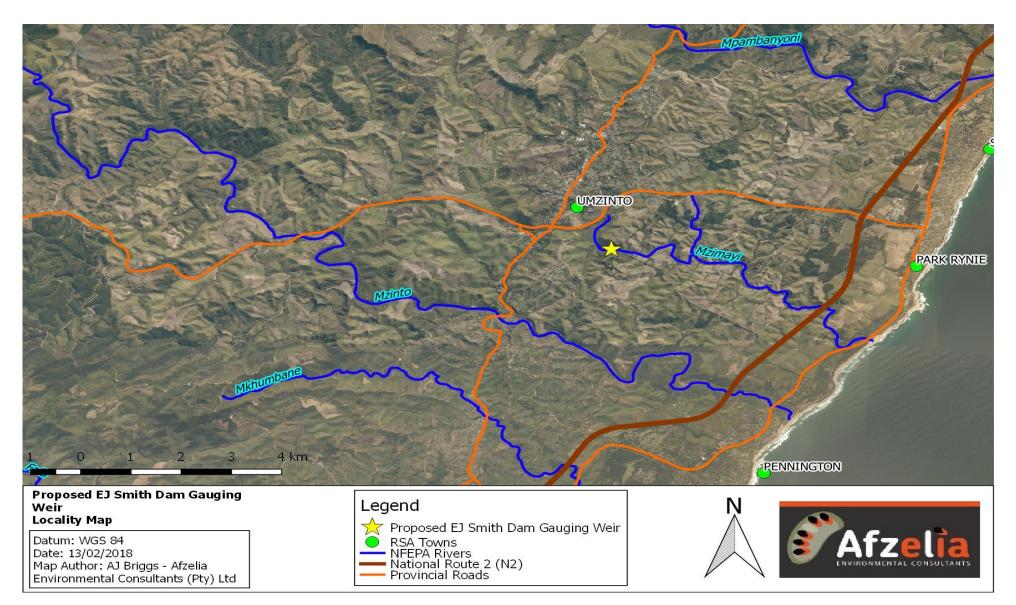

Figure 1: Proposed Gauging Weir Location

# 1.2. The Proposed Gauging Weir Description

A V-Notch crump weir was selected as the best solution downstream of the EJ Smith dam because the pattern of the stream lines over a v-notch crump weir is smooth (Refer to Figure 2 for the overall EJ Smith Dam Gauging weir layout).

This minimizes energy losses in the upstream pool thereby providing enough energy for the sediment to be transported over the weir instead of being deposited in front of it. It allows for measuring low flow rates (Refer to Figure 3), a normal flow of 404m<sup>3</sup>/day in this case, which will result with relatively good reliability in open channels. This is because of the flow cross-sectional are decreases rapidly as the head over the v-notch gets smaller.

#### The proposed EJ Smith Dam gauging weir consists of:

- A V-Notch crump weir;
- A downstream slab;
- A right flank,
- A left flank;
- GRP handrails;
- Training Wall;
- 3350m Inlet Pipe;
- 200mmø Silt Pipes;
- 1500mmø WELL;
- 84.890m MSL Top of Foundation;
- A concrete staircase which has a pitch angle of 45 degrees;
- An Ultrasonic Level Sensor mounted on top of the stilling well;
- A hut will be installed that will have a locking mechanism so that any unauthorised entry and potential theft can be prevented; and
- A vertically graduated plate will also be mounted on the face of the training all in order to measure whatever flow bigger than the normal design flow.

The weir comprises of a downstream slab, (Refer to Figure 4), which will eliminate the tendency of water to dig up downstream of the weir. The approach slab will be 1m wide and 6m long, it will induce uniform physical conditions for water flowing past the weir; thereby improving the degree of measuring accuracy. The weir is to be constructed with two construction joints formed at 1.5m from the face of each of the training walls. The proposed position for the weir is shown in Figure 5.

# 1.3. Hydraulic Consideration

The gauging weir structure was sized in cognisance with the expected top water level during flooding. The Recommended Design Flood (RDF) level is calculated to be 3.5m above the existing ground level. A freeboard of at least 500mm above the RDF was provided in order to avoid submergence and consequential damage to the gauging weir structure during flooding.

# 1.4. Structural Consideration

The proposed gauging weir was designed to take account of the worst possible loading condition, namely the upstream water level equal to the top of the weir level and no downstream water pressure. The weir was checked against potential overturning and sliding while allowing a Factor Of Safety (F.O.S.) of 1.5. The favourable forces (resistances) were found to be significantly greater than action forces for overturning and sliding. It can therefore be concluded that the structure's self-weigh alone will be enough to withstand potential overturning and sliding i.e. no dwelling into the rock will be required. The angle of friction between the rock and concrete was assumed to be 35 degrees.

# 1.4.1. Cut-off Walls

The cut-off walls on each side of the weir will minimise the requirements for bulk excavation. The cut-off wall will also form a physical barrier to protect the stilling well against any potential flood damage. The cut off walls was designed as a water retaining structure, based on the limit stated principles with a maximum allowable cracks width of 0.2mm. The following codes of practise have been applied: Structural use of concrete part 1 and 2 (SANS 10100: 2014), Design of concrete structure for retaining aqueous liquids (BS 8007: 1987) and Steel bars for concrete reinforcing (SANS 920:2011).

# 1.4.2. Pipe Work

Potential silt accumulation up stream of the weir which is proposed 50m downstream of the dam wall, will be removed through two 200mm diameter PVS scour pipes. Water will flow into the stilling well through a 100mm diameter Polyvinyl chloride (PVC) pipe. Table 5 below which details further information on the proposed pipework.

Table 5: Information on	the PVC Pipe.
-------------------------	---------------

	Parameter	Magnitude
	Outer Diameter	120
Inlet Pipe	Internal Diameter	100
	Length	3300
	Outer Diameter	220
Silt Pipe	Internal Diameter	200
	Length	3350

# 1.4.3. Stilling Well

A stilling well will be constructed in order to provide a clean target surface for an accurate measurement. The 3.8m high stilling well will be constructed of 1.5m diameter precast concrete rings. The floor slab and roof slab will both be 200mm thick concrete. The Project Engineer has confirmed that no detailed structural analysis is needed for the floor slab as it will be adequate because it is supported by the ground.

# 1.4.4 Staircase and Hand rails

In order to make sure that the completed structure to be constructed for the EJ Smith Dam Gauging Weir, complies with the Occupational Health and Safety Act, as well as the Building Regulations must be adhered to in order to minimise the risk of injury to working personnel.

A concrete staircase, which will have a high pitch angle of 45 degrees will be constructed in order to ensure safe permanent access to the gauging structure. Hand rails are to be installed around the perimeter of the staircase and on top of the training wall near the instrumentation hut. This will minimise the risk of falling over the edges, especially since the top level of the training wall is 3.5m above the highest point on the weir structure. The hand rails will be Glass-reinforced plastic (GRP) material.

# 1.4.5 Measuring Instrumentation

An Ultrasonic Level Sensor mounted on top of the stilling well, inside a hut, will measure the flow rate of the water flowing over the weir. The hut will be installed that will have a locking mechanism so that any unauthorized entry and potential theft can be prevented. A vertically graduated plate will also be mounted on the face of the training all in order to measure whatever flow that is bigger than the normal design flow.

## 1.5. Proposed Methodology for working within and around rivers /habitat areas

Running water in the river will have to be diverted in order to create conducive conditions for construction as the position of the gauging station. To lessen the disturbance to the environment, the working space shall be isolated by means of a cofferdam in adequate distances from the proposed weir position both upstream and downstream of the weir. This will be accomplished by constructing temporary diversion flumes across the working space to allow water to flow across during construction.

#### 1.6 Method Statement

The construction of the EJ Smith Gauging Weir will be performed in a manner that will incorporate the impact mitigation methods, including, but not limited to erosion control measures; emission controls; surface water control measures, 'Surface Storm Water Runoff'; spillage prevention and control measures; environmental health mitigation measures, 'Environmental Health'; traffic control measures; and other construction practice measures, 'Public Services and Utilities' that will minimize the Project's impact on the environment and the surrounding area. The aforementioned controls/measures are covered in detail in "Umgeni Water's Particular Specification for Environmental Management of Construction Projects" (UW-EMP)

# Construction will be performed in several stages and will include the following main elements and/or activities:

- Earthworks/platform creation;
- Construction of Cofferdams;
- Construction of minor access road/parking areas;
- Pipe trenching and laying of short sections of pipework;
- Construction of concrete Gauging Weir;
- Minor electrical and mechanical installation.

## Equipment

The following are envisaged equipment to be used during construction:

- TLB;
- Excavator;
- Trucks (7t & 10t);
- Hand held Plate Compactor;
- Water Booster;
- Grader 120G.

#### **Construction Procedures**

#### • Access Road

A permanent as well as a temporary (construction period) access road is required for the project. The existing access road will be cleared, re-shaped and re-gravelled to provide for storm water management. Any surplus material will be stored and taken to designated dump areas.

The Project roads will be gravel surfaced and generally designed with a low profile without ditches to allow stormwater pass over top. Road construction will be performed in multiple passes starting with the rough grading and levelling off the road way areas. Once rough grade is achieved, base rock will be trucked in, spread and compacted to create a road base. A capping rock will then be spread over the road base and roll-compacted to finish the grade.

Once heavy construction is complete, a final pass will be made with the grading equipment to level out the road surface and more capping rock will be spread ad compacted in areas where needed. Water bars, similar to speed bumps will be cut into the roads in areas where needed to allow for natural drainage of water over the road surface and to prevent road washout.

#### • Earth work

- Site clearance;
- Top soil preservation;
- Formation of the platform/s;
- Foundation excavation;
- Backfilling around the structures; and
- Rehabilitation using topsoil and grassing

Excavated soil and rock that arises through grading will either be spread across the site to the natural grade or transported to spoil at an approved landfill site. Larger excavated rocks will be disposed off-site or crushed and reused on-site as back fill or roadway material. On completion, top soil shall be re-laid or imported as necessary; and re-seeded with native grasses to control erosion by water and wind.

Stormwater controls, such as diversion ditches in some areas will control stormwater runoff during construction.

Foundation construction shall involve holes excavation, outer form setting, steel reinforcement assembly, casting and finishing of the concrete, removal of the forms, backfilling and compacting, and foundation site area restoration. Excavation and foundation construction will be conducted in a manner that will minimize the size and duration of excavated areas required to install foundations. Foundation work for a given excavation will commence after excavation of the earthwork platforms is completed. Backfill for the foundations will be installed immediately after approval by the engineer's field inspectors.

#### • Concrete work

The volume of concrete required for this work is too small to warrant onsite batching and mixing of concrete. Concrete will be supplied by ready mixed concrete Suppliers, only when required. Any unused concrete will be taken back to the suppliers batching yard.

#### • Electrical System

Cable ducting shall be constructed within and incorporated in the concrete work. All cables and trenches will be inspected before backfilling. Once the clean fill is covering the cables, the excavated material is then used to complete the backfilling.

#### Construction Clean-Up

Site clean-up generally consists of landscaping and earthwork. It is very weather and season sensitive. Landscaping clean-up is generally complete during the first allowable and suitable weather conditions after all of the heavy construction activities have been completed. Disturbed areas outside of the paved /gravelled areas will be reseeded to control erosion by water and wind. All construction clean work and permanent erosion control measures will be done in accordance to a formal Storm Water Pollution Prevention Plan for the Project as outlined in the relevant section/s of the *UW-EMP*.

Other site clean-up activities might include landscaping around the Weir, as well as other miscellaneous tasks that are part of normal construction clean-up using a motor grader, dump trucks, front-end loaders, and light trucks for transportation of any waste materials, packaging, etc.

#### 1.7. Storm Water Management Plan

The proposed Gauging Weir will be constructed across the water course. Minimum impact on natural storm water flow is envisaged. The followings are measures to mitigate storm run-off:

- Diversion ditches in some areas to control storm water runoff during construction;
- Stripping areas only when necessary and undertaking progressive rehabilitation;
- Minimizing the size of stripped and destabilized areas;
- Scheduling high-risk works for a drier time of year or drier time slot in the construction phase in order to minimise risk of damage from flooding and ensure that the work is completed as quickly as possible;
- Vegetation is the best defence against storm water run-off on site and must be retained on any area where clearing is not necessary for the works;
- An appropriately sized catch drain will be constructed where necessary to channel run-off to a designated location;
- Appropriately sized earth banks will be used to channel run-off to desired locations;
- Stabilization matting will be used to cover un-stabilized soils to provide a barrier between the soil and rainfall run-off; and
- Once the work is complete, areas disturbed will be stabilized by grassing.

#### 1.8 Alternatives

#### SITE ALTERNATIVES

No site alternatives have been considered for the proposed EJ Smith Dam gauging weir.

The proposed site for the V-Notch crump weir was selected as the best solution downstream of the EJ Smith Dam because the pattern of the stream lines over a v-notch crump weir will be smooth. This also minimises energy losses in the upstream pool thereby providing enough energy for sediment to be transported over the weir instead of being deposited in front of it.

#### DESIGN, LAYOUT OR TECHNOLGY ALTERNATIVES

There are no design, layout or technology alternatives for this project.

#### "NO-GO" ALTERNATIVE

The No-Go alternative, which means that the gauging weir will not be constructed, will mean the *status quo* will remain as is and the risk of inadequate flow to maintain the ecological reserve will remain This is likely to be exacerbated by the increasing demand on the already scarce water resource to continue and the inadequate measurement accuracy of hydrological information which will further negatively affect the effective management of existing water resources.

The primary goal is to ensure the accurate monitoring of the environmental release particularly during the dry season.

Should the status quo remain, the direct and indirect positive benefits of the proposed gauging weir on the environment and the surrounding community will not be realised.

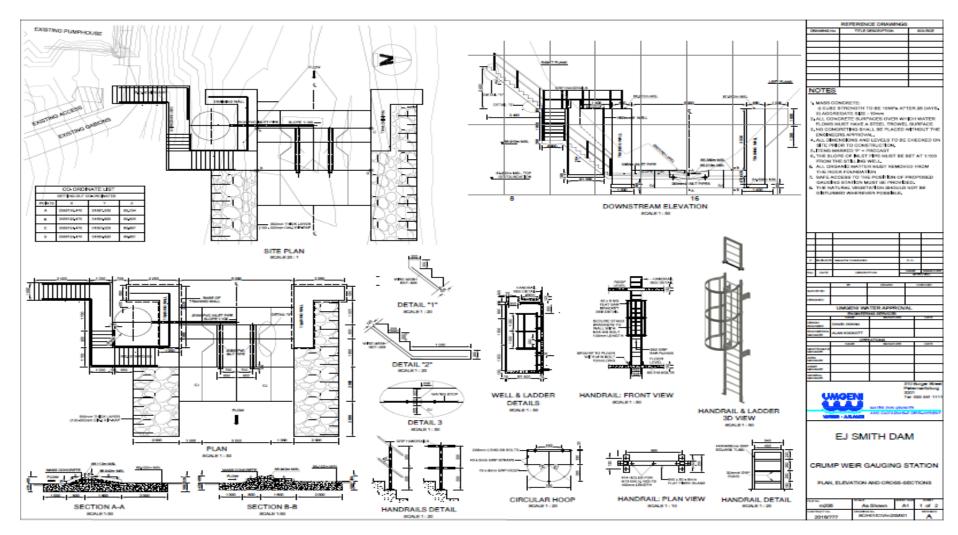

Figure 2: EJ Smith Dam – Crump Weir Gauging Station

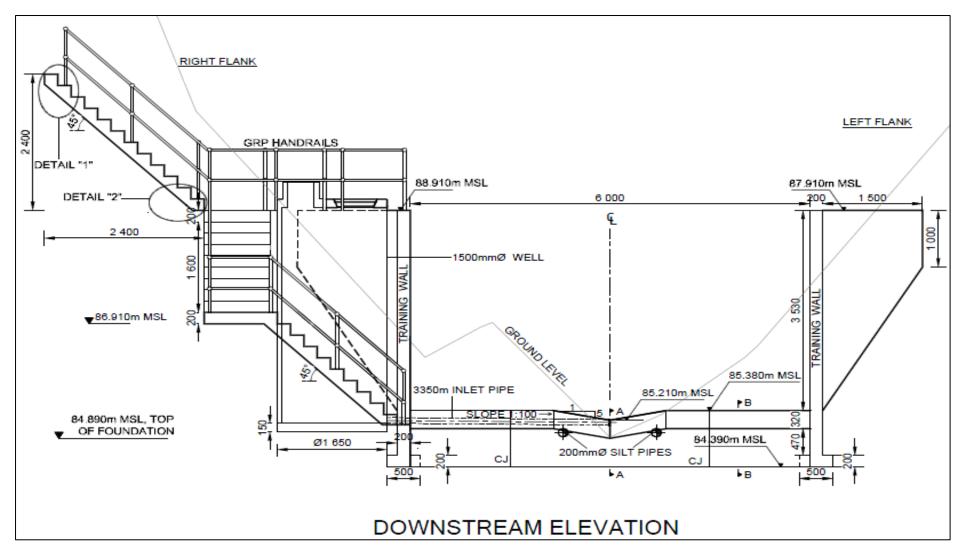

Figure 3: Downstream Layout of the EJ Smith Dam Gauging Weir

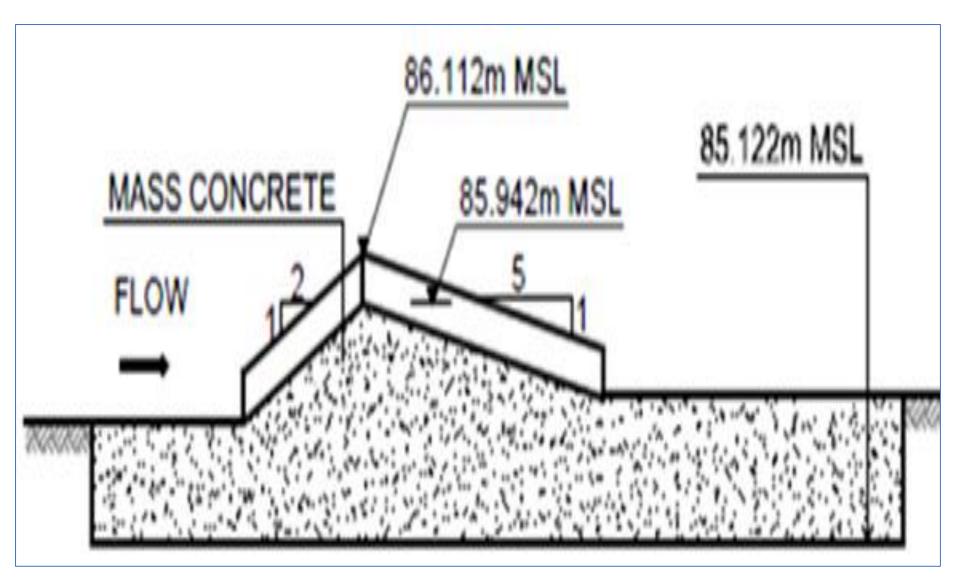

Figure 4: Cross - Section of the V-Notch Crump Weir

Figure 5: Position for the Proposed Gauging weir

# 2 Description of the Receiving Environment

# 2.1. Visual Characteristics

Aside from the EJ Smith Dam, which is an artificial reservoir, the study area also comprised primarily of riverine areas. The area surrounding the proposed gauging weir site is comprised of very steep slopes and drainage lines.

### 2.2. Climate

The mean annual precipitation is ~1011.3mm and the potential evaporation is ~1161.1mm with a simulated mean annual run-off of ~260.7mm. Rain fall occurs primarily in early summer and late summer with highly infrequent winter rainfall. The maximum temperatures vary between 24-28°C in February and 20-24°C in July whilst the minimum temperatures are between 16-20°C in February and 6-10°C in July.

## 2.3. Vegetation

According to National Classification and Status - The proposed site is located within the KwaZulu-Natal Coastal Belt (CB3).

The KwaZulu-Natal Coastal Belt Grassland (CB3) is characterised by undulating coastal plains. It is comprised mainly of a mosaic of sugarcane fields, timber plantations, thickets, coastal thornveld and secondary *Aristida* grasslands. This vegetation type is considered endangered with at least 50% already transformed by cultivation and urban sprawl (Mucina and Rutherford, 2006; Scott-Shaw and Escott, 2011) According to the National List of Threatened Ecosystem the KwaZulu-Natal Coastal Belt is listed as a vulnerable ecosystem (RSA 2011).

The provincial vegetation classification according to Scott-Shaw & Escott, 2011 states that the proposed site comprises of KwaZulu-Natal Coastal forest: Southern Mesic Coastal Lowlands Forest and are regarded at Critically Endangered.

According to Driver et al, 2011; the wetland vegetation for the proposed site comprises of the Indian Ocean Coastal Belt Group 2 and is regarded as Critically Endangered and moderately protected.

# 2.4. Wetland Vegetation

The wetland unit that is located above the EJ Smith dam was inaccessible by the Wetland Specialist. The vegetation, however, was visible from the edge of the unit, where it was determined that the system was dominated by *Typha capensis* and *Phragmites* sp., which are known obligate wetland plants. The edge of the wetland is dominated by large trees and shrubby vegetation such as *Albiziaadianthifolia*, *L. camera* and *Tithoniadiversifolia*.

The majority of soils within the drainage lines alongside the Mzimayi River comprised of brown sand and were colonised primarily by alien species including *S. officinarum*, *L. camara* and *T. diversifolia*.

# 2.5. NFEPA Wetlands

The National Freshwater Ecosystem Priority Areas (NFEPA) project aims to produce maps that provide strategic spatial priorities for conserving South Africa's freshwater ecosystems and support sustainable use of water resources. However, as this information is based on broad scale assessments it is critical that ground-truthing is undertaken to verify the existence and status of any NFEPA wetlands in an area. Examination of the NFEPA GIS database identified no NFEPA Wetlands located within the proposed project site.

## 2.6. Wetlands

The wetland delineation assessment for the proposed site identified a single wetland unit, that was approximately 400m upstream of the proposed EJ Smith Dam gauging weir site. Being located a considerable distance upstream and also above the EJ Smith Dam wall, the wetland unit identified, will not receive any impacts from the construction or operation of the proposed gauging weir.

Therefore, the wetland unit that was identified will not require a DWS mandated Risk Assessment due to not being impacted upon by the construction and operation activities for the proposed EJ Smith Dam gauging weir.

# 2.7. Land Use

The land use within the proposed study area is made up of coastal forest that is surrounded by intensive sugar cane agriculture.

# 2.8. Geology

According to the Department of Agriculture Land Types Database, the study site is underlain by Gneiss. Refer to Photo 1 below of the proposed site and the description regarding the underlain rock Gneiss.

Photo 1: Proposed study site underlain by Gneiss rock.

According to <u>www.geology.com</u>; Gneiss is a foliated metamorphic rock identified by its bands and lenses of varying composition, while other bands contain granular minerals with an interlocking texture.

Gneiss usually forms by regional metamorphism at convergent plate boundaries. It is a high-grade metamorphic rock in which mineral grains recrystallized under intense heat and pressure.

This alteration increased the size of the mineral grains and segregated them into bands, a transformation which made the rock and its minerals more stable in their metamorphic environment.

Gneiss can form in several different ways. The most common path begins with shale, which is a sedimentary rock. Regional metamorphism can transform shale into slate, then phyllite, then schist, and finally into gneiss. During this transformation, clay particles in shale transform into micas and increase in size. Finally, the platy micas begin to recrystallize into granular minerals. The appearance of granular minerals is what marks the transition into gneiss.

Intense heat and pressure can also metamorphose granite into a banded rock known as "granite gneiss." This transformation is usually more of a structural change than a mineralogical transformation. Granite gneiss can also form through the metamorphism of sedimentary rocks. The end product of their metamorphism is a banded rock with a mineralogical composition like granite.

#### 2.9. Catchment Characteristics

The proposed project is located in the Pongola – Mtamvuna Water Management Area, which is within the U80Hquaternary catchment. The closest Sub Quaternary Reach (SQR) to the project is the U80H-5120 SQR. This river reach is a portion of the Mzimayi River System.

# 3 Environmental Legislative Context for the Proposed Project

In order to protect the environment and to ensure that the development is undertaken in an environmentally responsible manner, significant portion of environmental legislation need to be considered during this study. These include the following.

# 3.1 The Constitution of South Africa (Act No. 108 of 1996)

The Constitution of the Republic of South Africa, Act No. 108 of 1996, is the supreme law of the land and provides amongst others the legal framework for legislation regulating coastal management in general. It also emphasises the need for co-operative governance. In addition, the Environmental clause in Section 24 of the Constitution provides that:

"Everyone has the right -

- a) To an environment which is not harmful to their health or well-being;
- b) To have the environment protected for the benefit of present and future generations through reasonable legislation and other measures that:
- i. Prevent pollution and ecological degradation;
- ii. Promotes conservation;
- iii. Secure ecologically sustainable development and the use of natural resources while promoting justifiable economic and social development".

The constitution provides the overarching framework for sustainable development.

#### 3.2. National Legislation and Regulations

# This section provides an outline of the applicable national legislation which needs to be taken cognisance of.

# 3.3. The National Environmental Management Act (Act No. 107 of 1998)

The National Environmental Management Act (Act No. 107 of 1998) (as amended), or otherwise known as NEMA, is South Africa's overreaching environmental legislation and has, as its primary objective, *provide for co-operative environmental governance by establishing principles for decision-making on matters affecting the environment, institutions that will promote co-operative governance and procedures for co-ordinating environmental functions exercised by organs of state, and to provide for matters connected therewith.* 

#### The principles of the Act are the following:

- Environmental management must place people and their needs at the forefront of its concern;
- Development must be socially, environmentally and economically sustainable;
- Environmental management must be integrated, acknowledging that all elements of the environment are linked and interrelated;
- Environmental justice must be pursued so that adverse environmental impacts shall not be distributed in such a manner as to unfairly discriminate against any person;
- Equitable access to environmental resources, benefits and services to meet basic human needs and ensure human well-being must be pursued;
- The responsibility for the environmental health and safety consequences of a policy, programme, project or activity exists throughout its life cycle;
- The participation of all interested and affected parties in environmental governance must be promoted;
- Decisions must take into account the interests needs and values of all interested and affected parties, and this includes recognizing all forms of knowledge including traditional and ordinary knowledge;
- Community well-being and empowerment must be promoted through environmental education, the raising of environmental awareness;
- Social, economic and environmental impacts of activities including disadvantages and benefits, must be considered, assessed and evaluated and decisions must be appropriate in the light of such consideration and assessment;
- The right of workers to refuse work that is harmful to human health or the environment;
- Decisions must be taken in an open and transparent manner, and access to information must be provided in accordance with the law;
- There must be intergovernmental co-ordination and harmonisation of policies, legislation and actions relating to the environment;
- The environment is held in public trust for the people, the beneficial use of the environment resources must serve the public interest and the environment must be protected as the people's common heritage;
- The cost of remedying pollution, environmental degradation and consequent adverse health effects and of preventing, controlling or minimising further pollution, environmental damage or adverse health effects must be paid for by those responsible for harming the environment; and
- Lastly, that the vital role of women and youth in environmental management and development must be recognised and their full participation therein must be promoted.

# 3.3.1 EIA Regulations 2014 (as amended on 7<sup>th</sup> April 2017)

The nature of the proposed project includes activities that are listed in the following Listing Notices – GNR 327 (Listing Notice 1) and GNR 324 (Listing Notice 3) of the EIA Regulations 2014 (As amended in April 2017). Please refer to **Table 6** below.

Please note that the regulations are referred to by their 2017 gazetted numbers, which are however, noted as being amendments of the 2014 version of the EIA Regulations. Thus, for completeness please not that Listing Notice 1 in terms of GNR 983 (4 December 2014), has been amended to GNR 327 (7 April 2017); Listing Notice 2 of GNR 984(2014) has been amended to GNR 325 (2017) and Listing Notice 3 of GNR 985 (2014) has been amended to GNR 324.

Activities that are Listed in Listing Notice 1 and 3 trigger the need for a Basic Assessment (BA) Process, whilst activities that are listed on Listing Notice 2 trigger a full Scoping and Environmental Impact Assessment (S&EIR) process.

Given the activities that are triggered for the proposed EJ Smith Dam Gauging weir, it is noted that a Basic Assessment Process is required and that a Scoping and Environmental Impact Assessment (S&EIR) is not triggered.

Table 6: Listed Activities in terms of Listing Notice 1 & 3 of the EIA Regulations 2014 (as amended in
April 2017)

Government Notice Number (s):	Activity Number	NumberActivity(ies) as set out in Listing Notice 1 (GN R. 327)project to which the applica activity relates.	
No. R. 327 of April 2017 (Listing Notice 1)	12	<ul> <li>The development of –</li> <li>i. Dams or weirs, where the dam weir, including infrastructure and water surface area, exceeds 100 square metres; or</li> <li>ii. Infrastructure or structures within a physical footprint of 100 square metres or more:</li> </ul>	Construction of the EJ Smith Dam gauging weir and associated infrastructure within 32m from watercourse and within a watercourse.
		Where such development occurs – Within a watercourse.	
No. R. 327 of April 2017 (Listing Notice 1)	19	The infilling or depositing of any material of more than 10 cubic metres into or the dredging, excavation, removal or moving of soil, sand, shells, shell grit, pebbles or rock of more than 10 cubic metres from. a watercourse	The construction of the EJ Smith Dam gauging weir and associated infrastructure within the watercourse. This will result in the excavating, dredging and infilling within a watercourse of more than 10m <sup>3</sup> .
No. R. 327 of April 2017 (Listing Notice 1)	27	The clearance of an area of 1 hectare or more, but less than 20 hectares of indigenous vegetation, except where such clearance of indigenous vegetation is required for – ii. maintenance purposes undertaken in accordance with a maintenance management plan.	The clearance of vegetation to allow access to the proposed gauging weir site.
GNR 325		No Activities are triggered.	
GNR 324		No Activities are triggered.	

# 3.3.2. The National Environmental Management Waste Act (Act No. 59 of 2008) (as amended)

The National Environmental Management Waste Act (Act No. 59 of 2008) (NEM:WA) – the 'Waste Act' – reforms the law regulating waste management in order to protect health and the environment by providing reasonable measures for the prevention of pollution and ecological degradation and for securing ecologically sustainable development; to provide for institutional arrangements and planning matters; to provide for national norms and standards for regulating the management of waste by all spheres of government; to provide for specific waste management measures; to provide for the licencing and control of waste management activities; to provide for the remediation of contaminated land; to provide for the national waste information system; to provide for compliance and enforcement; and to provide for matters connected therewith.

#### The objectives of NEM: WA are to:

- a) "protect the health, well-being and the environment by providing reasonable measures for -
- i. minimising the consumption of natural resources;
- ii. avoiding and minimising the generation of waste;
- iii. reducing, re-using, recycling and recovering waste;
- iv. treating and safely disposing of waste as a last resort;
- v. preventing pollution and ecological degradation;

vi. securing ecologically sustainable development while promoting justifiable economic and social development;

vii. promoting and ensuring the effective delivery of waste services;

viii. remediating land where contamination presents, or may present, a significant risk of harm to health or the environment; and

ix. achieving integrated waste management reporting and planning;

- b) to ensure that people are aware of the impact of waste on their health, well-being and the environment;
- c) to provide for compliance with the measures set out in paragraph (a); and
- d) generally, to give effect to section 24 of the Constitution in order to secure an environment that is not harmful to health and well-being."

# The NEM: WA has been considered, however, no activities in terms of this Act will be triggered by the proposed development.

#### 3.3.3. National Water Act (Act 36 of 1998) (as amended)

The National Water Act (NWA) is a legal framework for the effective and sustainable management of water resources in South Africa. Central to the NWA is recognition that water is a scarce resource in the country which belongs to all the people of South Africa and needs to be managed in a sustainable manner to benefit all members of society. The NWA places a strong emphasis on the protection of water resources in South Africa, especially against its exploitation, and the insurance that there is water for social and economic development in the country for present and future generations.

Water use in South Africa is managed through a water use authorisation process, which requires that every water use is authorised by the Department of Water and Sanitation (DWS, previously known as the Department of Water Affairs) or an established Catchment Management Agency (CMA; if applicable for that region), once the water requirements for the Reserve have been determined.

A water use must be licenced unless it (a) is listed in Schedule 1, (b) is an existing lawful use, (c) is permissible under a general authorisation (GA), or (d) if a responsible authority waives the need for a licence.

If none of these are relevant a so-called Water Use Licence (WUL) must be applied for and obtained prior to the commencement of such listed activity. In terms of such a WUL, the Minister may choose to limit the amount of water which a responsible authority (e.g. CMA, water board, municipality) may allocate. In making regulations and determining items such as GAs, the Minister may differentiate between different water resources, classes of water resources, and geographical areas.

The NWA defines a water resource to be a watercourse, surface water, estuary, or groundwater (aquifer). Included under surface water are manmade water channels, estuaries and watercourses.

As the proposed development involves the abstraction of water, impending or diverting the flow of water in a watercourse and as well as the alteration of the bed, banks, course or character tics of a watercourse, a WUL application will be submitted to DWS.

The NWA, as applicable to the proposed development, defines the identified water uses which are potentially applicable under Section 21 as follows:

The following water uses of Section 21 of the NWA are being applied for the WUL are Listed in the Table 7 below

Section 21	Description of Water Use	Relevance to Project
21 (c)	Impeding or diverting the flow of water in a watercourse	Construction activities within the regulated area of any watercourse. This includes encroachments into the regulated areas of watercourses by the following project infrastructure – weir, abstraction works and pipelines
21 (i)	Altering the bed, banks, course or characteristics of a watercourse	Construction activities within the regulated area of any watercourse. This includes encroachments into the regulated areas of watercourses by the following project infrastructure – weir, abstraction works and pipelines

#### Table 7: Listed Activities in terms of the National Water Act 1998 (Act No. 36 f 1998) (as amended)

The requisite documentation to satisfy DWS's requirements for the Water Use Authorisation process will be compiled. In addition, an aquatic and wetland assessment has been conducted and is summarised in **Section12** 

#### 3.3.7. National Environmental Management: Biodiversity Act (Act 10 of 2004)

The project must comply with the National Environmental Management: Biodiversity Act (Act No. 10 of 2004) (NEM:BA) in providing the cooperative governance in biodiversity management and conservation.

NEM:BA provides for the Minister to publish a notice in the Government Gazette that issues norms and standards, and indicators for monitoring progress for the achievement of any of the objectives of the Act.

#### The NEM:BA also provides for:

- The National Biodiversity Framework;
- Bioregional Plans;
- Biodiversity Management Plans;
- Biodiversity Management Agreements;
- The identification, listing and promotion of threatened or protected ecosystems; and
- For Alien invasive species control and enforcement.

#### 3.3.8. National Biodiversity Strategy and Action Plans (2005)

The National Biodiversity Strategy and Action Plans (NBSAP) aims to conserve and manage terrestrial and aquatic biodiversity to ensure sustainable and equitable benefits to the people of South Africa, now and in the future.

In South Africa, terrestrial, inland water, coastal and marine ecosystems and their associated species are widely used for commercial, semi-commercial and subsistence purposes through both formal and informal markets.

While some of this use is well managed and / or is at levels within the capacity of the resource for renewal, much is thought to be unsustainable. "Use" in this case refers to direct use, such as collecting, harvesting, hunting, fishing, etc., for human consumption and production, as well as more indirect use such as ecotourism.

#### 3.3.9. The National Environmental Management: Protected Areas Act (Act No.57 of 2003).

Protected areas are a fundamental tool for achieving biodiversity objectives and protecting essential natural heritage areas and ecosystems services, since these often provide greater security for conservation-worthy land than the agreements or land use limitations provided for in the parallel National Environmental Management: Biodiversity Act (NEM:BA).

The aim of the National Environmental Management Protected Areas Act (Act No. 57 of 2003) (NEMPA) is to provide for the protection and conservation of ecologically viable areas representative of South Africa's biological diversity and natural seascapes. The purpose of a Protected Environment is amongst others to protect a specific ecosystem outside a special nature reserve world heritage site or nature reserve and also to ensure the use of the natural resources in the area is sustainable.

The proposed development does not occur within a Protected Area.

# 3.3.10. National Forest Act (Act No.84 of 1998)

According to this Act, the Minister may declare a tree, group of trees, woodland or a species of trees as protected. The prohibitions provide that;

'no person may cut, damage, disturb, destroy or remove any protected tree, or collect, remove, transport, export, purchase, sell, donate or in any other manner acquire or dispose of any protected tree, except under a licence granted by the Minister'.

In essence the National Forests Act (NFA) prohibits the destruction of indigenous trees in any natural forest without a licence. In terms of the NFA and Government Notice 1339 of 6 August 1976 (promulgated under the Forest Act, 1984 [Act No. 122 of 1984] for protected tree species), the removal, relocation or pruning of any protected plants will require a licence.

# 3.3.11. KZN Nature Conservation Ordinance (Ordinance No. 150of 1974)

Protected indigenous plants in general are controlled under the relevant provincial Ordinances or Acts dealing with nature conservation. In KwaZulu-Natal, the relevant statute is the 1974 Provincial Nature Conservation Ordinance. In terms of this Ordinance, a permit must be obtained from *Ezemvelo* KZN Wildlife to remove or destroy any plants listed in the Ordinance. If, protected plant species are to be disturbed, the Applicant must pursue the necessary permit / licencing requirements from the Department of Agriculture, Forestry and Fisheries (DAFF) and *Ezemvelo* KZN Wildlife (*E*KZNW) prior to clearing of vegetation.

No rare or threatened plants were recorded within the proposed site.

#### 3.3.12. National Heritage Resources Act (Act No.25 of 1999)

The National Heritage Resources Act (Act No. 25 of 1999) was promulgated for the protection of National Heritage Resources and the empowerment of civil society to conserve their heritage resources.

No heritage sites or features were observed with the proposed project footprint, although artefacts may be uncovered during construction activities.

#### 3.3.13. The National Environmental Management: Air Quality Act (Act No. 39 of 2004)

The National Environmental Management: Air Quality Act (Act No. 39 of 2004) (NEMAQA) provides for the setting of national norms and standards for regulating air quality monitoring, management and control and describes specific air quality measures so as to protect the environment and human health or well-being by:

- Preventing pollution and ecological degradation, and
- Promoting sustainable development through reasonable resource use.

It also includes the establishment of national ambient dust fall out levels that may be relevant to the construction.

There will be minimal dust impacts associated with the construction phase of the project. Therefore, no authorisation in terms of NEMAQA is required. However, NEMAQA needs to be considered to decrease ambient dust impacts associated with construction activities.

# 3.3.14. Occupational Health and Safety Act (Act No. 85of 1993)

The Occupational Health and Safety Act (Act No. 85 of 1993) provides for the health and safety of people at work as well as the health and safety of persons using plant machinery. This act will need to be taken into account should the proposed development be approved.

#### 3.3.15. Sustainable Development

The principle of Sustainable Development has been established in the Constitution of the Republic of South Africa (No. 108 of 1996) and given effect by NEMA. Section 1(29) of NEMA states that sustainable development means the integration of social, economic and environmental factors into the planning, implementation and decision-making process so as to ensure that development serves present and future generations.

Therefore, Sustainable Development requires that:

- The disturbance of ecosystems and loss of biological diversity are avoided, or, where they cannot be altogether avoided, are minimised and remedied;
- That pollution and degradation of the environment are avoided, or, where they cannot be altogether avoided, are minimised and remedied;
- The disturbance of landscapes and sites that constitute the nation's cultural heritage is avoided, or where it cannot be altogether avoided, is minimised and remedied;
- Waste is avoided, or where it cannot be altogether avoided, minimised and re-used or recycled where possible and otherwise disposed of in a responsible manner;
- A risk-averse and cautious approach is applied, which takes into account the limits of current knowledge about the consequences of decisions and actions; and
- Negative impacts on the environment and on people's environmental rights be anticipated; and, prevented and where they cannot altogether be prevented, are minimised and remedied.

#### 3.3.16. Hazardous Substance Act (Act No. 15 of 1973) and Regulations

#### The object of the Act is inter alia to:

"provide for the control of substances which may cause injury or ill health to or death of human beings by reason of their toxic, corrosive, irritant, strongly sensitising or flammable nature or the generation of pressure thereby in certain circumstances; for the control of electronic products; for the division of such substances or products into groups in relation to the degree of danger; for the prohibition and control of such substances."

In terms of the Act, substances are divided into schedules, based on their relative degree of toxicity, and the Act provides for the control of importation, manufacture, sale, use, operation, application, modification, disposal and dumping of substances in each schedule. Pollution control in South Africa is affected through numerous national statutes, provincial ordinances and local authority by-laws. Only the more significant legislation pertaining to the regulation of water, air, noise and waste pollution has been dealt with in this section.

# 4 Basic Assessment Process

# 4.1. Environmental Assessment Triggers

The proposed EJ Smith gauging weir and abstraction works entails certain activities that require authorisation in terms of NEMA. Refer to Section 3for further discussion on the legal framework.

The process for seeking authorisation is undertaken in accordance with the 2014 EIA Regulations (GN No. R. 982, R. 983, R. 984 and R. 985), as amended (07 April 2017), promulgated in terms of Chapter 5 of NEMA. Based on the types of activities involved which include activities in GN No. R. 983, R. 984 and R. 985 of the 2014 EIA Regulations (as amended), the requisite environmental assessment for the 2014 EIA Regulations (as amended), the requisite environmental assessment for the Process.

#### 4.2. Environmental Assessment Authorities

In terms of Regulations, the lead decision making authority for the environmental assessment is DEA, as the Proponent / Applicant is Umgeni Water.

#### 4.3. Basic Assessment Process

#### 4.3.1. Formal Process

An outline of the Basic Assessment Process for the proposed EJ Smith gauging weir and abstraction works is provided in Figure 6.

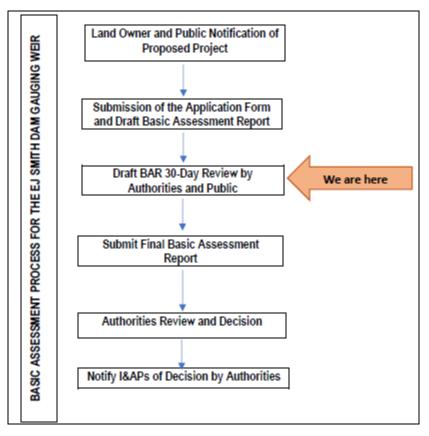

Figure 6: Basic Assessment Process for the EJ Smith Dam Gauging Weir

# 4.3.2. Landowner Consent

According to Regulation 39 (1) if GN No. R. 982 of the 2014 EIA Regulations as amended, if the proponent is not the owner or person in control of the land on which the activity is to be undertaken, the proponent must, before applying for an environmental authorisation in respect of such activity, obtain the written consent of the landowner or person in control of the land to undertake such activity on the land.

The Landowner is Illovo Sugar and they have been notified about the project.

# 4.3.3. Application Form

An application form in terms of Regulation 16 of Government Notice No. R. 982 of the 2014 EIA Regulations as amended in 2017, will be submitted to DEA together with the Draft BAR.

# 4.3.4. Public Participation and Review of the BAR

The Draft BAR will be made available to Interested and Affected Parties (I&APs) for a 30-Day review period. All comments received will be taken into account in the Final BAR and will also be noted in the Comments and Response Report.

More details on the Public Participation Process is provided in Section 9.

# 5 Assumptions and Limitations

The following assumptions were made during the BA Process:

- The detailed engineering design submitted by Umgeni Water to the EAP is the final design;
- No site alternatives have been considered for the proposed gauging weir;
- There are no design, layout or technology alternatives for this project;
- The findings of the Impact Assessment are informed by the Specialist reports which are assumed to be accurate; and
- The mitigation measures that are provided in the EMPr will be implemented and it is assumed that the measures will successfully enhance potential positive impacts while limiting potential negative impacts.

# 6 Need and Desirability

# 6.1. Need and Desirability of the proposed project

The DEA (2017), Guideline on Need and Desirability, has been used to inform and provide structure for the Need and Desirability Report for this project.

The concept of "need and desirability" relates to amongst others, the nature, scale and location of the development that is being proposed, as well as the wise use of land. Need and desirability are inter-related and the two should be considered in an integrated and holistic manner.

The on-going El Niño phenomenon has caused poor rainfall which, in combination with above-average temperatures, has resulted in a severe drought in South Africa. This combined with the increasing demand on the

already scarce water resource amplify the importance of accurate hydrological information and necessitate that existing water be conserved and managed effectively.

KwaZulu-Natal in particular has been affected significantly by the recent drought. Due to this the low river levels cause severe disruption to life cycles of aquatic organisms on the downstream side. To ensure accurate monitoring of the environmental release particularly during dry seasons, Umgeni Water proposes to install a Gauging Weir at the EJ Smith Dam.

The primary goal is to ensure the accurate monitoring of the environmental release particularly during the dry season.

The following policies, statues and documents were examined:

- The National Environmental Management Act Principles;
- Spatial Planning and Land Use Management Act Principles;
- The National Development Plan 2030;
- The Integrated Development Plan (IDP) for Umdoni Local Municipality;
- The Integrated Development Plan (IDP) for Ugu District Municipality;
- The Spatial Development Framework; and
- The Environmental Management Framework.

# 7 Socio Economic Value of the Proposed Project

The table below details the socio-economic value of the Proposed Project.

#### Table 8: Socio-economic value of the proposed project

Description	Value
What is the expected capital value of the activity on completion?	R 1 726 046.98
What is the expected yearly income that will be generated by or as a result of the activity?	N/A
Will the activity contribute to service infrastructure?	YES
Will the activity be a public amenity	NO
How many new employment opportunities will be created in the development phase of the activity?	10 - 12
What is the expected value of the employment opportunities during the development phase?	R 750 000.00
What percentage of this will accrue to previously disadvantaged individuals?	100%
How many permanent new employment opportunities will be created during the operational phase of the activity?	N/A
What is the expected current value of the employment opportunities during the first 10 years?	N/A
What percentage of this will accrue to previously disadvantaged individuals?	N/A

# 8 Resource Use and Process Details

# 8.1 Waste, Effluent, Emission and Noise Management

#### 8.1.1 Solid Waste Management

The activity will produce solid construction waste during the construction/initiation phase. The estimated quantity that will be produced per month is unknown. The construction solid waste will be disposed of at a suitably licensed Municipal landfill site. The proposed activity will not produce any solid waste during its operational phase.

#### 8.1.2. Liquid Effluent (other than domestic sewage)

The construction of the weir will not produce / result in liquid effluent that will be disposed of in a municipal sewage system.

#### 8.1.3. Liquid Effluent (domestic sewage)

The construction of the weir will not produce / result in liquid effluent that will be disposed of in a municipal sewage system.

#### 8.1.4. Emissions into the atmosphere

No emissions will be released into the atmospheres for the proposed activity. It must be noted that only construction related emissions will be released.

#### 8.1.5. Water Use

A water use permit from the Department of Water and Sanitation (DWS) is required. A WUL application for 21 (i) and (c) is required.

#### 8.1.6. Power Supply

The proposed gauging weir will not require any power supply to function. The primary goal is to ensure the accurate monitoring of the environmental release particularly during the dry season.

#### 8.1.7. Energy Efficiency

N/A.

# 9 Public Participation Process

# 9.1. Public Participation

The purpose of the public participation process for the proposed development includes:

- Provide Interested and Affected Parties (I&APs) with an opportunity to obtain information with regards to the project;
- Allowing I&APs to express their views, issues and concerns with the proposed project;
- Granting I&APs and opportunity to recommend measures to avoid or decrease negative impacts and enhance positive impacts that are associated with the proposed project; and
- Lastly, to enable the project team to incorporate the needs, concerns and recommendation that are made by the I&APs about the proposed project, where feasible.

The public participation process that was followed for the proposed project is governed by the NEMA and GN No. R. 982 of the 2014 EIA Regulations, as amended in April 2017. Detail for the process are provided below. All Public Participation material can be referred to in **Appendix B**.

# 9.2. <u>Pre-Application Consultation</u>

No Pre-Application Consultation Meeting was held with the DEA for the Proposed Project.

# 9.3. Identification of I&APs and Compilation of the I&AP Database

A database of I&APs, which includes authorities, different spheres of government (national, provincial and local), parastatals, ward councillors, stakeholders, interest groups and members of the general public, was prepared and is contained in **Appendix B**. This database will be maintained and updated as necessary during the course of the BA Process.

# 9.4. Landowner Notification

The Landowner is Illovo Sugar (Pty) Ltd. They have been notified via email and telephone of the project, a copy of the BID was circulated to the Landowner. (**Please refer to Appendix B5**).

# 9.5. Project Announcement

The notification process that was undertaken is detailed in the sections to follow:

# 9.5.1 Background Information Document (BID)

BIDs (Appendix B1) and Reply Forms were distributed by email to the I&APs contained in the I&AP Database. The BIDs contain a brief background and description of the project, as well as the BA Process, and listed the details for submitting comments regarding the proposed development. The BID served as a method to notify I&APs of the project and the details on how to register as an I&AP.

Proof of Notification is provided in Appendix B2.

# 9.5.2 Onsite Notices

Onsite Notices will be placed at strategic points within the study area. Notification of the proposed development are provided on the site notices. Details of the locations of the onsite notices and accompanying photographs will be provided in the **Final BAR**.

# 9.5.3. Newspaper Notices

A newspaper advertisement will be placed in the following newspapers as notification of the proposed EJ Smith Dam gauging weir and abstraction work and the 30-Day Review Period. Advertisements were placed in the following newspapers as notification of the project:

• Rising Sun Community Newspaper

Proof of these advertisements will be provided in the Final BAR.

# 9.6 Review Process for the Draft BAR

# 9.6.1 30 Day Public Review Period

In accordance with GN No. R. 982 of the amended 2014 EIA Regulations (07 April 2017)., I&APs were granted an opportunity to review and comment on the Draft BAR. Hardcopies of the document were placed at the public venues that are provided in Table 9. Emails will be sent to all registered I&APs to notify them of the review of the Draft BAR. The 30-Day public review period will take place from <u>15 February 2019 – 15 March 2019</u>.

#### Table 9: Location of Draft Basic Assessment Report for Review

Venue	Address	Contact Details
Umzinto Public Library	786 Nelson Mandela Road, Hazelwood, Umzinto	039 974 1121

# 9.6.2 30-Day Authority Review Period

Hardcopies of the Draft BAR were also provided to the key regulatory and commenting authorities, which include the following:

- DEA;
- KZN EDTEA;
- DWS: KZN region;
- Ezemvelo KZN Wildlife;
- DAFF;
- Department of Transport;
- Eskom;
- Amafa Akwa Zulu-Natali/Heritage KZN;
- Ugu District Municipality;
- Umdoni Local Municipality;
- Municipal Ward Councillor for 11

Proof of notification to commenting authorities of the review period and all proof of deliveries of the Draft BAR to all organs of states will be available in the Final BAR.

Should a Public Participation Meeting be requested by I&APS, one will then be held to discuss the project and any concerns by I&APs.

# 9.6.3 Comments and Response Report

A Comments and Responses Report which summarise the issues that are raised by I&APs and the project team's response to these matters, will be contained in the Final BAR. The issues that will be listed in the Comments and Response Report will be identified from completed Reply Forms, emails and other correspondence received by the allocated date.

# 10 Environmental Attributes

The environmental attributes that are associated with the proposed EJ Smith Dam weir and abstraction works include the geographical, physical, biological, social, economic and cultural aspects of the environment. The following significant environmental attributes are focused on in this report and are discussed in more detail in **Section 12**.

- Geology and Geohydrology;
- Soils;
- Topography;
- Surface Water;
- Flora;
- Fauna;
- Socio-Economic Environment;
- Air Quality;
- Noise;
- Historical and Cultural Features;
- Existing Structures and Infrastructure;
- Transportation; and
- Aesthetic Qualities.

The sensitive environmental features, attributes and aspects for which mitigation measures are included in the BAR and EMPr and are discussed further in **Section 12**.

# 11 Summary of Specialist Studies

The following Specialist Studies were undertaken as part of the Basic Assessment Process for the proposed EJ Smith Dam gauging weir. Refer to **Appendix C** for Specialist Reports.

#### 1. Aquatic Ecology Assessment;

#### 2. Wetland Assessment.

# 11.1. Aquatic Ecology Assessment

# **11.1.1. Details of the Specialist**

Specialist Details	
Organisation:	The Biodiversity Company
Name:	Mr. Russell Tate
Qualifications:	MSc (Aquatic Health)
Affiliation (if applicable)	Professional Natural Scientist – Ecological Science, Environmental Science and Aquatic Science (Reg number: 400213/11) with the South African Council for Natural Scientific Professions (SACNASP)

# 11.1.2. Main Findings of the Report

The proposed project is located in the Pongola – Mtamvuna Water Management Area (WMA). The river reach under consideration is a portion of the Mzimayi River System. An unnamed tributary of the Mzimayi River will be potentially affected by the proposed project. The considered sub quaternary catchment (SQC) is not considered a National Freshwater Ecological Priority Area (NFEPA) (Nel et al., 2011).

The desktop data of the SQR is presented in Table 10 below:

#### Table 10 Desktop information for the U80H-5120 SQR

Component / Catchment	U80H-5120
Present Ecological Status	Largely Natural
Ecological Importance Class	High
Ecological Sensitivity	Very High
Default Ecological Category	Natural

The results of the Desktop assessment indicate that the considered SQR PES was in a largely natural status (Class B). The Ecological Importance in the SQR was determined to be High. The Ecological Sensitivity of the SQR was determined to be very high. The Default Ecological Category for the considered reach was a Class A or Natural Based on desktop information.

The rationality that was used for the selection of the location for the aquatic sampling points was based on the location of the proposed project immediately upstream of the sampling point. The aquatic sampling point, survey methods and photographs details are provided in **Table 11**.

Table 11:	Location	of the	Aquatic	Sampling	g Points
-----------	----------	--------	---------	----------	----------

Site Name	Assessment Conducted	February 2018
A2 (Upstream)		<image/>
	Biology, Water	

and Habitat Quality

A2 (Downstream)

# 11.1.3. Limitations and Assumptions by the Aquatic Specialist

- A Single Aquatic ecology site survey was completed for this assessment. Thus, temporal trends were not investigated;
- No wetlands were considered in this study;
- The extent of the riparian zone was delineated on a desktop level;
- Due to the rapid nature of the assessment and the survey methods applied, fish diversity and abundance was likely to be under estimated;
- Invertebrates were only considered to the Family level and thus a defined species list for aquatic invertebrates was not completed;
- The specific activities and detailed infrastructure plans were not available at the time of writing this report;
- Only sites where there will be proposed activity was selected for this assessment; and
- No alternatives were considered for this assessment.

# 11.1.4. Results and Discussion

# 11.1.4.1. Water Quality

The results of the in-situ water assessment that was conducted indicates limited perturbations in terms of the physical water quality. However, considering that the catchment of the considered river reach is located in the urban area of Umzinto, urban runoff which consists of a multitude of chemical and chemical pollutants occurs within the considered sites.

The chemical water quality results if the selected sampling point are provided below in Table 12.

Constitute	Result
рН	7.7
Electrical Conductivity (mS/cm)	29.3
Chloride (mg/l)	44
Nitrate (mg/l)	0.1
Phosphate (mg/l)	<0.2
Free and Saline Ammonia as N (mg/l)	0.1
Sulphate (mg/l)	10
As (mg/l)	<0.01
Ca (mg/l)	14
Cd (mg/l)	<0.01

#### Table 12: Chemical Water Quality Results at A2 (February 2018)

Co (mg/l)	<0.01
Cr (mg/l)	<0.01
Cu (mg/l)	<0.01
Fe (mg/l)	0.026
Mg (mg/l)	8.0
Mg (mg/l) Mn (mg/l)	8.0 <0.01

The results of the chemical water quality assessment indicated that there was limited water quality deterioration in the considered river reach. The concentrations of metals were determined to be largely below the detection limits for ICP-MS. The concentration of nutrients in the form of nitrogen, sulphates and phosphates were also determined to be low. This result was unexpected due to the presence of the Umzinto urban areas that are located upstream of the sampling point. The EJ Smith impoundment is likely to be acting as a sink for contaminants whereby water quality impacts at the sampling point would be intermittent and likely aligned to periods during high runoff.

# 11.1.4.2. Intermediate Habitat Integrity Assessment

The results of the in-stream and riparian integrity assessment derived a class D (largely modified) status for the considered river reaches in this assessment. The predominant factors influencing the quality of the habitats are largely attributed to urban land use activities in the upper reaches of the project area, extensive dryland agriculture and the presence of the EJ Smith impoundment. Serious instream habitat modification has taken place in the catchment with the flow within the river reach highly regulated (Refer to Photo2).

Photo 2: Flow Regulation, Channel and bed modification (A2; February 2018)

# 11.1.4.3. Macroinvertebrates

Biological assessments were completed at representative sites in the considered river reaches. The invertebrate habitat at each site was assessed using the South African Scoring System version 5 (SASS5). Habitat availability within the assessed watercourse were rated as poor. The stones biotope was predominantly absent from the selected site and largely consisted of large bedrock boulders and bedrock. Considering the low biotope diversity at the sites the lowered diversity of macroinvertebrates can be anticipated.

The results of the SASS5 assessment derived SASS5 scores that was 65with 15 macroinvertebrate families observed with an ASPT of 4.3. The ecological class was found to be Class D at the sampled point.

The results of the Macroinvertebrate Response Assessment Index (MIRAI) assessment indicate that a largely/seriously modified invertebrate community was present in the considered watercourse based on the survey results. The primary driver of the macroinvertebrate community was determined to be water quality modification. However, the overall results indicate that each metric considered was modified and therefore resulting in the poor condition of the macroinvertebrate which can be attributed to the cumulative impacts of diffuse urban runoff, habitat and flow modification.

# 11.1.4.4 Fish Community

A total of 4 fish species were sampled during the survey and a sampled species included a listed species. The listed species is *Oreochromis mossambicus* which is listed as Near Threatened (ICUN, 2017). *Oreochromis mossambicus* threatened by hybridisation and therefore the proposed project will not negatively affect the population of this species. The expected native species composition was determined at each site based on site specific habitat features. The sampled native fish community structures were calculated according to the percentage of expected fish species sampled at a site.

The Fish Response Assessment Index (FRAI) results indicates a largely modified (class D) fish community structure. This was largely attributed to the absence of several fish species which could be attributed to in-stream modification and the presence of migratory barriers.

# 11.1.5 Overall Aquatic Ecology Present Ecological Status

The results of the PES assessment derived largely modified (class D) conditions in the river reach. Modified conditions were largely attributed to water quality level and cumulative impacts, resulting in the modification of instream habitat, invertebrate and fish communities. The results of the PES are provided in table 13 below:

#### Table 13: Present Ecological Status of the river reach assessed in the February 2018 survey.

Aspect Assessed	Ecological Category
Instream Ecological Category	45
Riparian Ecological Category	41
Aquatic Invertebrate Ecological Category	40
Fish Ecological Category	53
Ecostatus	Class D

#### 11.1.6. Aquatic Ecological Importance and Sensitivity

The overall Ecological Importance and Sensitivity (EIS) of the river reach in this study were guided by the desktop information. However, considering the PES of the river reaches the ecological importance and sensitivity can both be regarded as low.

### 11.1.7. Conclusion and Recommendations

The results of the PES assessment derived largely modified (class D) conditions in the river. The modified conditions were largely attributed to cumulative habitat and water quality level impacts which have resulted in the modification of in-stream habitat, invertebrate and fish communities.

The results of the risk assessment derived predominantly low risks for the proposed project. However, due to the permanent presence of the weir, the risk rating for the operation and maintenance activity of the V-notch structure was determined to be moderate. It is however anticipated that the overall impact of the proposed project will be low when considering the recommended mitigation measures and the nature of the proposed project.

The baseline environment indicated largely tolerant aquatic biology. In addition, the proposed project will be located approximately 20m downstream of the existing EJ Smith Dam wall. Considering the location of the proposed project, the cumulative impact on fish migration and loss of aquatic habitat is considered negligible.

Considering the status of the aquatic ecosystems, and furthermore the nature and requirements of the project, the proposed project has the potential to negatively affect the local ecology. However, should the proposed mitigation actions be implemented, impacts may be reduced. In light of this, it is the opinion of the specialist that no significant fatal flaws could be identified through the completion of this aquatic ecology study.

# 11.2 Wetland Delineation and Risk Assessment

11.2.1. Details of the Specialist

Specialist Details	
Organisation:	Afzelia Environmental Consultants
Name:	Mr. Andrew Briggs
Qualifications:	MSc Conservation Ecology (Stellenbosch University)
Affiliation (if applicable)	CandidateNatural Scientist (Reg number: 116886) with the South African Council for Natural Scientific Professions (SACNASP)

# 11.2.2. Main Findings of the Report

Upon investigation of the proposed site and the associated 500m DWS regulated area for water use, a single wetland unit was identified approximately 400m upstream of the proposed EJ smith Dam gauging weir site. The wetland unit was identified approximately 400m upstream of the proposed EJ Smith Dam gauging weir site. The wetland unit, being located a considerable distance upstream and also above the EJ Smith Dam wall, will not receive any impacts from the construction or operation of the proposed gauging weir and, as such, will not require a DWS mandated Risk Assessment. The areas surrounding the proposed gauging weir site is generally comprised of very steep slopes with onsite investigations yielding no additional wetland units. Aside from the EJ Smith Dam, which is an artificial reservoir, the study area also comprised primarily of riverine areas and drainage lines.

The wetland unit, located above the EJ Smith Dam, was inaccessible which resulted in no soil data being collected. The vegetation, however, was visible from the edge of the unit, where it was determined that the system was dominated by *Typha capensis* and *Phragmites* sp., which is a known obligate wetland plants. The edges of the wetland were dominated by large trees and shrubby vegetation such as *Albiziaadianthifolia*, *L. camara* and *Tithoniadiversifolia*.

The majority of soils within the drainage lines alongside the Mzimayi River are comprised of brown sand and are colonised primarily by alien species including *S. officinarum*, *L. camara T. diversifolia*.

It must be noted that the Mzimayi River, specifically, did not form part of this assessment due to its location within a riparian zone.

Photo 3: View downstream from the head of a drainage line in the vicinity of the EJ Smith Dam showing the extent of alien invasion encountered within drainage lines near the proposed weir site.

Photo 4: view from the top of a drainage line within the study area f the EJ Smith Dam looking downstream, showing the extent of *S. officinarum* (sugarcane) agriculture which was prevalent throughout the study area.

Photo 5: View downstream within a riparian system that flows into the Mzimayi River from the left-hand bank.

Photo 6: An example of the light brown sandy soils extracted from a drainage line within the study area, note the absence of wetland indicators.

Photo 7: Upstream view of the EJ Smith Dam wall in the vicinity of the site of the proposed gauging weir showing the active channel of the Mzimayi River as well as distinct riparian habitat.

Photo 8: View from a hillslope on the right-hand side of the wetland unit located above the EJ Smith Dam. The wetland is located between the two tree lines.

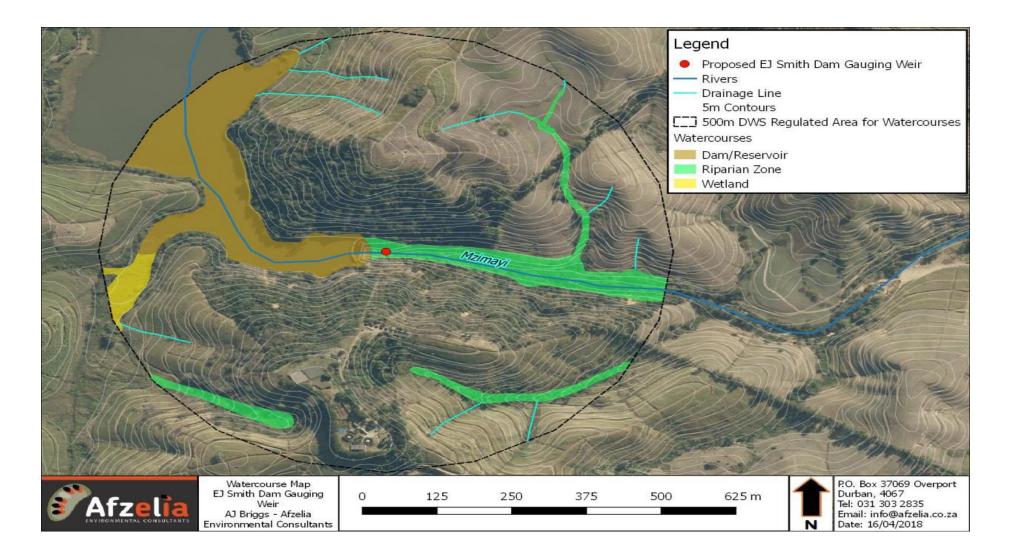

Figure 7: Watercourse map showing the riparian units in the vicinity of the proposed EJ Smith Dam Gauging Weir.

# 11.2.3. Impact and Risk Assessment

The Department of Water and Sanitation (DWS) Notice 509 of 2016 (General Authorisation in terms of Section 39 of the National Water Act 36 of 1998) for water uses as defined in Section21 (c) and (i) stipulates that a risk assessment must be conducted for all wetlands within 500m (wetland regulated area of a watercourse) of a development. The GA also stipulates that a risk assessment must be conducted for all riparian habitats should the activity fall within the delineated boundary of the river or within the 1:100-year floodline of the river.

There was only one wetland identified within a 500m radius of the proposed EJ Smith Dam gauging weir site. The location of the wetland above the EJ Smith Dam wall indicates that it will not derive any impacts from the proposed gauging weir construction and operation, which therefore alleviates the requirement for an impact or risk assessment.

It must be noted that an impact and risk assessment will be necessary for the riparian habitats as these habitats will likely derive certain negative impacts from the proposed gauging weir construction.

#### 11.2.4. Assumptions and Limitations

- The findings, results, observations, conclusions and recommendations given in this report are based on the author's best scientific and professional knowledge;
- The hand-held Garmin GPS map 60Cx used to delineate the wetland habitat and record various points of interest had an accuracy of ≤3m;
- Certain localities within the greater study area were inaccessible due to, in most cases, highly dense alien shrubland dominated by *Lantana camara*;
- Only wetlands that were likely to be impacted by proposed development activities were assessed in the field. Wetlands located within a 500m radius of the sites but not in a position within the landscape to be measurably affected by the developments were not considered as part of this assessment; and
- Riparian zones were mapped using the best available desktop spatial datasets as well as onsite data from the aquatic assessment reports compiled by The Biodiversity Company (2018a, b, c).

#### 11.2.5. Conclusion

The vast majority of watercourse units that are located within the respective study areas were riparian zones, although many invaded drainage lines were also present. A single wetland was identified above the EJ Smith dam and was therefore not assessed due to its location upstream as well as above, the EJ Smith Dam wall, indicating that it will receive no impacts from the proposed gauging weir construction.

No risk assessment was completed as part of this specialist report due to the fact that no definable wetland habitat was identified in a position within the landscape where it may receive impacts from the proposed weir development. It must be noted that riparian areas in close proximity to the proposed gauging weir sites will require complete impact and risk assessments as required by the DWS.

# 12 Impact Assessment

#### 12.1 Overview

This section of the Report focuses on the pertinent environmental impacts that could potentially be caused by the proposed EJ Smith Dam Gauging weir during the pre-construction, construction and operational phases of the project.

An "impact" refers to a change in an environment that results from an environmental activity (or aspect), whether desirable or undesirable. An impact may be the direct or indirect consequence of an activity.

Identified potential environmental impacts are linked to the project activities associated with the proposed development and its associated infrastructure.

#### 12.2. Project Activities

For the purpose of efficient and effective monitoring, aspects that are associated with construction, have been outlined into different sections for pre-construction, construction and operational phases. In order for one to understand impacts that are related to the proposed project, it is important to unpack the activities that are associated with the project cycle.

#### PRE-CONSTRUCTION PHASE

#### Project Activities

- Applicant (Umgeni Water) to appoint an ECO
- Negotiations and agreements with any affected landowners and stakeholders
- Detailed engineering design
- Detailed geotechnical design
- Site survey
- Procurement of contractors
- Marking of the construction servitude
- Capture pre-construction photographic records
- Approval of method statements
- The development and approval of construction plans
- Construction site planning including access and layout.

#### **Environmental Activities**

- To undertake a walkdown survey of the project footprint by the relevant environmental specialists in order to identify sensitive environmental features.
- Diligent compliance monitoring of the EA, EMPr and any other relevant environmental legislation.
- Ongoing consultation with landowners and affected parties.
- Establish the baseline water quality data for river crossings that are based on the aquatic and wetland studies.

#### CONSTRUCTION PHASE

#### **Project Activities**

- Site Establishment (including the sit camp and labour camp areas).
- Fencing of the construction footprint area.
- Registration of the servitude.
- Site clearing.
- The delivery of construction material to site.
- The transportation of equipment, machinery, materials and personnel to site.
- The storage and handling of material (hazardous and non-hazardous).
- Cut, fill and cover activities.
- Designated areas for the stockpiling of sand, crushed stone, aggregate, etc.
- Stormwater control procedures or mechanisms.
- The management of the topsoil and spoil on the site.
- The management of waste and waste water on the site.
- Traffic control measures on site.
- Bulk earthworks.
- Security for the site.
- Electrical supply for the site.
- The construction of the weir and the abstraction works.
- Concrete works.
- Temporary river diversion for the weir.

#### **Environmental Activities**

- The rehabilitation of the construction footprint or area.
- The control of invasive plant species.
- Diligent compliance monitoring of the EA, EMPr and other relevant environmental legislation.
- Conduct environmental awareness training of all site personnel.
- Implement the EMPr.
- Ongoing consultation with landowners and affected parties.

#### OPERATIONAL PHASE

#### **Project Activities**

- Servitude access and management requirements.
- The routine maintenance and inspection of the EJ Smith Dam gauging weir and abstraction works.
- Repair and maintenance works of the EJ Smith Dam gauging weir and abstraction works.

#### **Environmental Activities**

- Erosion monitoring programme.
- The management of sensitive areas.
- The management of vegetation clearance.
- Stormwater control management.
- Pollution control measures.
- The control of invasive plant species.
- Satisfy the EWR.
- Ongoing consultation with landowners and affected parties.

# 12.3 Environmental Aspects

Environmental aspects are regarded as components that are associated with a development / construction's activities, products and services that may interact with the environment and cause and impact to the environment. The environmental aspects that have been identified for the proposed EJ Smith Dam gauging weir, are linked to the project activities.

#### ENVIRONMENTAL ASPECTS

#### **Pre-construction Phase**

- Insufficient construction site planning and engineering layout designs.
- Poor consultation with landowners, affected parties, stakeholders and authorities.
- Site specific environmental issues not being fully understood.
- Inadequate environmental and compliance monitoring of the site.
- The absence of relevant permits for the site.
- Lack or inadequate provision of barricading of sensitive areas and environmental features.
- Poor waste management practices on site.
- Absence of ablution facilities.

#### **ENVIRONMENTAL ASPECTS**

#### **Construction Phase**

- Inaccurate walk-down survey of the site.
- Inadequate environmental and compliance monitoring of the site.
- Lack of environmental awareness.
- Construction occurring without search and rescue of indigenous and protected plant species.
- Indiscriminate site clearing.
- Poor site establishment.
- The poor management of access and use of access routes that are not approved.
- Poor transportation practices.
- Poor traffic management.
- The disturbance of topsoil
- The disruption of existing services.
- Poor consultation with landowners and affected parties.

#### **ENVIRONMENTAL ASPECTS**

#### **Construction Phase**

- The inadequate storage and handling of material.
- The inadequate storage and handling of hazardous material on site.
- Erosion.
- Poor maintenance of equipment and machinery on site.
- Pollution from the ablution facilities.
- Poor management of the construction camp area.
- Poor waste management practices hazardous, general solid and liquid.
- Poor management of the any pollution generation activities.
- Poor management of water.
- Damage to any significant fauna and flora.
- Environmental damage to any sensitive area.
- The disruption of any archaeological and culturally significant features if encountered.
- Increase in noise levels due to construction activities.
- Increase in dust and emissions into the environment.
- The influence on resource quality of the affected river from the river diversions.
- Poor rehabilitation practices of areas.

#### **Operational Phase**

- Poor consultation with affected parties, stakeholders, authorities and landowners.
- Lack of environmental and compliance monitoring of the gauging weir and abstraction works.
- Poor management of vegetation.
- Inadequate monitoring and management of access, routine maintenance and maintenance works,
- Not complying and satisfying the EWR.

# 12.4. Potential Significant Environmental Impacts

Environmental impacts are changes that occur in an environment as a result from an environmental aspect, whether desirable or undesirable. The potential significant impacts that are associated with the preceding activities and environmental aspects for the pre-construction, construction and operation phase of the proposed EJ Smith Dam gauging weir are stated below.

Feature	Impact
Topography of the site	<ul> <li>Visual impacts during construction.</li> <li>Crossing of watercourses (topographic features).</li> </ul>
	<ul> <li>Erosion of affected areas.</li> </ul>
Geohydrology of the site.	<ul> <li>Groundwater pollution due to the occurrence of any spillages on site.</li> </ul>
	<ul> <li>Poor construction practices.</li> </ul>
Surface Water	<ul> <li>Increased stormwater runoff on site.</li> </ul>
	Water leakages.
Geology and Soil	Loss of topsoil.
	Soil erosion through the clearance of areas and construction activities.
	Soil pollution through construction related activities. (cement spillages, diesel or oil spillages, chemical spillages, etc).
	<ul> <li>The compaction and erosion of removed and stockpiled soil on site.</li> </ul>
	Contamination of soil through the incorrect storage, handling, disposal of hazardous
	<ul> <li>waste on site.</li> <li>The contamination of soil through spillages and leakages that occur on site.</li> </ul>
	<ul> <li>Soil contamination due to the incorrect or</li> </ul>
	the mismanagement storage of hazardous chemicals.
	<ul> <li>Poor stormwater control measures during construction.</li> </ul>
Flora	The loss of sensitive vegetation.
	The loss of sensitive habitats.
	<ul> <li>Proliferation of exotic vegetation in disturbed areas.</li> </ul>
Fauna	Loss of habitats during the site clearing
	process.
	<ul> <li>Loss of habitats during construction.</li> </ul>

Potential significant environmental impacts during the Construction Phase.

	<ul> <li>The illegal poaching or hunting of mammals.</li> <li>Killing of snakes during the construction phase due to lack or poor environmental education procedures.</li> <li>Potential illness and or death of fauna due to pollution and or littering.</li> <li>Damage or clearance of habitats of conservation importance.</li> <li>Loss of fauna species of conservation importance.</li> <li>The obstruction to the corridors of movement that are used by animals.</li> </ul>
Noise	<ul> <li>Localised noise increase.</li> <li>Increase in noise levels.</li> <li>Noise nuisance.</li> </ul>
Aesthetics	Reduction in visual quality of the area.
Air Quality	<ul><li>Increase in dust levels.</li><li>Greenhouse gas emissions.</li></ul>
Transportation	<ul> <li>Construction related traffic.</li> <li>Increase in traffic on the local road network</li> </ul>
Safety and security	<ul> <li>Safety risk to landowners and surrounding communities.</li> </ul>
Socio-economic (positive)	<ul> <li>Generation of employment opportunities for the local community.</li> <li>Contribution to the local community</li> </ul>
Socio-economic (negative)	<ul> <li>Safety and security issues.</li> <li>Conflicted land uses.</li> <li>Nuisance from noise and dust.</li> </ul>
Waste Management	<ul> <li>The generation of waste from site preparations.</li> <li>The generation of domestic waste.</li> <li>Surplus and used building material.</li> <li>Hazardous waste, such as contamination of soil by spillages from chemicals, oil / diesel, cement etc.</li> <li>The disposal of excess spoil material (rock and soil) that is generated as part of the earthworks.</li> <li>Land, air and water pollution through poor waste management practices.</li> </ul>
Water Users	Water quality deterioration and disturbance to the flow caused by construction activities may adversely affect downstream water users.

	<ul> <li>Water that will be abstracted from watercourses for construction purposes.</li> </ul>
Riparian Habitat	<ul> <li>The loss of riparian and instream vegetation with the construction footprint.</li> <li>The change in the morphological characteristics of the river.</li> <li>The destruction of wetland or aquatic habitat units.</li> <li>Soil erosion.</li> </ul>
Aquatic Ecology	<ul> <li>Disruptions to the aquatic biota community due to water contamination.</li> <li>Disruption to the aquatic biota community due to the alteration of the flow.</li> <li>Disturbance to the aquatic biota community during construction activities.</li> <li>Alteration to habitat.</li> <li>The loss of aquatic -dependant biodiversity.</li> </ul>
Flow Regime	<ul><li>Alteration to the flow.</li><li>The effect on aquatic biodiversity.</li></ul>
Water Quality	<ul> <li>The release of contaminants from equipment and concreting activities.</li> <li>Water quality impacts die to siltation and pollution.</li> <li>The inflow of contaminated stormwater.</li> <li>Impacts on water quality due to poor construction activities.</li> <li>Impacts to the water quality due to spillages (cement, diesel / oil).</li> </ul>

Feature	Impact
Topography	<ul> <li>Visual impacts from infrastructure.</li> <li>Visual impacts from disturbed areas.</li> <li>Crossing of water courses.</li> <li>Erosion of affected areas.</li> </ul>
Flora	Th encroachment by exotic species through the lack of the eradication programme for the site.
Aesthetics	<ul> <li>The visibility of the weir.</li> <li>Poor rehabilitation procedures for the construction footprint.</li> </ul>
Water	Damage to the weir and abstraction works from the occurrence of major flooding.
Socio – Economic (positive)	The generation of employment activities for the local community
Socio – Economic (negative)	<ul> <li>Safety and security issues through the improper access control during inspections and maintenance activities.</li> <li>The increase in the use of the local road network for the operation and maintenance purposes.</li> </ul>

#### 12.5 Impact Assessment Methodology

The impact assessment that is carried out for each environmental impact that may arise from the proposed project, forms the basis in order to determine which management measures that will be required to prevent or minimise these impacts. It is also a means in which the mitigation measures that are determine in the impact assessment which are then translated to action items. These actions items are required in order to prevent or to keep those impacts that cannot be prevented within acceptable levels.

In order to establish best management practices and prescribe mitigation measures, the following project-related information needs to be adequately understood:

- **Activities** that are associated with the proposed project;
- **Environmental aspects** that are associated with the project activities;
- **Environmental impacts** resulting from the environmental aspects; and
- **4** The nature of the surrounding **receiving environment**.

Information provided by specialists was used to calculate an overall impact score by multiplying the product of the nature, magnitude and the significance of the impact by the sum of the extent, duration and probability based on the following equation:

#### Overall Score = (NxMxS) x (E+D+P)

Where: N = Nature; E = Extent M = Magnitude D = Duration P = Probability S = Significance

Table 14: Impact Methodology Table

Nature										
Negative Impact	Negative Impact Neutral Impact				Positive Impact					
-1		0				+1				
			Exte	ent

1	2		3		4			5		
			Signifi	cance						
No Impact / None No Impact After Mitigation / Low								npact Cannot be /itigated / High		
0	1			2			3			

#### The following definitions apply:

For the methodology for the impact assessment, the analysis is conducted on a qualitative basis with regards to the **nature, extent, magnitude, duration, probability and significance** of the impacts.

#### The following scoring system applies:

#### Nature / Status

The project could have a positive, negative or neutral impact on the environment.

#### Extent

- Local extends to the site and its immediate surroundings.
- **Regional** impact on the region but within the province.
- > National impact on an interprovincial scale.
- > International impact outside of South Africa.

#### **Magnitude**

Is the degree to which an impact may cause irreplaceable loss of resources.

- > Low natural and social functions and processes are not affected or minimally affected.
- Medium the affected environment is notably altered, the natural and social functions and processed continue albeit in a modified way.
- High the natural or social function or processes could be substantially affected or altered to the extent that could temporarily or permanently cease.

#### **Duration**

- Short term 0-5 years.
- **Medium term** -5 11 years.
- Long term the impact ceases after the operation life cycle of the activity either because of natural processes or by human intervention.
- Permanent mitigation is either by natural process or by human intervention, will not occur in such a way or in such a time span that the impact can be considered transient.

#### Probability

- Almost certain that the event is expected to occur in most circumstances.
- > Likely that the event will probably occur in most circumstances.
- > Moderate that the event should occur at some time.
- > **Unlikely** that the event could occur at some time.
- > Rare / Remote that the event may occur in exceptional circumstances.

#### Significance

Provides an overall impression of an impact's importance, and the degree to which the impact can be mitigated. The range for significance ratings are as follows:

- **0** Impact will not affect the environment; therefore, no mitigation is necessary.
- **1** No impact after mitigation.
- 2 Residual impact after mitigation.
- 3 Impact cannot be mitigated.

Impact Scores will be ranked in the following way as listed in the table below:

#### Table 15 Ranking of overall impact score

Impact Rating	Low / Acceptable Impact	Medium	High	Very High
Score	0 to 30	31 to 60	61 to90	91 to 117

### 13 Impact Management

The impacts for each environmental feature that has been identified are assessed for the pre-construction, construction and operation phases for the proposed EJ Smith Dam Gauging Weir.

#### 13.1. Geohydrology

#### 13.1.1 Potential Impacts

Groundwater will adversely affect excavation conditions, stability of excavated slopes and trenches. Pumping and possibly local de-watering will be required.

Groundwater may be impacted on as follows during the construction phase:

- Contamination of the groundwater resulting from the incorrect storage/handling and disposal of hazardous waste materials.
- > Contamination of groundwater through spillages from equipment, machinery and vehicle storage

#### 13.2 Surface Water

#### 13.2.1 Potential Impacts

The following impacts were identified by the Aquatic Specialist and extracted from the Aquatic Ecology Assessment Report (The Biodiversity Company, 2017):

- Increased runoff and erosion (Construction Phase);
- > Deterioration of water quality, alteration of instream and bankside aquatic habitat (Construction Phase);
- Loss of aquatic habitat, deterioration of water quality and direct impacts to aquatic fauna (Construction Phase);
- > Alteration of instream and bankside aquatic habitat (Construction Phase);
- > Deterioration of water quality (Construction Phase);
- Alteration of hydrology (Construction Phase);
- Modification of instream habitats (Operation);

The methodology used by the aquatic specialist differs slightly from that described in Section 13. All impacts were analysed with regards to their nature, extent, magnitude, duration, probability and significance. The assessments to follow were extracted from the Aquatic and Wetland Baseline and Impact Assessment (The Biodiversity Company, 2018) (**Tables 16, 17** and **18**).

Phase	Activity	Aspect	Impact
Construction	Site access and clearing of working areas	Reduced vegetative cover and compaction of soils	<ul> <li>Increased runoff and erosion.</li> </ul>
	Excavations	Alterations to water chemistry, Stream channel construction activities.	<ul> <li>Deterioration of water quality, alteration of in-stream and bankside aquatic habitat.</li> </ul>
	Explosives	Alterations to water chemistry, direct impact to aquatic fauna and hydrological alteration.	<ul> <li>Loss of aquatic habitat, deterioration of water quality and direct impacts to aquatic fauna.</li> </ul>
	River diversions	Stream channel construction activities	<ul> <li>Alteration of in-stream and bankside aquatic habitat.</li> </ul>
	Storage and use of construction chemicals and hydrocarbons.	Contaminated runoff	<ul> <li>Deterioration of water quality</li> </ul>
	Construction of V-notch Crump weir.	Hydrological alteration	<ul> <li>Alteration of hydrology.</li> </ul>
Operation	Operation and maintenance of the V-Notch Crump Weir.	Physical presence of structure	<ul> <li>Modification in-stream habitats</li> </ul>

#### Table 16: Activity and impact table for the proposed project.

The following recommendations are provided for the project:

- The working areas should be outside of the proposed 32 buffer zone if feasible;
- Construction activities are proposed to be conducted in the dry season, if possible (April August inclusive);
- Laydown yards for construction materials should be placed outside a 32m buffer zone from the rivers;
- No chemicals, building materials, hydrocarbons or soils must be stockpiled within the 30m buffer zone;
- River diversions must be done in a manner that avoids downstream erosion;
- All 'shock tubes' and detonation wires must be recovered following each blast;
- No mixture of ammonium nitrate-fuel oil mixtures must take place in or near the river (32m buffer);
- Any disturbed areas must be re-vegetated within appropriate indigenous plant species.

#### 13.3. Geology and Soil

#### 13.3.1 Potential Impacts

The proposed development of the gauging and abstraction works will require suitable geological founding conditions.

During the construction phase for the proposed project, areas of vegetation will be cleared, this may lead to soil erosion. The EMPr will address this issue and include suitable erosion and water management measures to minimise the risk of erosion.

Soil may be polluted by the poor storage of construction material (including hazardous substances), inadequate housekeeping practices and spillages (i.e. cement, diesel/oil etc). Specific mitigation measures are contained in the EMPr, where the primary objective is for the effective and safe management of materials on site, in order to minimise the impact of these materials on the biophysical environment.

# 13.3.2 Impact Assessment

			Geology	and Soil			
Project Life Cycle:	Construction and Op	erational Phases					
Potential Impact:	Soil Erosion						
Proposed Mitigation:	<ul> <li>Erosion Control:</li> <li>Suitable erosion protective measures to be implemented for access roads.</li> <li>Stabilisation of cleared areas to prevent and control erosion. The method chosen (e.g. watering, planting, retaining structures, commercial anti-erosion compounds) will be selected according to the site-specific conditions.</li> <li>Monitoring to be conducted to detect erosion at least on a weekly basis and immediately after rain events.</li> <li>Exposed areas to be rehabilitated as soon as possible to avoid erosion.</li> <li>The Contractor shall take measures to the approval of the Engineer to ensure that there is no undue stormwater damage and soil erosion resulting from the construction activities outside the construction camp and works areas.</li> <li>During construction, water diversion soil berms will be constructed to divert surface and stormwater from traversing the disturbed areas</li> <li>Sufficient cross and side stormwater drainage measures shall be constructed on access roads to the site to prevent erosion.</li> <li>At all stages of the project lifespan, stormwater control measures as specified by the Engineer shall be applied to keep soil on site by minimising:         <ul> <li>The erosion of temporary stockpiles of topsoil and permanent spoil dumps;</li> <li>The erosion from construction roads, excavations and the other cleared areas;</li> <li>The silt-laden run off from all areas stripped of vegetation, including excavation surfaces and stockpiles of spoil and topsoil; and</li> </ul> </li> </ul>					mage and soil the disturbed areas. erosion. eep soil on site by

#### 13.4. Flora

#### 13.4.1 Potential Impacts

Vegetation will be lost within areas that are to be cleared for the proposed project infrastructure. The clearing of vegetation for construction purposes may result in the proliferation of exotic vegetation, which could spread beyond the construction footprint. This potential impact will need to be managed effectively.

#### 13.4.2 Impact Assessment

	Flora Pre- Construction Phase
Detential Immed	
Potential Impact	Mitigation
Destruction of	Vegetation clearing shall be kept to a minimum, and this shall only occur where it is absolutely necessary, and the use of a brush-
indigenous flora during	cutter for this operation is highly preferable to the use a TLB or other earth-moving equipment.
site establishment	Rehabilitate all disturbed areas as soon as the construction is completed within the proposed development area.
	Ensure that all personnel have the appropriate level of environmental awareness and competence to ensure continued environmental
	due diligence and on-going minimisation of environmental harm and this can be achieved through provision of appropriate awareness
	to all personnel.
	Other than on public roads and thoroughfares, vehicles and construction workers shall under no circumstances be allowed outside the site boundaries to prevent impact on surrounding vegetation.
	<ul> <li>Disturbance of vegetation must be limited only to areas of construction.</li> </ul>
	Prevent contamination of natural areas by any pollution.
	Proliferation of alien and invasive species is expected within disturbed areas and this must be eradicated and controlled to prevent further spread.
	<ul> <li>No storage of building material or rubble is allowed in the sensitive areas, such as riparian habitats.</li> </ul>
	<ul> <li>Avoid translocating stockpiles of topsoil from one place to sensitive areas in order to avoid translocating soil seed banks of alien species.</li> </ul>

#### 13.5. Terrestrial Ecology – Fauna

#### 13.5.1 Potential Impacts

Vulnerable species could occur within the study area and the construction of the proposed development may have a negative impact on the habitats of such species. Fauna could also be adversely affected through the construction related activities (such as noise, illegal poaching and habitat loss) for the proposed EJ Smith Dam gauging weir and abstraction work.

#### 13.5.2 Impact Assessment

Fauna Pre-Construction Phase							
Potential Impact	Mitigation						
Loss and displacement of animals on site.	<ul> <li>Any fauna (mammal and reptile) that becomes trapped in the trenches or in any construction or operational related activity may not be harmed and must be rescued and relocated by suitably experienced personnel.</li> <li>Training of construction workers to recognise threatened animal species will reduce the probability of fauna being harmed unnecessarily.</li> <li>The contractor must ensure that no faunal species are disturbed, trapped, hunted or killed during the construction phase.</li> <li>Vehicles must adhere to a speed limit, 30km/h is recommended for light vehicles and a lower speed for heavy vehicles.</li> <li>All construction and maintenance vehicles must remain on properly demarcated and prepared roads. Off-road driving shall be strictly prohibited.</li> <li>No fires shall be allowed on the site</li> <li>No trapping or any other method of catching of any animal or bird may be performed on site</li> <li>No dogs or other domestic pets shall be allowed on the site.</li> </ul>

# 13.6 Aesthetic Quality13.6.1 Potential Impacts

Potential visual impacts during the construction phase of the proposed project will be caused by poor placement of the construction camp and equipment, as well as poor management of rubble, refuse and construction material on site. Additionally, destruction of the surrounding natural environment would decrease the aesthetic appeal of the area. Thus, visual impacts must be minimised.

#### 13.6.2 Impact Assessment

With Mitigation	Negative	Local	Low	Short-Term	Unlikely	1	4		

#### 13.7. Noise

#### 13.7.1 Potential Impacts

During construction, localised increases in noise and vibration will be caused by the following:

- > Operation of motorised vehicles for transportation of personnel, materials, and equipment to, from, and within the development site;
- Drilling operations;
- > Operation of mobile and stationary motorised equipment within the site boundary (e.g. haul trucks, excavators, bulldozers, loaders, drill rigs, aggregate crushers, conveyor systems and generators);
- > Operation of various auditory safety signals, alarms, or sirens (e.g. vehicle backup alarms and blast warning); and
- General construction activities on site.

During the operational phase, the weir and the abstraction works are unlikely to increase noise levels by any significant degree.

Noise that emanates from construction and operational activities will be addressed through targeted best practices for noise monitoring and management as detailed in the EMPr. The associated regulated standards must be adhered to.

Project personnel working on the site will experience the greatest potential exposure to the highest levels of noise and vibration. Workplace noise and vibration issues will be managed as part of the Occupational Health and Safety Management System to be employed on site, which will include specific measures aimed at preventing hearing loss and other deleterious health impacts.

#### 13.7.2 Impact Assessment

#### 13.8. Air Quality

#### 13.8.1 Potential Impacts

Potential impacts during the construction phase include the following:

- > Dust will be generated during the construction period from various sources, including blasting, earthworks, stockpiles, use of access roads, transportation of spoil material and general construction activities on site; and
- > Exhaust emissions from vehicles and equipment.

Mitigation measures are detailed in the EMPr to ensure that the air quality impacts during the construction phase are suitably monitored (dust falloutparticulate matter) and managed and that regulated thresholds are not exceeded.

#### 13.8.2 Impact Assessment

	Air Quality
Project Lifecycle	Construction Phase
Potential Impact	Excessive dust levels as a result of construction activities
Proposed	Appropriate dust suppression measures or temporary stabilising mechanisms to be used when dust generation is unavoidable (e.g.
Mitigation	dampening with water, chemical soil binders, straw, brush packs, chipping), particularly during prolonged periods of dry weather.
	Dust suppression to be undertaken for all bare areas, including construction area and access roads. Note that all dust suppression requirements should be based on the results from the dust monitoring and the proximity of sensitive receptors.
	<ul> <li>Speed limits to be strictly adhered to.</li> </ul>
	The Contractor will take preventative measures to minimise complaints regarding dust nuisances (e.g. screening, dust control, timing, pre- notification of affected parties).
	Air quality to be monitored (baseline and during construction) for dust fallout and particulate matter. Sampling locations to consider major sources of dust, the location of sensitive receptors and wind directions.

	Nature (positive / negative)	Extent	Magnitude	Duration	Probability	Significance	Score
Without Mitigation	Negative	Local	Medium	Short term	Likely	2	24
With Mitigation	Negative	Local	Low	Short-Term	Unlikely	1	4

#### 13.9. Safety and Security

#### 13.9.1 Potential Impacts

During construction, there may be the potential for employees to be injured, as well as the safety of landowners and surrounding communities may be compromised. All environmental hazards and safety risks must be included in the employees' safety file for inclusion into the contractor's mitigation measures.

#### 13.9.2 Impact Assessment

	Safety and Security
Project Lifecycle	Construction Phase
Potential Impact	<ul> <li>The uncontrolled access to proposed boundary extension.</li> <li>Construction employees getting injured during working hours on the site.</li> <li>Open trenches and construction vehicles may pose a safety risk while on site.</li> </ul>
Proposed Mitigation	<ul> <li>Compliance with Occupational Health and Safety Act (Act No. 85 of 1993).</li> <li>The Contractor must provide an Occupational Health and Safety Management Plan to the Construction Manager for approval prior to the commencement of works.</li> <li>Proper supervision of employees at all times. # 13.10. Traffic

### 13.10.1 Potential Impacts

During the construction period, there will be an increase in traffic on the local road networks due to the delivery of plant and material, transportation of staff and normal construction-related traffic. Haul roads and access roads will also be created on site, within the construction domain.

As part of the construction phase, measures will be implemented for the selective upgrade of the roads (if necessary) and to render these roads safe for other users (amongst others). After the construction phase, the local roads will only need to be used for operation and maintenance purposes.

All the appropriate traffic safety measures and control must be implemented to minimise any potential impacts associated with the construction of the EJ Smith Dam gauging weir. Any disruptions to the transportation network must be mitigated and will be discussed in the EMPr.

#### 13.11. Socio-Economic Environment

#### 13.11.1 Potential Impacts

A positive impact could be the creation of short-term work opportunities for local communities during construction, as well as long-term work during the operation and maintenance of the EJ Smith Dam gauging weir scheme. In addition, the proposed project will result in a sustained economic and social beneficiation from the water services.

There are also negative impacts associated with the construction of the gauging weir and are as follows:

- ➤ Traffic disruptions;
- Dust, noise and visual impacts;
- > Proximity to construction work and associated inconvenience and dangers; and
- Sense of place.

# 13.12. Waste Management

### 13.12.1 Potential Impacts

Waste management aims to avoid waste pollution of land, air and water during and as a consequence of the construction of the gauging weir.

The following describes the impacts during the construction phase:

- > Waste generated from site preparations (e.g. plant material);
- Domestic waste;
- Surplus and used building material;
- > Hazardous waste (e.g. chemicals, oils, soil contaminated by spillages, diesel rags);
- > Wastewater; and
- > Disposal of excess spoil material (soil and rock) generated as part of the bulk earthworks.

Poor waste management and practices during construction including lack of proper waste disposal, littering, and burning of refuse should not be tolerated.

#### 13.12.2 Impact Assessment

	Waste Management							
Project Lifecycle	Construction Phase							
Potential Impact	Land, Air and Water Pollution can occur through poor waste management practices.							
Proposed	Sufficient ablution facilities to be provided at the Construction Camp within the construction site.							
Mitigation	Suitable litter receptacles to be positioned strategically across the site at all working areas.							
	Waste must be separated at source (e.g. containers for glass, paper, metals, plastics, organic waste and hazardous wastes).							
	The Contractor shall dispose of all refuse generated on site or from the activities of construction or its related activities.							
	The contractor shall on a weekly basis dispose of all refuse at an approved refuse disposal site.							
	Proof of disposal must be kept on record.							
	<ul> <li>Littering by the workers is prohibited.</li> </ul>							
	<ul> <li>Clearly marked litterbins must be provided on site.</li> </ul>							
	Monitor the presence of litter on site							
	All staff shall be educated regarding the need and method of minimising waste and disposing of it in a sustainable manner.							

	<ul> <li>waste mate</li> <li>Waste mate</li> <li>No waste set</li> <li>Hazardous</li> <li>suitably lic</li> <li>No refuse</li> <li>The recycl</li> </ul>	erial or waste equi terial that may han shall be disposed of waste such as d ensed waste dispo or litter is allowed ing of all waste is parking areas and	pment used by the co m humans or animals of in the surrounding e esel, oil or petrol spil osal site. to be burnt on site. to be encouraged by b	nstruction team on a d shall be removed imm environment. lages are to be collect both the contractor and	ediately. ed and stored in special	ly marked containers ar	nd disposed of at a

#### 13.13 Cumulative Impacts

According to GN No. R. 982 of the amended EIA Regulations (07 April 2017), a "cumulative impact", in relation to an activity, means the impact of an activity that in itself may not be significant, but may become significant when added to the existing and potential impacts eventuating from similar or diverse activities or undertakings in the area.

Cumulative impacts can be identified by combining the potential environmental implications of the proposed project with the impacts of projects and activities that have occurred in the past, are currently occurring, or are proposed in the future within the project area.

The following cumulative impacts are anticipated for the proposed gauging weir:

- Loss of sensitive vegetation types;
- Encroachment of alien vegetation;
- > Traffic impacts.

			Cumulativ	ve Impacts						
Potential Impact	Loss of sensitive veg	getation types								
Proposed Mitigation	<ul> <li>Appropriate measures should be implemented in order to prevent potential soil pollution through fuel and oil leaks and spills and then compliance monitored by an appropriate person.</li> <li>Make sure construction vehicles are maintained and serviced to prevent oil and fuel leaks.</li> <li>Emergency on-site maintenance should be done over appropriate drip trays and all oil or fuel must be disposed of according to waste regulations.</li> <li>Drip-trays must be placed under vehicles and equipment when not in use.</li> <li>Implement suitable erosion control measures.</li> <li>All conditions of the EMPr must be adhered to.</li> </ul>									
	Nature (positive / negative)									
Without Mitigation	Negative	Local	Medium	Long Term	Likely	2	32

## 14 Conclusion and Recommendations

#### 14.1. Environmental Impact Statement

The on-going El Niño phenomenon has caused poor rainfall which is combination with above average temperatures, has resulted in severe drought in South Africa. This combined with the increasing demand on the already scarce water resource amplify the importance of accurate hydrological information and necessitate that existing water be conserved and managed effectively.

KwaZulu-Natal in particular has been affected significantly by the recent drought. Low river levels have caused severe disruption to life cycles of aquatic organisms on due to inadequate flow. To ensure accurate monitoring of the environmental release particularly during dry seasons. In order to better manage flow rates, Umgeni Water proposed to construct a Gauging weir for the EJ Smith Dam.

The EJ Smith dam is located within the Ugu District Municipality which lies south of Durban, in KwaZulu-Natal. The dam supplies communities in Shayamoya, Ifafa mission Umzinto Heights, Hazelwood and Nkonka areas and surrounds.

Afzelia Environmental Consultants was appointed by Umgeni Water to undertake the Basic Assessment process for the proposed EJ Smith Dam Gauging Weir and abstraction works in accordance with the National Environmental Management Act (Act No. 107 of 1998) and the 2014 Environmental Impact Assessment Regulations, as amended (07 April 2017).

Based on the location and nature of the proposed development, the following environmental specialist studies were conducted:

- Aquatic Assessment; and
- Wetland Delineation and Risk Assessment.

According to the Aquatic Assessment, the results of the Present Ecological State (PES) assessment derived largely modified (class D) conditions in the river reach that was considered in the assessment. The modified conditions were largely attributed to cumulative habitat and water quality level impacts which has resulted in the modification of instream habitat, invertebrate and fish communities.

The risk assessment derived predominantly low risks for the proposed project. However, due to the permanent presence of the weir, the risk rating for the operation and maintenance of activity of the V-Notch structure were determined to be moderate. It is however anticipated that the overall impact of the proposed project will be low when considering the recommended mitigation measures are the nature of the proposed project.

The baseline environment indicated largely tolerant aquatic biology. In addition, the proposed project will be located approximately 20m downstream of the existing EJ Smith Dam wall. Considering the location of the proposed project, the cumulative impact on fish migration and loss of aquatic habitat is considered negligible.

Considering the status of the aquatic ecosystems, and furthermore the nature and requirements of the project, the proposed project has the potential to negatively affect local ecology. However, should the proposed mitigation actions be implemented, the impacts may be reduced. In light of the above mentioned, it is the opinion of the specialist that no significant fatal flaws could be identified through the completion of this aquatic ecology study.

The wetland assessment identified only one wetland unit within a 500m radius of the EJ Smith Dam gauging weir site. The location of the wetland above the EJ Smith Dam wall indicates that it will not derive any impacts from the proposed gauging weir construction and operation. This alleviates the requirement for an impact or risk assessment.

# 14.2. Recommendations

Based on the information that is contained in this report and also taking into account the outcome of the impact assessment, the opinions and recommendations included in the specialist studies as well as all supporting documentation, it is the recommendations of the practitioner that and Environmental Authorisation be granted by the Department of Environmental Affairs for the proposed EJ Smith Dam gauging weir and abstraction works.

The following key recommendations, which may also influence the conditions of the EA (where relevant), accompany the BA for he proposed BAR for the EJ Smith Dam gauging weir and abstraction works:

- 1) The Layout Option for the Proposed EJ Smith Dam gauging weir is accepted;
- 2) Appointment of an ECO to monitor compliance with the EA and the approved EMPr;
- 3) As discussed in the EMPr, various forms of monitoring are required to ensure that the receiving environment is suitably safeguarded against the identified potential impacts, and to ensure that the environmental management requirements are adequately implemented and adhered to during the execution of the project. The types of monitoring to be undertaken include:
  - Baseline Monitoring needs to be undertaken to determine to the pre-construction state of the receiving environment, and serves as a reference to measure the residual impacts of the project by evaluating the deviation from the baseline conditions and the associated significance of the adverse effects;
  - b) Environmental Monitoring entails checking, at pre-determined frequencies, whether thresholds and baseline values for certain environmental parameters are being exceeded; and
  - c) Compliance Monitoring and Auditing for the independent ECO to monitor and audit compliance against the EMPr and EA, if granted.
- 4) All mitigation measures provided in the Specialist Studies in Appendix C of the BAR are to be adhered to, specifically the following:
  - Restrict construction activities to footprint area;
  - The recommended buffer zones should be strictly adhered to during the construction phase of the project, with exception of the activities and structures required to traverse a watercourse;
  - In order to facilitate the movement of fish species, a fish ladder is recommended as the mitigation action;
  - Quarterly vegetation rehabilitation surveys need to be conducted of the vegetation within the project footprint;
  - An alien invasive plant management plan needs to be compiled and implemented prior to construction to control and prevent the spread of invasive aliens;
  - Riparian habitat provides migratory corridors and in order to protect the habitat, a buffer around riparian habitats is recommended;
  - All areas to be affected by the proposed project will be rehabilitated after construction and all waste generated by the construction activities will be stored in a temporary demarcated storage area, prior to disposal thereof at a licensed registered landfill site.
