1. INTRODUCTION

The Applicant

The applicant is Vaporox (Pty) Ltd. They are planning to lease the proposed site from the landowner, the North West Development Corporation (Pty) Ltd, and use it for the development of a Waste Tyre Pyrolysis Plant.

Background description

It is estimated that there are approximately 60 million legacy waste tyres in South Africa. These tyres take up space at landfill sites or are burnt, releasing noxious gases such as carbon monoxide and dioxins.

Recycling of waste tyres is one way to eliminate the above mentioned problem. This can be achieved through waste tyre pyrolysis. Pyrolysis is defined as thermal decomposition in an oxygen-free environment. The pyrolysis process is an effective way to eliminate the present build-up of waste tyres in South Africa.

Project description

The proposed project entails the installation/construction of a Pyrolysis Plant at an existing facility (existing buildings and associated infrastructures) for the pyrolysis of waste tyres. The project will also include the storage of dangerous goods (approximately 500m³ of oil, ±5 tons of chemicals, such as catalysts, and 46 cubic tons of Liquefied Petroleum Gas) and the release of emissions from the pyrolysis plant. Due to the emissions that will be generated, the plant requires an Atmospheric Emission License.

Waste tyres will be delivered by truck, weighed and stockpiled outside. The tyres will then be cleaned and conveyed into the shredder to produce chips. Thereafter, the shredded tyres will be fed into the pyrolysis reactor vessel, which is devoid of oxygen. Combustion of the pyrolysis gases outside the cylinder will heat the tyre pieces and result in the decomposition of the rubber polymers into smaller molecules. Products from the proposed waste tyre pyrolysis process includes steel, oil and char. The steel will be separated from the carbon black by using a magnet. The char will be further processed to Carbon black.

Produced oil will be stored in tanks and processed Carbon black will be stored in silos and bags. A backup generator will be installed for emergency situations or power failures and approximately 20m³ of water will be stored at the facility, possibly in JoJo tanks, for the cooler. The proposed waste tyre pyrolysis plant will be self-sustainable as the pyro-gas generated from the pyrolysis process will be used to run the reactor vessel. An external fuel source (LPG) will only be used to start up the reactor vessel and as soon as the process generates its own gases, the external fuel source will be shut down.

Vaporox is also considering the installation of micro-turbines to use any excess gases produced in the pyrolysis process for the generation of electricity.

The proposed waste tyre pyrolysis plant will process approximately 95 tons of waste tyres per day and will operate 24 hours per day, seven days per week. The equipment will operate at between 400-600°C. At these operating conditions, 40 - 52% of the tyres will be converted into char, resulting in approximately 38 - 49.4 tons of char per day (EPA, 1993). The waste tyres will be sourced from trucking companies, tyre dealers and nearby mines. Tyres up to tractor size will be used in the process. Approximately seven day's stock of waste tyres (±665 tons) will be stored at the site prior to processing. Off-site storage of tyres is also a possibility.

A general pyrolysis process flow is shown in the figure below.

Figure 1: General pyrolysis process flow diagram

The following listed activities in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) are being applied for:

Number and date of the relevant notice	Activity No	Description
GN. No. R 545, Listing Notice 2 of 18 June 2010	3	The construction of facilities or infrastructure for the storage, or storage and handling of a dangerous good, where such storage occurs in containers with a combined capacity of more than 500 cubic metres. Facilities or infrastructure for the storage of dangerous goods will be constructed. This will include approximately 500m3 of oil, ±5 tons of chemicals, such as catalysts, in bags and silos and 46 cubic tons of Liquefied Petroleum Gas (LPG).
GN. No. R 545, Listing Notice 2 of 18 June 2010	5	The construction of facilities or infrastructure for any process or activity which requires a permit or license in terms of national or provincial legislation governing the generation or release of emissions, pollution or effluent and which is not identified in Notice No. 544 of 2010 or included in the list of waste management activities published in terms of section 19 of the National Environmental Management: Waste Act, 2008 (Act No. 59 of 2008) in which case that Act will apply. The proposed waste tyre pyrolysis plant will require an Atmospheric Emission License in terms of section 21 of the National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004) for the release of emissions from the plant. The Atmospheric Emission License application will be submitted to the Bojanala Platinum District Municipality – Health and Environmental Services Department.
GN. No. R 545, Listing Notice 2 of 18 June 2010	26	Commencing of an activity, which requires an atmospheric emission license in terms of section 21 of the National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004), except where such commencement requires basic assessment in terms of Notice of No. R544 of 2010. The proposed waste tyre pyrolysis plant will require an Atmospheric Emission License in terms of section 21 of the National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004) for the release of emissions from the plant. The Atmospheric Emission License application will be submitted to the Bojanala Platinum District Municipality – Health and Environmental Services Department.

Table 1: Listed activities in terms of GN. No 545, dated 2010 under NEMA, 1998

An Atmospheric Emission License Application will be submitted to the Bojanala Platinum District Municipality for the following activity in terms of the National Environmental Management: Air Quality Act, 2004 (Act No. 39 of 2004), List of Activities which result in Atmospheric Emissions which have or may have a significant detrimental effect on the Environment, including health, social conditions, economic conditions, ecological conditions or cultural heritage (Government Notice No. 893 of 22 November 2013):

No. and date of relevant notice	Activity No	Description	Application
Government Notice No. 893 of 22 November 2013 Category 3: Carbonisation and Coal Gasification	Subcategory 3.1. Combustion Installations	Combustion installations not used primarily for steam raising or electricity generation.	All combustion installations (except test or experimental installations).
Government Notice No. 893 of 22 November 2013 Category 3: Carbonisation and Coal Gasification	Subcategory 3.4. Char, Charcoal and Carbon Black Production	Production of char, charcoal and the production and use of carbon black.	All installations producing more than 20 tons of char and charcoal. All installations consuming more than 20 tons per month of carbon black in any processes.
Government Notice No. 893 of 22 November 2013 Category 4: Metallurgical Industry	Subcategory 4.21. Metal recovery	The recovery of metal from any form of scrap material by the application of heat.	All installations.
Government Notice No. 893 of 22 November 2013 Category 8: Thermal Treatment of General and Hazardous Waste	Subcategory 8.1. Thermal Treatment of General and Hazardous Waste	Facilities where general and hazardous waste are treated by the application of heat.	All installations treating 10kg per day of waste.

Table 2: Listed activities in terms of GN.	. No 893, dated 2013 under NEM: AQA, 2004
--	---

Government Notice No. 248 of 31 March 2010 previously stipulated the activities that require an Atmospheric Emission License.

5. ENVIRONMENTAL MANAGEMENT PROGRAMME

Refer to the tables below for the EMP. Responsibility is assigned to the relevant parties, keeping in mind that Vaporox (Pty) Ltd are ultimately still responsible for ensuring implementation of the EMP. The EMP must be updated should any significant changes occur to the operations at the Waste Tyre Pyrolysis Plant. The mitigation measures are set out in the tables below (per project phase), for the proposed waste tyre pyrolysis plant.

Nature and significance of environmental impact

Note: Mitigation measures, as contained in the tables below, have taken the various alternatives into consideration.

5.1 SPECIFIC TRIGGERED LISTED ACTIVITY

5.1.1 Planning, Construction, Operational, Rehabilitation and Decommissioning Phases

Table 4: EMP – Planning and Design Phase

Activity:

• Planning and design of the Waste Tyre Pyrolysis Plant

Aspect:

- Inadequate design of the Waste Tyre Pyrolysis Plant and its abatement measures
- Inadequate design of storage vessels for pyrolysis oil, chemicals and LPG
- Inadequate design of the Waste Tyre Storage Area
- Inadequate design of the ablution facilities
- Inadequate design, repair and/or replacement of the sewerage and water pipeline systems
- Inadequate design of the water storage vessels
- Inadequate design or ineffective operation of the backup diesel generator
- Inadequate planning for the construction of the Waste Tyre Pyrolysis Plant

Monitoring and Con **Impact Description Environmental Objective** Management / Mitigation Measures Reporting **Planning and Design Phase** • Air pollution (generation of atmospheric emissions) due to the • The Waste Tyre Pyrolysis plant must be designed to minimise the release of atmospheric inadequate design of the plant and its' abatement measures emissions. A pipeline chimney stack height of 18.75m is recommended. Should a pipeline · Generation of excessive noise due to the inadequate design of chimney stack height of 4m be chosen, the possibility of abatement technology being required the Waste Tyre Pyrolysis Plant must be considered when finalising the designs for the pyrolysis plant. The provisions and Vaporox (Pty) Ltd mu To ensure adequate design of the recommendations of the Atmospheric Impact Assessment Report and Atmospheric Emission implementation • Soil, stormwater or groundwater pollution due to the inadequate of Waste Tyre Pyrolysis Plant License should be taken into account when the pyrolysis plant design is finalised. mitigation measures p design of the Waste Tyre Pyrolysis Plant in this EMP. · Injury to workers due to unsafe operating conditions should the • The Waste Tyre Pyrolysis plant must be designed to minimise the excessive generation of noise. Adequate silencers should be considered for all equipment and machinery. Waste Tyre Pyrolysis Plant not be designed correctly The Waste Tyre Pyrolysis plant must be designed to prevent the release of waste and effluent · Resource wastage due to the inadequate design of the Waste Tyre Pyrolysis Plant into the environment. Product storage areas must be designed to be within existing buildings and

pliance	Timeframe	Responsibility
st verify the roposed	Before construction commences	 Vaporox (Pty) Ltd Plant designer

		 bunded areas, where applicable. The washing area for the tyres must be designed so that the wash water can be contained and re-used. Should any tyre wash water need to be disposed of into the municipal sewage disposal system, the design of the wash water system must ensure that the wash water is of such a quality that it will be permitted within the municipal system. The Waste Tyre Pyrolysis plant must be designed with safety precautions, such as safety valves and Carbon monoxide (CO) sensor and alarm systems. The design of the Waste Tyre Pyrolysis must take the Environmental Regulations for Workplaces, 1987, into consideration. The Waste Tyre Pyrolysis plant must be designed to re-use its by-products as far as possible. For average the unsplice must be designed to re-use its by-products as far as possible. For 			
		wash water can be re-used to clean the tyres. The pyrolysis plant can also be designed to re-use the pyro-gases that it will generate to fuel the reactor vessel.			
 Air pollution (release of fugitive emissions) due to the inadequate design of the pyrolysis oil, chemical and LPG storage vessels Soil, stormwater or groundwater pollution due to the inadequate design of the pyrolysis oil, chemical and LPG storage vessels 	To ensure adequate design of the storage vessels for pyrolysis oil, LPG and chemicals	 The oil storage tanks must be designed in accordance with SANS 10089-1:2008 (The Petroleum Industry Part 1: Storage and distribution of petroleum products in above-ground bulk installations). The LPG storage tank must be designed in accordance with SANS 10087-3:2008 (The handling, storage, distribution and maintenance of liquefied petroleum gas in domestic, commercial and industrial installations). 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
 Air pollution (generation of dust) due to the inadequate design of the Waste Tyre Storage Area Soil erosion due to the inadequate design of the Waste Tyre Storage Area 	To ensure adequate design of the Waste Tyre Storage Area	 The design of the Waste Tyre Storage Area must be in accordance with the Waste Tyre Regulations, 2009. Adequate stormwater management measures must be designed for the Waste Tyre Storage Area. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
Soil, stormwater or groundwater pollution due to the inadequate design of the ablution facilities	To ensure adequate design of the ablution facilities	 The planning phase must determine whether the existing ablution facilities will be sufficient for the maximum number of workers that will be present at the plant on any given day. If existing facilities are not sufficient, additional facilities must be constructed. The current ablution facilities must be repaired and upgraded to acceptable standards. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
 Soil, stormwater or groundwater pollution due to the inadequate design, repair and/or replacement of the sewerage pipeline system Wastage of a valuable natural resource (water) due to the inadequate design, repair and/or replacement of the water pipeline system 	To ensure adequate design, repair and/or replacement of the sewerage and water pipeline systems	 All broken or damaged sewerage and water pipelines must be replaced by suitable, new pipelines, should effective repair not be possible. The new pipelines must be designed with durability in mind. Meters must be installed to monitor the volume of water used at the pyrolysis plant. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
• Wastage of a valuable natural resource (water) due to the inadequate design of the water storage vessels	To ensure adequate design of the water storage vessels	 Suitable water storage vessels must be chosen for the storage of cooling water on site. An examples of such a vessel is a JoJo tank. An inspection schedule must be compiled so that the water storage vessels are regularly checked for leakages. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
• Wastage of a valuable natural resource (diesel) due to the inadequate design or ineffective operation of the backup generator	To ensure adequate design and effective operation of the backup diesel generator	 The generator storage area must be designed to have a concrete floor, bund wall and sump system with sufficient capacity for the volume of diesel that the generator can take. A maintenance schedule must be compiled for the generator and it must be operated as prescribed by the manufacturer. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	Vaporox (Pty) LtdPlant designer
 Delays due to poor planning. Legal non-compliances to the Environmental Authorisation and EMP. Harm to the environment. 	To ensure pro-active planning for the construction phase of the Waste Tyre Pyrolysis Plant	 Obtain an Atmospheric Emission License and Waste Management License before commencing with the construction phase of the proposed project. Obtain approval of the Waste Management Plan from the local municipality. Obtain permission from the local municipality for the discharge of washwater into the municipal sewage disposal system, if required. The approved EMP and Environmental Authorisation must be binding on the construction contractor and included in the tender documentation and contracts. 	Vaporox (Pty) Ltd must verify implementation of the mitigation measures proposed in this EMP.	Before construction commences	• Vaporox (Pty) Ltd

	Adequate planning and scheduling of the construction activities to allow for disruptions caused by
	rain and wet conditions. The scheduling must make provision for environmental
	training/awareness raising for workers prior to the commencement of construction. Records of all
	training must be maintained.
	Adjacent land owners must be timeously informed that the construction phase will commence and
	must be kept informed of the progress throughout.
	Appoint an independent Environmental Control Officer (ECO) prior to the commencement of the
	construction phase.
	• Ensure that a complaints register is kept at the construction site from the first day of construction.
	• Ensure that the Environmental Authorisation and EMP are kept at the construction site from the
	first day of construction.
	Source unskilled labour locally, wherever possible.
	A construction site plan must be compiled and approved by Vaporox and the ECO. The site plan
	must include the location of the construction camp, toilets, stores and site office.

Table 5: EMP - Construction, Operational, Rehabilitation and Decommissioning Phases – General Environment

Activity:

- Construction activities, repair activities and the installation and assembly of the Waste Tyre Pyrolysis Plant.
- Operation of the Waste Tyre Pyrolysis Plant.

Aspect:

• Lack of knowledge amongst workers and contractors in terms of how their actions may impact on the environment.

Nature and significance of environmental impact

Table 6: EMP - Construction, Operational, Rehabilitation and Decommissioning Phases: Atmosphere and Noise

Activity:

- Construction activities, repair activities and the installation and assembly of the Waste Tyre Pyrolysis Plant.
- Operation of the Waste Tyre Pyrolysis Plant.

Aspect:

Construction Phase

- Vehicles not adhering to speed limits on the site.
- Ineffective dust suppression.
- Vehicle emissions released from additional construction vehicles and equipment used during the construction phase and clearance of vegetation.
- Noise generated by additional construction vehicles and equipment during the construction activities.

Operational Phase

- Atmospheric emissions from the Waste Tyre Pyrolysis Plant.
- Atmospheric emissions due to an inefficient emission abatement system.
- Atmospheric emissions from the diesel generator on site.
- Release of atmospheric emissions from potential burning of stockpiled tyres due to unsafe storage practices that result in the establishment of fires.
- Potential establishment of fires due to the inadequate storage of diesel and oil.
- Inadequate or ineffective storage of Carbon black and other products from the pyrolysis process.
- Inadequate storage of ash.
- Increased traffic flow to the site.
- Noise generated by the pyrolysis process and vehicles travelling to and from the facility.

Degradation of ambient air quality due to dust generation. The road onsite is tarred, but is not in a good condition and is broken in places. There are open areas adjacent to the road where vehicles may travel, especially towards the area where the waste tyres will be stockpiled once the facility is operational.	To minimise the impact of vehicles travelling to and from the site as well as loading and offloading activities on the ambient air quality.	 A dustcart needs to be onsite to water down dusty roads. Speed bumps or traffic speed signs need to be erected to reduce speeding onsite that could result in the generation of dust. Regular maintenance of vehicles to address wear of tires and breaks. Optimal engine combustion will allow for 'cleaner' exhaust emissions. A complaints register must be kept onsite. The register must record the following: Date when complaint was received, name of person who reported the complaint, details of the complaint and when and how concern was addressed. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO
Atmospheric pollution due to the release of emissions from vehicles as a by-product of the fuel combustion process.	To limit the generation of atmospheric emissions from construction vehicles.	 Regular maintenance of vehicles to address wear of tires and breaks. Optimal engine combustion will allow for 'cleaner' exhaust emissions. Use cleaner, low Sulphur fuel, as far as possible. Unnecessary idling of engines must be avoided. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO
According to Jorgensen & Johnson (1981), the noise levels generated by general construction activities on a building site can reach levels of approximately 70 dB, caused by for instance heavy machinery. It can therefore be assumed that the proposed development will have a negative impact on the environmental noise of the area once construction starts. Sound is inversely proportional to the distance from the source and can get absorbed by buildings and vegetation barriers. Noise intensities (dB) will be at their highest on site and will decrease as one moves away from their sources. The noise decline curve gives an indication of how noise generated at the site will decrease with distance. It shows the distance that the sound would have travelled upon reaching a level of 60 dB, prescribed by the SABS as being the acceptable limit for environmental noise. According to the noise decline curve, at a distance of 27 metres from the construction site, the generated noise would have decreased to a level of 60 dB and at a distance of 45 metres it would have decreased to approximately 55dB. It can therefore be said that noise travelling further than 45 metres will have a low impact on neighbouring receptors. The site is situated within an existing industrial area and is surrounded by other industries that generate varying levels of noise. The site is also zoned for Industrial purposes. There are no known sensitive receptors, such as residential dwellings, within the immediate vicinity of the site. The construction activities will mostly entail repairs to existing infrastructure as well as the installation/construction of the Waste Tyre Pyrolysis plant and its associated structures.	To minimise noise generation during the construction phase.	 Schedule activities that will generate the most noise during times of the day that will result in least disturbance to adjacent industries. Site workers and contractors will adhere to the requirements of the Occupational Health and Safety Act, 1993 (Act No. 85 of 1993) regarding hearing protection and noise control measures. Regular maintenance of vehicles and equipment. All equipment and machinery should be fitted with adequate silencers. Working hours should be restricted to daylight hours. No sound amplification equipment, such as sirens, loud hailers or hooters are to be used on site except in emergencies and no amplified music is permitted on site. If work is to be undertaken outside of normal work hours permission must be obtained from the ECO and the facility manager. No noisy work is to be conducted over the weekends or on public holidays. The relevant stipulations of the Noise Control Regulations, 1992 (Government Notice No. 154 of 10 January 1992) must be adhered to. A complaints register must be kept onsite. The register must record the following: Date when complaint was received, name of person who reported the complaint, details of the complaint and when and how concern was addressed. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO
Operational Phase					

Air pollution due to the release of emissions from the Waste Tyre An Atmospheric Emission License must be obtained for the proposed facility for activities triggered Pyrolysis Plant. in terms of Government Notice No. 893 of 22 November 2013 (in terms of the National Environmental Management: Air Quality Act, 2004). In general, one can expect pyrolysis plants to have minimal air • The license conditions of the Atmospheric Emission License (if granted) must be adhered to. pollution impacts because most of the pyro-gas generated by the Monitoring reports must be submitted to the licensing authority as stipulated in the Atmospheric pyrolysis process will be burnt to provide energy for the process Emission License. itself. This burning process will release combustion gases (CO, • All vented air must be directed upwards for efficient dispersion. SO₂, NO₂ and PM10) (EPA, 1991), which are criteria pollutants • The oil storage tank(s) must be operated according to SANS 10089-1:2008. [National Ambient Air Quality Standards (NAAQS)]. The combustion of these gases are much cleaner than combustion of **Fugitive emissions** raw feedstocks. For example, the combustion of pyro-gas is more • It is recommended that a Leak Detection and Repair program be developed and implemented. similar to the combustion of natural gas than it is to the combustion • Fugitive VOC emissions can be significantly reduced by using components (such as pumps, of fossil fuels, like coal (University of California Riverside, 2006). valves and compressors) specifically designed to minimise fugitive emissions (EPA, 1991). Excess pyro-gas can be used to generate electricity, for example, · Fugitive VOC emissions can also be reduced by training operators and mechanics in ways to using the micro-turbines that are being considered. Excess pyroreduce fugitive emissions, by maintaining good supervision, and through good maintenance gas can also be flared. practices. Periodic sampling of VOCs (including Chlorobenzenes, HCB, PCBs, Benzene, Toluene, Xylenes, 'Pure' Pyro-gas consists of a number of very harmful chemicals and PAHs and NH₃) should take place to determine if the Leak Detection and Repair Program is should not be vented to the atmosphere without treatment. When sufficient in managing fugitive VOC emissions. pyro-gas is burnt to provide energy for the process or when it is Should VOCs persist, it is recommended that emission control technology be investigated and an Regular site inspection flared, the pyro-gas is decomposed into water, Carbon dioxide independently monitored Performance Verification Test conducted to determine the Destruction (CO₂), Carbon monoxide (CO), Sulphur dioxide (SO₂) and Nitrogen Internal audits again Efficiency (DE) and Destruction and Removal Efficiency (DRE) of principal organic hazardous oxides (NO_x). Although these emissions are less harmful than To minimise the release of EMP must be cor compounds (POHC) using a suitable verification compound (e.g. trichloroethane). Persistent Organic Pollutants (POPs), they are not without effect. atmospheric emissions from the every 6 months and A plan for conducting a Performance Verification Test must be submitted to the licensing authority They are just as likely to have a detrimental effect on the Waste Tyre Pyrolysis Plant. kept onsite. Motivation for why the plant should be used for treatment of High Level POPs; A feasibility study showing that the plant is technically gualified; Studies have shown that exposure to dioxins at high enough levels Planned date for commencement of the test and expected duration; . may cause a number of adverse health effects, including cancer. Details on the waste to be co-processed during the test, including source, volume, composition Periodic sampling of these emissions are therefore important to etc.: determine if they are generated by the specific pyrolysis process Motivation for the particular choice of waste and its suitability in providing an accurate and and if so how they can be controlled. representative indication of the plant's DE and DRE, and therefore suitability to treat High Level POPs Containing Waste; The absence of oxygen (or low levels of oxygen) within the pyrolysis Extension of monitoring regime to include Chlorobenzenes, HCB, PCBs, Benzene, Toluene, reactor vessel helps to inhibit the formation of dioxins and furans. Xylenes, PAHs and NH₃; and Tyres also have low levels of Chlorine and are therefore not Monitoring and analysis to be conducted, the associated methodologies and independent . expected to result in significant dioxin emissions (University of parties responsible for monitoring. California Riverside, 2006). A detailed, independent report documenting and interpreting the results of the Performance Verification Test must be compiled. As a minimum, a DE/DRE of 99.9999% would be required, Fugitive Volatile Organic Compound (VOC) emissions occur due to as well as compliance with Air Emission Standards. worn or loose packing around pump shafts and valve stems, from • Fugitive particulate emissions occur during the handling and processing of char. The PM10 loose pipe connections (flanges), compressors, storage tanks, and emissions and should be controlled with dust collectors and a bag house. open drains. Fugitive emissions of VOCs may be released from the Periodic emission sampling of PM10 (and later PM2.5 if found to be important in initial samplings) oil storage tanks (California Integrated Waste Management Board, and their chemical analysis is recommended, to determine/verify its presence and respective 1995). sources in order to manage and/or control them if necessary.

 Fugitive particulate emissions escape during the handling and processing of char. Char contains carbon black, sulphur, zinc oxide, clay fillers, calcium and magnesium carbonates and silicates, all of which produce PM10 emissions. The inhaling of particulate matter may cause asthma, lung cancer, cardiovascular issues and respiratory diseases. It is therefore important to determine the presence of these particulates and their respective sources in order to manage and/or control them, if necessary. The Atmospheric Impact Assessment Report found that Scenario C (4m pipeline chimney height) resulted in more exceedances of the National Ambient Air Quality Standards than Scenario I. Scenario C may also prove to be acceptable in practice, but is more likely to require abatement technology. 		 Point source emissions It is recommended that Scenario I be implemented. Scenario C may also prove to be acceptable in practice, but it is more likely to require abatement technology. A feasibility study is recommended to determine the most viable monitoring method (periodic or continuous) and equipment that will comply with the requirements for compliance monitoring as specified in part 2 of GG 37054, GN 893. This feasibility study should take into consideration the special arrangements for activities listed as Sub category 3.1: Combustion installations and Sub category 4.21: Thermal Treatment of General and Hazardous Waste in part 3 of GG 37054, GN 893. The results of this study should be submitted to the Licensing authority for approval. Should monitoring show emissions persist above minimum emission standards specified for the facility, in part 3 of GN 893, it is recommended that emission control technology be investigated. The special arrangement for the listed activity: Thermal Treatment of General and Hazardous Waste, requires periodic measurements of heavy metals and dioxin and furan emissions to be undertaken. The generation of dioxin and furan emissions from the pyrolysis of waste tyres is, however, not expected. It is therefore recommended that, as a best practice measure, it be 			
The same impacts apply to Scenario I as given for Scenario C above. The Atmospheric Impact Assessment Report found that Scenario I (18.75m pipeline chimney height) resulted in less exceedances of the National Ambient Air Quality Standards than Scenario C. Scenario I is less likely to require abatement technology than Scenario C.	To minimise the release of atmospheric emissions from the Waste Tyre Pyrolysis Plant.	 determined if heavy metals and/or dioxin and furans are present in the combustion gases before any monitoring schedule is proposed. Management An impending Atmospheric Impact Assessment, within a year from the date of signature of the provisional Atmospheric Emission License, should be done using results from periodic emission measurement campaigns, combined with information from emission inventories as derived from point source monitoring. Hourly Sequential Ambient Air Quality data should be requested from the South African Ambient Air Quality Information system, to be used in impending Atmospheric Impact Assessments. Develop a Pollution Prevention Plan following the impending Atmospheric Impact Assessment. At this stage the National Pollution Prevention Plan regulations are still in draft and members of the public have been given the opportunity to comment on them. Unless it is changed in the final version, the National Pollution Prevention Plans Regulations will come into effect on the 31 March 2015. Pollution prevention plans will be revised every 5 years, but a progress report on its implementation of the plan will have to be submitted every year. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Air pollution due to the release of atmospheric emissions from the backup diesel generator. The combustion of diesel within the generator will result in the release of Sulphur dioxide (SO ₂), Carbon monoxide (CO), Particulate Matter (PM), Oxides of Nitrogen (NO _x) and Hydrocarbon emissions.	To minimise the release of atmospheric emissions from the diesel generator.	 Use cleaner, low Sulphur diesel as far as possible. Ensure that the generator is correctly maintained as stipulated by the manufacturer and repaired when required. Optimal combustion will allow for 'cleaner' emissions. Limit unnecessary idling of the generator. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Air pollution due to the release of emissions from tyre fires established on site. The burning of tyres generates black smoke and noxious gases such as carbon monoxide (CO), dioxins, volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), benzene, styrene, phenols, butadiene (www.epa.gov), furans, nitrous oxides, sulphur oxides, polychlorinated biphenyles (PCBs)	To prevent the establishment of fires at the site and in particular the establishment of a fire at the waste tyre storage area. This will subsequently prevent the release of emissions into the atmosphere from the burning tyres.	 The site must have clearly visible signs posted near the entrance of the facility. The signs must show the operating hours, contact details and site regulations. A security attendant trained in fire prevention must be on site at all times. The site manager must be on site at all times (when the facility is open/operational). Adequate access for firefighting vehicles must be available to the waste tyre piles. Maintain adequate stockpiles of cover material to smother fires. The waste tyres must not be stored on steeply graded surfaces or anywhere else where they may pose a significant environmental or fire risk. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager

Construction Phone					
Construction Phase					
Soil, stormwater and groundwater pollution due to spillages and/or improper handling-, storage-, mixing- or disposal- of cement and concrete.	To prevent the pollution of soil, stormwater and groundwater as a result of spillage, improper handling, storage, mixing or disposal of cement and concrete.	 Cement may only be mixed on an impermeable surface (not on bare soil). Dry cement must be removed from the soil surface to prevent an impermeable layer forming on top of the soil. The cement must be disposed of together with any building rubble. Ready-mix trucks are not permitted to clean chutes on site. Cleaning into foundations or a dedicated cleaning pit is permitted. Bricklayers and plasterers are to minimise any cement spill or runoff in their work area and are to ensure that the work area is cleaned of all cement spillage at the end of each workday. Both used and unused cement bags are to be stored in weatherproof containers so as not to be affected by rain or runoff. Contaminated soil resulting from concrete or cement spills, including residue produced by the washing of cavities, are to be removed immediately after the spillage has occurred and placed on the appropriate rubble stockpile. Runoff from the washing out of wall cavities is to be contained against the building by excavations or berms around the foundations. All reasonable measures must be taken to prevent the dirty water from contaminating the environment. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO
Soil, stormwater and groundwater pollution due to poor management and accidental spills of hazardous chemical substances including fuel, greases and oils used onsite.	To prevent and minimise soil and water pollution as a result of poor management and accidental spills of hazardous chemical substances including fuel, greases and oils used onsite.	 Identify all hazardous chemical substances used onsite including fuel, greases and oils. Obtain the material safety data sheet of each of hazardous chemical substance. Material Safety Data Sheets for all hazardous chemical substances must be readily available on site. Ensure that the material safety data sheets have sufficient information to enable the user to take the necessary measures to protect his/her health and safety and that of the environment. Train staff on the use of chemicals in accordance with the risks as described in the material data sheets. Keep a stock inventory register of all chemicals in the store. Powders must be stored above liquids. Proper storage of chemicals in a lockable, well ventilated building. Ensure adequate access control for the storage area. Storage areas for hazardous chemicals are to comply with standard fire safety regulations. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO

		• Safety signage including "No Smoking", "No Naked Lights" and "Danger", and product	
		identification signs, are to be clearly displayed in areas housing chemicals.	
		• Appropriate equipment to deal with emergency spill incidents is to be readily available on site.	
		This includes fire extinguishers, spill kits for hydrocarbon spills, drip trays for equipment and/or	
		machinery leaks, drums or containers for contaminated water.	
		Chemicals are to be properly labelled and handled in a safety conscious manner.	
		• All personnel handling hazardous chemicals and hazardous materials are to be issued with the	
		appropriate Personal Protective Equipment (PPE).	
		• Ensure that diesel, fuel and/or oil tanks are in a bunded area with capacity of holding 110% of the	
		total storage volume.	
		• The removal of only the daily-required amount of chemicals to be used from the shed.	
		• If refuelling on site or from drums, the ground must be protected and proper dispensing equipment	
		is to be used i.e. hand pumps and funnels. Drums may not be tipped to dispense fuel.	
		• Use of drip trays during filling of machinery or equipment. Drip trays should be emptied into	
		secondary containers on a regular basis.	
		• Ensure that any spilled chemicals cannot exit the designated storage area by constructing a berm	
		or bump at the exit, or store chemicals in a spill tray.	
		Immediately clean all spillage of fuels, lubricants and other petroleum based products.	
		• The contaminated material must be disposed of in accordance with the waste management	
		procedure.	
		No hazardous chemicals must be discarded in the sewage or stormwater system.	
		Soil contaminated with bazardous chemical substances shall be treated as bazardous waste and	
		removed from site.	
		Building and demolition waste must be disposed of at a licensed landfill site. Steel should be	
		taken to a licensed recycling facility	
		• The management of waste must be in accordance with the stipulations of the municipal Solid	
		Waste By-law (2013)	
		 Installation of sufficient waste bins, skins or bulk containers. Containers must be present on site. 	
		at all times	
		• All containers (hins, skins, or bulk containers) shall be kept in a clean and bygionic manner	
		• All containers (bins, skips of bulk containers) shall be kept in a clean and hygienic mainter.	ECO to verify impleme

	To prevent the pollution of soil,	 Ablating anywhere other than in the toilets shall not be allowed. Temporary ablution facilities are to be secured to prevent them from blowing or falling over. The contractor shall ensure that any chemicals and/or waste from the ablution facilities is not spilled on the ground at any time. Ablution facilities are to be serviced weekly or more frequently if required. The contractor is to ensure that no spillage occurs and that the contents are removed from site on a regular basis. Toilet paper must be provided at all times. No washing of vehicles is permitted on site. 	ECO to verify implementation	
Soil and water pollution as a result of contaminated wash water entering the environment.	through contaminated wash water. An example of this would be water that is contaminated with cement or concrete.	 A dedicated temporary cleaning area is to be identified to facilitate washing of all cement equipment. The cleaning area could be a plastic lined cleaning pit or dedicated plastic or metal drums, located as close as possible to a water point. No wastewater/wash water may be disposed of on site, onto the soil or into any water body. Runoff from washing activities is to be contained by berms or trenches. 	proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase. • Construction contractor • ECO
Hydrocarbon pollution of soil, stormwater and groundwater due to the fuel-, grease- or oil spillages or leaking equipment and vehicles.	To prevent hydrocarbon pollution of soil, stormwater and groundwater through the spilling of fuel, grease or oil or leaking equipment and vehicles.	 Equipment and vehicles are to be repaired immediately upon developing leaks. Drip trays shall be supplied for all repair work undertaken on machinery on site. Drip trays are to be utilised during greasing and re-fuelling of machinery and to contain incidental spills and pollutants. Drip trays are to be inspected daily for leaks and effectiveness and emptied when necessary. This is to be closely monitored during rain events to prevent overflow. Appropriate equipment to deal with emergency spill incidents is to be readily available on site. This includes fire extinguishers, spill kits for hydrocarbon spills, drip trays for equipment and/or machinery leaks and drums or containers for contaminated water. Soil contaminated with hazardous substances, fuel or oil shall be treated as hazardous waste and removed from site. If refuelling on site or from drums, the ground must be protected and proper dispensing equipment is to be used i.e. hand pumps and funnels. Drums may not be tipped to dispense fuel. All liquid fuels (petrol and diesel) are to be stored in tanks or containers with lids. Inspect vehicles on entering the construction site to ensure that they are in sound condition to reduce the risk of oil or diesel spillages. 	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase. • Construction contractor • ECO
Operational Phase				
Soil, stormwater and groundwater pollution due to poor management and accidental spills of hazardous chemical substances including fuel, greases and oils used during operational activities.	To prevent and minimise soil, stormwater and groundwater pollution as a result of poor management and accidental spills of hazardous chemical substances including fuel, greases and oils used onsite.	Apply the same mitigation measures as for the construction phase.	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation Facility Manager
Soil, stormwater and groundwater pollution due to poor waste management during operational activities. Nuisance caused by odours and unsightly appearance of waste onsite. Domestic waste will be removed from site by the municipal waste removal service.	To prevent and minimise soil, stormwater and groundwater pollution and nuisance due to poor waste management.	 The Waste Tyre Pyrolysis Plant must obtain a Waste Management License for activities that will be triggered at the proposed facility in terms of Government Notice No. 921 of 29 November 2013 (in terms of the National Environmental Management: Waste Act, 2008). The management of waste must be in accordance with the stipulations of the municipal Solid Waste By-law (2013). The Waste Tyre Pyrolysis Plant must be registered on the South African Waste Information System. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation Facility Manager

		• All waste storage containers must comply with the conditions as stipulated in GNR. 926 of 29			
		November 2013.			
		• Training must be provided continuously to employees working with waste. The training			
		programme must include the provisions stipulated in GNR. 926 of 29 November 2013.			
		• An Emergency Preparedness Plan must be compiled in accordance with GNR 926 of 29			
		November 2013.			
		• Monitoring, auditing, reporting and record keeping must be conducted in accordance with GNR.			
		926 of 29 November 2013.			
		• Domestic waste must be removed from site on a weekly basis by the municipal waste removal			
		service. If waste is not removed by the municipality, the facility manager must ensure that the			
		domestic waste is removed to a licensed waste disposal site on a weekly basis.			
		• Should any of the char need to be disposed of, it must be taken to a suitable, licensed landfill site.			
		The char must be transported in sealed plastic bags.			
		• Any of the products from the pyrolysis process (char, Carbon Black, fibres, pyrolysis oil and/or			
		steel) that cannot be sold or re-used or processed further must be considered waste and disposed			
		accordingly at a licensed landfill site (California Integrated Waste Management Board, 1995).			
		• The Waste Classification and Management Regulations, 2013, and the National Norms and			
		Standards for Disposal of Waste to Landfill, 2013, must be used to determine to which type of			
		landfill a particular waste stream must be sent for disposal.			
		No littering is permitted and site clean-ups must regularly be undertaken.			
			Regular site inspections.		
		• Sufficient ablution facilities shall be provided – minimum of 1 toilet per 15 workers.	Internal audits against this

		Leaking tanks, taps, toilets and pipes are to be repaired immediately.			
		Running water taps and pipes may not be left unattended.			
		• All pipe, hose and tap connections are to be fitted with correct and appropriate plumbing fittings.			
Operational Phase					
Wastage or depletion of water from the municipal water supply due to leaking or broken water pipelines and water storage vessels.	To prevent the wastage or depletion of a valuable resource.	 Ensure that all employees have been informed of the importance of natural resources (proper environmental training and awareness). Regular site inspection by supervisors. Regular maintenance and inspection of the municipal water supply pipeline(s) to the site. Monitoring of resource consumption to detect leakages as soon as possible. Integrity tests must be conducted on water storage vessels as stipulated by the suppliers. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Inefficient or ineffective operation of the backup generator. This may lead to higher diesel usage should the generator not operate efficiently and can also result in more breakages than normal.	To ensure the efficient, long-term operation of the backup generator.	 Ensure that the generator is correctly maintained as stipulated by the manufacturer and repaired when required. Optimal combustion will allow for 'cleaner' emissions. Limit unnecessary idling of the generator. Only use the generator when required and use it as prescribed by the manufacturer. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Wastage or depletion of valuable resources, such as LPG and water, due to inefficient or ineffective operation of the Waste Tyre Pyrolysis plant.	To ensure efficient operation of the Waste Tyre Pyrolysis plant so that resources are used optimally.	 The pyro-gas from the pyrolysis process must burn to provide energy for the pyrolysis process. Process Char into Carbon Black. Water used for the washing of the incoming tyres should be used in a closed system, if possible. This will allow the re-use of water. Cleaning the tyres using compressed air instead of water should be considered. The metal that is separated from the waste tyres must be recycled. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Decommissioning Phase					
Closure and decommissioning of the pyrolysis plant is not anticipated for the foreseeable future. Should the facility close, a detailed closure and rehabilitation plan will be submitted to the North West Department of Rural, Environmental and Agricultural	N/A

		 An emergency procedure, taking into consideration all potential emergencies, such as a fire outbreak, hazardous chemical spill, etc. should be compiled. All employees, including sub-contractors and their employees, must be trained on the emergency procedure. Follow-up emergency training may be required from time to time as new subcontractors or crews commence work. The facility manager is to maintain accurate records of any emergency training undertaken. Suitable sensors must be installed for gas, temperature and pressure within the Waste Tyre Pyrolysis Plant. The sensors will ensure that products are only removed from vessels when it is safe to do so. A safety valve must be installed to release any excess pressure build-up within the reactor vessel. A Carbon monoxide (CO) sensor and alarm system must be installed within the main working 	must immediately be addressed.		
		area so that workers can be alerted should the CO concentrations exceed safe limits.			
		• The requirements of the Environmental Regulations for Workplaces, 1987, must be adhered to.			
The incorrect storage of LPG may lead to explosions, fires and harm to employees. The gas is stored as liquid under pressure. Leakages, especially of the liquid, will release large volumes of highly flammable gas. Ignition will result in a rate of combustion of near-explosive force. LPG is non-toxic, but it can induce headaches and dizziness and may cause cancer and genetic defects by inhalation if 1,3-butadiene is a component. According to the SDS, LPG is inherently biodegradable and accumulation in terrestrial organisms is unlikely. It is not expected to be harmful to aquatic organisms. Liquid release is only expected to cause localised, non-persistent environmental damage, such as freezing. Biodegradation of LPG may occur in soil and water. Volatilisation is expected to be the most important removal process in soil and water. LPG is expected to exist entirely in the vapour phase in ambient air.	To ensure that the LPG is stored in a safe and responsible manner.	 A copy of the Safety Data Sheet (SDS) for LPG must be kept on site and the provisions in the SDS followed. No smoking may take place in the vicinity of the LPG storage tank and signage indicating "No Smoking" must be displayed. Open flames, hot surfaces, heat and sparks must be kept away from the LPG storage tank and signage indicating the before mentioned must be displayed. Employees must avoid breathing in the gas. Employees must wear protective clothing such as goggles, gloves and face shields, to prevent eye, skin and face contact. Protect the LPG storage tank from sunlight and place it in a secure or locked up location that is well ventilated. Adequate firefighting equipment must be kept at the LPG storage tank. Use a suitable extinguishing media. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
The incorrect storage of the pyrolysis oil may lead to fires and harm to employees.	To ensure that the pyrolysis oil is stored in a safe and responsible manner.	 Adequate firefighting equipment must be kept at the pyrolysis oil storage tank(s). Use a suitable extinguishing media. No smoking may take place in the vicinity of the storage tank(s) and signage indicating "No Smoking" must be displayed. Open flames, hot surfaces, heat and sparks must be kept away from the storage tank(s) and signage indicating the before mentioned must be displayed. Place the oil storage tank(s) in a secure or locked up location. 	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager
Decommissioning Phase					
Closure and decommissioning of the pyrolysis plant is not					
anticipated for the foreseeable future. Should the facility close, a detailed closure and rehabilitation plan will be submitted to the North West Department of Rural, Environmental and Agricultural Development prior to decommissioning.	N/A

Disturbance of artefacts or sites of cultural heritage (archaeolog	cal and historical) significance.					
		Nature and significance of environmental impact				
Impact Description	Environmental Objective	Management / Mitigation Measures	Monitoring and Compliance Reporting	Timeframe	Responsibility	
Construction Phase						
Construction activities may disturb or destroy sites, features or artefacts of archaeological and/or historical importance. As the open space on site which will be disturbed by the proposed development is less than 5 000m ² , a Heritage Impact Assessment has not been done. The property is zoned for Industrial Land Use and is in a disturbed state. For this reason, it is expected that the impact on any heritage resources would be low. To date, no comments have been received from the South African Heritage Resources Agency.	To protect artefacts or sites of cultural heritage (archaeological and historical) significance.	If during any construction activities, any sites, features and objects of a cultural heritage (archaeological or historical) nature are exposed, an expert should be called in to investigate and suitable mitigation measures must be implemented. All activities in the area should be halted until the situation has been resolved.	ECO to verify implementation of the mitigation measures proposed in this EMP. ECO to submit monthly compliance reports to the competent authority.	During the construction phase.	 Construction contractor ECO 	
Operational Phase						
Operational activities may disturb or destroy sites, features or artefacts of archaeological and/or historical importance. The property is zoned for Industrial Land Use and is in a disturbed state. For this reason, it is expected that the impact on any heritage resources would be low. To date, no comments have been received from the South African Heritage Resources Agency.	To protect artefacts or sites of cultural heritage (archaeological and historical) significance.	If during any operational activities, any sites, features and objects of a cultural heritage (archaeological or historical) nature are exposed, an expert should be called in to investigate and suitable mitigation measures must be implemented. All activities in the area should be halted until the situation has been resolved.	 Regular site inspections. Internal audits against this EMP must be conducted every 6 months and records kept onsite. Shortcomings must immediately be addressed. 	Life of Operation	Facility Manager

6. ENVIRONMENTAL AWARENESS PLAN

The following Environmental Awareness Plan must be implemented by Vaporox (Pty) Ltd in order to inform their employees and contractors of the environmental risk that may result from their work. The plan must be conducted as part of the induction process for all new employees (including contractors) that will perform work in terms of the proposed activities. Proof of all training provided must be kept on-site.

The Environmental Awareness Plan is referred to as the "SHE match" training programme. The training programme focuses on the following aspects:

- 1. Explaining clearly what the environment is and what the environment consist of namely: air, water, soil, fauna, flora and people.
- 2. Once participants have grasped the description of what the environment entails, the training focuses on the potential impacts that the construction and operational activities may have on each one of these environmental components. This is done by making use of the aspect register, where each one of the environmental aspects and associated impacts has been identified.
- 3. To ensure that the training is effective, visual aids are used. Photos are taken of actual and potential impacts occurring on site and in some cases role-play is used to illustrate a potential impact.
- 4. The participants are then exposed to a poster that reflects the various environmental components. The various photos taken are posted on the poster on a rotational basis and the participants indicate (based on the visual component) what environmental component was or could have been affected by the activities portrayed on the photo.
- 5. By doing this the participants visualise the action as well as the potential consequence (environmental impact) of their action.
- 6. This general awareness training must be done before construction commences and also when new employees start work. The training should be done every two years during the Operational Phase. The poster is posted in the communal area where the impacts are visualised and the photos rotated on a monthly basis.
