## 1. Executive Summary

The study area is underlain by Mokolian aged rocks that may contain microfossils. These rocks that are exposed in the middle of the study area are considered to be of low palaeontological concern. The sandy soils that cover the northern and southern parts of the study area may contain fossils and sub-fossils of Quaternary age and is considered to be of moderate palaeontological significance. The Eskom's Environmental Officer should take responsibility for supervising the development and should follow the Chance Find Procedure (pp.13-14) if in the unlikely event a significant fossil discovery is made.

## 2. Introduction

The palaeontological heritage of South Africa is unsurpassed and can only be described in superlatives. The South African palaeontological record gives us insight in inter alia the origin of dinosaurs, mammals and humans. Fossils are also used to identify rock strata and determine the geological context of the subregion with other continents and played a crucial role in the discovery of Gondwanaland and the formulation of the theory of plate tectonics. Fossils are also used to study evolutionary relationships, sedimentary processes and palaeoenvironments.

South Africa has the longest record of palaeontological endeavour in Africa. South Africa was even one of the first countries in the world in which museums displayed fossils and palaeontologists studied earth history. South African palaeontological institutions and their vast fossil collections are world-renowned and befittingly the South African Heritage Act is one of the most sophisticated and best considered in the world.

Fossils and palaeontological sites are protected by law in South Africa. Construction and mining in fossiliferous areas may be mitigated in exceptional cases but there is a protocol to be followed.

This is a Palaeontological Desktop Study which was prepared in line with Regulation 28 of the National Environmental Management Act (No. 107 of 1998) Regulations on

Environmental Impact Assessment. This involved a site visit where the palaeontologist evaluated the nature of the geology and potential palaeontology of the study site and an overview of the literature on the palaeontology and associated geology of the area.

### 3. Terms of reference for the report

According to the South African Heritage Resources Act (Act 25 of 1999) (Republic of South Africa, 1999), certain clauses are relevant to palaeontological aspects for a terrain suitability assessment.

- **Subsection 35(4)** No person may, without a permit issued by the responsible heritage resources authority-
  - (a) destroy, damage, excavate, alter, deface or otherwise disturb any archaeological or palaeontological site or any meteorite;
  - (b) destroy, damage, excavate, remove from its original position, collect or own any archaeological or palaeontological material or object or any meteorite;
  - (c) trade in, sell for private gain, export or attempt to export from the republic any category of archaeological or palaeontological material or object, or any meteorite; or
  - (d) bring onto or use at an archaeological or palaeontological site any excavation equipment or any equipment which assist with the detection or recovery of metals or archaeological material or objects, or use such equipment for the recovery of meteorites.
- **Subsection 35(5)** When the responsible heritage resources authority has reasonable cause to believe that any activity or development which will destroy, damage or alter any archaeological or palaeontological site is under way, and where no application for a permit has been submitted and no heritage resources management procedures in terms of section 38 has been followed, it may-
  - (a) serve on the owner or occupier of the site or on the person undertaking such development an order for the development to cease immediately for such period as is specified in the order;

- (b) carry out an investigation for the purpose of obtaining information on whether or not an archaeological or palaeontological site exists and whether mitigation is necessary;
- (c) if mitigation is deemed by the heritage resources authority to be necessary, assist the person on whom the order has been served under paragraph (a) to apply for a permit as required in subsection (4); and
- (d) recover the costs of such investigation from the owner or occupier of the land on which it is believed an archaeological or palaeontological site is located or from the person proposing to undertake the development if no application for a permit is received within two weeks of the order being served.

South Africa's unique and non-renewable palaeontological heritage is protected in terms of the NHRA. According to this act, heritage resources may not be excavated, damaged, destroyed or otherwise impacted by any development without prior assessment and without a permit from the relevant heritage resources authority.

As areas are developed and landscapes are modified, heritage resources, including palaeontological resources, are threatened. As such, both the environmental and heritage legislation require that development activities must be preceded by an assessment of the impact undertaken by qualified professionals. Palaeontological Impact Assessments (PIAs) are specialist reports that form part of the wider heritage component of:

- Heritage Impact Assessments (HIAs) called for in terms of Section 38 of the National Heritage Resources Act, Act No. 25, 1999 by a heritage resources authority.
- Environmental Impact Assessment process as required in terms of other legislation listed in s. 38(8) of NHRA;
- Environmental Management Plans (EMPs) required by the Department of Mineral Resources.

HIAs are intended to ensure that all heritage resources are protected, and where it is not possible to preserve them in situ, appropriate mitigation measures are applied. An HIA is a comprehensive study that comprises a palaeontological, archaeological, built environment, living heritage, etc specialist studies. Palaeontologists must acknowledge this and ensure that they collaborate with other heritage practitioners. Where palaeontologists are engaged for the entire HIA, they must refer heritage components for which they do not have expertise on to appropriate specialists. Where they are engaged specifically for the palaeontology, they must draw the attention of environmental consultants and developers to the need for assessment of other aspects of heritage. In this sense, Palaeontological Impact Assessments that are part of Heritage Impact Assessments are similar to specialist reports that form part of the EIA reports or any related and relevant Environmental Study.

The standards and procedures discussed here are therefore meant to guide the conduct of PIAs and specialists undertaking such studies must adhere to them.

The process of assessment for the palaeontological (PIA) specialist components of heritage impact assessments, involves:

In case this project may escalate and becomes a Basic Assessment or even a Scoping and EIA stage in line with regulation 28 of the National Environmental Management Act (No. 107 of 1998) Regulations on Environmental Impact Assessment. This involves an **initial assessment** where the specialist evaluates the scope of the project (based, for example, on NID/BIDs) and advises on the form and extent of the assessment process. At this stage the palaeontologist may also decide to compile a **Letter of Recommendation for Exemption from further Palaeontological Studies**. This letter will state that there is little or no likelihood that any significant fossil resources will be impacted by the development. This letter should present a reasoned case for exemption, supported by consultation of the relevant geological maps and key literature.

A **Palaeontological Desktop Study** – the palaeontologist will investigate available resources (geological maps, scientific literature, previous impact assessment reports,

institutional fossil collections, satellite images or aerial photos, etc) to inform an assessment of fossil heritage and/or exposure of potentially fossiliferous rocks within the study area. A Desktop studies will conclude whether a further field assessment is warranted or not. Where further studies are required, the desktop study would normally be an integral part of a field assessment of relevant palaeontological resources.

**A Phase 1 Palaeontological Impact Assessment** is generally warranted where rock units of high palaeontological sensitivity are concerned, levels of bedrock exposure within the study area are adequate; large-scale projects with high potential heritage impact are planned; and where the distribution and nature of fossil remains in the proposed project area is unknown. In the recommendations of Phase 1, the specialist will inform whether further monitoring and mitigation are necessary. The Phase 1 should identify the rock units and significant fossil heritage resources present, or by inference likely to be present, within the study area, assess the palaeontological significance of these rock units, fossil sites or other fossil heritage, comment on the impact of the development on palaeontological heritage resources and make recommendations for their mitigation or conservation, or for any further specialist studies that are required in order to adequately assess the nature, distribution and conservation value of palaeontological resources within the study area.

**A Phase 2 Palaeontological Mitigation** involves planning the protection of significant fossil sites, rock units or other palaeontological resources and/or the recording and sampling of fossil heritage that might be lost during development, together with pertinent geological data. The mitigation may take place before and / or during the construction phase of development. The specialist will require a Phase 2 mitigation permit from the relevant Heritage Resources Authority before Phase 2 may be implemented.

**A 'Phase 3' Palaeontological Site Conservation and Management Plan** may be required in cases where the site is so important that development will not be allowed, or where development is to co-exist with the resource. Developers may be required to enhance the

value of the sites retained on their properties with appropriate interpretive material or displays as a way of promoting access of such resources to the public.

The assessment reports will be assessed by the relevant heritage resources authority, and depending on which piece of legislation triggered the study, a response will be given in the form of a Review Comment or Environmental Authorisation (EA). In the case of PIAs that are part of EIAs or EMPs, the heritage resources authority will issue a comment or a record of decision that may be forwarded to the consultant or developer, relevant government department or heritage practitioner and where feasible to all three.

#### 4. Details of study area and the type of assessment:

Figure 1: Google Earth photo indicating the study area (white polygon)

The study site is situated south of the town Washersvlei (see Fig. 1).

The relevant literature and geological maps for the study area, in which the development is proposed to take place, have been studied for a Desktop Report.

## 5. Geological setting of the study area

Figure 2: Geological Map of the study area (black polygon) and surroundings. Adapted from the 2328 PIETERSBURG 1: 250 000 Geology Map (Geological Survey, 1985)

### LEGEND:

	Lithology	Stratigraphy		Age
Q	Soil, sand, alluvium			Quarter-nary
++ Mp ++	Coarse-grained pink and red hornblende-biotite granite	Palala Granite		Mokolian
M	Mylonite, ultramylonite, blastomylonite and various strongly sheared rocks			

Mk	Conglomerate, quartzite, shale	Koedoesrand Formation		
Vv	Gabbro, anorthosite, magnetite gabbro, norite, olivine diorite	Villa Nora Gabbro	Bushveld Igneous Complex	Vaalian
Zbp	Metapelite		Bandelierkop Complex	Swazian
Zbm	Amphibolite, mafic granulite			

The oldest rock formations at the study site are the Swazian aged mafic rocks of the Bandelierskop Complex that include the amphibolite and mafic granulite that are derived from basaltic lavas of tholeiitic and partly komatititic type (Brandl, 1986).

The overlying Swazian aged metapelites of the Bandelierskop Complex are composed largely of plagioclase, quartz, biotite, garnet, cordierite, K-feldspar, spinel and kyanite that have been derived from greywacke (Brandl, 1986).

The Vaalian aged Villa Nora Gabbro forms part of the Bushveld Igneous Complex and is exposed to the south of the study site. This igneous unit consists of gabbro, anorthosite, magnetite gabbro, norite, olivine and diorite (Brandl, 1986).

Mokolian aged rocks occur to the south of the study site. These rocks include the metamorphosed conglomerate, quartzite and shale of the Koedoesrand Formation, followed by a geological unit characterised by mylonite, ultramylonite, blastomylonite and various strongly sheared rocks. This is in turn followed by the Palala Granite (Brandl, 1986).

Most of the southern and northern parts of the study site is covered by Quaternary aged sandy soil (see Fig. 2).

## 6. PALAEOONTOLOGICAL ASSESSMENT

Figure 3: Palaeontological sensitivity map of the study area (white polygon) and surroundings (SAHRA, 2020)

Colour	Palaeontological Significance	Action
GREEN	MODERATE	Desktop study is required.
BLUE	LOW	No palaeontological studies are required however a protocol for finds is required.
GREY	INSIGNIFICANT / ZERO	No palaeontological studies are required.

The study site is classified as having a low to moderate palaeontological sensitivity (see Fig. 3). The Swazian aged Bandelierskop geological units are classified as having a low palaeontological significance. These units may contain Archaean microfossils in cherts and volcanic glasses (Groenewald & Groenewald, 2014). The sandy soil covering the study site is the only unit of moderate palaeontological significance (Groenewald & Groenewald, 2014). Although no fossils have been reported for the study area, fossils such as root casts, burrows, termitaria, ostrich egg shells, mollusc shells and isolated bones have been discovered in Quaternary aged deposits elsewhere (Partridge *et al.*, 2009).

## 7. Conclusion and recommendations:

There is a slight chance of finding fossils and sub-fossils in the sandy soils that covers the northern and southern parts of the study site. If fossils are exposed during construction, geological exploration or mining, the Eskom's Environmental Officer (EO) must follow the Chance Palaeontological Find Procedure as stipulated below and to contact a palaeontologist for further advice.

### PROCEDURE FOR CHANCE PALAEONTOLOGICAL FINDS

(Extracted and adapted from the National Heritage Resources Act, 1999 Regulations Reg No. 6820, GN: 548)

The following procedure must be considered in the event that previously unknown fossils or fossil sites are exposed or found during the life of the project:

1. Surface excavations should continuously be monitored by the Eskom's Environmental Officer and any fossil material be unearthed the excavation must be halted.
2. If fossiliferous material has been disturbed during the excavation process it should be put aside to prevent it from being destroyed.

3. The EO then has to take a GPS reading of the site and take digital pictures of the fossil material and the site from which it came.
4. The EO then should contact a palaeontologist and supply the palaeontologist with the information (locality and pictures) so that the palaeontologist can assess the importance of the find and make recommendations.
5. If the palaeontologist is convinced that this is a major find an inspection of the site must be scheduled as soon as possible in order to minimise delays to the development.

From the photographs and/or the site visit the palaeontologist will make one of the following recommendations:

- a. The material is of no value so development can proceed, or:
  - b. Fossil material is of some interest and a representative sample should be collected and put aside for further study and to be incorporated into a recognised fossil repository after a permit was obtained from SAHRA for the removal of the fossils, after which the development may proceed, or:
  - c. The fossils are scientifically important and the palaeontologist must obtain a SAHRA permit to excavate the fossils and take them to a recognised fossil repository, after which the development may proceed.
7. If any fossils are found then a schedule of monitoring will be set up between the developer and palaeontologist in case of further discoveries.

## 8. Declaration of Independence:

I. Jacobus Francois Durand declare that I am an independent consultant and have no business, financial, personal or other interest in the proposed development, application or appeal in respect of which I was appointed other than fair remuneration for work performed in connection with the activity, application or appeal. There are no circumstances that compromise the objectivity of my performing such work.

Palaeontological specialist:

**Dr JF Durand (Sci. Nat.)**

BSc Botany & Zoology (RAU), BSc Zoology (WITS), Museology Dipl. (UP),

Higher Education Diploma (RAU), PhD Palaeontology (WITS)
