# 1 IMPORTANT NOTICE

In terms of the Mineral and Petroleum Resources Development Act (Act 28 of 2002 as amended), the Minister must grant a prospecting or mining right if among others the mining “will not result in unacceptable pollution, ecological degradation or damage to the environment”.

Unless an Environmental Authorisation can be granted following the evaluation of an Environmental Impact Assessment and an Environmental Management Programme report in terms of the National Environmental Management Act (Act 107 of 1998) (NEMA), it cannot be concluded that the said activities will not result in unacceptable pollution, ecological degradation or damage to the environment.

In terms of section 16(3)(b) of the EIA Regulations, 2014, any report submitted as part of an application must be prepared in a format that may be determined by the Competent Authority and in terms of section 17 (1) (c) the competent Authority must check whether the application has taken into account any minimum requirements applicable, or instructions or guidance provided by the competent authority to the submission of applications.

**It is therefore an instruction that** the prescribed reports required in respect of applications for an environmental authorisation for listed activities triggered by an application for a right or a permit are submitted in the exact format of, and provide all the information required in terms of, this template. Furthermore, please be advised that failure to submit the information required in the format provided in this template will be regarded as a failure to meet the requirements of the Regulation and will lead to the Environmental Authorisation being refused.

**It is furthermore an instruction that** the Environmental Assessment Practitioner must process and interpret his/her research and analysis and use the findings thereof to compile the information required herein. (Unprocessed supporting information may be attached as appendices). The EAP must ensure that the information required is placed correctly in the relevant sections of the Report, in the order, and under the provided headings as set out below, and ensure that the report is not cluttered with un-interpreted information and that it unambiguously represents the interpretation of the applicant.

## 2 Objective of the basic assessment process

The objective of the basic assessment process is to, through a consultative process—

- a. determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context;
- b. identify the alternatives considered, including the activity, location, and technology alternatives;
- c. describe the need and desirability of the proposed alternatives,
- d. through the undertaking of an impact and risk assessment process inclusive of cumulative impacts which focused on determining the geographical, physical, biological, social, economic, heritage, and cultural sensitivity of the sites and locations within sites and the risk of impact of the proposed activity and technology alternatives on these aspects to determine:
  - (i) the nature, significance, consequence, extent, duration, and probability of the impacts occurring to; and
  - (ii) the degree to which these impacts—
    - (aa) can be reversed;
    - (bb) may cause irreplaceable loss of resources; and
    - (cc) can be managed, avoided or mitigated;
- e. (e) through a ranking of the site sensitivities and possible impacts the activity and technology alternatives will impose on the sites and location identified through the life of the activity to—
  - (i) identify and motivate a preferred site, activity and technology alternative;
  - (ii) identify suitable measures to manage, avoid or mitigate identified impacts; and
  - (iii) identify residual risks that need to be managed and monitored.

## General Project Overview

Manyeleti Consulting SA (Pty) Ltd (Manyeleti) appointed Ndi Geological Consulting Services (Pty) Ltd (Ndi Geological Consulting) as the independent Environmental Assessment Practitioner (EAP) to facilitate the environmental authorisation process for its proposed iron ore, manganese and diamond prospecting project located in the Magisterial District of Kuruman.

The proposed prospecting project will cover an area of 3 500 hectares and located approximately 30.3 km south of Kuruman town in the Northern Cape Province.

Manyeleti requires a prospecting right in terms of the Mineral and Petroleum Resources Development Act (Act No. 22 of 2002) (MPRDA). Before the prospecting right will be granted, Manyeleti must undertake an environmental authorisation process in terms of the National Environmental Management Act (Act No. 107 of 1998) (NEMA). The competent authority for the environmental authorisation process is the Northern Cape Department of Mineral Resources (DMR).

The Department of Environmental Affairs (DEA) has identified the need for the alignment of environmental authorisations and has promulgated a single environmental management system under NEMA whereby the DMR has become the competent authority for the authorisation of mining-related projects under the NEMA Environmental Impact Assessment (EIA) Regulations. This will result in simultaneous decisions in terms of NEMA and other environmental management Acts.

Since the proposed prospecting project triggers activities listed in Listing Notice 1 of the NEMA, a Basic EIA authorisation process in terms of NEMA Government Notice Regulation (GNR) 982 (as amended by GNR325 of 7 April 2017) will be required.

Before an iron ore, manganese and diamond mining process can be planned and built, several tests and surveys must be conducted to ensure that the project is economically viable, technically feasible, and environmentally sound. Assessment of the geological information available has determined that the area in question may have good quality iron ore, manganese and diamond reserves. To ascertain the above and determine the nature, location and extent of the reserves within the proposed prospecting area, it will be necessary that prospecting be undertaken. The prospecting will also determine if there are any features that may have an impact on the economic extraction of the iron ore, manganese and diamond.

The proposed prospecting project will consist of non-invasive and invasive (drilling sampling) activities. On surface, invasive methods include 30 Reverse Circulation (RC) and diamond core drill boreholes. Non-invasive methods will include analytical desktop studies, geological mapping and decision-making on the viability of the project.

Most of the rehabilitation will be conducted while prospecting activities are undertaken. The final rehabilitation will be done once the prospecting activities have been completed at a site and before the drilling team leaves the site.

The stakeholder engagement process, as part of the Environmental Authorisation process, is conducted in terms of NEMA (as amended) which provides clear guidelines for stakeholder engagement during an EIA. One of the general objectives of integrated environmental management set out in Section 23(2) of NEMA is to ensure the “adequate and appropriate opportunity for public participation in decisions that may affect the environment”.

The stakeholder engagement process is primarily aimed at affording Stakeholders and Interested and Affected Parties (I&APs) the opportunity to gain an understanding of the project. In addition, the

purpose of consultation with the landowner, affected parties and communities is to provide them with the necessary information about the proposed project so that they can make informed decisions as to whether and to which degree the project will affect them. In addition, the purpose of consultation with the Stakeholders and I&APs is to provide the competent authority with the necessary information for them to make informed decisions.

Before an EAP submits a final report, they must have given registered I&APs access to, and an opportunity to comment on the report prior to the submission of the final report to the competent authority for approval.

Stakeholders were therefore provided with an opportunity to participate in the public review period of the Draft BAR from 23 April 2021 – 23 May 2021 to ensure that the assessment of impacts and proposed management of impacts have addressed their concerns. Comments received during the 30-day comment period (from the Draft BAR review) will be incorporated into the Final BAR/EMPr that will be submitted to the DMR for decision making.

This BAR/EMPr has been compiled in terms of the provisions of Appendix 1 and Appendix 4 of December 2014 GNR 982 of the NEMA. These requirements are cross-referenced to the various sections in this report where these requirements are addressed (Table 2-1 and Table 2-2).

**Table 2-1: Requirements of Appendix 1 of GNR 982 for a BAR**

| Section of the EIA Regulations, 2014 | Description of EIA Regulations Requirements for Basic Assessment Reports   | Section                  |
|--------------------------------------|--|--------------------------|
| Appendix 1: 3 (1) (a)                | Details of –<br>the EAP who prepared the report;<br>and the expertise of the EAP, including a curriculum vitae   | Section 5.1              |
| Appendix 1: 3 (1) (b)                | The location of the activity, including –<br>The 21-digit Surveyor General code of each cadastral land parcel;<br>Where available, the physical address and farm name;<br>Where the required information in items (i) and (ii) is not available, coordinates of the boundary of the property or properties.  | Section 6                |
| Appendix 1: 3 (1) (c)                | A plan which locates the proposed activity or activities applied for at an appropriate scale, or, if it is –<br>A linear activity, a description and coordinates of the corridor in which the proposed activity or activities is to be undertaken; or<br>On land where the property has not been defined, the coordinates within which the activity is to be undertaken; or. | Section 6<br>Figure 7-1  |
| Appendix 1: 3 (1) (d)                | A description of the scope of the proposed activity, including –<br>All listed and specified activities triggered and being applied for;<br>A description of the activities to be undertaken, including associated structures and infrastructure.  | Section 7.5<br>Section 7 |
| Appendix 1: 3 (1) (e)                | A description of the policy and legislative context within which the development is proposed including-<br>an identification of all legislation, policies, plans, guidelines, spatial tools, municipal development   | Section 8                |

| Section of the EIA Regulations, 2014 | Description of EIA Regulations Requirements for Basic Assessment Reports   | Section                               |
|--------------------------------------|--|---------------------------------------|
|                                      | <p>planning frameworks and instruments that are applicable to this activity and have been considered in the preparation of the report; and</p> <p>how the proposed activity complies with and responds to the legislation and policy context, plans, guidelines, tools frameworks, and instruments;</p>  |                                       |
| Appendix 1: 3 (1) (f)                | A motivation for the need and desirability for the proposed development including the need and desirability of the activity in the context of the preferred location.  | Section 9                             |
| Appendix 1: 3 (1) (g)                | A motivation for the preferred site, activity and technology alternative.  | Section 10                            |
| Appendix 1: 3 (1) (h)                | A full description of the process followed to reach the proposed preferred activity, site and location within the site, including-   | Section 11                            |
|                                      | Details of all alternatives considered;  | Section 11.1                          |
|                                      | Details of the public participation process undertaken in terms of regulation 41 of the Regulations, including copies of the supporting documents and inputs;  | Section 11.2                          |
|                                      | A summary of the issues raised by interested and affected parties, and an indication of the manner in which the issues were incorporated, or the reasons for not including them;   | Section 11.5                          |
|                                      | The environmental attributes associated with the alternatives focusing on the geographical, physical, biological, social, economic, heritage and cultural aspects;   | Section 12                            |
|                                      | <p>The impacts and risks identified for each alternative, including the nature, significance, consequence, extent, duration, and probability of the impacts, including the degree to which the impacts-</p> <p>(aa) can be reversed;</p> <p>(bb) may cause irreplaceable loss of resources; and</p> <p>(cc) can be avoided, managed, or mitigated.</p> | Section 13                            |
|                                      | The methodology used in deterring and ranking the nature, significance, consequences, extent, duration and probability of potential environmental impacts and risks associated with the alternatives;  | Section 14                            |
|                                      | Positive and negative impacts that the proposed activity and alternatives will have on the environment and on the community that may be affected focusing on the geographic, physical, biological, social, economic, heritage and cultural aspects;  | Section 15                            |
|                                      | The possible mitigation measures that could be applied and level of residual risk;   | Table 13-1, Table 13-2 and Table 13-3 |
|                                      | The outcome of the site selection matrix;  | N/A                                   |
|                                      | If no alternatives, including alternative locations for the activity were investigated, the motivation for not considering such and;   | Section 17                            |

| Section of the EIA Regulations, 2014 | Description of EIA Regulations Requirements for Basic Assessment Reports   | Section                               |
|--------------------------------------|--|---------------------------------------|
|                                      | A concluding statement indicating the preferred alternatives, including preferred location of the activity.  | Section 18                            |
| Appendix 1: 3 (1) (i)                | <p>a full description of the process undertaken to identify, assess and rank the impacts the activity will impose on the preferred location through the life of the activity, including—</p> <p>a description of all environmental issues and risks that were identified during the environmental impact assessment process; and</p> <p>an assessment of the significance of each issue and risk and an indication of the extent to which the issue and risk could be avoided or addressed by the adoption of mitigation measures;</p>                             | <p>Section 18.1</p> <p>Section 13</p> |
| Appendix 1: 3 (1) (j)                | <p>An assessment of each identified potentially significant impact and risk, including—</p> <p>cumulative impacts;</p> <p>the nature, significance and consequences of the impact and risk;</p> <p>the extent and duration of the impact and risk;</p> <p>the probability of the impact and risk occurring;</p> <p>the degree to which the impact and risk can be reversed;</p> <p>the degree to which the impact and risk may cause irreplaceable loss of resources; and</p> <p>the degree to which the impact and risk can be avoided, managed or mitigated;</p> | Section 13                            |
| Appendix 1: 3 (1) (k)                | where applicable, a summary of the findings and impact management measures identified in any specialist report complying with Appendix 6 to these Regulations and an indication as to how these findings and recommendations have been included in the final report;   | N/A                                   |
| Appendix 1: 3 (1) (l)                | <p>an environmental impact statement which contains—</p> <p>a summary of the key findings of the environmental impact assessment;</p> <p>a map at an appropriate scale which superimposes the proposed activity and its associated structures and infrastructure on the environmental sensitivities of the preferred site indicating any areas that should be avoided, including buffers; and</p> <p>a summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;</p>  | <p>Section 21</p> <p>Figure 21-1</p>  |
| Appendix 1: 3 (1) (m)                | based on the assessment, and where applicable, impact management measures from specialist reports, the recording of the proposed [impact management objectives and the impact management outcomes for the development for inclusion in the EMPr;   | Table 13-1, Table 13-2 and Table 13-3 |

## YOUR COMMENT ON THE BASIC ASSESSMENT REPORT

This Draft Basic Assessment Report (Draft BAR) will be available for comment for a period of 30 days from 23 April 2021 to 23 May 2021. Copies of the Draft BAR been made available at the following public place for review:

| Public Place           | Locality  | Telephone    |
|------------------------|---|--------------|
| Ndi Geological website | <a href="http://www.ndigeoservices.co.za/">http://www.ndigeoservices.co.za/</a> | 053 842 0687 |

I&APs are requested to provide comments and information on the following aspects of the proposed project:

1. Information on how I&APs consider that the proposed activities will impact on them or their socio-economic conditions;
2. Written responses stating their suggestions to mitigate the anticipated impacts of each activity;
3. Information on current land uses and their location within the area under consideration;
4. Information on the location of environmental features on site to make proposals as to how and to what standard the impacts on site can be remedied; and
5. How to mitigate the potential impacts on their socio-economic conditions and to make proposals as to how the potential impacts on their infrastructure can be managed avoided or remedied.

### DUE DATE FOR COMMENT

**23 May 2021**

**Please submit comments to the EAP:**

| 13.2.3 Surface water .....  | 58        |
| 13.2.4 Aquatic Ecology .....  | 58        |
| 13.2.5 Flora .....  | 59        |
| 13.2.6 Fauna .....  | 59        |
| 13.2.7 Soils, Land Use and Land Capability .....  | 59        |
| 13.2.8 Air Quality .....  | 59        |
| 13.2.9 Visual .....   | 59        |
| 13.2.10 Heritage, Archaeological Resources .....  | 59        |
| 13.2.11 Palaeontology Impacts .....   | 59        |
| 13.2.12 Ambient Noise .....   | 60        |
| 13.2.13 Traffic .....   | 60        |
| 13.2.14 Climate .....   | 60        |
| 13.2.15 Vibrations .....  | 60        |
| 13.3 Decommissioning and Closure .....  | 66        |
| 13.3.1 Soils and Land Capability .....  | 66        |
| 13.3.2 Land Use .....   | 66        |
| 13.3.3 Soils and Vegetation .....   | 66        |
| 13.3.4 Surface Water and Aquatic Ecosystems .....   | 66        |
| 13.3.5 Air Quality .....  | 66        |
| 13.3.6 Noise .....  | 66        |
| <b>14 Impact Assessment Methodology .....</b>   | <b>69</b> |
| <b>15 Positive and Negative Impacts .....</b>   | <b>72</b> |
| <b>16 The possible mitigation measures that could be applied and the level of risk.....</b>   | <b>73</b> |
| <b>17 Motivation where no alternative sites were considered.....</b>  | <b>73</b> |
| <b>18 Statement motivating the alternative development location within the overall site.<br/>(Provide a statement motivating the final site layout that is proposed).....</b> | <b>73</b> |
| 18.1 Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site .....                       | 73        |

|  |            |
|--|------------|
| <b>19 Assessment of each identified potentially significant impact and risk.</b>   | <b>75</b>  |
| <b>20 Summary of specialist reports.</b>   | <b>79</b>  |
| <b>21 Environmental impact statement</b>   | <b>80</b>  |
| 21.1 Summary of the key findings of the environmental impact assessment.   | 80         |
| 21.2 Final Site Map  | 80         |
| 21.3 Summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;  | 81         |
| <b>22 Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;</b>  | <b>82</b>  |
| <b>23 Aspects for inclusion as conditions of Authorisation.</b>  | <b>83</b>  |
| <b>24 Description of any assumptions, uncertainties and gaps in knowledge.</b>   | <b>84</b>  |
| <b>25 Reasoned opinion as to whether the proposed activity should or should not be authorised.</b>   | <b>85</b>  |
| 25.1 Reasons why the activity should be authorized or not.   | 85         |
| 25.2 Conditions that must be included in the authorisation.  | 85         |
| <b>26 Period for which the Environmental Authorisation is required.</b>  | <b>86</b>  |
| <b>27 Undertaking</b>  | <b>87</b>  |
| <b>28 Financial Provision.</b>   | <b>88</b>  |
| 28.1 Explain how the aforesaid amount was derived.   | 89         |
| 28.2 Confirm that this amount can be provided for from operating expenditure.  | 89         |
| <b>29 Specific Information required by the competent Authority.</b>  | <b>89</b>  |
| 29.1 Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). the EIA report must include the: | -89        |
| 29.1.1 Impact on the socio-economic conditions of any directly affected person.  | 89         |
| 29.2 Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act.   | 90         |
| 29.3 Other matters required in terms of sections 24(4)(a) and (b) of the Act.  | 91         |
| <b>30 Draft environmental management programme.</b>  | <b>92</b>  |
| 30.1 Details of the EAP  | 92         |
| 30.2 Description of the Aspects of the Activity  | 92         |
| 30.3 Composite Map   | 92         |
| <b>31 Description of Impact management objectives including management statements.</b>   | <b>93</b>  |
| 31.1 Determination of closure objectives.  | 93         |
| <b>32 Volumes and rate of water use required for the operation.</b>  | <b>94</b>  |
| <b>33 Has a water use licence has been applied for?</b>  | <b>95</b>  |
| <b>34 Impacts to be mitigated in their respective phases.</b>  | <b>96</b>  |
| <b>35 Impact Management Outcomes.</b>  | <b>106</b> |
| <b>36 Impact Management Actions</b>  | <b>111</b> |
| <b>37 Financial Provision.</b>   | <b>116</b> |
| 37.1 Determination of the amount of Financial Provision.   | 116        |

|  |            |
|--|------------|
| 37.1.1 Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under the Regulation.....                                      | 116        |
| 37.1.2 Confirm specifically that the environmental objectives in relation to closure have been consulted with landowner and interested and affected parties. ....                          | 116        |
| 37.1.3 Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main mining activities, including the anticipated mining area at the time of closure..... | 116        |
| 37.1.4 Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives. ....  | 117        |
| 37.1.5 Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline. ....                    | 117        |
| 37.1.6 Confirm that the financial provision will be provided as determined. ....   | 118        |
| <b>38 Mechanisms for monitoring compliance with and performance assessment against the environmental management programme and reporting thereon, including. ....</b>                       | <b>119</b> |
| 38.1 Monitoring of Impact Management Actions .....   | 119        |
| 38.2 Monitoring and Reporting Frequency.....   | 119        |
| 38.3 Responsible Persons (Roles and Responsibilities) .....  | 119        |
| 38.3.1 Project Developer.....  | 119        |
| 38.3.2 Environmental Control Officer .....   | 119        |
| 38.3.3 Environmental Health and Safety (EHS) Manager .....   | 120        |
| 38.3.4 Site Manager .....  | 120        |
| 38.4 Time Period for Implementing Impact Management Actions .....  | 121        |
| 38.5 Mechanism for Monitoring Compliance.....  | 121        |
| <b>39 Indicate the frequency of the submission of the performance assessment/ environmental audit report. ....</b>   | <b>124</b> |
| <b>40 Environmental Awareness Plan .....</b>   | <b>125</b> |
| 40.1 Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work. ....   | 125        |
| 40.2 Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment. ....  | 125        |
| 40.3 Specific information required by the Competent Authority. ....  | 127        |
| <b>41 UNDERTAKING.....</b>   | <b>128</b> |

### 3 Project background

Manyeleti Consulting SA (Pty) Ltd (Manyeleti) appointed Ndi Geological Consulting Services (Pty) Ltd (Ndi Geological Consulting) as the independent Environmental Assessment Practitioner (EAP) to facilitate the environmental authorisation process for its proposed iron ore, manganese and diamond project located in the magisterial district of Kuruman.

The proposed prospecting project will cover an area of 3 500 hectares and located approximately 30.3 km south of Kuruman town in the Northern Cape Province.

Manyeleti requires a prospecting right in terms of the Mineral and Petroleum Resources Development Act (Act No. 22 of 2002) (MPRDA). Before the prospecting right will be granted, Manyeleti must undertake an environmental authorisation process in terms of the National Environmental Management Act (Act No. 107 of 1998) (NEMA). The competent authority for the environmental authorisation process is the Northern Cape Department of Mineral Resources (DMR).

The Department of Environmental Affairs (DEA) has identified the need for the alignment of environmental authorisations and has promulgated a single environmental management system under NEMA whereby the DMR has become the competent authority for the authorisation of mining-related projects under the NEMA Environmental Impact Assessment (EIA) Regulations. This will result in simultaneous decisions in terms of NEMA, the National Environmental Management Waste Act (Act No. 59 of 2008) (NEM: WA) and other environmental management Acts.

Since the proposed prospecting project triggers activities listed in Listing Notice 1 of the NEMA, a Basic EIA authorisation process in terms of NEMA Government Notice Regulation (GNR) 982 (as amended by GNR325 of 7 April 2017) will be required.

Before an iron ore, manganese and diamond operation can be planned and built, several tests and surveys must be conducted to ensure that the project is economically viable, technically feasible, and environmentally sound. The proposed prospecting project will consist of non-invasive and invasive (drilling sampling) activities. On surface, invasive methods include drilling of 25 boreholes of Reverse Circulation (RC) and 5 diamond core drillholes. Non-invasive methods will include desktop studies, geological mapping and decision-making on the viability of the project.

Most of the rehabilitation will be conducted while prospecting activities are undertaken. The final rehabilitation will be done once the prospecting activities have been completed at a site and before the drilling team leaves the site.

The total duration of the prospecting and evaluation activities is planned for two (2) years.

Most of the rehabilitation will be conducted while prospecting activities are undertaken. The final rehabilitation will be done once the prospecting activities have been completed at a site and before the drilling team leaves the site.

The stakeholder engagement process, as part of the Environmental Authorisation process, is conducted in terms of NEMA (as amended) which provides clear guidelines for stakeholder engagement during an EIA. One of the general objectives of integrated environmental management set out in Section 23(2) of NEMA is to ensure the *“adequate and appropriate opportunity for public participation in decisions that may affect the environment”*.

The stakeholder engagement process is primarily aimed at affording Stakeholders and Interested and Affected Parties (I&APs) the opportunity to gain an understanding of the project. In addition, the purpose of consultation with the landowner, affected parties and communities is to provide them with the necessary information about the proposed project so that they can make informed decisions as to whether and to which degree the project will affect them. In addition, the purpose of consultation

with the Stakeholders and I&APs is to provide the competent authority with the necessary information for them to make informed decisions.

Before an EAP submits a final report, they must have given registered I&APs access to, and an opportunity to comment on the report prior to the submission of the final report to the competent authority for approval.

Stakeholders are therefore invited to participate in the public review period of the Draft Basic Assessment Report (Draft BAR) from 23 April 2021 to 23 May 2021 to ensure that the assessment of impacts and proposed management of impacts has addressed their concerns. After the public review period, the report will be updated with comments received from stakeholders on the Draft BAR.

The updated Final BAR will be submitted to the competent authority (DMR) and other commenting authorities for review once the comments from the stakeholders have been incorporated into the Draft BAR. The DMR will consider the findings in consultation with various authorities and decide whether environmental authorisation should be granted for the proposed prospecting project.

## 4 Purpose and context of this document

The project triggers activities listed in terms of Listing Notices 1 of the National Environmental Management Act, 1998 (Act 107 of 1998) (NEMA) (as amended) and will require an Environmental Authorisation (EA) from the Department of Mineral Resources (DMR), Northern Cape Province.

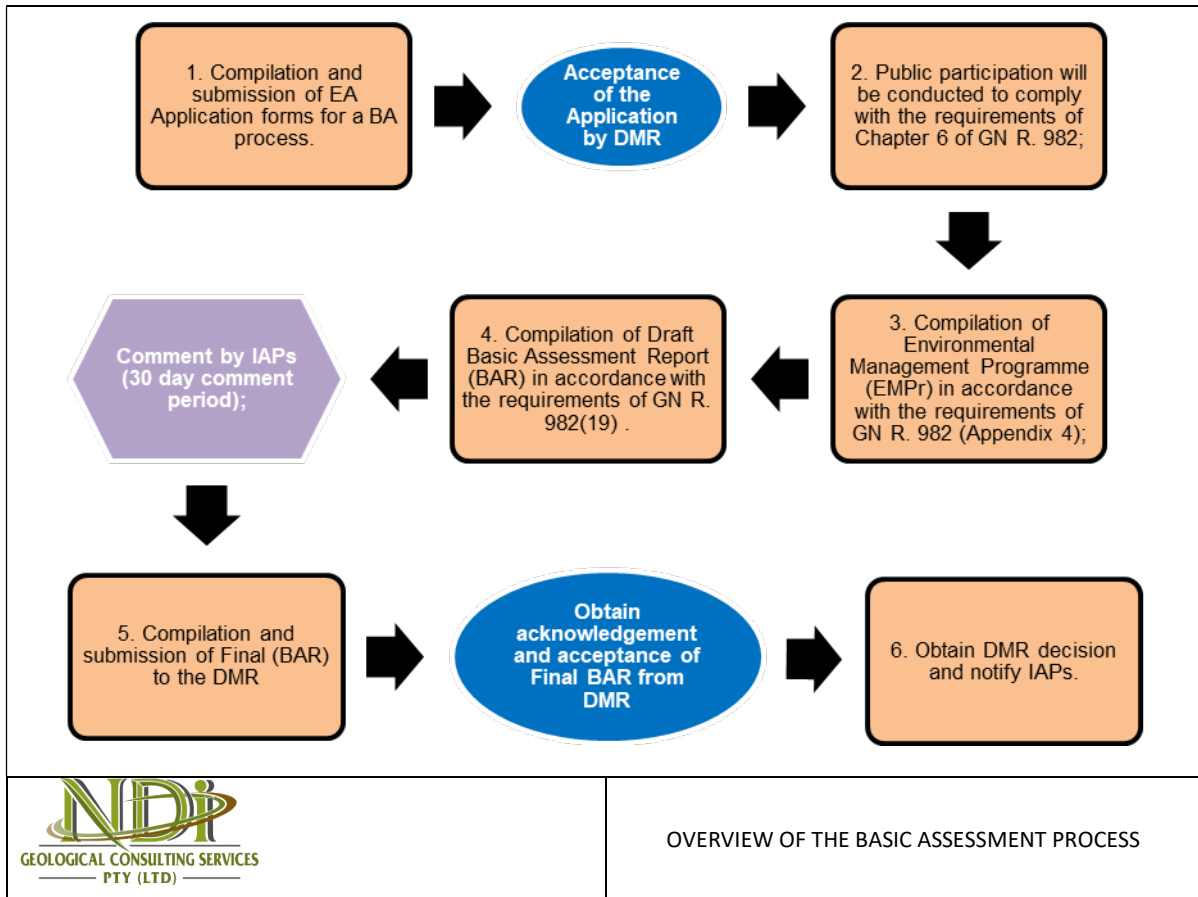

This document serves as the draft Basic Assessment Report (Draft BAR) and includes the following objectives as a minimum:

- To comply with the requirements of NEMA and associated Regulations;
- Identify and assess the environmental (biophysical, socio-economic, and cultural) impacts of activities associated with decommissioning and closure of the cement-ash mixing plant. The cumulative impacts of the proposed development will also be identified and evaluated;
- Identify and evaluate potential management and mitigation measures that will reduce the possible negative impacts of the proposed development and enhance the positive impacts;
- Compile monitoring, management, mitigation and training needs in the EMPr; and
- Provide the decision-making authorities with sufficient and accurate information to make a sound decision on the proposed development and set conditions that must be adhered to.

All activities that trigger activities listed in GNR 983 require that a Basic Assessment (BA) process be followed. The BA process will entail:

- Compilation of an Initial Draft BAR and draft EMPr for the public to comment on before the submission of the application to DMR.
- Submission of the EA Application to the DMR.
- Finalisation of the Draft BAR and EMPr for the official public participation comment period of 30 days.
- Incorporation of stakeholder comments into the final BAR and EMPr.
- Public Participation Process (PPP).

The BA process will follow the procedure as prescribed in Regulations 19 to 20 and is summarised in Figure 4-1.

OVERVIEW OF THE BASIC ASSESSMENT PROCESS

**Figure 4-1: Overview the Basic Assessment Process**

## 5 Contact Person and Correspondence Address

### 5.1 Details of EAP who prepared the report.

The EAP involved in the compilation of this BAR and her contact details are provided in Table 5-1 below:

**Table 5-1: EAP Contact Details**

| EAP Name               | Contact Number | Fax Number   | Email Address  |
|------------------------|----------------|--------------|--|
| Ndivhudzannyi Mofokeng | 053 842 0687   | 086 538 1069 | <a href="mailto:atshidzaho@gmail.com">atshidzaho@gmail.com</a> |

### 5.2 Expertise of the EAP

#### 5.2.1 Qualifications of the EAP

The qualifications of the EAP are provided for in Table 5-2 below, and copies of the qualifications are provided in Appendix 1.

**Table 5-2: EAP Qualifications**

| EAP Name               | Qualifications  | Professional registration        | Years' Experience |
|------------------------|---|----------------------------------|-------------------|
| Ndivhudzannyi Mofokeng | BSc (Hons) Earth Sciences in Mining and Environmental Geology | GSSA Prof Reg<br>EAPASA Prof Reg | 10                |

#### 5.2.2 Summary of EAPs experience

Ndivhudzannyi holds BSc (Hons) Earth Sciences in Mining and Environmental Geology. She has close to 10 years' experience in the exploration and open cast work in the mining industry. She has proven leadership skills from supervising exploration rigs (Reverse Circulation (RC) and percussion drilling). She has proven working experience in field exploration and mapping, borehole logging, borehole sampling, sample preparation for laboratory analysis, handling of GPS, supervisory duties within the field, geological report and progress report writing, including Prospecting Work Programmes and Environmental Management Plans, handling the Department of Mineral Resources (DMR) documents in general. Ndivhudzannyi has as a solid technical background in GIS ArcView software, Rockworks, Turbo-Cad and Turbo-Sketch, and Global Mapper 9 Application.

A detailed Curriculum Vitae (CV) of the EAP is provided for Appendix 2.

## 6 Project Location

### 6.1 Property Description

The description of the affected property is provided in Table 6-1 and map showing the affected property is provided in **Error! Reference source not found.**

**Table 6-1: Description of Properties affected by the Newstead Project.**

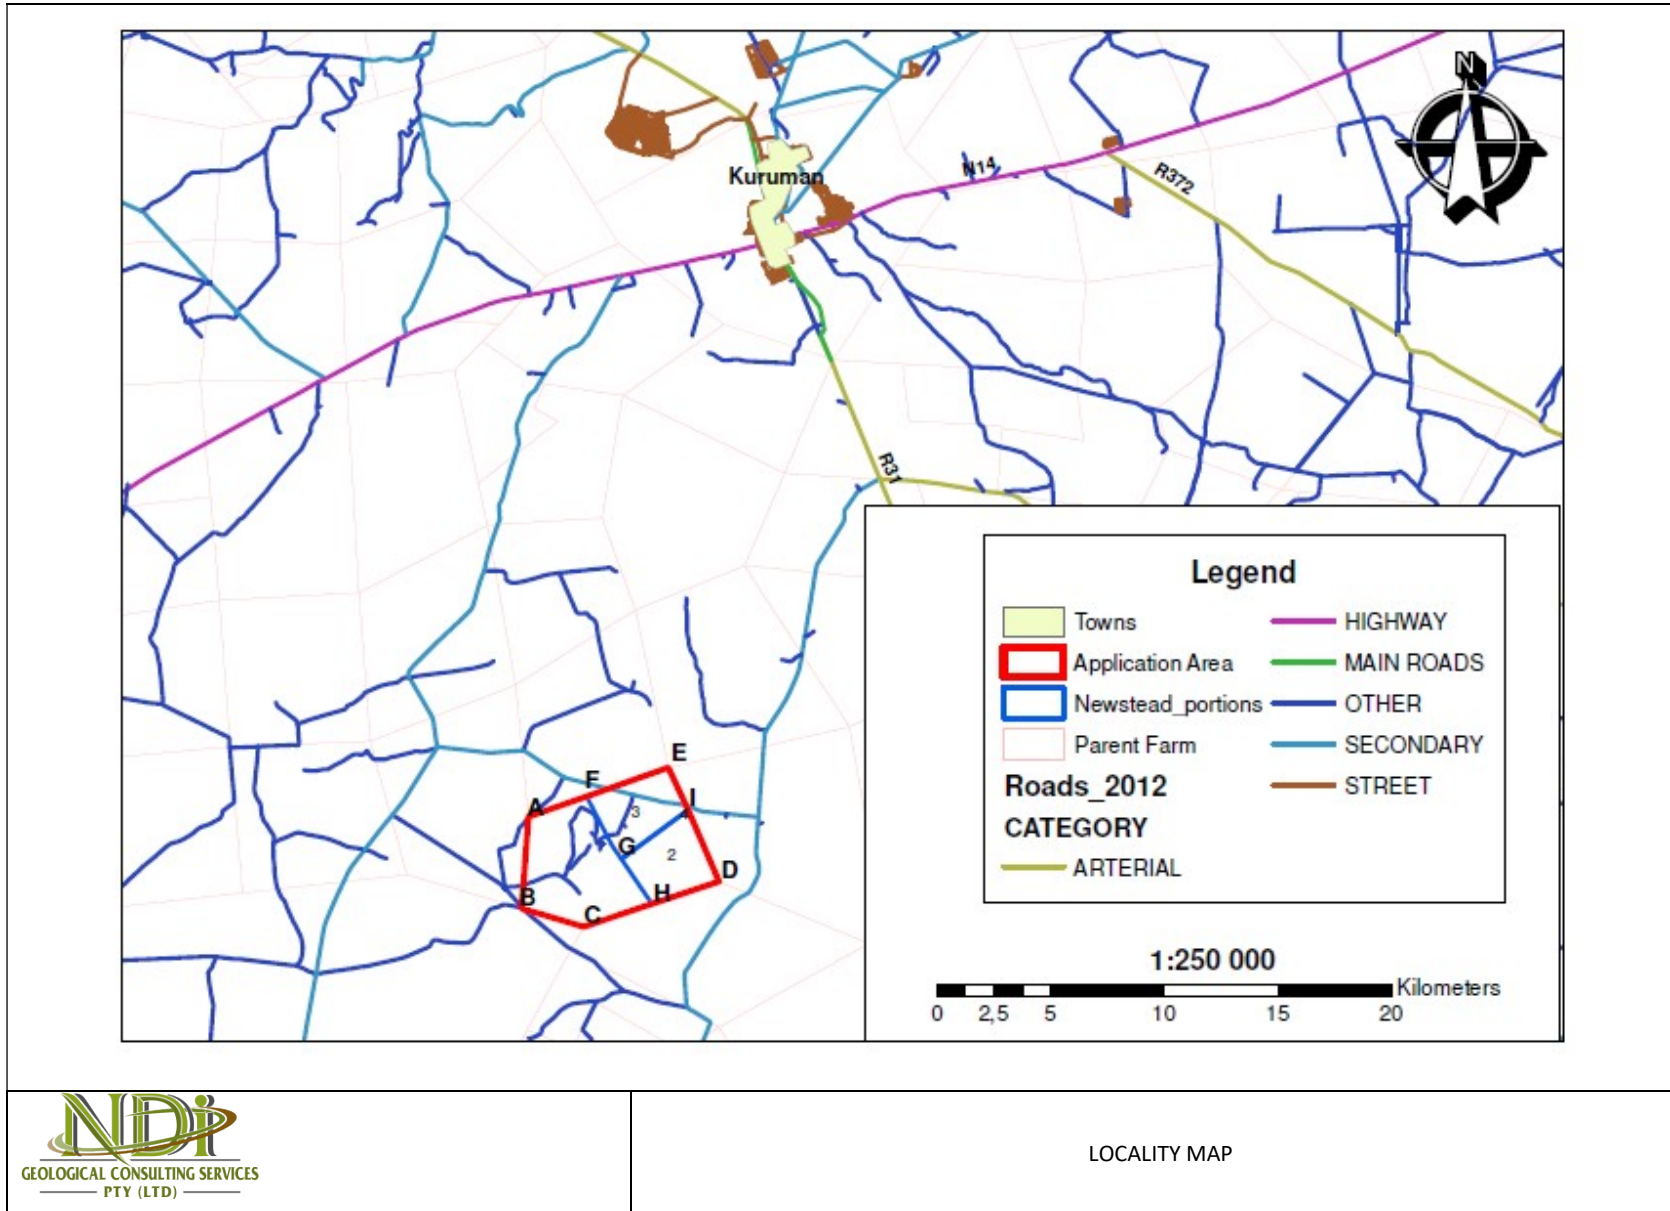

|   |  |                      |                      |

|   | Newstead 449   | Portion 2            | C0410000000044900002 |
|   |  | Portion 3            | C0410000000044900003 |
| Portion 4   |  | C0410000000044900004 |                      |

## 6.2 Locality map

The proposed Newstead project is in the Northern Cape Province of South Africa, approximately 30.3 km south of Kuruman (Figure 6-1).

A copy of the locality map is provided in Appendix 3.

LOCALITY MAP

Figure 6-1: Locality Map

## **7 Description of the Scope of the Proposed Overall Activity**

### **7.1 Overview**

The proposed prospecting project will consist of non-invasive and invasive (drilling sampling) activities. The review of available information that exists over the area of interest will be undertaken by means of conducting a literature review from satellite images and other available information.

The proposed activities will be conducted over a period of two years and will be categorized into phases, wherein phase 1 will be desktop study followed by RC and diamond drilling in phase 2. Phase 3 will be a completion studies and pre-feasibility. The machines and vehicles that will be used have been proven to be trusted to carry out the prospecting activities optimally. These machines and vehicles make use of hydrocarbon fuels such as diesel, petrol and oil.

### **7.2 Phase 1 (Literature Review)**

The first approach will be to analyse existing data on the area of study with relation to the topography, geology, mineralogy, geophysics, hydrology etc. This data will aid in determining the amount of potential that area carries in terms of mineralisation and the factors that affect it and its extraction thereof. The report that will be produced from this study will inform the next stage which is geological mapping.

Phase 1 will take approximately twelve (12) months and will compile the relevant data and observations from the recent and historical work done on site. The deliverables will be a detailed report and maps highlighting areas with the best potential to contain targeted minerals.

Ongoing prospecting activities will be developed and refined further using the assessed data. Aerial photographs and a high-resolution satellite image will be acquired for the prospecting right application so that a target identification process using both desktop study and geological mapping can be executed. Both desktop study and geological mapping interpretations will be used to focus future prospecting activities.

After the Desktop Study, a site geological mapping will be undertaken.

A desktop study is a process of physically locating the targeted ore body outcrop while obtaining detailed information about it. This information includes the strike and dip of the outcrop, the colour, the grain size and shape amongst others. The result of this stage will be a detailed geological map of the study area which will be correlated with the other maps obtained during the desktop study.

### **7.3 Phase 2 (Drilling)**

This phase of the project will consist of RC and diamond drilling and will consist of drilling approximately 25 RC boreholes. The prospecting drilling campaign will be aimed at defining the extent of mineralisation and will demonstrate geological continuity of the mineralized zone across the entire area under investigation (application area). Samples will be collected and tested in a registered laboratory.

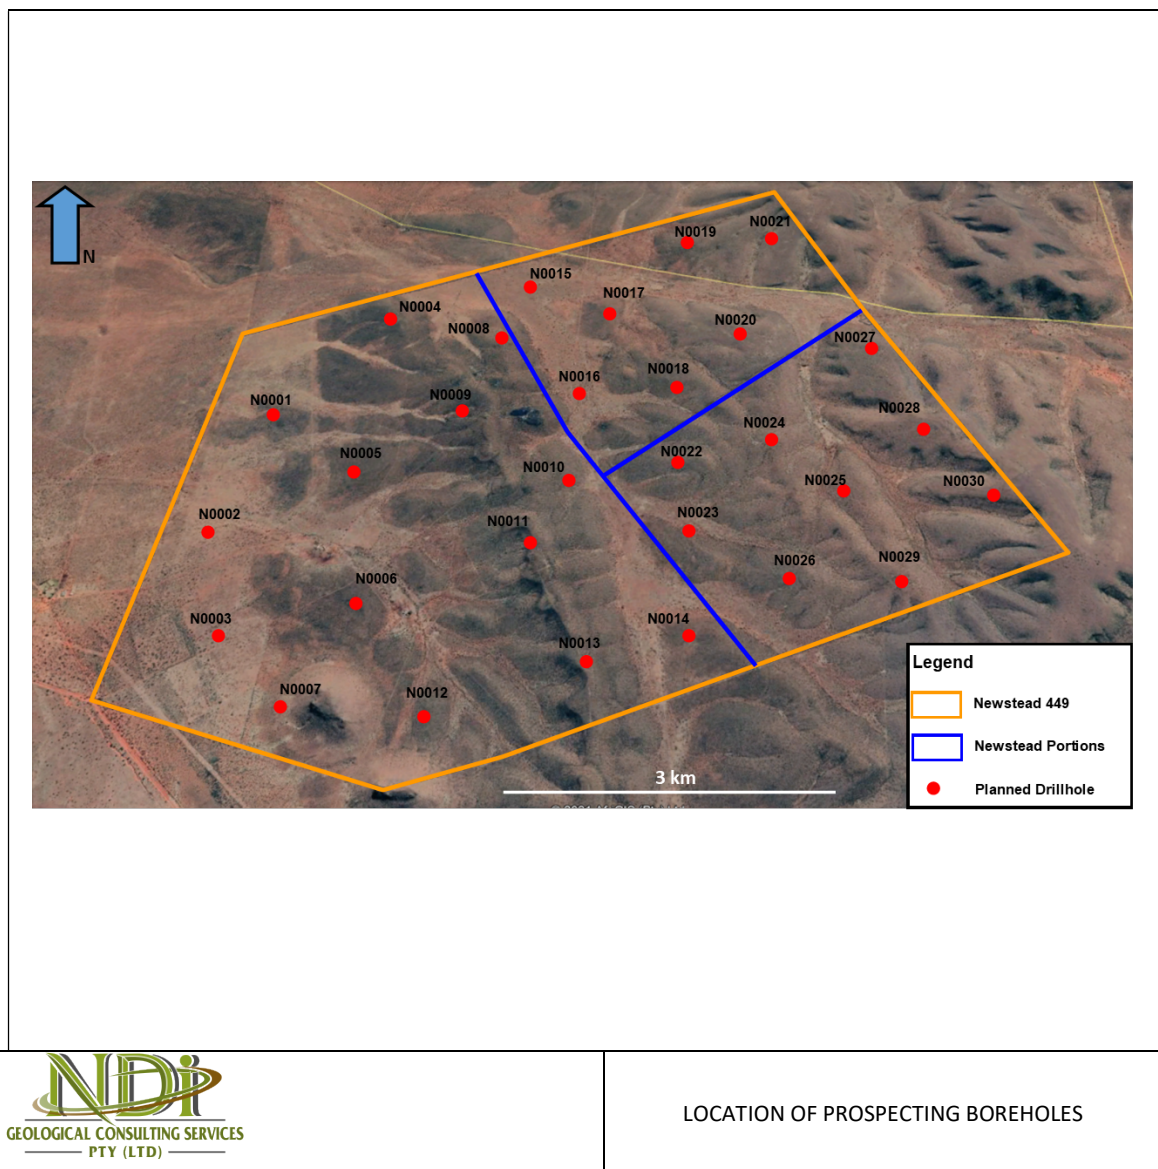

RC drilling involves the process of crushing the rock material into fragments. Using air pressure, the rock fragments are lifted up the hole into the cyclone where they are collected into sample bags. A rifle splitter is used to homogenize the sample and to split it into two. The weights of the samples are recorded. Part of the one sample is washed and placed into a labelled chip tray after logging by the Field Geologist. This sample is stored for future reference. The remainder of the logged sample is

labelled while still in the sample bag and taken to an accredited laboratory for analysis. Detailed geological, grade resource models and mineral resource estimates will be the result of this phase.

The plan is to drill five (5) diamond core holes for petrological studies. Diamond drill boreholes will be split and quartered where assaying is warranted. One quarter will be dispatched to the assay lab, one quarter kept for a permanent record, and the halves utilized for petrological studies.

Borehole collars will be covered by labelled slabs, and the position measured by GPS (Figure 7-1).

Each drill borehole and sample site will be rehabilitated as prospecting proceeds.

**Figure 7-1: Prospecting Boreholes Location**

## **7.4 Phase 3: Analytical Desktop Studies and Decision Making:**

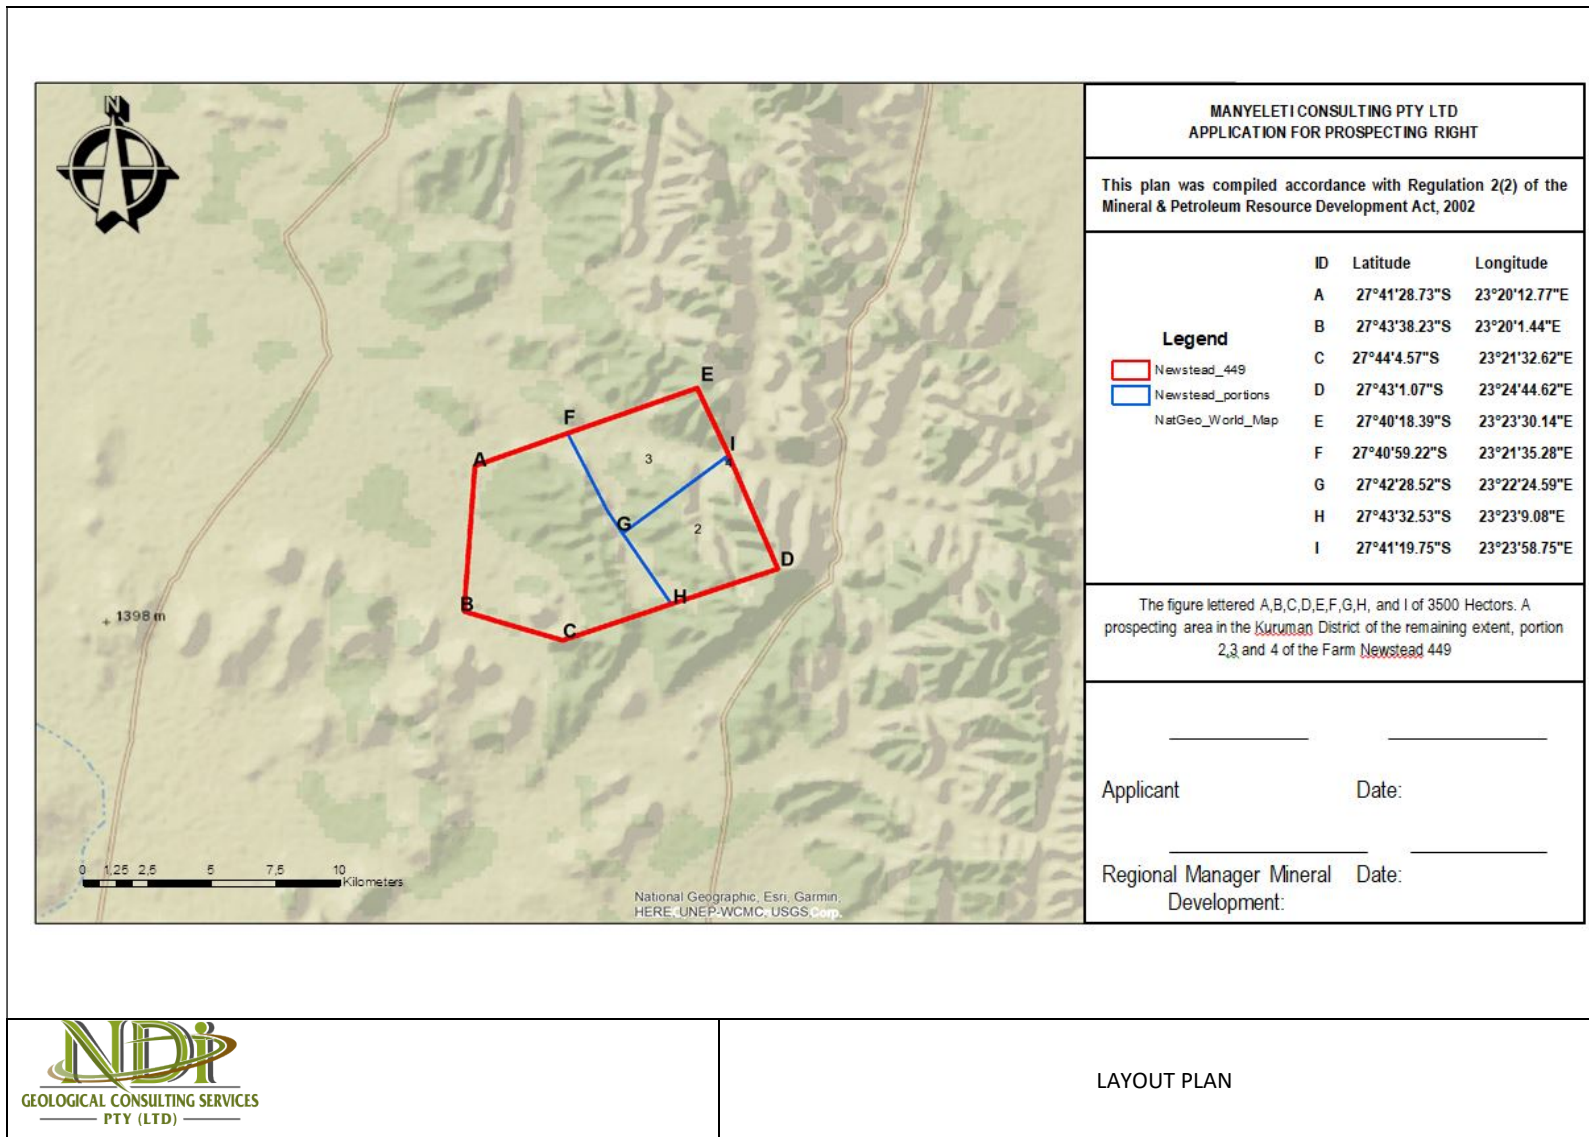

Depending on the results of Phase 2, the project geologist will monitor the programme, consolidate, process the data and amends the programme. This is a continuous process throughout the programme and continues even when no prospecting is done on the ground.

Every physical phase of prospecting is followed by desktop studies involving interpretation and modelling of all data gathered. These studies will determine the way the work programme is to proceed in terms of activity, quantity, resources, expenditure and duration (Table 7-1).

A GIS based database will be constructed capturing all exploration data. Figure 7-2 shows the layout plan of the prospecting right area.

**Table 7-1: Project Phases and Requirements**

| Phase              | Activity<br><small>(what are the activities that are planned to achieve optimal prospecting)</small>  | Skill(s) required<br><small>(refers to the competent personnel that will be employed to achieve the required results)</small> | Timeframe<br><small>(in months) for the activity)</small> | Outcome<br><small>(What is the expected deliverable, e.g., Geological report, analytical results, feasibility study, etc.)</small> | Timeframe for outcome<br><small>(deadline for the expected outcome to be delivered)</small> | What technical expert will sign off on the outcome?<br><small>(e.g., geologist, mining engineer, surveyor, economist, etc.)</small> |

LAYOUT PLAN

Figure 7-2: Layout Plan showing the location and area of the Prospecting Rights Area

## 7.5 Listed and specified activities

Section 16 of the MPRDA requires, upon request by the Minister that an Environmental Management Programme (EMPr) be submitted, and that the applicant must notify and consult with Interested and Affected Parties (I&APs). Section 24 of the NEMA requires that listed activities, which may potentially affect the environment negatively, must obtain an environmental authorisation from a relevant authority before the activities may commence.

Such activities are listed under the EIA Regulations (2014 which has been amended in 2017) and consist of:

- EIA Process (Government Notice Regulation (GNR) 982);
- Listing Notice 1 GNR 983 – Basic Assessment process,
- Listing Notice 2 GNR 984 – Scoping and EIA process;
- Listing Notice 3 GNR 985 – Activities in specific identified geographical areas only.

GNR 982, 983, 984 and 985 have been amended in 2017 through GNR 324, 325, 326 and 327, respectively.

The purpose of these regulations is to avoid negative impacts on the environment, and where these cannot be avoided, ensure the mitigation and management of the impacts to acceptable levels, while optimising positive environmental impacts.

The proposed prospecting activity triggers activities listed in NEMA GNR 983: Listing Notice 1 as follows:

Activity 20: “Any activity including the operation of that activity which requires a prospecting right in terms of Section 16 of the Minerals and Petroleum Resources Development Act, 2002 (Act 28 of 2002), including associate infrastructure, structures and earthworks, directly related to prospecting of a mineral resource...”

It is noted that no activities will be undertaken within 32 metres of a watercourse.

A summary of the identified NEMA listed activities that will be triggered by the prospecting project is provided in Table 7-2.

**Table 7-2: Applicable Activities**

| Name of the activity (All activities including activities not listed)  | Aerial extent of the activity in Ha or m <sup>2</sup> | Listed activity mark with an x where applicable or affected | Applicable listing notice (GNR 983, GNR 984 or GNR 985 or NOT LISTED)   |
|--|---|---|---|
| Any activity including the operation of that activity which requires a prospecting right in terms of section 16 of the Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002), including associated infrastructure, structures and earthworks, directly related to prospecting of a mineral resource, including activities for which an exemption has been issued in terms of section 106 of the Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002). | 3500 ha   | X   | GNR 983 as amended by GNR 327, Listing 1, Activity 20                   |

## **7.6 Activities to be undertaken.**

### **7.6.1 Prospecting**

Please refer to Sections 7.1 to 7.3 for a detailed description of the prospecting activities to be undertaken.

### **7.6.2 Establishment of Temporary Access Roads**

Temporary roads will be opened where necessary but will not exceed 300m<sup>2</sup> in size.

### **7.6.3 Power**

Diesel powered vehicles and machinery will be used for the proposed project.

### **7.6.4 Water Supply**

The plan is that water will be brought onto site and trucked to the identified drill sites. Water bowsers will be deployed to the sites as and when required.

RC drilling in general does not require water. Additional water requirements relate to the potable water supply for diamond drilling of 5 holes and prospecting personnel.

### **7.6.5 Ablution Facilities**

Portable chemical toilets will be used for the management of sewage waste generated on site.

### **7.6.6 Temporary Site Office Area**

There will not be a need for a site office, equipment for logging such as chip and core trays, logging sheets, papers, pens and trays will be transported to and from site daily.

### **7.6.7 Blasting**

Bulk sampling is not included in the Prospecting Works Programme; therefore, no blasting will take place.

### **7.6.8 Waste Management**

#### **Hazardous Waste**

Hazardous waste to be generated includes mineral residue, hydrocarbon wastes (oil and liquid fuel wastes) and sewage waste. Hydrocarbon waste will be collected in drums for storage. The removal of the drums or any other appropriate receptacle will be undertaken by a registered waste disposal company, for disposal at a registered licensed waste disposal site. The drums will be placed on protected ground.

Mineral residue will include muds and drilling chips generated during the drilling of the exploration boreholes. The mineral residue will be removed from the site and disposed of at a registered waste disposal site.

Oil waste and liquid fuel waste include used oils from mine machinery and vehicles and diesel/petrol waste.

#### **General Waste**

General waste to be generated from the proposed project area will include domestic waste which includes food containers, smoked cigarette. These will be collected daily to be disposed of at a registered domestic waste disposal site.

**Storage of Dangerous Goods (Hydrocarbons)**

No diesel fuel, oil and lubricants will be stored on site. These will be transported daily or when required.

**7.6.9 Topsoil Stockpiling**

Topsoil removed during the construction phase will be stockpiled for later use in the rehabilitation process.

**7.6.10 Vegetation Clearance**

Vegetation clearance will be necessary where prospecting and construction activities will be taking place. This will be done only in areas where it is required, unnecessary vegetation clearance will be discouraged.

**7.6.11 Ablution Facility**

The site staff and the workers residing on site will make use of the provided ablution facilities.

**7.6.12 Vehicle Parking**

A demarcated parking area for staff vehicles and other vehicles working on the project will be provided.

**7.6.13 Contractors Camp**

Contractors working on the Newstead Project will stay on site for the duration of the project. The structure will be temporary and will be demolished at the end of the project. The camp will be erected near the road to avoid opening unnecessary roads and for ease of accessibility.

## 8 Policy and legislative context

Table 8-1 provides a summary of the applicable legislation, policies and guidelines identified as relevant to the proposed project. In addition, a description of how the proposed activity complies with and responds to the legislation and policy context, is provided. This list is not exhaustive but rather represents an indication of the most applicable pieces of legislation relevant to the project.

**Table 8-1: Applicable legislation, policies and guidelines**

| <b>APPLICABLE LEGISLATION AND GUIDELINES USED TO COMPILE THE REPORT</b>                     | <b>REFERENCE WHERE APPLIED</b>  | <b>HOW DOES THIS DEVELOPMENT COMPLY WITH AND RESPOND TO THE LEGISLATION AND POLICY CONTEXT</b>   |
|---|---|--|
| Mineral and Petroleum Resources Development Act, 2002 (Act 28 of 2002) (MPRDA) (As amended) | Application for Prospecting in terms of Section 16  | A prospecting right application was submitted and DMR accepted it on 29 January 2021.  |
| National Heritage Resources Act, 1999 (Act 25 of 1999) (NHRA)                               | The project may trigger the requirements under Section 38 of the NHRA. However, the requirements for the permits have not yet been established. | The Environmental Management Programme (EMPr) will regulate the applicant to apply for tree removal permits from the South African Heritage Resources Agency (SAHRA) prior to removal or relocation of any heritage resources.<br><br>The BAR and EMPr will also be submitted to the SAHRA through the South African Heritage Resources Information System (SAHRIS) to determine whether any permits will be required.   |
| National Environmental Management Act, 1998 (Act 107 of 1998) (NEMA)                        | This Basic Assessment Report (BAR) and Environmental Management Plan (EMP)  | An application for an Environmental Authorisation was submitted to the DMR. The BAR and EMPr will be submitted to the DMR once finalised and have been subjected to a public participation process as required by Chapter 6 of the NEMA.   |
| National Environmental Management: Biodiversity Act, 2004 (Act 10 of 2004) (NEM:BA)         | The possibility of the presence of protected flora  | The EMPr will regulate the applicant to apply for tree removal permits prior to removal of any sensitive and/or protected species.   |
| National Water Act, 1998 (Act 36 of 1998) (NWA)   | Sampling and drilling site establishment within 100 m of a watercourse or 500m of a wetland   | The South African National Biodiversity Institute (SANBI) National Wetlands database shows that there are no wetlands in the prospecting area. There are also watercourses and drainage lines that may be affected by the project. In terms of the NWA, any activities undertaken within 500 m of a wetland or within 100 m of a watercourse require a Section 21 (c) and (i) Water Use Licence (WUL). Should the impacts of the activities be of low significance, the activities may also be Generally Authorised (GA).<br><br>Clarification is required from the DWS on whether a WUL or GA will be required. |

| ZF Mgcawu Spatial Development Framework (SDF)                    | Alternatives            | There are no identified land claims in the proposed prospecting area.                   |

## 9 Need and Desirability.

Although the GDP contribution of the mining industry has gone down over the years, it is still one of the major contributors to the South African economy. More resources need to be identified to keep up with the demand for iron ore, manganese and diamond. For that reason, prospecting for these minerals is the first step to identifying these resources.

The activity of prospecting itself will not bring many benefits to the community, nonetheless it will determine the geology and the mineralisation in size and grade. Should the prospecting determine that mining of the interested minerals is feasible, preparations for mining a mining right application will have to be initiated. Mining will lead to job creation for the community and make use of local businesses when in need of services related to mining. This way, the local economy is boosted and eventually that of the region and country. Prospecting is important in also determining the possibility of expanding the already existing mining projects.

Evaluation of the geological information available has determined that the area in question may have good quality iron ore, manganese and diamond resources. To ascertain the above and determine the nature, location and extent of the reserves within the proposed prospecting area, it will be necessary that prospecting be undertaken. The prospecting will also determine if there are any features that may have an impact on the economic extraction of the iron ore, manganese and diamond.

Data to be obtained from the prospecting to be undertaken will be necessary to determine, should iron ore, manganese and diamond be found, how and where the minerals will be extracted and how much economically viable reserves are available within the proposed prospecting area.

Should good quality iron ore, manganese and diamond be found in the project area, Manyeleti will be able to mine the available reserves. This will result in job creation and boost to local businesses is continued.

A process that ensures consultation with Interested and Affected Parties (I&APs) for the project is being undertaken. The stakeholder engagement process is being conducted is a way to provide all interested and affected parties with an opportunity to comment on the project, with several platforms that allow public commenting opportunities to be offered to the I&APs. All issues raised by the interested and affected parties will be recorded and addressed in the BAR and EMPr.

## 10 Motivation

### 10.1 Preferred Site

The site was chosen based on its potential for iron ore, manganese and diamond which in turn is based on the geology of the farm, which comprise brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology. Banded ironstone with bands of amphibolite and lenses of flat-pebble conglomerate in places, crocidolite and tuff is observed to the east forming the eastern boundary of the property. The rest of the farm is covered by white to flesh coloured windblown sand. Desktop studies which took into consideration the existing historical data of proposed project location, has indicated the potential for iron ore, manganese and diamond on the application area. The other reason was that the area was available for prospecting , there were no existing rights for the same minerals which Manyeleti is applying for.

### 10.1.1 Regional Geology

The farm is underlain by Kuruman and Griquatown iron-formations, which constitute the Asbesheuwels Subgroup of the Ghaap Group of the Transvaal Supergroup in the Northern Cape Province (Beukes, 1978) and extend over some 500 km along a north-south strike. The Kuruman Ironformation follows conformably on the carbonate rocks of the Campbellrand Subgroup and is in turn overlain by the Griquatown Iron-formation. South of the Griquatown fault zone the latter grades upwards into siliciclastic rocks of the Koegas Subgroup. The bulk of the crocidolite asbestos produced in South Africa comes from the Kuruman Iron-formation and the remainder from the Griquatown Iron-formation. It is known that these deposits are stratabound (Cilliers, 1961; Hanekom, 1966; Fockema, 1967; Welch, 1969; Beukes, 1973). Detailed stratigraphic knowledge of the iron-formations is therefore of importance to the asbestos mining industry.

The iron ore deposit at Sishen Mine is one of several outcrops of the Campelrand Subgroup at Kuruman. Diamond mining in most places is associated with the carbonate rocks.

Formation of bedded manganese deposits in the Kuruman area, South Africa, is attributed to near-surface enrichment by circulating meteoric waters of a slightly manganiferous limestone zone intercalated in late Precambrian banded ironstones of the upper Griquatown series.

### 10.1.2 Local Geology

In a more localised scale, the geology of the proposed application is covered by Brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology (Vad). Banded ironstone with bands of amphibolite and lenses of flat-pebble conglomerate in places, crocidolite and tuff (Vak) is observed to the east forming the eastern boundary of the property. Red to flesh coloured windblown sand also forms part of the geology (Qs) is all over the property. Small bands of diamictite, banded jasper, siltstone, dolomite with chert and graywacke (Vm) towards the west of the farm are noticeable trending in a north-south direction. A small portion of amagdaloidal andesite lava with interbeds of tuff, agglomerate, chert and red jasper (Vo) is flanked by diamictite, banded jasper, siltstone, dolomite with chert and graywacke (Vm). The geology of the application area is shown in Figure 10-1.

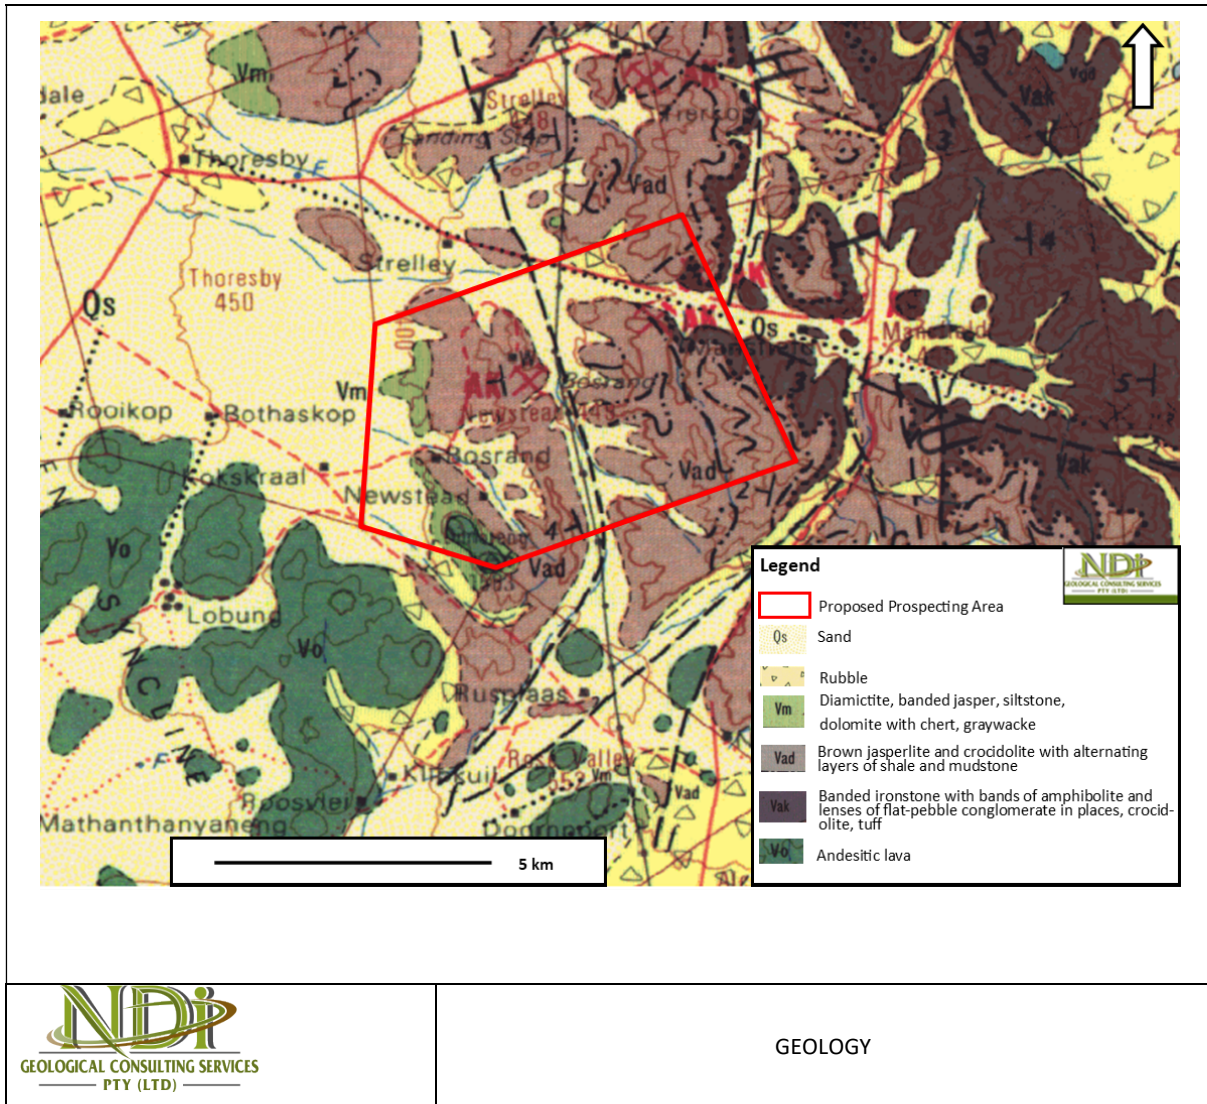

Figure 10-1: Geology of the Prospecting Area

### 10.2 Technologies

Due to the nature of the proposed prospecting activities, future land use alternatives will not be compromised. Once the viable reserve has been confirmed, a comprehensive social and environmental impact assessment will be required (according to legislation), during which alternative land use to mining of the aggregate stone will be investigated.

Drilling is still considered the best way to effectively achieve the resource evaluation process. There is a proof of long-term success in prospecting. The prospecting activities proposed in the Prospecting Works Programme are dependent on the preceding phase (desktop studies), therefore no alternatives have been indicated. The location of the intrusive drilling activities has been determined as provided in Figure 7-1. All infrastructure will be mobile.

### 10.3 Design/Layout

Since no complicated surface infrastructure will be required for this project no design and layout alternatives for the proposed project were determined.

## **11 Full description of the process followed to reach the proposed preferred alternatives within the site.**

Phase 2 of the prospecting activities will be dependent of the results of the preceding phase. The location and extent of the drilling sites cannot be determined at this stage, therefore comprehensive mapping of the specific prospecting activity site could not be undertaken at this stage. For the purposes of this report, the overall prospecting site is presented in Figure 7-2 and location of the drilling boreholes presented in Figure 7-1.

The stakeholder consultation process has not been finalised at this stage, and therefore the comments raised by the I&APs have not been incorporated in this section. This will be updated as part of the final report.

### **11.1 Details of the Development Footprint Alternative Considered**

The property to which the application relates has potential for iron ore, manganese and diamond mineralisation due to the nature of the geology in the area and it has no other existing rights (right to prospect iron ore, manganese and diamond) belonging to another company.

The proposed area is underlain by brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology (Vad). Banded ironstone with bands of amphibolite and lenses of flat-pebble conglomerate in places, crocidolite and tuff (Vak) is observed to the east forming the eastern boundary of the property. Red to flesh coloured windblown sand also forms part of the geology (Qs) is all over the property. Small bands of diamictite, banded jasper, siltstone, dolomite with chert and graywacke (Vm) towards the west of the farm are noticeable trending in a north-south direction. A small portion of amagdaloidal andesite lava with interbeds of tuff, agglomerate, chert and red jasper (Vo) is flanked by diamictite, banded jasper, siltstone, dolomite with chert and graywacke (Vm). The site is therefore regarded as the preferred site and alternatives are not considered.

#### **11.1.1 The type of activity to be undertaken.**

Prospecting is a requirement before a company can engage into mining. This has proven to be successful for many years. For these reasons, no alternatives were considered. The activity will be conducted in phases. The physical phase of the Prospecting Works Programme will be dependent on the findings of Phase 1 of the process. Phase 1 will entail a desktop study and geological mapping. Phase 2 will consist of drilling of both RC and diamond core, metallurgical sampling. The last phase will be a pre-feasibility study.

#### **11.1.2 The design or layout of the activity**

The infrastructure to be erected will be temporary. There will be no need for a site office. All the equipment needed will be transported daily. A contractor's camp will be erected on site since travelling from the closest town will be costly. Existing roads will be used as far as practically possible. New roads will also be opened where necessary. There will be a need for a stockpile area where topsoil will be temporarily stored before it can be used again during rehabilitation. There will be an area demarcated for vehicle parking of the staff and other machinery working on site. The contractors residing on site as well as the site staff will need to use the toilets. These will be provided on site and will be mobile in nature. The contractor's camp will be erected next to a road in order to avoid opening unnecessary roads.

The location of the infrastructure will be determined based on the location of the prospecting activities, which will only be determined during Phase 1 of the Prospecting Works Programme, as well as the presence of sensitive environmental attributes such as wetlands, watercourses, protected flora and graves. All infrastructure will be mobile (Refer to Section 7.6 of this report).

### **11.1.3 The technology to be used in the activity.**

The proposed technologies have been chosen based on long term proven success in prospecting. This technology will be in the form of drilling machines and vehicles transporting staff and general equipment required in the drilling activity.

### **11.1.4 The operational aspects of the activity**

No permanent services in terms of water supply, electricity, access routes and or sewage facilities will be required. The activities will commence with Phase 1, during which desktop studies will be conducted. After the desktop studies, geological mapping will be undertaken. This phase will also include planning for the drilling survey.

Phase 2 will entail the invasive prospecting drilling campaign where the extent of mineralisation will be defined, and the geological continuity of the mineralised zone will be determined. Numerous samples will be collected and tested in a registered laboratory.

Phase 3 of the process will entail desktop studies involving interpretation and modelling of all data gathered. These studies will determine the way the work programme is to proceed in terms of activity, quantity, resources, expenditure and duration.

### **11.1.5 The option of not implementing the activity.**

Should prospecting not be conducted, the result will be a loss in valuable information regarding the mineral status of the iron ore, manganese and diamond present on the affected properties. In addition to this, should economical reserves be present, and the applicant does not have the opportunity to prospect, the opportunity to utilise the reserves will be lost.

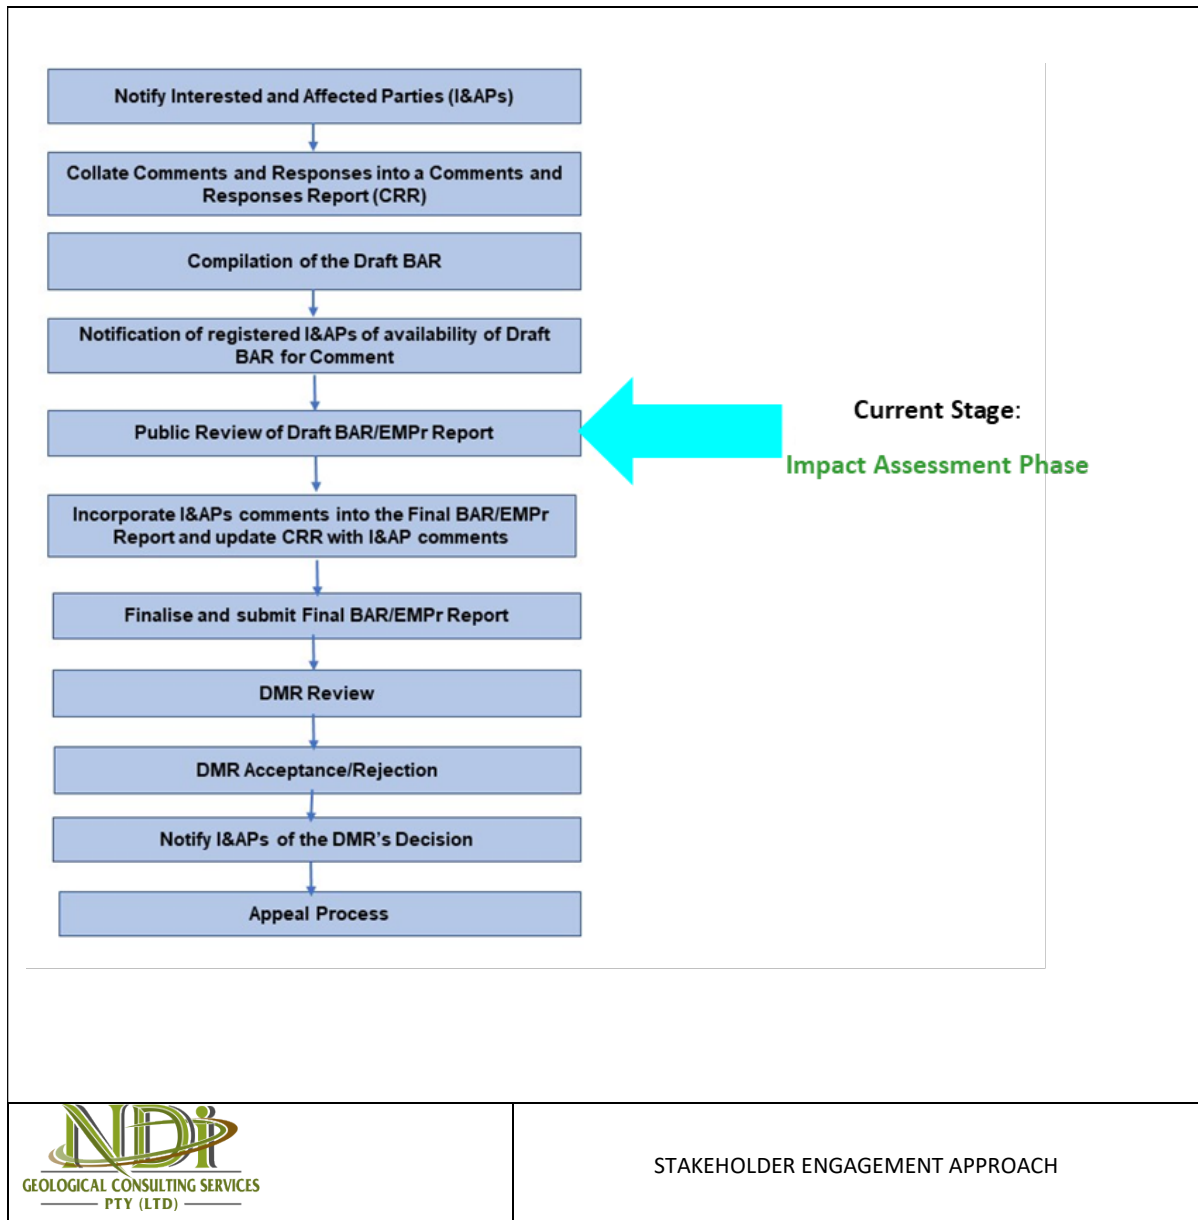

## **11.2 Details of the Public Participation Process Followed**

The Public Participation Process (PPP) was conducted in terms of Chapter 6 of the National Environmental Management Act, 1998 (Act 107 of 1998).

The stakeholder engagement process forms an important part of the impact assessment process. The stakeholder engagement process is primarily aimed at affording I&AP's the opportunity to gain an understanding of the proposed project. In addition, the purpose of consultation with the landowners, key stakeholders, and I&AP's is to provide them with the necessary information about the proposed project so that they can make informed decisions as to whether the project will affect them and provide the EIA team with local knowledge of the area and raise concerns relating to the biophysical, socio-economic and cultural impacts that may arise.

The stakeholder engagement process is conducted in terms of NEMA, which provides clear guidelines for stakeholder engagement during an EIA. Chapter 1 of the NEMA outlines the principles of environmental management, several pertaining to public consultation (e.g., Chapter 1, subsections (2), (3), (4) (f), (g), (h), (k), (q) and (r). Chapter 6, Regulations 39 – 44 of the amended EIA Regulations GNR) 982, promulgated on 8 December 2014, specify the minimum requirements for stakeholder engagement in an EIA process conducted under the NEMA. In 2017, the Minister of Environmental Affairs published, in terms of Section 24J of the NEMA, Public Participation Guidelines which guide the Public Participation Process (PPP) in order to give effect to Section (2)(4)(f), (o) and 24 (1A) (C) of the NEMA.

Figure 11-1 provides a summary of the stakeholder engagement process followed for the proposed project.

**Figure 11-1: Summary of the Stakeholder Engagement Process followed**

The stakeholder engagement process has incorporated all the above guidelines. This application will be submitted to the DMR for authorisation as the competent authority. Identified commenting authorities on this application include:

- DWS – Regional Office;
- SAHRA – Provincial;
- Tsantsabane Local Municipality;
- ZF MGCAWU District Municipality; and
- Northern Cape Department of Nature Conservation (DENC)).

All stakeholder engagement documents have been included in Appendix 4.

### 11.2.1 Stakeholder Identification Interested and Affected Parties

An I&APs register was developed using information from the surveyor general's office and from stakeholders that responded to the project announcement that was conducted through placement of newspaper advertisements, on-site notices and notification letters sent to the adjacent and affected landowners.

The I&APs register will be maintained for the duration of the study where the details of stakeholders are captured and automatically updated upon communication to the EAP. The identification, registration, and comments from I&APs will be an on-going activity.

The affected properties are provided in Table 11-1.

**Table 11-1: List of Affected Farm and Farm Portions**

| Farm         | Portions         | 21 Digit Survey General Code |
|--------------|------------------|------------------------------|
|              | Remaining Extent | C0410000000044900000         |
| Newstead 449 | Portion 2        | C0410000000044900002         |
|              | Portion 3        | C0410000000044900003         |
|              | Portion 4        | C0410000000044900004         |

A map of the affected and adjacent farm portions and farm portions of the site are illustrated in Figure 11-2.

**Figure 11-2: Affected and Adjacent Properties**

### 11.2.2 Project Announcement

Stakeholders were informed of the proposed prospecting project as well as Manyeleti's intention to undertake the required and environmental processes and EA application through various methods. Stakeholders were provided with the opportunity to participate and register as I&AP's during the announcement phase of the project.

- Distribution of Notification Letters: Notification letters were sent to identified I&APs on 18 April 2021, informing them of the proposed project.
- Site Notice Placements: Sites notice boards (Size A2: 600 mm X 420 mm) notifying stakeholders and I&APs of the proposed prospecting were placed at conspicuous places in the project area. Newspaper advertisements notifying stakeholders about the proposed project and the opportunity to participate in the EIA process were placed in the Kathu Gazette and Noordkaap Bulletin newspapers on 24 April 2021.

### 11.3 Public Review of the Draft Basic Assessment Report

All comments received during the announcement phase of the stakeholder engagement process will be incorporated into Draft BAR and collated into a Comments and Responses Report (CRR) which will form an appendix to the draft BAR.

The availability of the Draft BAR was announced by means of SMSes, letters and emails and newspaper advertisement to registered I&APs.

The Draft BAR was compiled in terms of the requirements of GNR 326. Copies of the draft BAR will be made available at the venues listed in Table 11-2.

**Table 11-2: List of places the Draft BAR will be place for public review.**

| Public Place                    | Locality  | Telephone    |
|---------------------------------|---|--------------|
| Ndi Geological Services Website | <a href="http://www.ndigeoservices.co.za/">http://www.ndigeoservices.co.za/</a> | 053 842 0687 |

The draft BAR will also made available to the competent and commenting authorities during the 30-day review and comment period.

### 11.4 Stakeholder Consultation Meeting

Due to the Covid-19 EIA Regulations (GNR 650) that were promulgated on 5 June 2020, no face-to-face meetings will be conducted with stakeholders. Stakeholders are however welcome to call or email the EAP on the contact details above to discuss the findings of the impact assessment process.

### 11.5 Summary of Issues Raised by I&APs

Table 11-3 provides a summary of the comments received to date following the newspaper adverts, site notices, written notification of the project and the Draft BAR review period.

**Table 11-3: Summary of issues raised by Interested and Affected Parties**

# 12 Environmental Attributes Associated with the Alternatives

## 12.1 Baseline Environment

### 12.1.1 Geographical

The proposed project area is situated in the Tsantsabane Local Municipality (TLM) area of jurisdiction, within the ZF Mgcawu District Municipality (ZFMD), Northern Cape Province. The affected property is located approximately 30.3 km south of Kuruman.

### 12.1.2 Topography

The topography in the area is characterised by ridges which trend in a north-south direction with varying altitudes of between 1380m and 1605m. The area has occasional narrow and shallow non-perennial watercourses. There are no major river courses around the area. Figure 12-1 presents the topography of the study area.

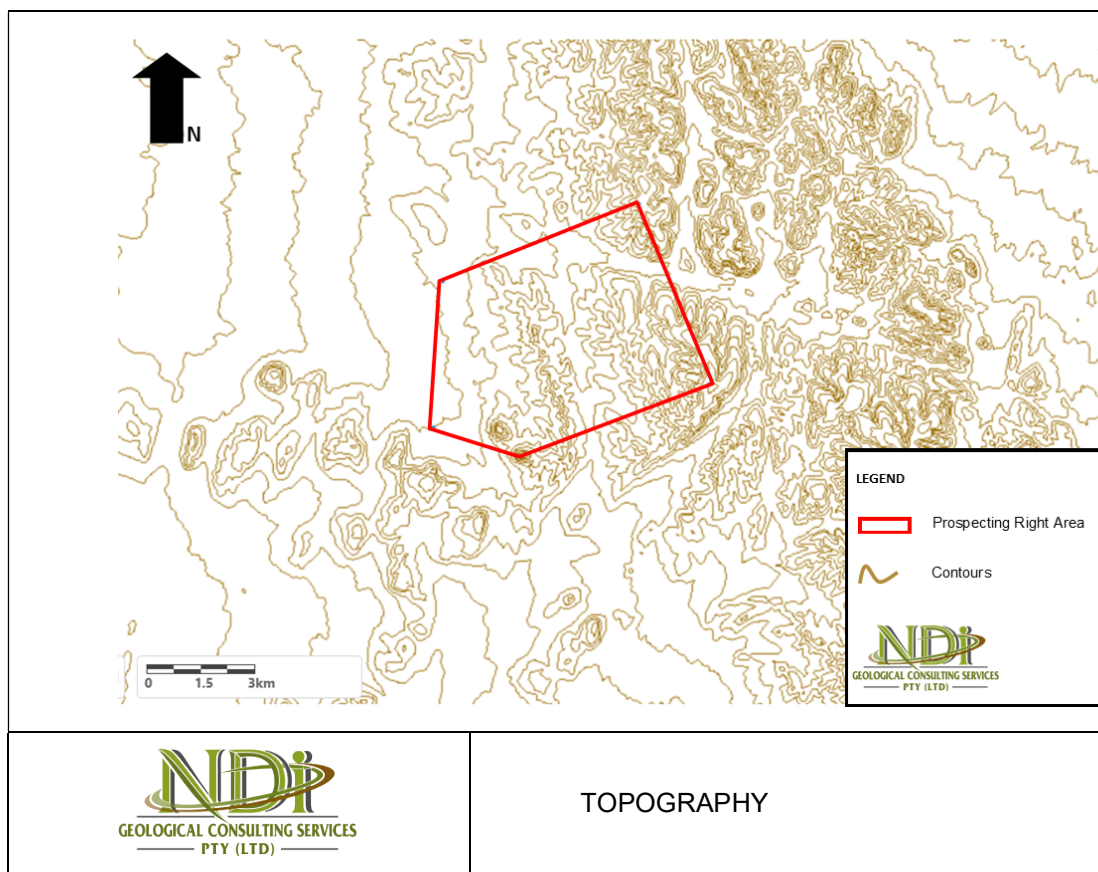

Figure 12-1: Topography of the Prospecting Right Area

### 12.1.3 Climate

The Northern Cape is known for its extreme climate conditions and the ZF Mgcawu District Municipal area is by no means an exception to the rule. The weather data for ZF Mgcawu

Municipality is obtained from weather stations at Augrabies Falls, Postmasburg, Twee Rivieren, Upington and Van Zylsrus. The Northern Cape is characterised by a harsh climate and many more Rainfall and prolonged droughts. This added climate is accompanied by high evaporation due to the intense heat of the dry summer months. (Mukheibir, 2007).

As shown in Figure 12-2, Kuruman has the semi-arid climate prevailing. It is warm to hot all year round and trees do not grow here because of the drought. It consists mainly of sand with grasses and sometimes shrubs. The average annual temperature for Kuruman is 25° degrees and there is about 353 mm of rain in a year. It is dry for 215 days a year with an average humidity of 52% and an UV-index of 5.

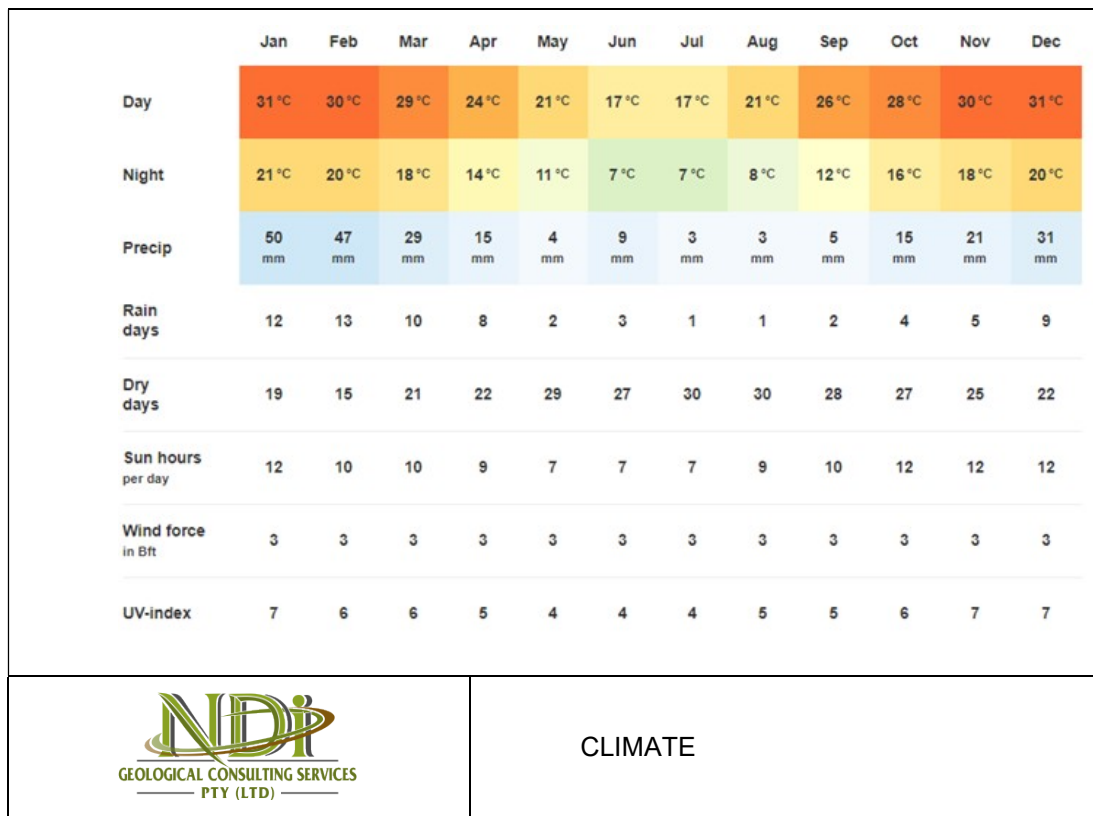

Figure 12-2: Site Climate

### 12.1.4 Geology

The proposed prospecting area falls geologically within the Kuruman and Griquatown iron-formations, which constitute the Asbesheuwels Subgroup of the Ghaap Group of the Transvaal Supergroup in the Northern Cape Province (Beukes, 1978) and extend over some 500 km along a north-south strike. The Kuruman Ironformation follows conformably on the carbonate rocks of the Campbellrand Subgroup and is in turn overlain by the Griquatown Iron-formation. South of the Griquatown fault zone the latter grades upwards into siliciclastic rocks of the Koegas Subgroup. The bulk of the crocidolite asbestos produced in South Africa comes from the Kuruman Iron-formation and the remainder from the Griquatown Iron-formation. It is known that these deposits are stratabound (Cilliers, 1961; Hanekom, 1966; Fockema, 1967; Welch, 1969; Beukes, 1973). Detailed stratigraphic knowledge of the iron-formations is therefore of importance to the asbestos mining industry.

The iron ore deposit at Sishen Mine is one of several outcrops of the Campelrand Subgroup at Kuruman. Diamond mining in most places is associated with the carbonate rocks.

Formation of bedded manganese deposits in the Kuruman area, South Africa, is attributed to near-surface enrichment by circulating meteoric waters of a slightly manganiferous limestone zone intercalated in late Precambrian banded ironstones of the upper Griquatown series.

In a more localised scale, the geology of the proposed application is covered by brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology (Iron Formation). Red to flesh coloured windblown sand also forms part of the geology (Sand, Limestone) is all over the property. Small bands of diamictite, iron formation and arenite are observed towards the west of the farm are noticeable trending in a north-south direction. See Figure 12-3.

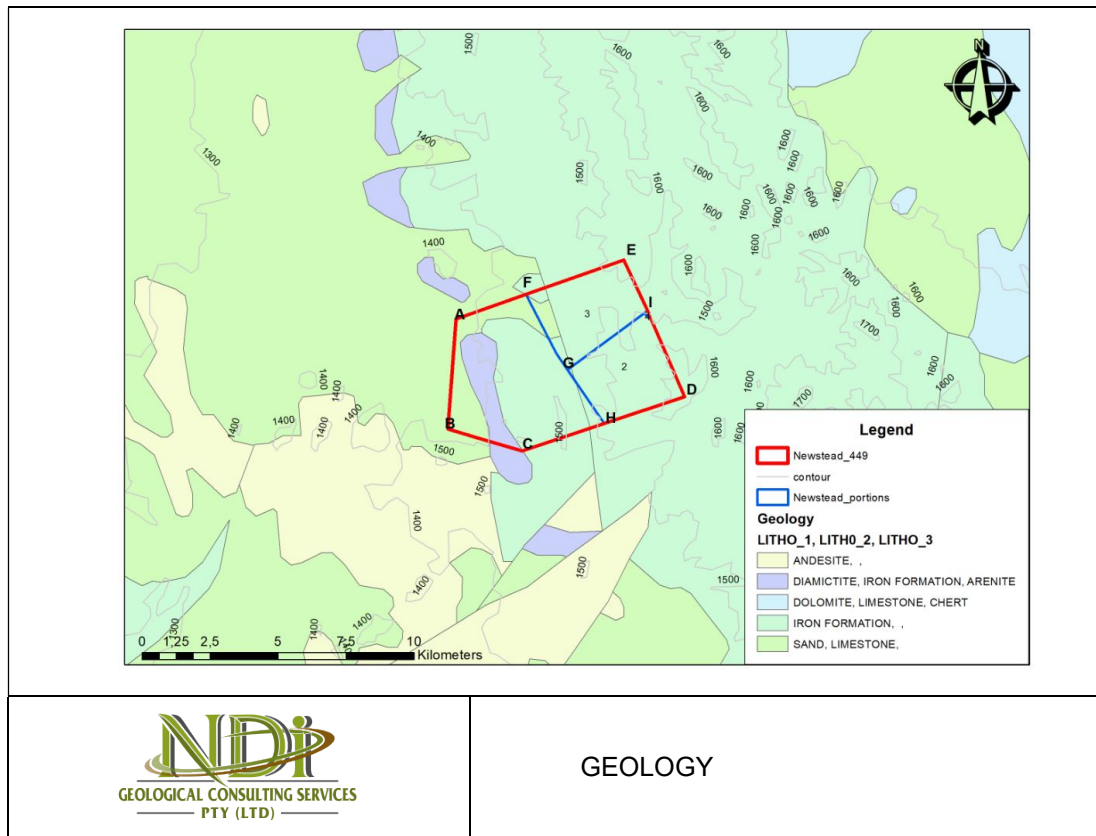

Figure 12-3: Geological Map

### 12.1.5 Water Resources

The three main rivers in the ZFMDM are the Orange, Hartbees and Molopo Rivers. The Orange River is under severe pressure from agriculture and the encroachment of alien vegetation. The other main rivers in the study area include: Kaboep; Tuins; Gamagara rivers. All rivers in the ZFMD, except the Orange River, are non-perennial rivers. There are no significant dams on the Orange River in the ZFMD. Several containment dams such as Boegoeberg (Groblershoop), Neusberg (Kakamas) and Rooiberg (Kenhardt) help to serve the agricultural areas. Water Management Areas and Quaternary Catchment Area covering the proposed project area.

### 12.1.6 Surface Water (river)

The Kuruman River originates east of Kuruman where it receives water from several springs of which the Great Koning Eye, Little Koning Eye and the Kuruman Eye are the largest. The confluence of the Kuruman River with the Molopo River is situated upstream of the project

area. The Kuruman River and the Ga-Mogara River are non-perennial. It only flows for short periods of time after sufficient rainfall. The nearest river system is a tributary of the Kuruman River located approximately 21.4 km to the north east of the north eastern portion of the project footprint, with the Kuruman River itself located approximately 3,7km from the project footprint. The Kuruman River as well as the tributary are ephemeral watercourses indicated to be within a Class B (largely natural) PES (NFEPA, 2011). The Ga-Mogara River with its associated tributaries is located approximately 4 km to the south of the south western portion of the project footprint.

### **Dams:**

Within the region there are no significant dams on the Orange River. There are however various containment dams from which water for irrigation or urban settlement is diverted through canals. Examples of these are Boegoeberg Dam near Groblershoop and the Neusberg Dam near Kakamas. The Rooiberg Dam at Kenhardt is fed by the Hartbees River and is sometimes empty because of the inconsistency of the river flow. In the north of the region is the Leeubos Dam in the Swartbees River.

Although the amount of silt in the Orange River has decreased since the construction of the Gariiep Dam, the Boegoeberg Dam was already covered by silt before the building of the Gariiep Dam.

### **Surface Water (rainfall):**

Upington, situated in the centre of the region, has an average annual rainfall of 189mm, which falls mainly between September and March. The average annual evaporation is 3400 mm pa. The quality of the rainwater is good since there is no significant air pollution in the area which could result in acid rain.

Figure 12-4 shows the National River network within and in the vicinity of the study area. The affected property is not characterised by surface water sources but rather characterised by mostly dry water courses and in addition to the fact that the proposed project will only involve drilling and not trenching or pitting, it is envisaged that there will be insignificant impact on the aquatic life, if any.

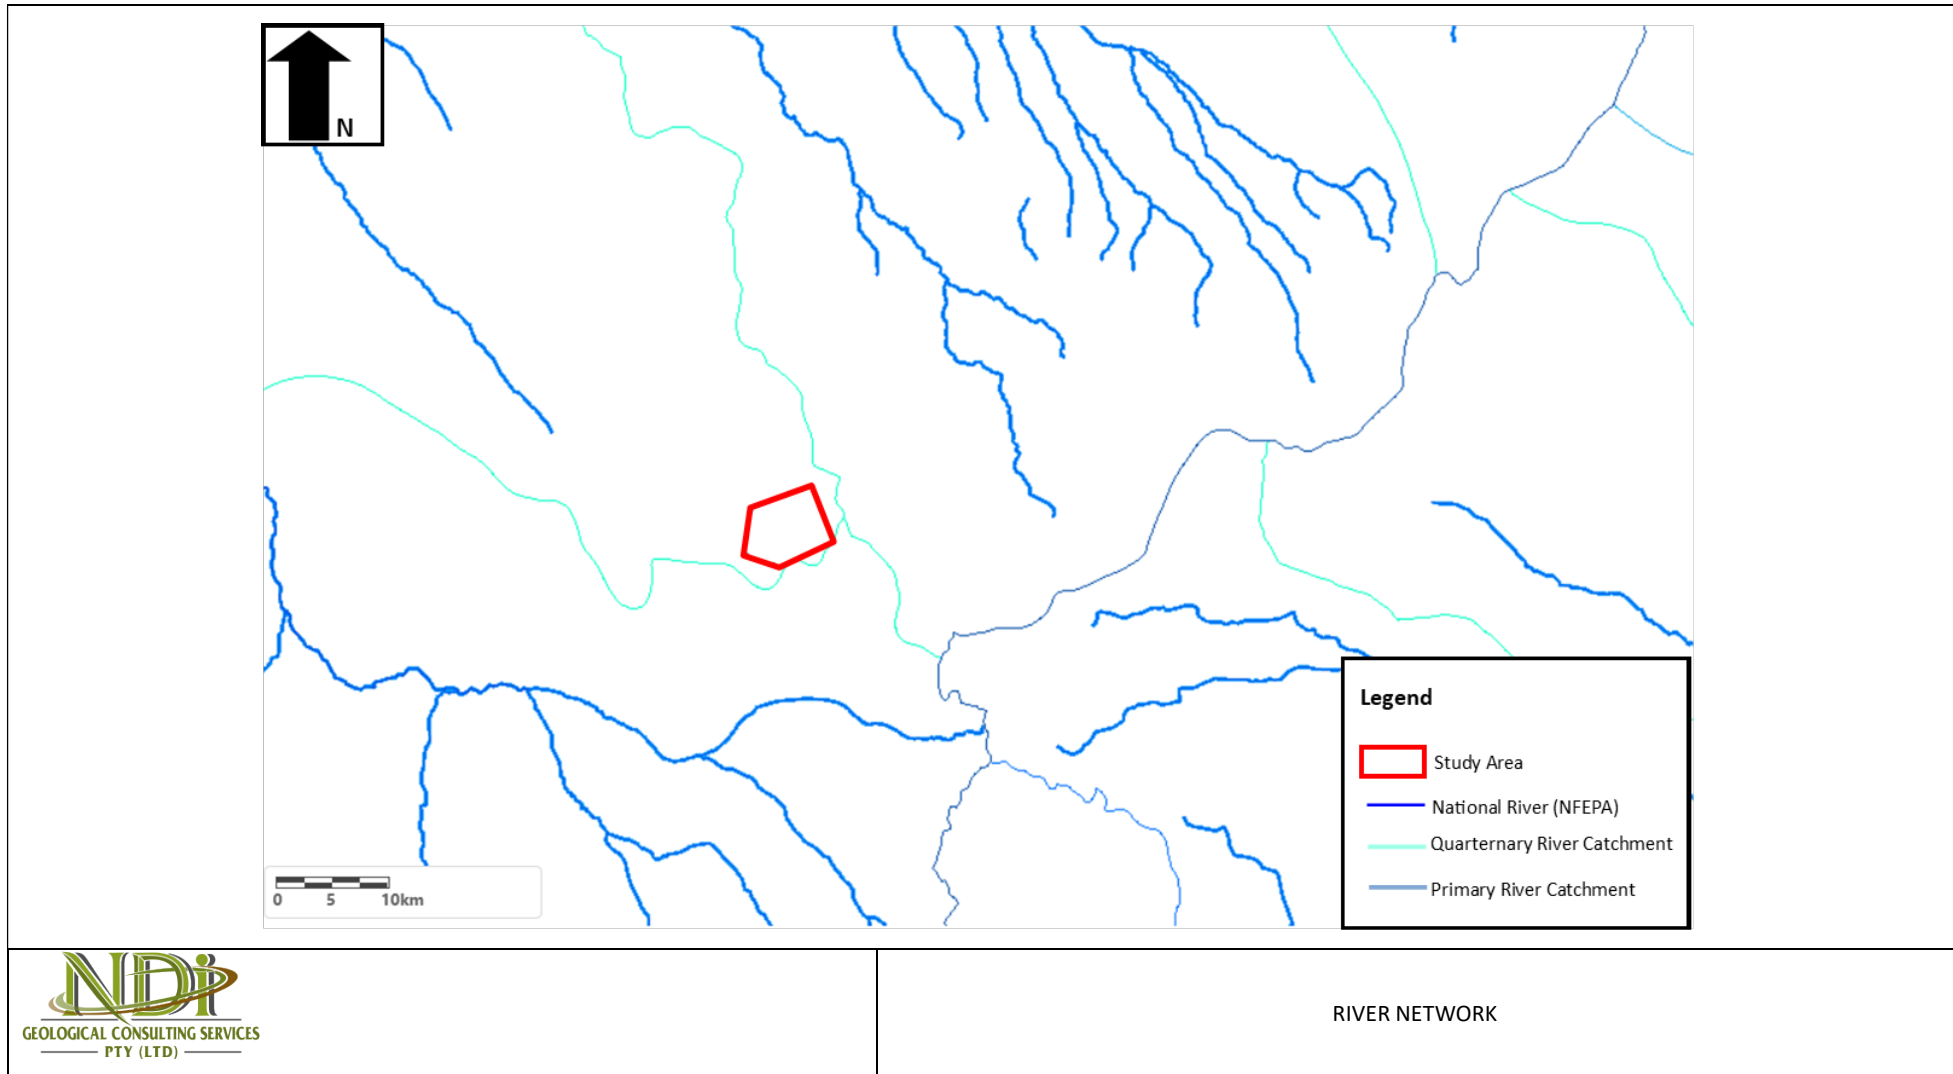

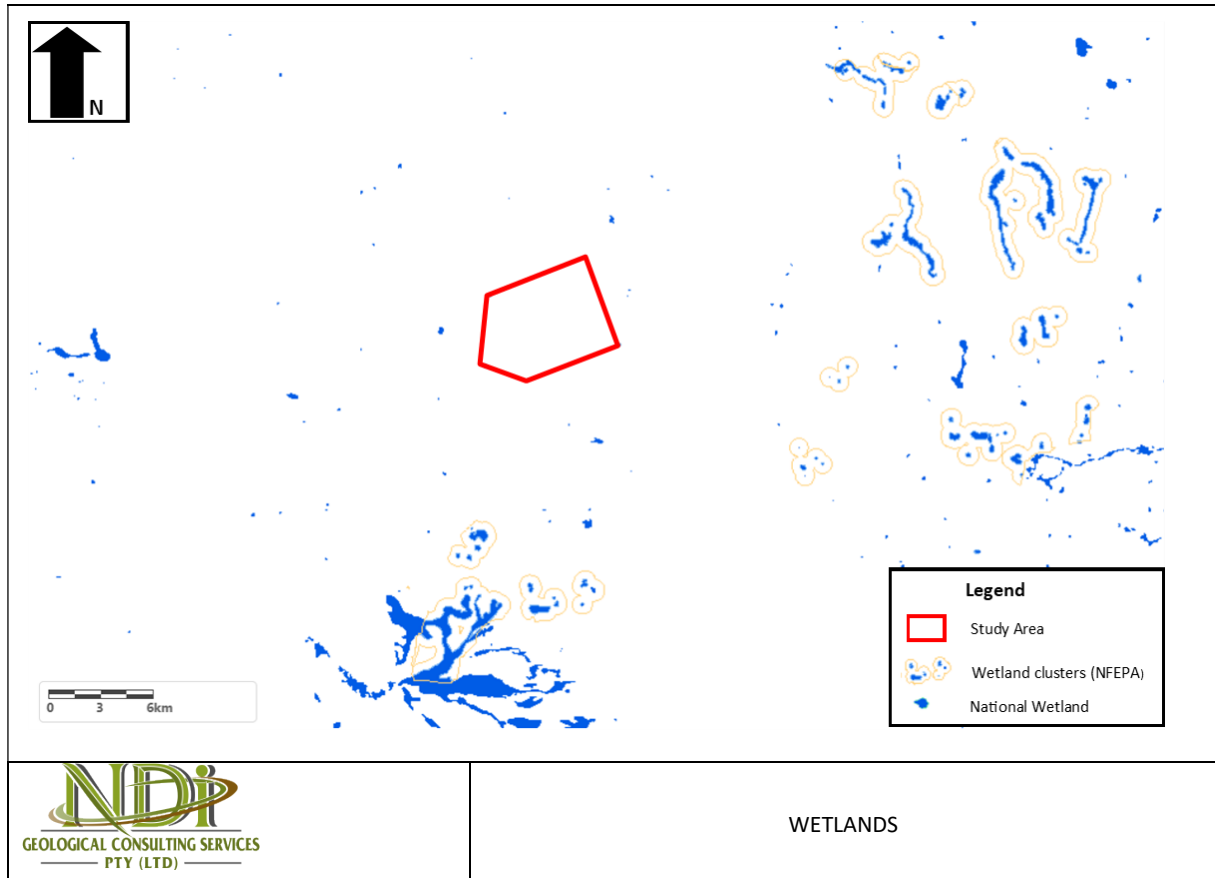

Figure 12-4: River Network and Catchment in the ZFMDM

According to the SANBI Wetland Inventory (2006) National Freshwater Ecosystem Priority Areas (NFEPA) (2011), the affected quaternary catchment areas are not regarded as important in terms of fish sanctuaries, rehabilitation or corridors. The Quaternary Catchment is on the boundary of the study area.

In addition, the project area is not considered important in terms of translocation and relocation zones for fish.

### 12.1.7 Wetlands

The study area itself has no wetlands occurring within it. Nonetheless, the SANBI data shows that there are wetlands and wetland clusters surrounding it. Figure 12-5 shows the wetland types in the vicinity of the study area.

**Figure 12-5: Wetland Types**

### 12.1.8 Groundwater

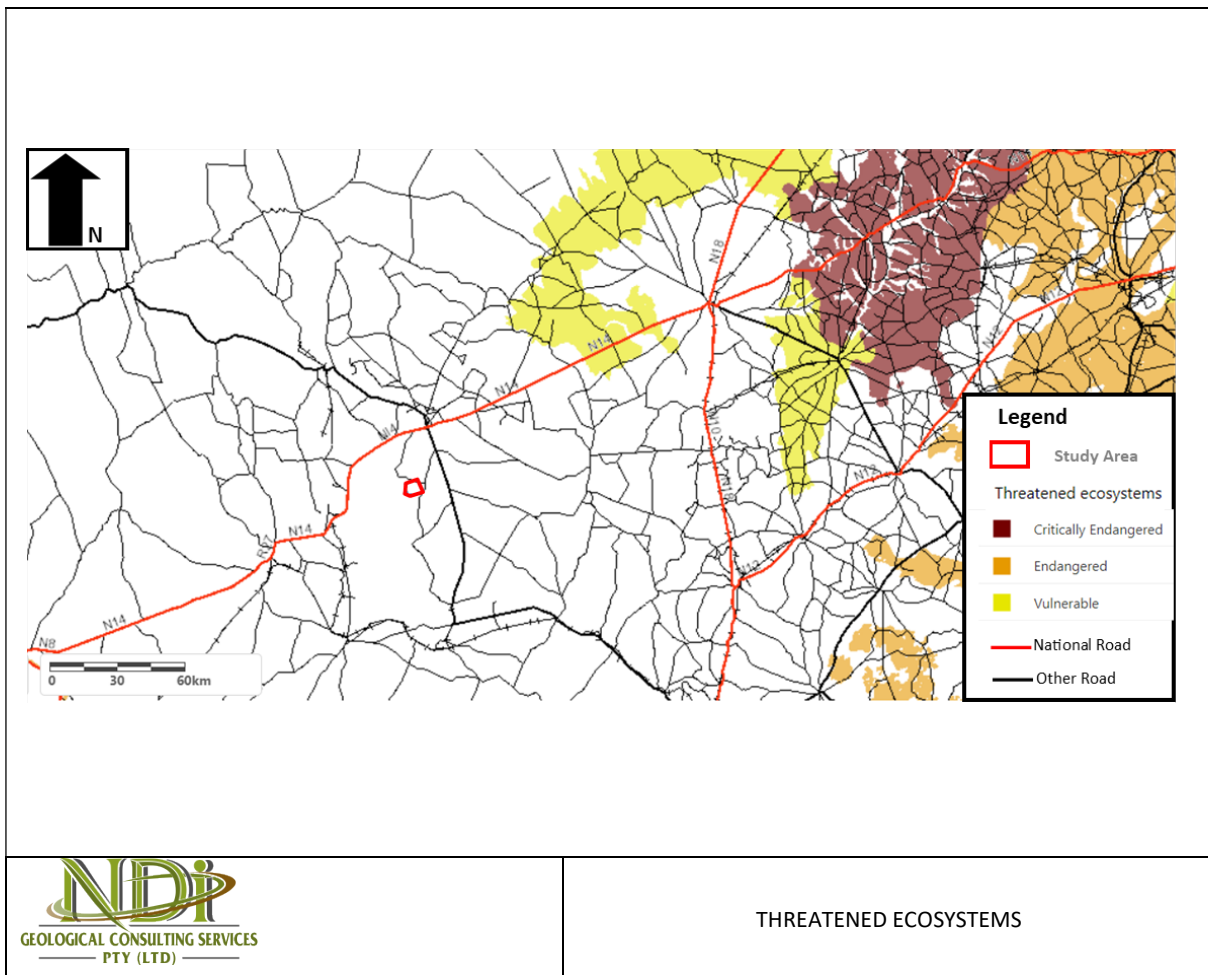

Significant water requirements are the sub-area for urban use as well as rural domestic supplies and stock watering. Groundwater utilization is important in the area and constitutes the only source of water over much of the rural areas. As a result of the low rainfall over the area, the groundwater is mainly used for rural domestic water supplies, stock watering and water supplies to inland towns. Recharge of groundwater is limited, and only small quantities can be abstracted on a sustainable basis. (TLM IDP, 2020)

### 12.1.9 Vegetation Types

Kuruman Mountain Bushveld is not widely distributed and has a total mapped extent of 4360 km<sup>2</sup> which is a narrow range for an arid vegetation type. It is distributed in the Northern Cape and North-West Provinces from Asbestos Mountains southwest and northwest of Griekwastad, along the Kuruman Hills north of Danielskuil, passing west of Kuruman and re-emerging as isolated hills at Makhubung and around Pomfret. This vegetation unit is associated with rolling hills with gentle to moderate slopes and hill pediment areas and typically consists of an open shrubveld. Kuruman Mountain Bushveld has been little impacted by transformation and is classified as Least Threatened but is not currently conserved within any formal conservation areas. One vegetation-type endemic species *Euphorbia planiceps* is known from Kuruman Mountain Bushveld.

The Kuruman Thornveld is the next majority plains after the Kuruman Mountain Bushveld. This is also a restricted vegetation type which occupies 5794 km<sup>2</sup> of the Northern Cape and North West Provinces from the vicinity of Postmasburg and Danielskuil in the south, extending via Kuruman to Tsineng and Dewar in the North. It has been little impacted by transformation and more than 98% of the original extent is still intact and it is classified as Least Threatened. This vegetation unit occupies flat rocky plains and sloping hills with a very well developed, closed shrub layer and well-developed tree stratum usually consisting of *Acacia erioloba*. The only endemic taxon known from this vegetation type is *Gnaphalium englerianum*. Kathu Bushveld occupies an area of 7 443 km<sup>2</sup> and extends from around Kathu and Dibeng in the south through Hotazel and to the Botswana border between Van Zylsrus and McCarthysrus.

The Kathu Bushveld vegetation type is still largely intact and less than 2% has been transformed by mining activity and it is classified as Least Threatened. It is, however, poorly conserved and does not currently fall within any formal conservation areas. Although no endemic species are restricted to this vegetation type several Kalahari endemics are known to occur in this vegetation type such as *Acacia luederitzii* var *luederitzii*, *Antheophora argentea*, *Megaloprotachne albescens*, *Panicum kalaharensis* and *Neuradopsis bechuanensis* (CSIR, 2018) (Figure 12-6).

**Figure 12-6: Vegetation with Threatened Ecosystems**

**Local Vegetation**

According to the national vegetation map (Mucina & Rutherford 2006/2012), there are two vegetation types in the study area, Kuruman Mountain Bushveld and Kuruman Thornveld. A large part of the areas surrounding the study area is also covered by the Kuruman Mountain Bushveld and Kuruman Thornveld. About 10 km northwest of the study area, the areas are covered with Kathu Bushveld type of vegetation (Figure 12-7).

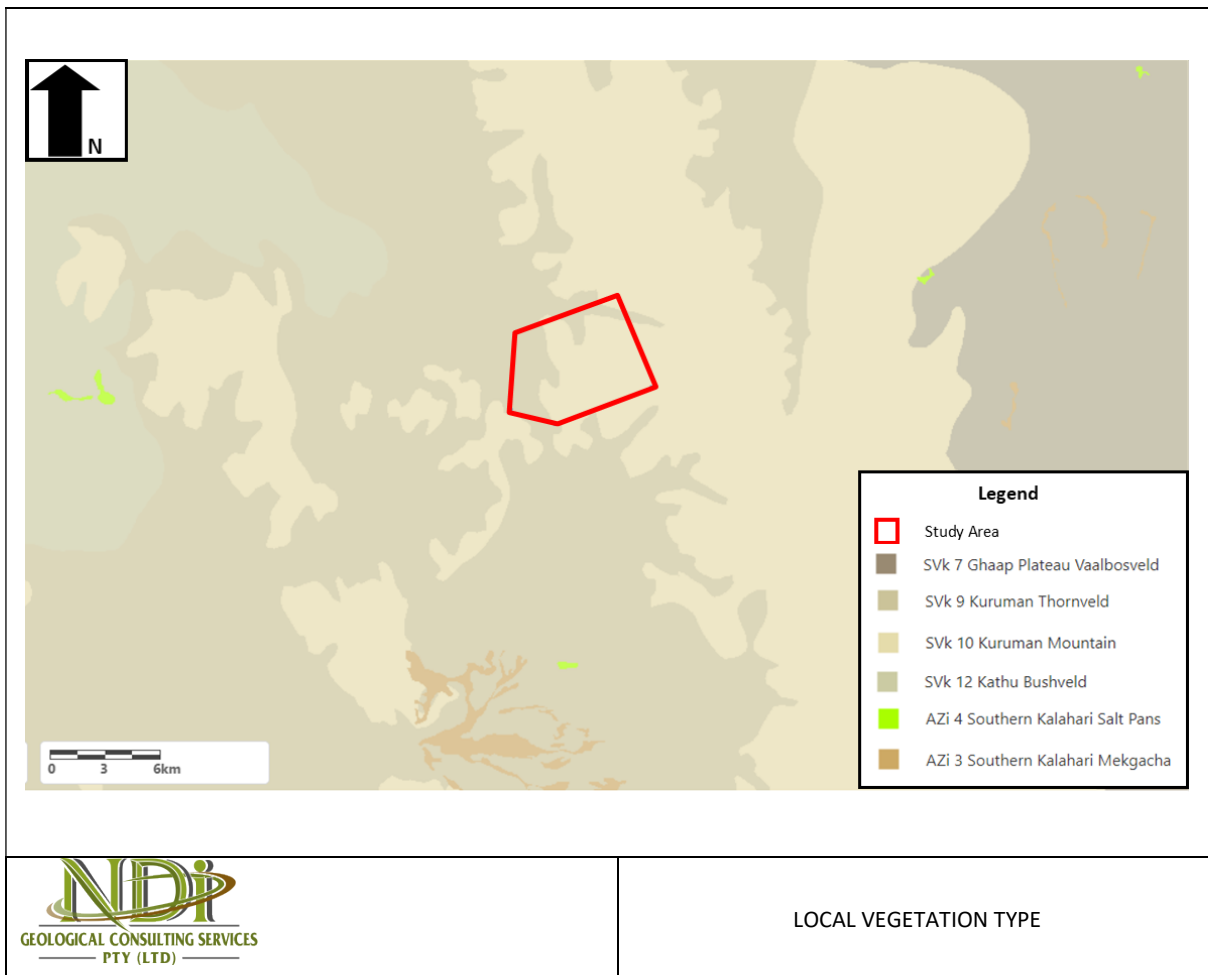

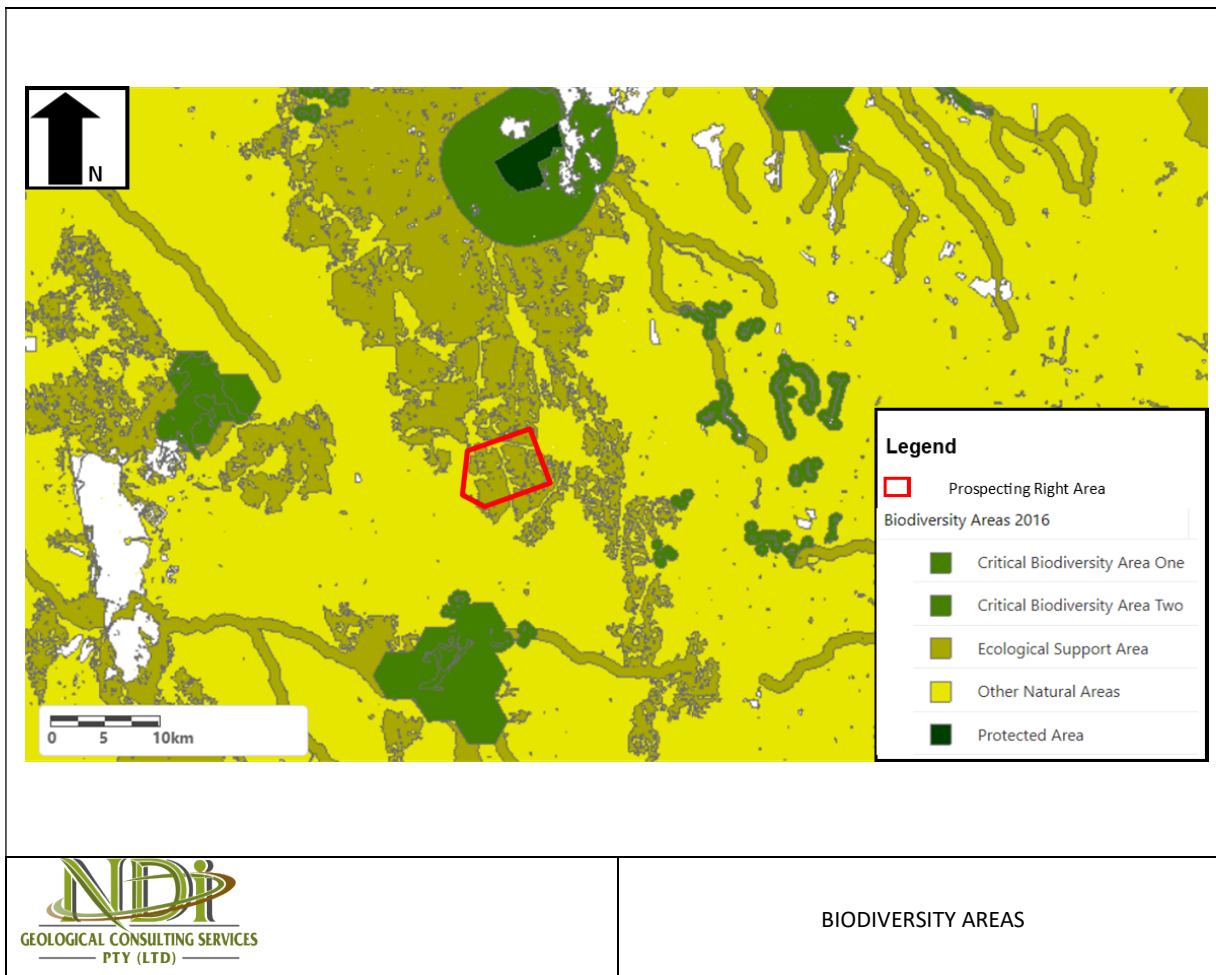

Figure 12-7: Status of Vegetation

### 12.1.10 Conservation Plan

Most of the study area is classified as Ecological Support Area, this is according to the Northern Cape Provincial Biodiversity Conservation Plan (C Plan). Some of the areas in the study area are classified as Other Natural Areas (ONA). There are neither Protected nor Critical Biodiversity Areas in the study area. The surrounding areas are mostly Ecological support and Other Natural Areas with few areas classified as Critical Biodiversity Areas surrounding the study area in distances of not less than 10 km.

Figure 12-8 provides a map showing areas of conservation importance that may be affected by the prospecting activities.

**Figure 12-8: Areas of Conservation Importance**

### 12.1.11 Heritage Resources

There are several heritage and cultural resources in the Northern Cape Province. However, there are no major heritage resources sites that are associated with the affected properties. The proposed study area is not known to have heritage features. It is however expected that there may be a possibility of graves and burial sites present that may be affected by the proposed prospecting activities.

Heritage resources may be tangible, such as buildings and archaeological artefacts or intangible such as landscapes and living heritage. Their significance is based upon their aesthetic, architectural, historical scientific, social, spiritual, linguistic economic or technological values; their representation of a particular period; their rarity and their sphere of influence.

Should there be any heritage sites (graves) within the prospecting area, they will be identified and fenced before any prospecting activities take place.

### 12.1.12 Socio-Economic

The proposed prospecting project will be located within the Tsantsabane Local Municipality (TLM) which is situated in the ZF Magcawu District Municipality (ZFMDM).

#### Population

Census 2011 population figures for TLM is 35 093, this indicates a population growth 4079 from population size of 31 014 (Census 2001). The municipality has 9839 households. The attributing factor

to this population growth is the increase of people who come to the municipal area in search for better living conditions or jobs in the mining and solar industrial sectors.

**Level of Education**

From a statistical analysis there has been an increase of people obtaining Matric since 2001. There has also been an increase in the number of people with higher education. The statistics indicate that although a high number of students in Tsantsabane enrolling for primary school, a very low number of students complete grade 12. This has resulted in a very low probability for employment. Only 5% of those who enrolled for grade 1 make it into tertiary. Less than 15% of the population has a tertiary qualification or have completed Grade 12. It must, however, be mentioned that the education level is affected negatively by the urbanization process, in the past since it mostly involves matriculates and those with a better qualification, due to the local lack of job opportunities. This can also be attributed to the fact that the nearest University of Technology (Central University of Technology, in Bloemfontein) is almost 400 km away and the Sol Plaatjie University has recently started a limited offering of some courses. Males seems to be doing much better when it comes to education levels, as more men have some secondary education, grade 12 and higher education than their female counterparts. Figure 12-9 shows the education levels based on gender.

**Figure 12-9: Education levels by gender in TLM**

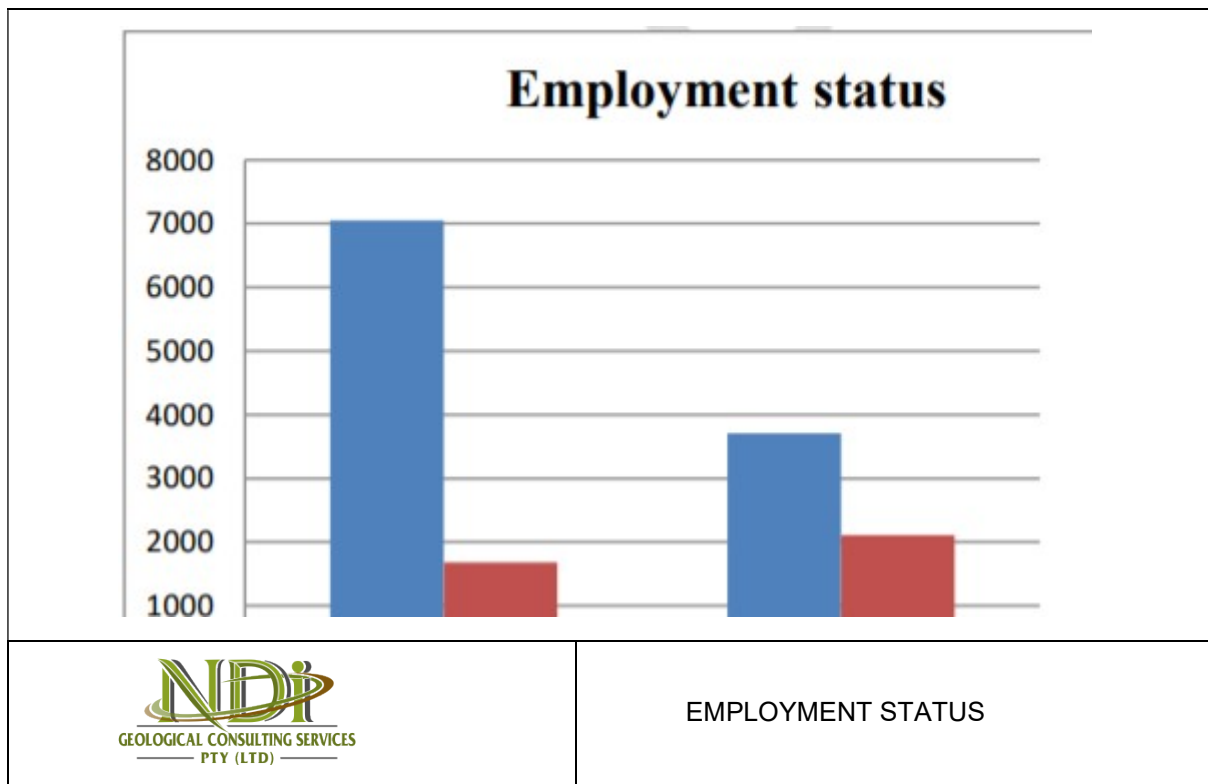

**Employment Levels**

According to the STATSA unemployment figure has drastically reduced from 4 466 in 2001 to 3 795 in 2011 this shows a decrease of 15%. Employment has increased by 69% in 2011, this clearly indicates that there are more people working in 2011 than in 2001.

The TLM is not developing its IDP in isolation. A range of national and provincial policy documents informed the IDP created an important context for the municipality’s plans and strategies. Achieving a developmental state is not a responsibility of national government alone – let alone local municipalities. In the spirit of the 2003 Agreement at the National Growth and Development Summit, stronger social partnerships between government, organized labour, organized business and the

community constituency are needed to address the investment, employment and poverty challenges that are confronting our faces.

There are more employed people in 2011 than in 2001, however there is a very high level of economically inactive members in 2011 than it was in 2001. The high number of economically inactive could indicate a high level of dependency on those who are employed. Figure 12-10 shows that there are generally more employed males than females.

**Figure 12-10: Employment Status by Gender**

**Economic Statistics:**

Local economic development

Local government is mandated to create the necessary conditions for economic growth and job creation. The municipality has a LED Strategy, which is due for review. The municipal area plays an important role in the economy of the region/province, as it is in the Gamagara Corridor.

Sectors

The Draft SDF cited Provincial Treasury (2014) indicates that “during 2012 the primary sector contributed 76% of all the sectors’ contribution to the GDP of TLM. Mining is the single biggest contributor of all industries to the GDP. Mining contributed 74%, namely R3.9 billion, and tertiary sector contributed 4% and 20% respectively.

**12.2 Description of the current land uses.**

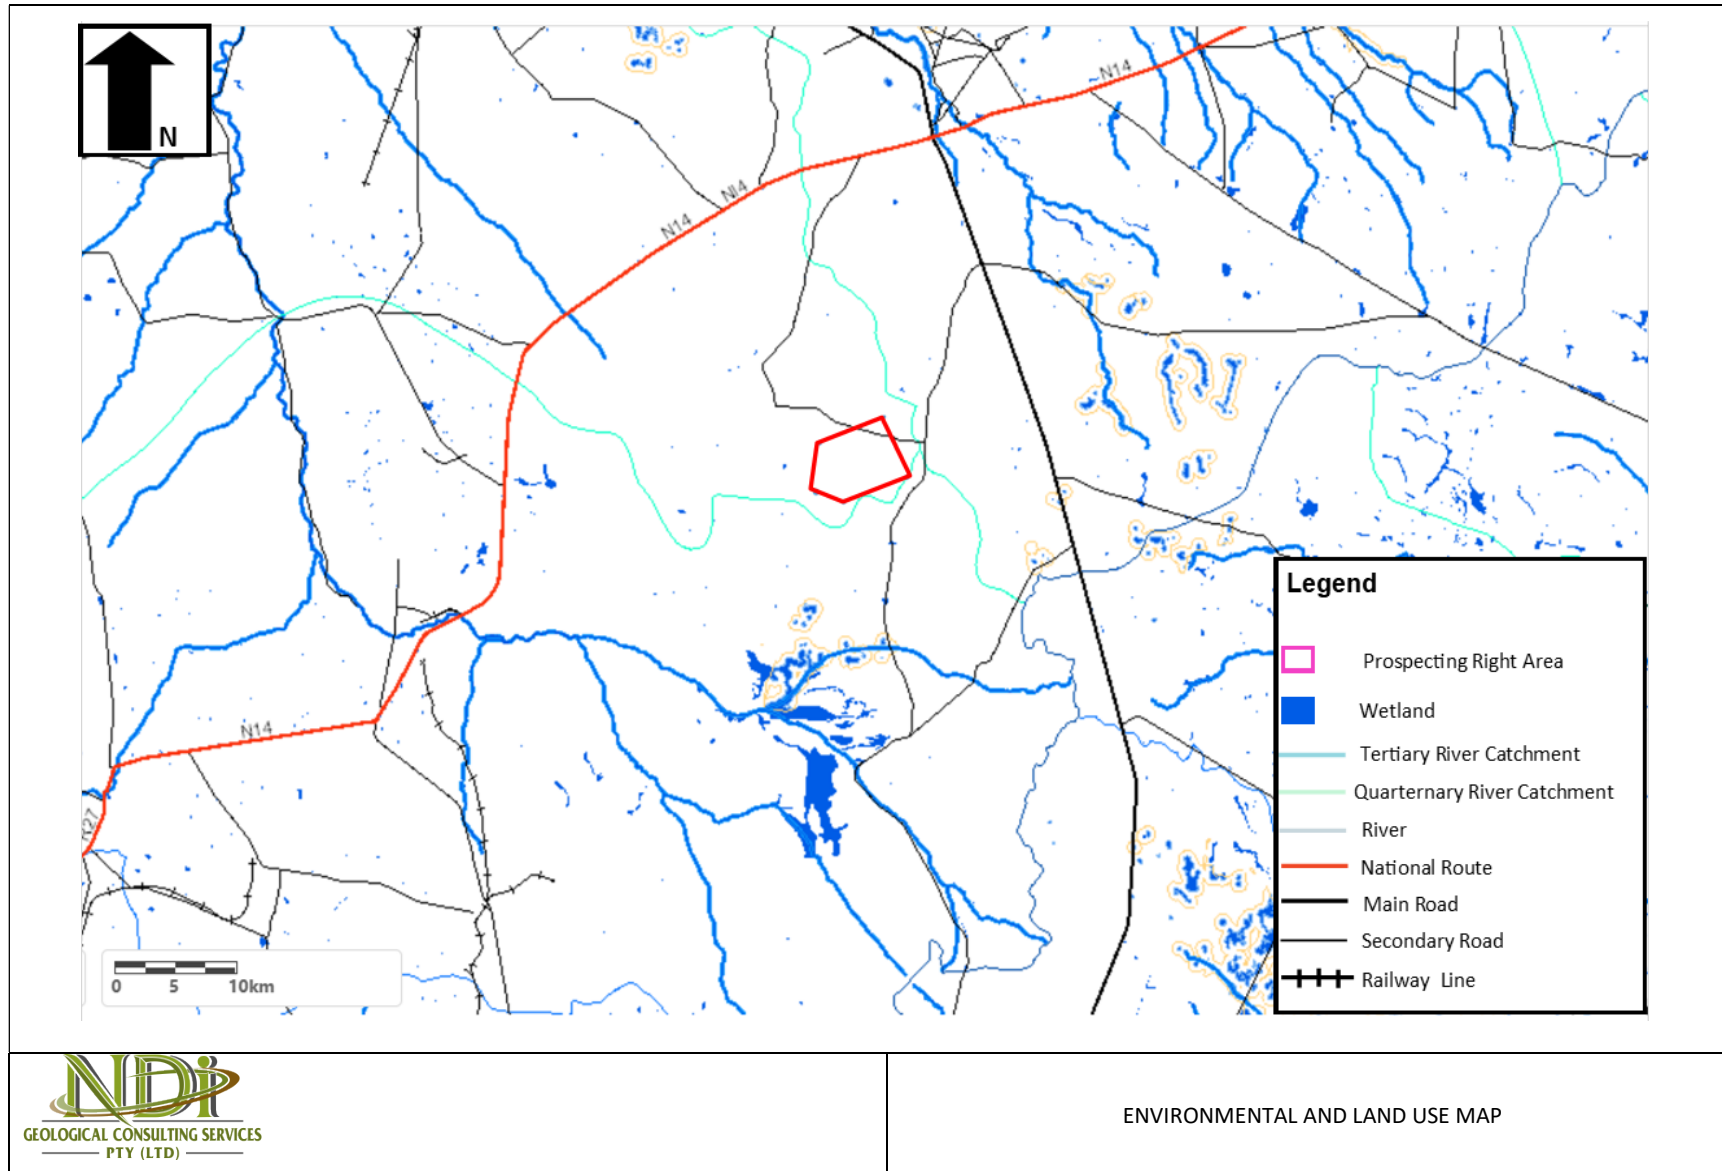

Most of the affected area is currently being used for agriculture.

### **12.3 Description of specific environmental features and infrastructure on the site.**

Please refer to Section 12.1.

### **12.4 Environmental and current land use map.**

TLM is located within the middle to northern parts of the Northern Cape Province and falls within the boundaries of the ZF Mgcawu District. The nearest business centre to the proposed study area is Kuruman, which is about 30.3 km away. Agriculture in the form of livestock grazing seems to be dominant land use in and around the proposed project location. The area is generally rural with few people living in the area. Figure 12-11 shows the current environmental attributes and land use. Map also attached as Appendix 6.

ENVIRONMENTAL AND LAND USE MAP

Figure 12-11: Current Environmental Attributes and Land Use Map

## 13 Impacts and Risks Identified

Table 13-1 provide a high-level assessment of the potential impacts and associated mitigation measures which could result from the proposed mine during construction, operation and decommissioning/closure. These impacts will be further refined and assessed according to the impact assessment methodology in Section 14.

**Table 13-1: Summary of Potential Environmental Impacts Associated with the Proposed Development**

| Element of Environment         | Potential Impact Descriptions  |
|--------------------------------|--|
| Socio-Economic                 | Possible job opportunities during the construction and operation.                  |
| Hydrogeology                   | Possible groundwater contamination.  |
| Surface water                  | Possible surface water contamination.  |
| Air Quality                    | Possible impact on Air Quality in the area.  |
| Climate Change                 | Possible contribution to climate change through emission of Green House Gases      |
| Blasting and Vibrations        | Possible impacts on private properties and fauna due to blasting and vibrations    |
| Noise                          | Possible generation of noise during construction and operation.                    |
| Soils/Land Use/Land Capability | Loss of soil resource and change in land capability and land use.                  |
| Biodiversity                   | Disturbance and loss of biodiversity, especially SCC.                              |
| Aquatic ecology                | Possible loss, sedimentation and contamination of aquatic resources                |
| Heritage                       | Possible impact on heritage and cultural resources (including graves) in the area. |
| Traffic                        | Potential safety issues due to the increased traffic.                              |
| Cumulative Impacts             | Cumulative Impacts   |

### 13.1 Construction

The construction phase of the project will entail the site establishment for surveying and pegging sites. Environmental impacts on the biophysical and socio-economic environment which are anticipated to occur throughout the construction were identified as follows:

#### 13.1.1 Socio-Economic

Prospecting activities will not only result in negative impacts but positive impacts as well. The main positive impacts of the prospecting activities will be the temporary creation of jobs during the construction phase of the project. The project may also result in a temporary boost in small local businesses in the area.

There is a possibility that activities relating to site establishment in some instances, may result in grievance because of possible grave relocation. It is expected that the final site layout will consider all the sensitive environment in the area and will avoid graves and other heritage and cultural resources in the area. Movement of construction vehicles on the roads (R31 and other farm roads) may increase the risks accidents on the roads. Other health and safety risks may be as a result on construction workers lighting fires on site, littering and lack of housekeeping. Potential increase in social pathologies and negative health impacts due to potential squatting of job seekers and increase in nuisance dust may also occur.

### 13.1.2 Groundwater

Prospecting activities relating to prospecting will generally pose danger on the groundwater resources. The use of earth moving machinery and construction vehicles on site poses the risk of chemical spillages including fuel and oils, which may leach into the groundwater. The removal of vegetation could furthermore lower the evapotranspiration rates, thereby allowing a greater volume of potentially contaminated water to percolate to the underlying aquifer in the event of an accidental spill from the machinery. It must however be noted that the removal of vegetation will be limited to the required footprints for the access roads, the boreholes and sumps as well as the camp sites. The impact on evapotranspiration is therefore expected to be negligible.

Ground water quality is unlikely to be considerably affected by activities such as site clearing and grubbing. Hydrocarbons and chemicals mishandling may have an impact on groundwater quality as a result of spillages and uncontrolled release.

### 13.1.3 Surface water

The main users of surface water resources are agricultural irrigation, domestic, industrial, mining and power generation, while plantation forestry intercepts and reduces runoff before it reaches the rivers and groundwater.

The potential impacts on surface water during the construction phase of the proposed project are as follows:

- Accidental spillages of hazardous substances from construction vehicles used during construction of the crossings, as well as from hazardous storage areas;
- Contamination of runoff by poor materials/waste handling practices;
- Debris from poor handling of materials and/or waste blocking watercourses;
- Contaminated dirty water runoff to surrounding areas resulting in the impact on local surface water quality;
- Increase in turbidity of the local water streams as a result of runoff of cleared areas; and
- Increase of surface runoff and potentially contaminated water that needs to be controlled in the areas where site clearing occurred.

Some level of sedimentation is expected to occur in the drainage line that traverse the project area as runoff is naturally anticipated to pick up environmental debris as it crosses natural areas. Increased turbidity is reversible and surface water should return to pre-impact turbidity levels once sediment levels entering the watercourse are reduced. Settled sediments should naturally move downstream during periods of high flow flowing storm events.

### 13.1.4 Aquatic Ecosystems

The removal of vegetation from the construction area is also expected to have an impact on the provision of ecological and sociocultural services by aquatic ecosystems. In addition, construction waste dumping and oil leakages from construction vehicles will alter biodiversity maintenance of the aquatic ecosystems, which endangers the survival of aquatic ecosystem and riparian species inhabiting the area. Impacts on the aquatic ecosystems and will include:

- Loss of habitat and aquatic ecosystem and riparian ecological structure as a result of site clearance activities and uncontrolled aquatic ecosystem and riparian habitat degradation;

- Impact on the aquatic ecosystem and riparian systems as a result of changes to the sociocultural service provisions through site clearance, waste management and riparian disturbance;
- Impact on the hydrological functioning of the aquatic ecosystem and riparian systems;
- Soil compaction and levelling as a result of construction activities and vehicle movement leading to loss of riparian habitat; and
- Increased runoff due to topsoil removal and vegetation clearance leading to possible erosion and sedimentation of riparian resources.

The proposed project will only involve drilling and not trenching or pitting, there are also no major surface water sources and for that reason, it is not anticipated that there will be significant impact on aquatic life, if any.

### 13.1.5 Heritage and Archaeological Resources

The following impacts are envisaged on archaeological artefacts and graves because of the construction phase of the proposed project:

- The proposed project has the potential to impact on local graves within the area; and
- The proposed project has the potential to impact on sites of archaeological importance.

The final layout plan will be dependent on the location of local heritage and archaeological resources. The siting of the boreholes and infrastructure will be in such a way as to avoid sensitive environments, which include graves and archaeological resources as far as is practicable.

### 13.1.6 Palaeontology Impacts

Earth moving activities such as vehicle and machinery movement, site clearance and excavation may result in the destruction of fossils (if any).

### 13.1.7 Biodiversity

Biodiversity is crucial to ecosystem health, and healthy ecosystems are central to human well-being. Healthy ecosystems interlinked with working landscapes and other open spaces form the ecological infrastructure of the country and are the foundation for clean air and water, fertile soil and food. All South Africans depend on healthy ecosystems for economic and livelihood activities, including agriculture, tourism and a number of income generating and subsistence level activities. These natural ecosystems are under pressure from land use change and related processes causing degradation, as well as invasive alien species.

#### **Flora**

The project may result in the following impacts on the floral environment during the construction phase:

- Impact on floral diversity as a result of site clearance, anthropogenic activity, and possible uncontrolled fires;
- Destruction of potential floral habitats for species of conservational concern as a result of site clearing, alien species, waste management and soil compaction;
- Vegetation clearance may lead to floral habitat loss of potential species of conservational concern;
- Potential spreading of alien invasive species as a result of floral disturbance;

- Generation of waste and incorrect disposal from construction material leading to disturbance of natural vegetation; and
- Habitat fragmentation because of construction activities leading to loss of floral diversity.
- Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase;
- 

### **Fauna**

The project may result in the following impacts on the faunal environment during the construction phase:

- Loss of faunal habitat and ecological structure as a result of site clearing, alien invasive species, erosion, and general construction activities;
- Loss of faunal species due to collisions with construction vehicles and machinery;
- Loss of faunal diversity and ecological integrity as a result of construction activities, erosion, poaching and faunal specie trapping;
- Impact on faunal species of conservational concern due to habitat loss and collision with construction vehicles;
- Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts on faunal habitat during the operation phase.

The loss of biodiversity is expected be insignificant as it will be limited to the footprints of the required infrastructure. However, mitigation and management of species of conservational concern, if any, needs to be adhered to.

### **13.1.8 Air Quality**

The area is characterised by rural areas and therefore its air quality can be described as good because there is very little air pollution compared to urban areas. Problems such as acid rain do not occur in the area. The few cases of air pollution which occur are mostly because of smoke from the burning of vegetation such as reeds along the river, and, to a lesser extent, from certain households. Legislation relating to air pollution (Part III of Act 45 of 1965) is applicable to the region and was promulgated in the Government Gazette R1255 of 19 July 1978. This act is specifically applicable to households with coal stoves, as well as any fuel burning appliance installed at a business or any other property which would make use of it.

With the above said, the movement of construction vehicles and earth moving machinery as well as the stripping of vegetation may still likely result in an increase in nuisance dust, PM10 and PM2.5. There is also potential for increase in carbon emissions and ambient air pollution due to the movement of vehicles and construction machinery. It is expected that the implementation of dust suppressing mitigation measures will result in the reduction in nuisance dust.

### **13.1.9 Visual**

The following impacts on the visual character because of the proposed project are envisaged during the construction phase:

- Scaring of the landscape as a result of the clearance of vegetation;
- Visual intrusion because of the movement of machinery and the erection of contractor camps; and

- Indirect visual impact due to dust generation as a result of the movement of vehicles and materials, to and from the site area.

### **13.1.10 Ambient Noise**

Using vehicles and machinery may result in an increase in ambient noise in the immediate vicinity of the project. To alleviate this, work will be limited to day hours and the field staff will be supplied with hearing protection PPE such as earmuffs and ear plugs.

### **13.1.11 Soil Land use and Land Capability**

Due to the sandy nature of much of the soil a large part of the ZFMDM is susceptible to wind erosion if the natural vegetation cover is disturbed. During the construction phase, all infrastructure and activities required for the operational phase will be established. The main envisaged activities include the following:

- Movement of construction vehicles, machinery and workers in unprotected areas (bare) may result in compacting of the soil of the existing roads. Fuel and oil spills from vehicles may result in soil chemical pollution;
- Clearing of vegetation will result in the soils being particularly more vulnerable to soil erosion. The impact can persist long after cessation of prospecting activities depending on mitigation and rehabilitation strategies. Strategic stormwater management should be put in place to minimise soil losses.
- Soil contamination as a result of construction activities can be as a result of a number of activities (i.e., incorrect hazardous substance storage, incidental hydrocarbon leakages from construction vehicles);
- Loss of soil resource and utilisation as a result of the cleaning and topsoil stripping of the construction footprint. Although soils will be stripped and stockpiled, loss of seed reserve and organic matter depletion through decomposition during stockpiling will severely reduce soil quality and its ecological function if not managed appropriately. Re-vegetation should be imposed as far as is possible to maintain soil fertility through natural nutrient cycling during soil storage prior to rehabilitation phase;
- Other activities in this phase that will impact on soil are the handling and storage of building materials and different kinds of waste. This will have the potential to result in soil pollution when not managed properly; and
- In areas of permanent changes such as the borehole and sump area, access roads (tracks), the erection of infrastructure and stockpiles, the current land capability and land use will be lost permanently. This will however be localised to the footprint of the infrastructure.

### **13.1.12 Traffic**

Whilst there will be a need for vehicles to move in and out of the project site during the construction stage, this movement will result in an increase in traffic on the roads.

### **13.1.13 Climate Change**

ZF Mgcawu District Municipality acknowledges that climate change poses a threat to the environment, its residents, and future development. Actions are required to reduce carbon emissions (mitigation) and prepare for the changes that are projected to take place (adaptation) in the District.

The movement of vehicles and earth moving machinery may result in the production of carbon dioxide (Green House Gas), which may have an impact on the climate in the area.

The above-mentioned impacts were assessed based on the quantitative impact assessment methodology described in Section 14 of this Report. For each impact assessed, mitigation measures have been proposed to reduce or avoid negative impacts and enhance positive impacts. These mitigations were also incorporated in the EMPr to ensure that they are implemented during the various phases of the proposed project.

The summary of the impact assessment during the construction phase is provided in Table 13-2.

**Table 13-2: Impact Assessment Table for the Construction Phase**

| Environmental Aspect  | Nature of potential impact/risk   | Environmental Impact Significance Before Mitigation |         |          |                     |          |                   |                     | Impact Management Actions (Proposed Mitigation Measures)  | Environmental Impact Significance After Mitigation |             |          |                     |                   |              |                     |              |                     |
|---|---|---|---------|----------|---------------------|----------|-------------------|---------------------|---|--|-------------|----------|---------------------|-------------------|--------------|---------------------|--------------|---------------------|
|   |   | Consequence   |         |          | Probability         |          | Frequency: Impact | Significance        |   | Significance Rating                                | Consequence |          |                     | Probability       |              | Frequency: Impact   | Significance | Significance Rating |
|   |   | Severity  | Spatial | Duration | Frequency: Activity | Severity |                   |                     |   |  | Spatial     | Duration | Frequency: Activity | Frequency: Impact | Significance |                     |              |                     |
| <b>Site Establishment: Establishment of the access (tracks) to the prospecting site, Establishment of the campsite, site physical surveying and pegging of drilling sites</b> |   |   |         |          |                     |          |                   |                     |   |  |             |          |                     |                   |              |                     |              |                     |
| Social  | Influx of job seekers will have a negative social impact on the landowners and land occupiers.  | 2   | 2       | 3        | 2                   | 2        | 28                | Medium Low          | Random and regular alcohol and drug testing shall be conducted on all personnel responsible for operating machinery and driving construction vehicles to ensure the safety of the public;<br>Security and safety should be emphasised;<br>Recruitment will not be undertaken on site;<br>Recruitment practises will favour locals, but farm labourers will not be employed unless agreed to with the farm owners;<br>Liaise with the SAPD and existing forums in order to implement effective crime prevention strategies; and<br>No construction workers shall be allowed to access private properties without the owner's knowledge and consent.  | 1  | 1           | 1        | 1                   | 2                 | 9            | Low                 |              |                     |
|   | Unauthorised access to private property outside of the demarcated areas will result in conflict with landowners.  | 2   | 2       | 3        | 2                   | 2        | 28                | Medium Low          |   | 1  | 1           | 1        | 1                   | 2                 | 9            | Low                 |              |                     |
|   | Increased traffic in the area will increase the likelihood of accidents on the roads, posing a health and safety issue for the landowners and land occupiers.   | 2   | 2       | 3        | 2                   | 2        | 28                | Medium Low          |   | 1  | 1           | 1        | 1                   | 2                 | 9            | Low                 |              |                     |
|   | The influx of job seekers in the area may result in an increase in petty crimes.  | 2   | 2       | 3        | 2                   | 2        | 28                | Medium Low          |   | 1  | 1           | 1        | 1                   | 2                 | 9            | Low                 |              |                     |

|                      |   | Severity  | Spatial | Duration | Frequency: Activity | Severity |                   |              |   |  | Spatial     | Duration | Frequency: Activity | Frequency: Impact | Significance |                   |              |                     |
|                      | Localised loss of resource and its utilisation potential due to compaction over unprotected ground/soil.  | 2   | 1       | 2        | 2                   | 2        | 20                | Low          | Erosion control measures shall be implemented where deemed necessary;<br>In general, all steep slopes steeper than 1:3 or where the soils are more prone to erosion must be stabilised;<br>If stockpiles are not going to be used immediately the stockpiles shall be rehabilitated to prevent erosion;<br>Runoff from stockpiles shall be detained in order to support growth of vegetation;<br>Runoff from the stockpiles shall be suitably managed to ensure that the runoff volumes and velocities are similar to pre disturbed levels;<br>Vegetation shall be used to promote infiltration of water into the stockpile instead of increasing runoff;<br>A monitoring programme will be implemented if the stockpiles are not used within the first year whereby the vegetation of the stockpiles is monitored in terms of basal cover and species diversity;<br>If it is noticed that the vegetation on the stockpiles is not sustainable, appropriate corrective actions shall be taken to rectify the situation;<br>Stockpiles shall be maintained until the topsoil is required for rehabilitation purposes;<br>Topsoil stockpiles shall be monitored regularly to identify alien vegetation, which shall be removed as soon as possible to prevent further distribution of any alien vegetation. | 1  | 1           | 1        | 1                   | 2                 | 9            | Low               |              |                     |
|                      | Localised loss of soil and land capability due to reduction in nutrient status - de-nitrification and leaching due to stripping and stockpiling footprint areas.  | 2   | 1       | 2        | 2                   | 2        | 20                | Low          |   | 1  | 1           | 1        | 1                   | 2                 | 9            | Low               |              |                     |
| Traffic              | Increase in traffic volumes as a result of pre-construction activities which may lead to an increase in traffic congestion along the Secondary and N14 roads as well as the farm roads around the prospecting area. | 2   | 3       | 2        | 2                   | 2        | 28                | Medium Low   | Local speed limits and traffic laws shall apply at all times to minimise the occurrences of accidents on public roads;<br>The number of construction vehicles and trips shall be kept to a minimum; and<br>Where possible the transportation of construction materials and rubbish shall be undertaken outside traffic peak hours to minimise inconveniencing residents.  | 2  | 2           | 2        | 1                   | 2                 | 18           | Low               |              |                     |
| Climate              | Emissions of Green House Gases as a result of the use of plant, heavy moving machinery, generators etc.   | 2   | 2       | 2        | 2                   | 2        | 24                | Low          | All the construction vehicles shall undergo maintenance on a regular basis to improve on the combustion engine vehicle efficiency.  | 1  | 2           | 1        | 1                   | 1                 | 8            | Low               |              |                     |
| Waste Management     | Potential water and soil pollution as a result of inappropriate waste management practices.   | 2   | 3       | 2        | 2                   | 2        | 28                | Medium Low   | Separation of waste:<br>All waste shall be separated into general waste and hazardous waste;<br>Hazardous waste shall not be mixed with general waste and in doing so increase the quantities of hazardous waste to be managed;<br>General waste can further be separated into waste that can be recycled and or reused;<br>No littering shall be allowed in and around the site, a sufficient number of bins shall be provided for the disposal of waste;<br>Where necessary dedicate a storage area on site for collection of construction waste.<br>Storage of waste:<br>No stockpiling of debris shall be permitted within 100 m of any water courses and drainage lines, or within 500 m of  | 2  | 2           | 2        | 1                   | 2                 | 18           | Low               |              |                     |

| Environmental Aspect | Nature of potential impact/risk | Environmental Mitigation |         |          |                     |                   |              | Impact Management Actions (Proposed Mitigation Measures)  | Environmental Impact Significance After Mitigation |          |         |             |                     |                   |
|----------------------|---------------------------------|--------------------------|---------|----------|---------------------|-------------------|--------------|---|--|----------|---------|-------------|---------------------|-------------------|
|                      |                                 | Consequence              |         |          | Probability         |                   |              |   | Consequence  |          |         | Probability |                     |                   |
|                      |                                 | Severity                 | Spatial | Duration | Frequency: Activity | Frequency: Impact | Significance |   | Significance Rating                                | Severity | Spatial | Duration    | Frequency: Activity | Frequency: Impact |
|                      |                                 |                          |         |          |                     |                   |              | riparian areas;<br>General waste will be collected in an adequate number of litter bins located throughout the construction site;<br>Bins must have lids in order to keep rainwater out;<br>Bins shall be emptied regularly to prevent them from overflowing;<br>All work areas shall be kept clean and tidy at all times;<br>All waste management facilities will be maintained in good working order;<br>Waste shall be stored in demarcated areas according to type of waste;<br>Runoff from any area demarcated for waste will be contained, treated and reused;<br>Flammable substances must be kept away from sources of ignition and from oxidizing agents;<br>No construction rubble shall be disposed of to the riparian area;<br>If construction rubble is not removed immediately, it shall be stockpiled outside the 1:100-year floodline and outside the sensitive riparian areas;<br>Demolition waste and surplus concrete shall be disposed of responsibly;<br>Waste shall not be buried or burned on site; and<br>The maximum retention time for temporary storage of waste generated shall not exceed 30 days, provided the waste does not present a health hazard or risk of odour.<br>Disposal of hazardous waste:<br>No dumping shall be allowed in or near the construction site;<br>Hazardous containers shall be disposed of at an appropriate licensed site;<br>Hazardous waste will be removed and managed by an approved service provider;<br>A safe disposal certificate will be provided by the approved service provider as proof of responsible disposal of hazardous waste; and<br>The safe disposal certificate shall be stored and provided on request.<br>Disposal of general waste:<br>No dumping shall take place in or near the construction site;<br>All general waste shall be disposed of to the nearest licensed landfill site;<br>Demolition waste and builder's rubble shall be disposed of to an appropriate licensed landfill site; and<br>The necessary permissions must be obtained to dispose of builders' rubble to the landfill site. |  |          |         |             |                     |                   |

## 13.2 Operational Phase

The operation phase of the project will comprise RC and diamond core drilling.

### 13.2.1 Social-Economic

Prospecting requires highly specialised personnel; hence It is not expected that during the operation phase the project will not result in the creation of employment. The applicant will make use of qualified contractors for the drilling and sampling of the sites. The community will however continue to benefit because of the continued boost in small local businesses. The socio-impacts expected during the operation phase include:

- Impact on the day-to-day operation by landowners in the area, which may have an impact on their livelihoods;
- Negative impacts on health and safety of the local communities as a result of additional vehicles on the roads;
- Negative impact on, local community health and safety due to influx of employees, the presence of job seekers, which may lead to prostitution and conflict with the local communities. Illegal informal settlement of job seekers in the area may exacerbate the situation; and
- Potential damage to adjacent landowners'/occupiers' infrastructure as a result of drilling activities.

### 13.2.2 Groundwater

Prospecting activities such as drilling will involve the use of vehicles which may result in the spillages of hydrocarbons from vehicles and machinery. This will result in the contamination of soils and groundwater.

The prospecting operations will require the drilling of boreholes, which may result in the drawdown, which may affect the yield to the surrounding groundwater users.

Material used for backfilling boreholes may leach pollutants, which will result in the contamination of surrounding groundwater regime. This may spread beyond the backfilling site via plume migration.

### 13.2.3 Surface water

Drilling operations may result in the generation of surface water runoff contaminated with drill muds and cuttings, should spillage occur. The runoff containing sediments will have negative impacts on the water quality due to increase turbidity and sedimentation of water courses. This will also have an impact on aquatic habitats.

### 13.2.4 Aquatic Ecology

In addition to the impacts on aquatic habitats as explained above, the operation phase of the project is expected to have the following impacts on aquatic ecosystems:

- Loss of habitat and aquatic ecological structure as a result of continual disturbance and uncontrolled degradation;
- Impact on the aquatic ecological systems because of changes to the sociocultural service provisions through continued uncontrolled vegetation clearance, waste management and disturbance; and

- Impact on the hydrological functioning of the aquatic ecological and riparian systems because of reduced aquatic ecosystem and riparian footprints and uncontrolled disturbance.

### 13.2.5 Flora

The project may result in the following impacts on the floral environment during the operation phase:

- Destruction of potential floral habitats as a result of continual disturbance of soil, leading to altered floral habitats, erosion and sedimentation;
- Impact on floral diversity as a result of possible uncontrolled fires;
- Potential spreading of alien invasive species as a result of floral disturbance; and
- Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase.

### 13.2.6 Fauna

The project may result in the following impacts on the faunal environment during the operation phase:

- Migration of fauna from the prospecting area due to noise as a result of drilling activities;
- Loss of faunal species due to collisions with vehicles and machinery;
- Loss of faunal diversity and ecological integrity as a result of poaching and faunal species trapping;
- Failure to initiate a rehabilitation plan and alien control plan during the operation phase may lead to further impacts during the operation phase.

### 13.2.7 Soils, Land Use and Land Capability

Vehicle movement during the drilling of the exploration boreholes will be expected and may result in the spillages of hydrocarbons from the vehicles and machinery. This will result in the contamination of soils. The material from the drilling site may result in the contamination of soils, which may render the land not usable after backfilling operation.

### 13.2.8 Air Quality

The movement of vehicles and drilling machinery will likely result in an increase in nuisance dust, PM10 and PM2.5. There is also potential for increase in carbon emissions and ambient air pollution due to the movement of vehicles and construction machinery. It is expected that the implementation of dust suppressing mitigation measures will result in the reduction in nuisance dust.

### 13.2.9 Visual

The drill rigs and towers used during the drilling operation phase will be visible from nearby locations and will have visual impact on the local communities near the prospecting area.

### 13.2.10 Heritage, Archaeological Resources

The drilling operations may result in the destruction of graves and other heritage resources that may be on site.

### 13.2.11 Palaeontology Impacts

Earth moving activities may result in the destruction of fossils (if any).

**13.2.12 Ambient Noise**

The use of vehicles and machinery may result in an increase in noise in the immediate vicinity of the project. The drilling activities will also result in an increase in noise in the vicinity of the project.

**13.2.13 Traffic**

The movement of vehicles in the project area will result in an increase in traffic on the roads.

**13.2.14 Climate**

The movement of vehicles and machinery may result in the production of carbon dioxide (Green House Gas), which may have an impact on the climate in the area.

**13.2.15 Vibrations**

Drilling ground vibrations may result in possible damage to infrastructure and private property.

The summary of the impact assessment during the operation phase is provided in Table 13-3.

**Table 13-3: Impact Assessment Table for the Operation Phase**

| Environmental Aspect | Nature of potential impact/risk   | Environmental Impact Significance Before Mitigation |         |          |                     |                   |              |                     | Impact Management Actions (Proposed Mitigation Measures)   | Environmental Impact Significance After Mitigation   |         |          |                     |                   |              |                     |     |
|----------------------|---|---|---------|----------|---------------------|-------------------|--------------|---------------------|--|--|---------|----------|---------------------|-------------------|--------------|---------------------|-----|
|                      |   | Consequence   |         |          | Probability         |                   |              |                     |  | Consequence  |         |          | Probability         |                   |              |                     |     |
|                      |   | Severity  | Spatial | Duration | Frequency: Activity | Frequency: Impact | Significance | Significance Rating |  | Severity   | Spatial | Duration | Frequency: Activity | Frequency: Impact | Significance | Significance Rating |     |
| Socio-Economic       | Operation may affect the day-to-day operation of the landowners hence result in direct impact on their livelihood.  | 2   | 1       | 2        | 2                   | 3                 | 25           | Low                 | <p>Random and regular alcohol and drug testing shall be conducted on all personnel responsible for operating machinery and driving construction vehicles to ensure the safety of the public;</p> <p>Drill sites shall be kept to a minimum;</p> <p>Landowners shall be informed of the exact location of the drill sites and shall be privy to the drilling programme, indicating the days on which each site will be drilled; and</p> <p>The time spent at each drill site shall be kept to a minimum.</p>  | 1  | 1       | 2        | 1                   | 1                 | 8            | Low                 |     |
|                      | Uncontrolled access of private property during operation may result in conflict with affected landowners and occupiers.   | 2   | 1       | 1        | 2                   | 2                 | 16           | Low                 |  | 1  | 1       | 1        | 1                   | 1                 | 6            | Low                 |     |
|                      | Negative impact as a result of additional trucks on the roads, impacting on local communities' health and safety.   | 3   | 3       | 2        | 1                   | 2                 | 24           | Low                 |  | 1  | 2       | 1        | 1                   | 1                 | 8            | Low                 |     |
|                      | Negative impact on, local community health and safety due to potential influx of employees, the presence of job seekers, which may lead to prostitution and conflict with the local communities. |                      | As a result of drilling activities during operation, potential damage to adjacent landowner's/occupiers' infrastructure   | N/A   | N/A     | N/A      | N/A                 | N/A               | N/A          | N/A                 |  | <p>Drill sites shall be located as far from private property as is possible to minimise damage to infrastructure;</p> <p>Should private property be damaged due to operation activities, property owners shall be appropriately compensated.</p> | N/A     | N/A      | N/A                 | N/A               | N/A          | N/A                 | N/A |
|                      | As a result of drilling, there is potential for the occurrence of subsidence, impacting on the safety surface land dwellers and users.  | N/A   | N/A     | N/A      | N/A                 | N/A               | N/A          | N/A                 |  |  | N/A     | N/A      | N/A                 | N/A               | N/A          | N/A                 | N/A |
| Groundwater          | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination of the vegetation cover and soils. The material removed from the drilling exercises will contain carbonaceous material, which has a potential for pollution should it be allowed stay for a prolonged period at the drilling site. | 3   | 2       | 2        | 2                   | 2                 | 28           | Medium Low          | <p>Ensure that the drilling of the exploration boreholes is conducted in such a manner that the environment is protected from probable spillages and contamination.</p> <p>All boreholes and sumps will be rehabilitated to pre-drilling conditions.</p> <p>Tarpaulins will be placed on the ground to prevent oil, grease, hydraulic fluid and diesel spills during emergency repairs.</p> <p>All oil spills will be remedied using approved methodologies. The contaminated soils will be removed and disposed of at a licensed waste disposal facility.</p> <p>All waste generated from the drilling sites and the campsite will be collected in proper receptacles and removed to a registered disposal facility e.g., sewage treatment plant, solid waste disposal site or hydrocarbon recycling or treatment facilities.</p> | 2  | 1       | 2        | 1                   | 2                 | 15           | Low                 |     |
|                      | Storage of hydrocarbons and chemicals, which may impact on groundwater as a result of spillages and uncontrolled release.   | 3   | 2       | 2        | 2                   | 2                 | 28           | Medium Low          |  | 2  | 1       | 2        | 1                   | 2                 | 15           | Low                 |     |

|------------------------------------|--|---|---------|----------|---------------------|----------|-----------|--------------|---|--|-------------|----------|---------------------|-------------|----|-------------------|--------------|--------------|
|                                    |  | Consequence   |         |          | Probability         |          | Frequency | Significance |   | Significance Rating                                | Consequence |          |                     | Probability |    | Frequency: Impact | Significance | Significance |
|                                    |  | Severity  | Spatial | Duration | Frequency: Activity | Severity |           |              |   |  | Spatial     | Duration | Frequency: Activity |             |    |                   |              |              |
|                                    | The prospecting operations will require the drilling of boreholes. The boreholes may result in the drawdown, which may affect the yield to the surrounding groundwater users. Material used for backfilling may leach pollutants that will result in the pollution of the surrounding groundwater regime. This may even spread beyond the backfilling site via plume migration.  | 2   | 2       | 2        | 2                   | 2        | 24        | Low          | Ensure that the landowners' borehole yields are monitored during the drilling operation.<br>Should it be proven that the operation is indeed affecting the quantity and quality of groundwater available to users and surrounding water resources, the affected parties must be compensated.  | 2  | 1           | 2        | 1                   | 2           | 15 | Low               |              |              |
| Surface Water                      | The drilling operations may result in the generation of surface water runoff contaminated with drilling muds and cuttings should spillages occur. The sedimentation and possible contamination with carbonaceous material will have negative impacts on the surrounding clean water environment. These will cause an increase in the turbidity and will decrease acidity of the water in the streams, which will affect the aquatic habitat, hence important habitats may be lost. | 2   | 2       | 2        | 2                   | 2        | 24        | Low          | No prospecting operations will be undertaken within 100 metres from the nearby steams and 500 meters from riparian areas without consent from the DWS;<br>Sumps will be excavated for the collection mud and excess water from the drilling sites;<br>The sumps will be sized such that they will be able to contain the water and mud that will be generated during the prospecting operation;<br>Storm water generated around the drilling site will be diverted away to the clean water environment;<br>No concrete mixing and vehicle maintenance will be allowed on site.<br>All hydrocarbons will be stored on protected storage areas away from the streams.   | 2  | 1           | 2        | 1                   | 2           | 15 | Low               |              |              |
| Biodiversity                       | Continued destruction of potential floral habitats for species of conservational concern as a result continual disturbance of soils leading to altered floral habitats, erosion and sedimentation.   | 2   | 1       | 3        | 2                   | 2        | 24        | Low          | All disturbed areas must be rehabilitated in tandem with construction activities.<br>The collection of any plant material for firewood or medicinal purposes shall be strictly prohibited.  | 2  | 1           | 1        | 1                   | 1           | 8  | Low               |              |              |
|                                    | Impact on floral species of conservational concern as a result of an increased in alien species proliferation and ineffective rehabilitation of exposed areas  | 2   | 1       | 3        | 2                   | 2        | 24        | Low          | The existing integrity of flora surrounding the study area shall be upheld and no activities shall be carried out outside the footprint of the demarcated drill sites.  | 2  | 1           | 1        | 1                   | 1           | 8  | Low               |              |              |
|                                    | Loss of faunal habitat and ecological structure as a result of increased fires during operation and introduction of alien species, leading to transformation of the natural habitat  | 2   | 1       | 3        | 2                   | 2        | 24        | Low          | The rehabilitation of the disturbed areas must be conducted such that the rehabilitated areas will encourage the migration of animals back into the rehabilitated areas.<br>The proposed development footprint areas shall remain as small as possible and where possible be confined to already disturbed areas.<br>No trapping or hunting of fauna shall be permitted.<br>Edge effects of all operational activities, such as erosion and alien plant species proliferation, which may affect faunal habitat shall be strictly managed.<br>No informal fires in the vicinity of drill sites shall be permitted.<br>An alien vegetation control plan must be implemented in order to manage alien plant species occurring within the study area, and to prevent further faunal habitat loss.<br>Poaching of wild animals and livestock will be prohibited. | 1  | 1           | 1        | 1                   | 1           | 6  | Low               |              |              |
| Soils Land use and Land Capability | Topsoil removal, storage and replacement during the excavation of the sumps will result. This will result in the disruption of the soils profile.  | 2   | 1       | 2        | 2                   | 2        | 20        | Low          | Ensure that topsoil is properly stored, away from the streams and drainage areas.<br>The soils must be used for the backfilling and rehabilitation of the sumps.  | 1  | 1           | 1        | 1                   | 1           | 6  | Low               |              |              |
|                                    | Soil contamination as a result of operational activities can be as a result of a number of activities (i.e., hazardous substance storage, incidental hydrocarbon leakages from construction vehicles).   | 3   | 1       | 2        | 2                   | 2        | 24        | Low          | The rehabilitated sump must be seeded with recommended seed mix consisting of indigenous species.<br>Tarpaulins will be placed on the ground to prevent oil, grease, hydraulic fluid and diesel spills during emergency repairs.<br>Soil disturbance within the drill sites shall be kept to a minimum.   | 2  | 1           | 1        | 1                   | 1           | 8  | Low               |              |              |

|                      |                                 |   |         |          |                     |          |           |              | Waste shall not be buried or burned on site; and<br>The maximum retention time for temporary storage of waste generated shall not exceed 30 days, provided the waste does not present a health hazard or risk of odour.<br><i>Disposal of hazardous waste</i><br>No dumping shall be allowed in or near the construction site;<br>Hazardous containers shall be disposed of at an appropriate licensed site;<br>Hazardous waste will be removed and managed by an approved service provider;<br>A safe disposal certificate will be provided by the approved service provider as proof of responsible disposal of hazardous waste; and<br>The safe disposal certificate shall be stored and provided on request.<br><i>Disposal of general waste</i><br>No dumping shall take place in or near the drill sites; and<br>All general waste shall be disposed of to the nearest licensed landfill site. |  |             |          |                     |             |         |                   |              |              |

### **13.3 Decommissioning and Closure**

The impacts for the decommissioning and closure phases will be like the impacts during the construction phase and have not been assessed in detail (please refer to the construction phase assessment). The most significant impacts will be:

#### **13.3.1 Soils and Land Capability**

The affected soil and land use will be restored after rehabilitation of the drilling sites and associated access infrastructure. This will also result in the resumption of the use of the land since the infrastructure would have been removed. However, should the rehabilitation of affected sites not be conducted properly, it may result in loss of usable soils and agricultural land, resulting in reduced land capability.

#### **13.3.2 Land Use**

Positive impacts will result due to the reduction in areas of disturbance and the return of land use of the affected areas and making available an area that was covered by the drilling sites.

#### **13.3.3 Soils and Vegetation**

The use of vehicles/machinery during the rehabilitation of the exploration sites may result in the compaction of soils and in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination and destruction of the vegetation cover, soils and groundwater.

#### **13.3.4 Surface Water and Aquatic Ecosystems**

During the decommissioning and closure phases equipment will be removed, stockpiled soils will be used for rehabilitation, remaining sumps will be backfilled, levelled, top soiled and the area re-seeded. During the process of rehabilitation surface water runoff from the rehabilitation site may have elevated silt load, which may cause pollution of the nearby water courses.

#### **13.3.5 Air Quality**

Rehabilitation and removal of the prospecting sites and equipment will require vehicular movement. This will result in the generation of dust by movement of vehicles and due to blowing winds. Vehicles and machinery will also generate diesel or petrol fumes. Generated dust will migrate towards the predominant wind direction and may settle on surrounding properties including nearby vegetation.

#### **13.3.6 Noise**

Noise will be generated during the removal of equipment and rehabilitation of the sites. The noise is not expected to exceed occupational noise limits and will be short lived.

The summary of the impact assessment during the decommissioning and closure phase is provided in Table 13-4

**Table 13-4: Impact Assessment Table for the Decommissioning and Closure Phase**

| Environmental Aspect  | Nature of potential impact/risk  | Environmental Impact Significance Before Mitigation |         |          |                          |          |                   |                | Impact Management Actions (Proposed Mitigation Measures)  | Environmental Impact Significance After Mitigation |             |          |                     |                          |         |                   |              |                     |
|---|--|---|---------|----------|--------------------------|----------|-------------------|----------------|---|--|-------------|----------|---------------------|--------------------------|---------|-------------------|--------------|---------------------|
|   |  | Consequence   |         |          | Likelihood (Probability) |          | Frequency: Impact | Significance   |   | Significance Rating                                | Consequence |          |                     | Likelihood (Probability) |         | Frequency: Impact | Significance | Significance Rating |
|   |  | Severity  | Spatial | Duration | Frequency: Activity      | Severity |                   |                |   |  | Spatial     | Duration | Frequency: Activity | Severity                 | Spatial |                   |              |                     |
| <b>Management and Mitigation Measures</b>                     |  |   |         |          |                          |          |                   |                |   |  |             |          |                     |                          |         |                   |              |                     |
| Soils, Land Capability and Land Use                           | The removal of the campsite equipment and the rehabilitation of the drilling sites and associated access infrastructure will result in the affected soil and land use being restored. This will also result in the resumption of the use of the land since the infrastructure would have been removed.   | N/A   | N/A     | N/A      | N/A                      | N/A      | 0                 | N/A            | Ensure that contamination of the rehabilitate area by hydrocarbon liquids is prevented.<br>Ensure that the rehabilitation work is done in such a manner that the environment is protected from probable spillages.<br>All boreholes and sumps will be rehabilitated to pre-drilling conditions.<br>Tarpaulins will be placed on the ground to prevent oil, grease, hydraulic fluid and diesel spills during emergency repairs.<br>All oil spills will be remedied using approved methodologies. The contaminated soils will be removed and disposed of at a licensed waste disposal facility.<br>All waste generated from the rehabilitation sites will be collected in proper receptacles and removed to registered disposal facilities e.g., sewage treatment plant, sold waste disposal site or hydrocarbon recycling or treatment facilities. | N/A  | N/A         | N/A      | N/A                 | N/A                      | N/A     | N/A               |              |                     |
| Land Use  | Positive impacts will result due to the reduction in areas of disturbance and the return of land use of the affected areas and making available an area that was covered by the campsite and drilling sites.   | N/A   | N/A     | N/A      | N/A                      | N/A      | 0                 | N/A            |   | N/A  | N/A         | N/A      | N/A                 | N/A                      | N/A     | N/A               |              |                     |
| Soils and Vegetation  | The use of vehicles/machinery during the rehabilitation of the exploration sites may result compaction of soils and in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination and destruction of the vegetation cover and soils.  | 2   | 1       | 2        | 2                        | 2        | 20                | Low (-)        |   | 1  | 1           | 2        | 1                   | 2                        | 12      | Low (-)           |              |                     |
| Surface water, wetlands, riparian areas and aquatic ecosystem | During the decommissioning and closure phases equipment will be removed, stockpiled soils will be used for rehabilitation, remaining sumps will be backfilled, levelled, top soiled and the area re-seeded. During the process of rehabilitation, surface water runoff from the rehabilitation site may have elevated silt load, which may cause pollution of the nearby water environment.                | 2   | 3       | 2        | 2                        | 2        | 28                | Medium Low (-) |   | 2  | 1           | 2        | 2                   | 2                        | 20      | Low (-)           |              |                     |
| Air Quality   | Rehabilitation and removal of the prospecting sites and equipment will require vehicular movement. This will result in the generation of dust by movement of vehicles and due to blowing winds. Vehicles and machinery will also generate diesel or petrol fumes. Generated dust will migrate towards the predominant wind direction and may settle on surrounding properties including nearby vegetation. | 1   | 3       | 2        | 2                        | 2        | 24                | Low (-)        |   | 1  | 1           | 1        | 1                   | 2                        | 9       | Low (-)           |              |                     |

| Environmental Aspect | Nature of potential impact/risk  | Environmental Impact Significance Before Mitigation |         |          |                          |                   |              |                     | Impact Management Actions (Proposed Mitigation Measures)   | Environmental Impact Significance After Mitigation |         |          |                          |            |              |                     |

|                      |  | Severity  | Spatial | Duration | Frequency: Activity      |                   |              |                     |  | Severity   | Spatial | Duration | Frequency: Activity      |            |              |                     |
| Noise                | Noise will be generated during the removal of equipment and rehabilitation of the sites. This noise is not expected to exceed occupational noise limits and will be short lived. | 2   | 1       | 2        | 2                        | 2                 | 20           | Low (-)             | Where necessary, provide employees with ear plugs and employees must be instructed to use the ear plugs.<br>Ensure that equipment is well maintained and fitted with the correct and appropriate noise abatement measures. | 1  | 1       | 1        | 1                        | 2          | 9            | Low (-)             |

## 14 Impact Assessment Methodology

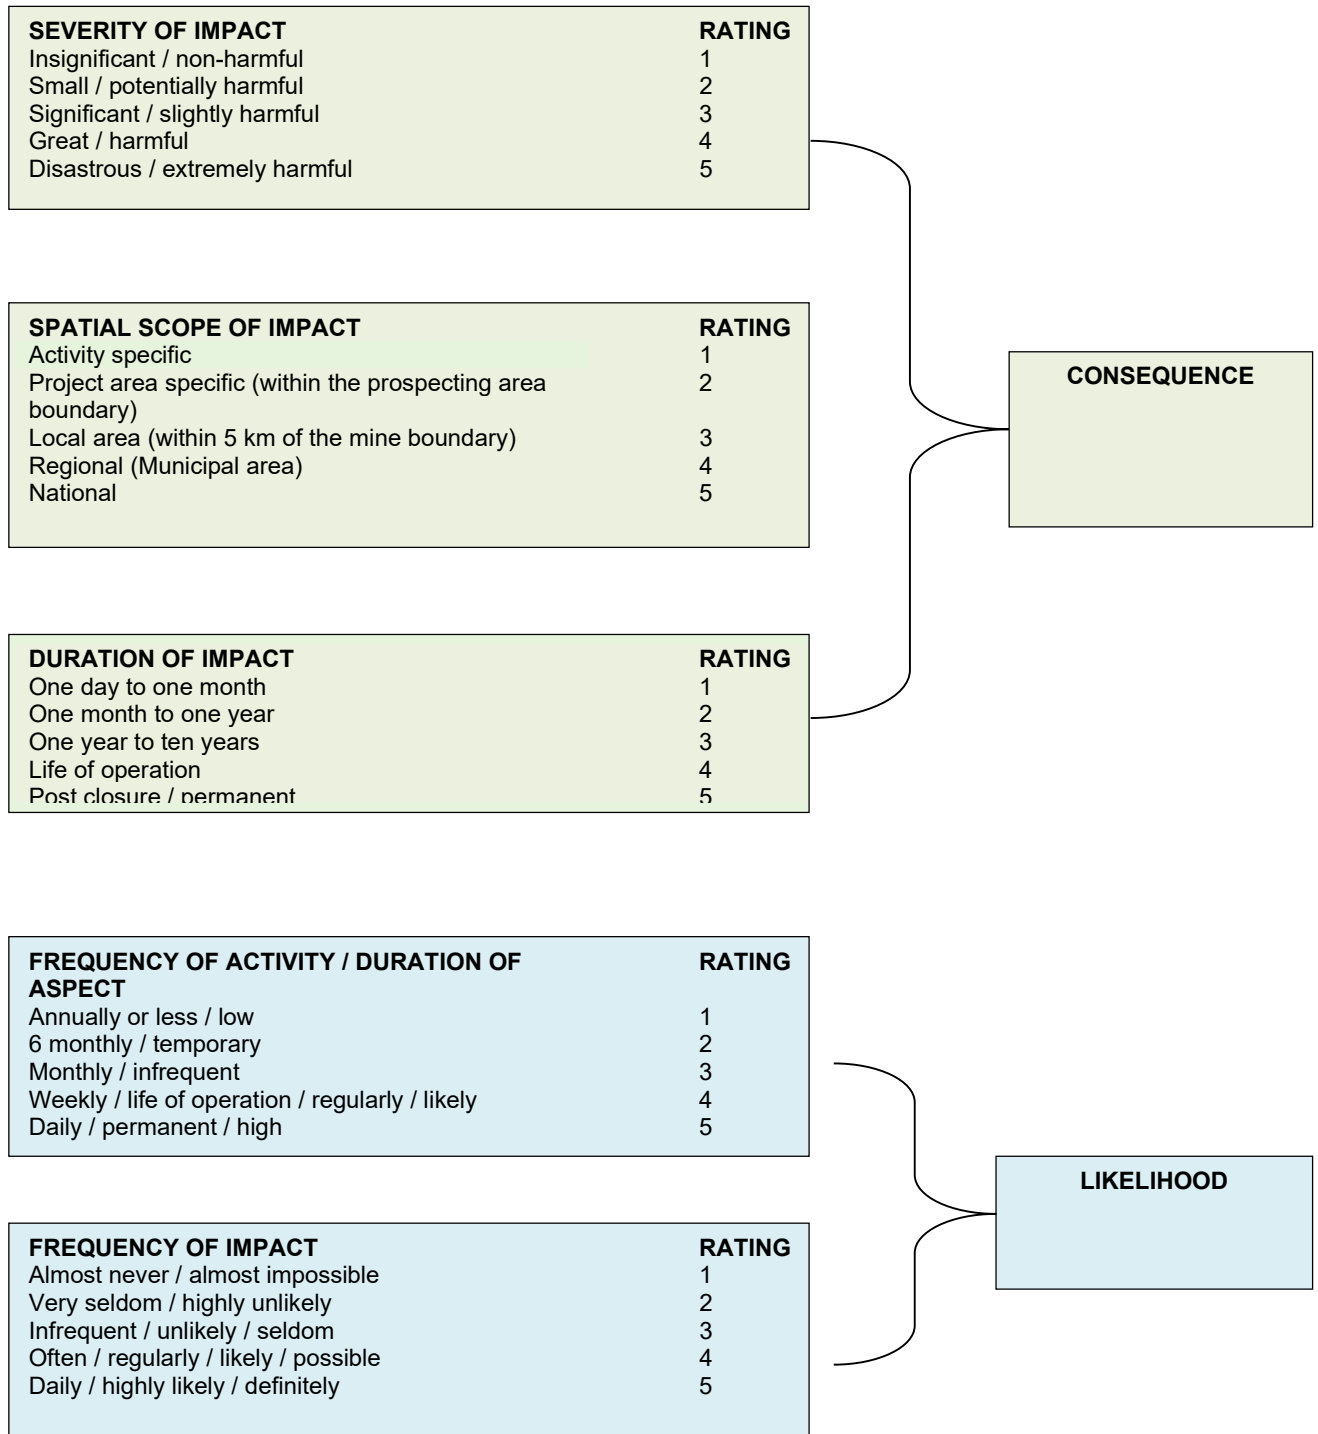

Identified potential impacts were assessed according to the following Impact Assessment Methodology as described below. This methodology has been utilised for the assessment of environmental impacts where the consequence (severity of impact, spatial scope of impact and duration of impact) and likelihood (frequency of activity and frequency of impact) have been considered in parallel to provide an impact rating and hence an interpretation in terms of the level of environmental management required for each impact.

The first stage of any impact assessment is the identification of potential environmental activities, aspects and impacts which may occur during the commencement and implementation of a project. This is supported by the identification of receptors and resources, which allows for an understanding of the impact pathway and an assessment of the sensitivity to change. Environmental impacts (social and biophysical) are then identified based on the potential interaction between the aspects and the receptors/resources.

The significance of the impact is then assessed by rating each variable numerically according to defined criteria as outlined in Table 14-1. The purpose of the rating is to develop a clear understanding of influences and processes associated with each impact. The severity, spatial scope and duration of the impact together comprise the consequence of the impact and when summed can obtain a maximum value of 15. The frequency of the activity and the frequency of the impact together comprise the likelihood of the impact occurring and can obtain a maximum value of 10. The values for likelihood and consequence of the impact are then read off a significance rating matrix table as shown in Table 14-1. This matrix thus provides a rating on a scale of 1 to 150 (low, medium low, medium high or high) based on the consequence and likelihood of an environmental impact occurring.

Natural and existing mitigation measures, including built-in engineering designs, are included in the pre-mitigation assessment of significance. Measures such as demolishing of infrastructure, and reinstatement and rehabilitation of land, are considered post-mitigation.

**Table 14-1: Criteria for Assessing Significance of Impacts**

|            |    | Consequence |    |    |    |     |     |     |     |     |     |     |     |     |     |     |
|------------|----|-------------|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|            |    | 1           | 2  | 3  | 4  | 5   | 6   | 7   | 8   | 9   | 10  | 11  | 12  | 13  | 14  | 15  |
| Likelihood | 1  | 2           | 4  | 6  | 8  | 10  | 12  | 14  | 16  | 18  | 20  | 22  | 24  | 26  | 28  | 30  |
|            | 2  | 4           | 8  | 12 | 16 | 20  | 24  | 28  | 32  | 36  | 40  | 44  | 48  | 52  | 56  | 60  |
|            | 3  | 6           | 12 | 18 | 24 | 30  | 36  | 42  | 48  | 54  | 60  | 66  | 72  | 78  | 84  | 90  |
|            | 4  | 8           | 16 | 24 | 32 | 40  | 48  | 56  | 64  | 72  | 80  | 88  | 96  | 104 | 112 | 120 |
|            | 5  | 10          | 20 | 30 | 40 | 50  | 60  | 70  | 80  | 90  | 100 | 110 | 120 | 130 | 140 | 150 |
|            | 6  | 12          | 24 | 36 | 48 | 60  | 72  | 84  | 96  | 108 | 120 | 132 | 144 | 156 | 168 | 180 |
|            | 7  | 14          | 28 | 42 | 56 | 70  | 84  | 98  | 112 | 126 | 140 | 154 | 168 | 182 | 196 | 210 |
|            | 8  | 16          | 32 | 48 | 64 | 80  | 96  | 112 | 128 | 144 | 160 | 176 | 192 | 208 | 224 | 240 |
|            | 9  | 18          | 36 | 54 | 72 | 90  | 108 | 126 | 144 | 162 | 180 | 198 | 216 | 234 | 252 | 270 |
|            | 10 | 20          | 40 | 60 | 80 | 100 | 120 | 140 | 160 | 180 | 200 | 220 | 240 | 260 | 280 | 300 |

|             |           |                             |
|-------------|-----------|-----------------------------|
| High        | 76 to 150 | Improve current management  |
| Medium High | 40 to 75  | Maintain current management |
| Medium Low  | 26 to 39  |                             |
| Low         | 1 to 25   | No management required      |

**SIGNIFICANCE = CONSEQUENCE x LIKELIHOOD**

## 15 Positive and Negative Impacts

The impacts of the proposed site layout will be the same as those of the alternative sites that may be identified during the prospecting exercise. The alternative sites will be identified based on the location of sensitive environments such as heritage sites (graves etc.), aquatic ecosystems, riparian zones, and areas with Red Data Species. Changes in the layout plan will be discussed and agreed on with the affected landowners and the layout map amended accordingly.

Positive impacts resulting from prospecting activities will be the creation of employment, which is required in the region. Should adequate iron ore, manganese and diamond be found in the project area, Manyeleti will be able to mine the available reserves. This will result in job creation and support to local businesses is continued. Manyeleti expects that substantial benefits from the project (should adequate reserves be found and confirmed) will accrue to the immediate project area, the sub-region and the province of the Northern Cape.

Minerals of interest, iron ore, manganese and diamond mining in South Africa is of important economic value, especially for the construction and jewellery industries. The proposed prospecting project has a potential to decrease level of unemployment rate in proposed areas and surroundings. This prospecting project will bring revenue into the city and the province which will in turn boost the economy of the country.

Activities to be conducted have medium to low significance impacts, which will be short term activities in nature. The probability of occurrence of an impact was determined and most of the activities can be controlled and impacts can be reduced or avoided. The probability was also determined based on other prospecting activities of similar nature. It was found that generally prospecting activities have low impact on the environment.

Please refer to Section 13 for a comprehensive impact assessment.

## **16 The possible mitigation measures that could be applied and the level of risk.**

Please refer to Section 13 for the management and mitigation measures.

## **17 Motivation where no alternative sites were considered.**

The preferred site is in an area where there is potential for iron ore, manganese and diamond due to the geology of the area. The site is therefore regarded as the preferred site and alternative sites are not considered. The alternative drill sites will be identified based on the location of sensitive environments such as heritage sites (graves etc.), aquatic ecosystems, riparian zones, and areas with Red Data Species. Changes in the layout plan will be discussed and agreed on with the affected landowners.

## **18 Statement motivating the alternative development location within the overall site. (Provide a statement motivating the final site layout that is proposed)**

Information derived from the desktop surveys as well as the specialist studies will aid in determining the location and extent of the prospecting activities. Where practicable, the drilling sites and location of infrastructure will be selected to avoid sensitive environments such as aquatic ecosystems, riparian areas, watercourses, biodiversity of conservation importance and heritage features.

### **18.1 Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site.**

To identify the potential impacts associated with the proposed prospecting activities, the following steps were undertaken:

- The stakeholder consultation process is currently underway in a manner to be interactive, providing the landowners and identified stakeholders with an opportunity to provide input into the project. This is considered a key focus as the local residents have capabilities of providing site-specific information, which may not be available in desktop research material. Stakeholders were requested, as part of the notification letter, to provide their views on the project, and to state any potential concerns they may have. All comments and responses provided will be collated into the Comments and Responses Register, which will be attached to the final BAR, and will also be incorporated into the final impact assessment.
- A thorough desktop study was undertaken to determine the environmental setting in which the project is located. Based on the desktop investigations, various resources were used to determine the significance and sensitivity of the various environmental considerations. The desktop investigation involved the use of:

- The South African National Biodiversity Institute (SANBI) Biodiversity Geographic Database LUDS System;
- The Municipal Integrated Development Plan for the Tsantsabane Local Municipality; and
- The Spatial Development Framework for the ZF Mgcawu District Municipality.

The rating of the identified impacts was undertaken in a quantitative manner as provided in Section 11 (impact rating). The ratings were undertaken in a manner to calculate the significance of each of the impacts. The identification of management and mitigation measures was done based on the significance of the impacts and measures included are considered sufficient, appropriate and practical to protect the environment.

# 19 Assessment of each identified potentially significant impact and risk.

Table 19-1: Assessment of each identified potentially significant impact and risk.

| NAME OF ACTIVITY               |  | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | ASPECTS AFFECTED | PHASE In which impact is anticipated | SIGNIFICANCE if not mitigated | MITIGATION TYPE  | SIGNIFICANCE if mitigated |
|--------------------------------|--|---|------------------|--------------------------------------|-------------------------------|--|---------------------------|
| Data Collection and Assessment | Desktop Study  | None  | N/A              | Planning                             | N/A                           | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.  | N/A                       |
| Geological Mapping             |  | None  | N/A              | Planning                             | N/A                           | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.  | N/A                       |
| Planning for Drilling Surveys  |  | None  | N/A              | Planning                             | N/A                           | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.  | N/A                       |
| Access Roads                   | Physical surveying of the site and pegging of drilling boreholes | None  | N/A              | N/A                                  | N/A                           | Rehabilitation of areas cleared of vegetation and dust control   | Low                       |
| Drill Sites                    |  | Contamination of groundwater from hydrocarbon spillages   | Groundwater      | Construction                         | Medium Low                    | Control through management and monitoring of spillages. Where spillages occur, the soil must be stripped and disposed of as stipulated in the EMPr.  | Low                       |
| Temporary Soil Storage Area    |  | Contamination of surface water due to erosion of soils which will lead to increased turbidity as well as contamination from hydrocarbon spillages | Surface water    | Construction                         | N/A                           | Monitoring through rehabilitation and management of spoil sites  | Low                       |
| Hydrocarbon Storage Area       |  | None  | N/A              | Construction                         | N/A                           | Control through clear demarcation of prospecting areas to ensure avoidance of graves and other heritage sites  | Low                       |
| Contractors Camp               |  | None  | N/A              | Construction                         | N/A                           | Management of drill sites. Should any fossils be discovered, operations must cease and SAHRA must be notified  | Low                       |
| Mobile Ablution Facility       |  | Loss of natural vegetation in the affected areas  | Flora            | Construction                         | Low                           | Rehabilitation of areas cleared of vegetation.<br>Control of alien invasive plant species  | Low                       |
|                                |  | Migration of fauna due to disturbance caused by the proposed project  | Fauna            | Construction                         | Low                           | Relocation of affected species of conservation importance  | Low                       |
|                                |  | Air pollution through nuisance dust, PM 10 and PM2.5 as well as emissions from construction vehicles and machinery.                               | Air Quality      | Construction                         | Low                           | Dust control measures  | Low                       |
|                                |  | Increase in ambient noise due to movement of construction vehicles and machinery  | Noise            | Construction                         | Low                           | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers<br>Control through the limiting of the activities to the daytime and the implementation of an open and transparent channel of communication | Low                       |
|                                |  | Visual impacts as a result of vegetation clearance  | Visual           | Construction                         | Low                           | Rehabilitation of areas cleared of vegetation  | Low                       |

| NAME OF ACTIVITY             |                       | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | ASPECTS AFFECTED                   | PHASE In which impact is anticipated | SIGNIFICANCE if not mitigated | MITIGATION TYPE  | SIGNIFICANCE if mitigated |
|------------------------------|-----------------------|--|------------------------------------|--------------------------------------|-------------------------------|--|---------------------------|
|                              |                       | Increased traffic on the roads due to additional construction vehicles   | Traffic, Socio-economic            | Construction                         | Medium Low                    | Speed control and limitation of the times when construction vehicles may be on the roads   | Low                       |
|                              |                       | Impact of carbon dioxide (GHG) produced by construction vehicles on the local climate  | Climate Change                     | Construction                         | Low                           | Control and keep to a minimal the number of vehicles used for construction. Vehicles must be maintained to ensure efficient use of fuel. | Low                       |
| RC and Diamond Core Drilling | Drilling and Sampling | It is expected that during the operation phase the project will not result in the creation of employment as prospecting requires highly specialised personnel. The applicant will make use of qualified contractors for the drilling and sampling of the sites. The community will however continue to benefit because of the continued boost in small local businesses. Drilling has potential to affect the day-to-day operations by affected landowners   | Socio-Economic                     | Operation                            | Low                           | Control of times during which operation activities will take place   | Low                       |
|                              |                       | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from vehicles and machinery. This will result in the contamination of soils and groundwater. The prospecting operations will require the drilling of boreholes, which may result in the drawdown, which may affect the yield to the surrounding groundwater users. Material used for backfilling boreholes may leach pollutants, which will result in the contamination of surrounding groundwater regime. This may spread beyond the backfilling site via plume migration. | Groundwater                        | Operation                            | Medium Low                    | Rehabilitation of affected areas and control using bunds   | Low                       |
|                              |                       | Drilling operations may result in the generation of surface water runoff contaminated with drill muds and cuttings, should spillage occur. The sedimentation will have negative impacts on the water quality due to increase turbidity in the watercourses. This will have an impact on aquatic habitats.  | Surface Water                      | Operation                            | Low                           | Control through management and monitoring of surface runoff  | Low                       |
|                              |                       | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from the vehicles and machinery. This will result in the contamination of soils. The material from the drilling site may result in the contamination of soils, which may render the land not usable after backfilling operation.  | Soils Land use and Land Capability | Operation                            | Low                           | Rehabilitation of affected areas   | Low                       |
|                              |                       | The movement of vehicles and drilling machinery will likely result in an increase in nuisance dust, PM10 and PM2.5. There is also potential for increase in carbon emissions and ambient air pollution due to the movement of vehicles and construction machinery.   | Air Quality                        | Operation                            | Medium Low                    | Dust control measures  | Low                       |
|                              |                       | The drill rigs and towers used during the drilling operation phase will be visible from nearby locations and will have visual impact on the local communities near the prospecting area.   | Visual                             | Operation                            | Medium Low                    | Strategic location of rigs and towers to areas where there may be some tree cover, as far as practicable                                 | Low                       |
|                              |                       | The drilling operations may result in the destruction of graves and other heritage resources that may exist on site.   | Heritage Resources                 | Operation                            | Low                           | Control through clear demarcation of prospecting areas to ensure avoidance of graves and other heritage sites                            | Low                       |

| NAME OF ACTIVITY  |   | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | ASPECTS AFFECTED                    | PHASE In which impact is anticipated | SIGNIFICANCE if not mitigated | MITIGATION TYPE   | SIGNIFICANCE if mitigated |
|---|---|--|-------------------------------------|--------------------------------------|-------------------------------|---|---------------------------|
|   |   | Earth moving activities may result in the destruction of fossils (if any).   | Palaeontological Resources          | Operation                            | Low                           | Management of drill sites. Should any fossils be discovered, operations must cease and SAHRA must be notified   | Low                       |
|   |   | The use of vehicles and machinery may result in an increase in noise in the immediate vicinity of the project. The drilling activities will also result in an increase in noise in the vicinity of the project.  | Noise                               | Operation                            | Low                           | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers  | Low                       |
|   |   | The movement of vehicles in the project area will result in an increase in traffic on the roads.   | Traffic                             | Operation                            | Low                           | Speed control and limitation of the times when construction vehicles may be on the roads  | Low                       |
|   |   | The movement of vehicles and machinery may result in the production of carbon dioxide (Green House Gas), which may have an impact on the climate in the area.  | Climate                             | Operation                            | Low                           | Control and keep to a minimal the number of vehicles used for operations. Vehicles must be maintained to ensure efficient use of fuel.  | Low                       |
|   |   | Drilling ground vibrations may result in possible damage to infrastructure.  | Drilling and Vibrations             | Operation                            | Low                           | Drill sites must be located as far from infrastructure as is possible to avoid damage to infrastructure   | Low                       |
| Data Analysis   | Feasibility Studies   | None   | N/A                                 | Operation                            | N/A                           | N/A   | N/A                       |
| Feasibility Studies Report                                  |   | None   | N/A                                 | Operation                            | N/A                           | N/A   | N/A                       |
| Borehole capping<br>Removal of equipment and infrastructure | Closure and Rehabilitation of borehole and infrastructure sites | The rehabilitation of the drilling sites and associated access infrastructure will result in the affected soil and land use being restored. This will also result in the resumption of the use of the land since the infrastructure would have been removed.   | Soils, Land Capability and Land Use | Decommissioning and Closure          | N/A                           | N/A   | N/A                       |
|   |   | Positive impacts will result due to the reduction in areas of disturbance and the return of land use of the affected areas and making available an area that was covered by the drilling sites.  | Land Use                            | Decommissioning and Closure          | N/A                           | N/A   | N/A                       |
|   |   | The use of vehicles/machinery during the rehabilitation of the exploration sites may result compaction of soils and in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination and destruction of the vegetation cover and soils.  | Soils and Vegetation                | Decommissioning and Closure          | Low                           | Control and prohibit access of vehicles and machinery to areas outside of established access tracks.<br>Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system. Control through the implementation of a soil management programme in terms of the correct tops oil removal, stockpiling and rehabilitation practices as discussed in the EMPr. | Low                       |
|   |   | During the decommissioning and closure phases equipment will be removed, stockpiled soils will be used for rehabilitation, remaining sumps will be backfilled, levelled, top soiled and the area re-seeded. During the process of rehabilitation surface water runoff from the rehabilitation site may have elevated silt load, which may cause pollution of the nearby water environment. | Surface Water                       | Decommissioning and Closure          | Medium Low                    | Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system.<br>Control through the implementation of the NWA GN 704 water management principles.   | Low                       |

| NAME OF ACTIVITY |  | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | ASPECTS AFFECTED | PHASE In which impact is anticipated | SIGNIFICANCE if not mitigated | MITIGATION TYPE  | SIGNIFICANCE if mitigated |
|------------------|--|--|------------------|--------------------------------------|-------------------------------|--|---------------------------|
|                  |  | Rehabilitation and removal of the prospecting sites and equipment will require vehicular movement. This will result in the generation of dust by movement of vehicles and due to blowing winds. Vehicles and machinery will also generate diesel or petrol fumes. Generated dust will migrate towards the predominant wind direction and may settle on surrounding properties including nearby vegetation. | Air Quality      | Decommissioning and Closure          | Low                           | Dust control measures and rehabilitation of areas stripped of vegetation   | Low                       |
|                  |  | Noise will be generated during the removal of equipment and rehabilitation of the sites. This noise is not expected to exceed occupational noise limits and will be short lived.   | Noise            | Decommissioning and Closure          | Low                           | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers | Low                       |

The supporting impact assessment conducted by the EAP must be attached as an appendix, marked Appendix.

Please refer to Appendix 5.

## 20 Summary of specialist reports.

No specialist studies were conducted as part of this application. Desktop information was used to compile the report and to conduct the impact assessment.

## 21 Environmental impact statement

### 21.1 Summary of the key findings of the environmental impact assessment.

During the proposed prospecting operation, impacts may occur on soils, natural vegetation, surface water, groundwater, sensitive landscapes, air quality, noise, visual aspects, and sites of archaeological and cultural importance should the EMPr not be adhered to.

Manyeleti will undertake measures to ensure that the identified impacts are minimised. Assessment of the impacts with the proposed mitigation measures has shown the significance of the impacts on all affected environmental aspects to be reduced from medium and low to low and negligible significance.

Landowners and land occupiers within the proposed project area may be affected although on a temporary basis due to the need to access the sites. Measures such as safety along the roads and dust suppression will be undertaken to ensure that the impacts on the landowners and land occupiers are minimised.

Storm water runoff from the dirty water areas of the drilling sites, may have a detrimental impact on the surrounding water environment should this water be released to the environment. To prevent the occurrence of the above-mentioned impacts, dirty water collection sump will be used to collect all dirty water from the drilling site. The water collected from the sump will be re-used, evaporated and the sump will be rehabilitated once the drilling is finished. Sediments will be created from the site during the construction, operational and decommissioning phase, which may impact negatively on the surrounding water environment. The sediments will be treated should they contain hydrocarbon waste.

Employees will undergo training and will be given strict instruction not to undertake activities that will affect the environment and that may have an impact on the landowners. Waste generated from the site will be collected in proper receptacles and disposed of in registered waste disposal sites.

Key findings of the environmental impact assessment include:

- Identified impacts will be localised, short term and will have a medium and low significance. The significance of potential environmental impacts can be reduced to low and very low significance with implementation of mitigation measures and monitoring.
- Cumulative noise, visual and air quality (dust) impacts are deemed to not be significant (low) when proper mitigation measures are implemented.
- During the construction phase of the project, vegetation loss is inevitable. This will however be limited to the footprint of the infrastructure (boreholes). Care must be taken to manage any species of special concern as well as the proliferation of alien invasive plant species.

### 21.2 Final Site Map

Please refer to Appendix 6 for the preliminary site map which includes the environmental sensitive areas.

The final map showing the layout of the proposed project will be submitted to the DMR on granting of the prospecting right. The map will be developed to superimpose the proposed prospecting project and associated infrastructure together with the environmentally sensitive areas such as heritage sites, wetland and riparian areas, water courses and Red Data Listed floral species within the proposed project site.

### **21.3 Summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;**

It was determined that the proposed activities will have medium and low significance and will be short term activities. The probability of occurrence of an impact was determined and most of these activities can be controlled and impacts can be reduced or avoided. Generally prospecting activities have low impact on the environment. The planned activities' negative impacts can be controlled and avoided or minimised. Mitigation measures will be used to manage and control any potential impact. The main impacts will include:

- Increased ambient noise levels resulting from drilling activities and increased traffic movement;
- Potential water and soil pollution resulting from hydrocarbon spills and soil erosion which may impact on the water resources utilised by the communities and landowners;
- Potential water and soil pollution resulting from hydrocarbon spills and soil erosion which may impact on ecosystem functioning;
- Increased vehicle activity within the area resulting in potential destruction and disturbance of flora and fauna;
- Poor access control to farms may impact on cattle movement, breeding and grazing practices;
- Influx of job seekers to site may result in increased opportunistic crimes;
- Potential visual impacts by drilling activities as well as vegetation clearance;
- Prospecting will be undertaken by special sub-contractors and it is not anticipated that employment opportunities for local and/or regional communities will result from prospecting activities; and
- Short term boost for local businesses.

## **22 Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr;**

The objectives of the EMPr will be to:

- Provide sufficient information to strategically plan the prospecting activities as to avoid unnecessary social and environmental impacts;
- Provide sufficient information and guidance to plan the prospecting activities in a manner that will reduce impacts (social, physical and biological) as far as is practically possible;
- Ensure an approach that will provide the necessary confidence in terms of environmental compliance; and
- Provide a management plan that is effective and practical for implementation.

It is anticipated that the identified impacts can be managed and mitigated effectively through the implementation of the identified proposed mitigation measures. All the impacts were assessed to have significance ranging between medium and low without the implementation of mitigation measures. All the identified impacts will have a reduced significance of low when the mitigation measures have been implemented.

## **23 Aspects for inclusion as conditions of Authorisation.**

The following conditions should be included in the Environmental Authorisation:

- A minimum distance of 100 m from any dwellings or infrastructure must be kept;
- Landowners as well as land occupiers must be re-consulted at least 30 days prior to any prospecting activities undertaken on their properties;
- A map detailing the drilling locations should be submitted to the relevant landowners, the DWS and DMR prior to the commencement of the prospecting activities;
- No activities may be undertaken within 500 m of riparian areas/wetland areas and/or within 100 m of watercourses without approval from the DWS;
- No relocation or destruction of heritage resources may be undertaken without the approval of SAHRA; and
- Heritage Impact Assessment must be undertaken where infrastructure and drilling sites will be located, prior to commencement of the prospecting activities.

## 24 Description of any assumptions, uncertainties and gaps in knowledge.

The following assumptions, uncertainties and gaps are applicable to this project:

- The Stakeholder Consultation is not yet complete. The Draft BAR will be updated once the 30-day public review and comment period has lapsed. Comments from the stakeholders will be incorporated into the Final BAR to be submitted to the DMR;
- Details on the Water Use Licence requirements are not available;
- No Heritage Impact Assessment was undertaken therefore details on the SAHRA permit requirement are not available;
- No wetland/riparian area delineation was undertaken;
- No detailed site layout is currently available due to the nature of the prospecting activities. The impact assessment was undertaken as a holistic assessment for the overall site.

## **25 Reasoned opinion as to whether the proposed activity should or should not be authorised.**

### **25.1 Reasons why the activity should be authorized or not.**

The EAP's opinion is that the activity may be authorised. The proposed prospecting area that Manyeleti identified is in an area underlain by rocks of the Kuruman and Griquatown iron-formations, which constitute the Asbesheuwels Subgroup of the Ghaap Group of the Transvaal Supergroup. The farm is covered by brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology (Vad). Banded ironstone with bands of amphibolite and lenses of flat-pebble conglomerate in places, crocidolite and tuff (Vak) is observed to the east forming the eastern boundary of the property. Red to flesh coloured windblown sand also forms part of the geology (Qs) is all over the property. Small bands of diamictite, banded jasper, siltstone, dolomite with chert and graywacke (Vm) towards the west of the farm are noticeable trending in a north-south direction. The site is therefore regarded as the preferred site and alternatives are not considered.

Should the project not be approved, this will result in a significant loss of valuable information regarding the mineral status (in terms of iron ore, manganese and diamond), present on the identified properties. In addition, should economical reserves be present and the applicant does not have the opportunity to prospect the opportunity to utilize these reserves for future phases will be lost.

As stated in the impact assessment undertaken for the proposed project, the impacts of the project are of medium and low significance. The significance of the impacts can be reduced to low and very low when the mitigation measures are implemented.

The project will also have positive impacts due to the employment to be created although for a short term, as well as a short boost to local businesses.

The stakeholders will also be requested for their comments. All comments to be received during Public Participation Process will be included in this BAR and EMPr. These comments will be addressed the as far as possible to the satisfaction of the interested and affected parties.

The management of the impacts identified in the impact assessment for all phases of the proposed project will be undertaken through a range of programmes and plans contained in the EMPr. In consideration of the layout plan and the management and mitigation measures contained within the EMPr compiled for the project, which are expected to be effectively implemented, there will be significant reduction in the significance of potential impacts.

### **25.2 Conditions that must be included in the authorisation.**

See Section 23 of the BAR.

## **26 Period for which the Environmental Authorisation is required.**

The prospecting right has been applied for a period of two (2) years. The Environmental Authorisation should therefore allow for 2 year of prospecting.

## 27 Undertaking

Confirm that the undertaking required to meet the requirements of this section is provided at the end of the EMPr and is applicable to both the Basic Assessment Report and the Environmental Management Programme report.

An undertaking by the EAP and the client is provided in Section 41 of the EMPr.

## 28 Financial Provision

Work will be carried out by the contractors and consultant. The closure costs were calculated to be **R 102 364,00** as shown in Table 28-1.

**Table 28-1: Cost Estimate Expenditure**

| CALCULATION OF THE QUANTUM |   |      |             |             |                         |                    |                |

## **28.1 Explain how the aforesaid amount was derived.**

The financial provision for the environmental rehabilitation and closure of any mine/prospecting and its associated operations forms an integral part of the MPRDA. Sections 41 (1) and, 41 (2), 41 (3) and 45 of the MPRDA deal with the financial provision for rehabilitation and closure. During 2012, the DMR made updated rate available for the calculation of the closure costs, where contractor's costs are not available, these apply.

The "Guideline Document for the Evaluation of Financial Provision made by the Mining Industry" was developed by the DMR in January 2005 to empower the personnel at Regional DMR offices to review the quantum determination for the rehabilitation and closure of mining sites.

With the determination of the quantum for closure, it must be assumed that the infrastructure had no salvage value (clean closure). The closure cost estimate (clean closure) was determined in accordance with the DMR guidelines.

## **28.2 Confirm that this amount can be provided for from operating expenditure.**

The amount required to cover the rehabilitation is estimated to be R 102 364,00 at this stage. Manyeleti will fund the operation.

The applicant hereby confirms that the amount is anticipated to be an operating cost and is provided for as such in the Prospecting Work Programme.

## **29 Specific Information required by the competent Authority.**

### **29.1 Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). the EIA report must include the:**

-

#### **29.1.1 Impact on the socio-economic conditions of any directly affected person.**

No specific report was generated for the purposes of the socio-economic conditions. Current land uses inside the prospecting area, such as farming and grazing, may be temporarily impacted through the presence of the fenced areas that drill rigs will operate within. These will, however, be small areas. These areas will be rehabilitated post drilling activities and the areas will once again become available for grazing. Other potential socio-economic impacts will include:

- Nuisance noise due to on site activities and drilling;
- Poor access control resulting in impacts on cattle movement, breeding and grazing practises;
- Influx of job seekers to site, which may result in an increase in opportunistic crime;
- Uncontrolled access to private property outside of the demarcated boundaries; and
- Visual impact because of the vegetation clearance.

Prospecting will be undertaken by sub-contractors and it is not anticipated that employment opportunities for local and/or regional communities will result from the prospecting activities during the drilling phases.

Management and mitigation measures must be implemented to prevent environmental pollution which may impact on environmental resources utilised by communities, landowners and other stakeholders. Measures to manage the potential impacts on communities, individuals or competing land uses in close proximity include;

Noise due to construction activities and drilling:

- Directly affected and adjacent landowners and land occupiers must be informed of the planned dates of the drilling activities and a grievance lodging mechanism must be made available to the stakeholders.
- Site activities shall be concluded during daytime hours (07:00 to 17:30), to avoid night-time noise disturbances and night-time collisions with fauna.

Poor access control resulting in impacts on cattle movement, breeding and grazing practices:

- Access control procedures must be agreed on with the farm owners and all on site personnel shall be trained on these procedures.

Influx of job seekers to the site which may result in increased opportunistic crime:

- Casual labour shall not be recruited at the site. This will eliminate the incentive for people to travel to site seeking employment. Where necessary, a recruitment centre may be established in the major town areas;
- The landowners shall be notified on unauthorised persons encountered on site; and
- Where necessary, the South African Police Service (SAPS) will be notified of unauthorised persons encountered on site.

Visual Impact:

- Dust suppression will be undertaken to manage nuisance dust from construction vehicle movements and other construction activities as and when necessary;
- The portable ablution facilities and any other infrastructure will be acquired with a consideration for colour. Natural earth, green and mat black options which blend with the surrounding must be favoured;
- A waste management system will be implemented, and sufficient waste bins will be provided for on site. A fine system must be implemented to further prohibit littering and poor housekeeping practices; and
- Vegetation cover shall be used where drill rigs will be located to minimise visual impacts.

## **29.2 Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act.**

As outlined in Section 7 of this report, prospecting will be undertaken in phases. The first phase will be a desktop study, which will be followed by mapping.

Drill sites will be determined based on the outcome of the desktop studies activities and mapping. Potential heritage impacts will only occur once the drilling sites have been identified. It is therefore recommended that if the HIA is to be undertaken, it should be done so prior to the commencement of the drilling activities, and that the HIA be conducted over the identified localised drill sites and access routes, as opposed to the entire exploration area.

This recommendation will be submitted to the SAHRA for approval.

### **29.3 Other matters required in terms of sections 24(4)(a) and (b) of the Act.**

The proposed prospecting area is covered by brown jasperlite and crocidolite with alternating layers of shale and mudstone. This banded ironstone is the majority lithology (Iron Formation). Red to flesh coloured windblown sand also forms part of the geology (Sand, Limestone) is all over the property. Small bands of diamictite, iron formation and arenite are observed towards the west of the farm are noticeable trending in a north-south direction. The site is therefore regarded as the preferred site and alternatives are not considered.

The location of the infrastructure will be determined based on the location of the prospecting activities, which will only be determined during Phase 1 of the Prospecting Works Programme, as well as the presence of sensitive environmental attributes such as wetlands, watercourses, protected flora and graves. All infrastructures will be temporary and/or mobile (Refer to Section 7.6) of this report).

In addition, the proposed technologies have been chosen based on long term proven success in prospecting.

## **PART B**

### **ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT**

## **30 Draft environmental management programme.**

### **30.1 Details of the EAP**

Details of the EAP are included in Part A Section 3

### **30.2 Description of the Aspects of the Activity**

The EAP hereby confirms that the requirement to describe the aspects of the activity that are covered by the draft Environmental Management Programme is already included in Part A, Section 11 of this report as required.

### **30.3 Composite Map**

Please refer to Appendix 7 for the composite map. No specific heritage sites have been identified and therefore have not been included in the preliminary composite map. The composite map will be updated once all the sensitive environmental sites have been identified. The current composite map includes red flag areas which include the following:

- Water Course and 100m regulated buffer area;
- Wetlands and regulated 500m areas;
- CBAs and ESAs; and
- Protected Areas.

## **31 Description of Impact management objectives including management statements.**

### **31.1 Determination of closure objectives.**

Each phase of the prospecting activities is dependent on the success of the preceding phase. Depending on the findings from Phase 1, Phase 2 will be initiated. The location and extent of the drill sites can therefore not be determined at this stage of the process.

The rehabilitation plan was developed on the basis that the rehabilitated areas will be made safe, stable, non-polluting and will be able to support self-sustaining ecosystems, similar to surrounding natural ecosystems.

To ensure that the rehabilitation plan is aligned with the closure objective, high-level risk assessment of the prospecting components was undertaken to establish the potential risks associated with therewith.

The closure objectives are to:

- Eliminate any safety risks associated with drill holes and sump through adequate drill hole capping and backfilling;
- Remove and/or rehabilitate all pollution and pollution sources such as waste materials and spills;
- To establish rehabilitated areas to a state which with no susceptible to soil erosion which may result in loss of soil, pollution of water resources;
- Restore disturbed areas and re-vegetate these areas with plant species naturally occurring in the area to restore the ecological function of the affected areas as far as practicable; and
- Eliminate all alien invasive plant species from the disturbed areas.

## **32 Volumes and rate of water use required for the operation.**

The rates and volumes of water to be used are not available at this stage.

### **33 Has a water use licence has been applied for?**

Discussions will be held with the DWS to determine whether abstraction of water will be required. Based on the outcomes of the discussions with the DWS, any potential abstraction of water due to drilling activities will be clarified. At this stage it is not anticipated that abstraction will be required.

Water will be used for dust suppression purposes, consumption by field staff as well as for a few diamond core drilling holes. Furthermore, depending on the DWS opinion, Section 21 (c) and (i) WUL may not be required. This will also be clarified with the DWS. Should it be deemed necessary, on instruction by the DWS, the applicant will submit a water use licence application.

### 34 Impacts to be mitigated in their respective phases.

Table 34-1: Environmental Management Programme for the proposed Manyeleti Prospecting project

| NAME OF ACTIVITY               |  | PHASE        | SIZE AND SCALE of disturbance   | MITIGATION MEASURES  | COMPLIANCE WITH STANDARDS   | TIME PERIOD FOR IMPLEMENTATION |
|--------------------------------|--|--------------|---|--|---|--------------------------------|
| Data Collection and Assessment | Desktop Study  | Planning     | N/A   | N/A  | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.   | Throughout the planning phase  |
| Geological Mapping             |  |              | N/A   | N/A  |   |                                |
| Planning for Drilling Surveys  |  |              | N/A   | N/A  |   |                                |
| Access Roads                   | Physical surveying of the site and pegging of drilling boreholes | Construction | 0.2   | <u>Loss of soils, erosion of the soils and impacts on landowner's livelihood:</u><br>No soil stripping will be allowed during site establishment;  | Implementation of mitigation measures will ensure that the activities in the development of the prospecting sites and associated infrastructure do not have detrimental impacts on the soils, land use and land capability. | During the construction phase  |
| Drill Sites                    |  |              | Total 30 RC and Diamond core drilling sites with a total footprint of 0.2ha | Should it be necessary to conduct geophysical surveys and geological mapping, ensure minimal disturbance of soil;<br>Any activity that may result into the disturbance of the soils must be rehabilitated immediately on discovery;<br>Machinery to be used for the operation will be of good working conditions;<br>Any hydrocarbon spill from the site establishment will be remediated as soon as possible;   |   |                                |
| Temporary Soil Storage Area    |  |              | 0.01 ha   | Use sites that are unused and that are in the degraded state for the proposed development. This must be done in agreement with the landowner. The siting of the boreholes must be conducted such that rocky ridges, sensitive grass lands, indigenous trees and shrubs, sites of geological importance and farmlands actively used for crop farming are avoided;   |   |                                |
| Vegetation Clearance           |  |              | <0.1 ha   | Contaminated soil shall be removed and disposed of to an appropriate licensed landfill site in terms of NEMWA, or can be removed by a service provider that is qualified to clean the soil;  |   |                                |
| Vehicle Parking Area           |  |              | 0.02 ha   | The time in which soils are exposed during construction activities should remain as short as possible;   |   |                                |
| Contractors Camp               |  |              | 0.025 ha  | Erosion control measures shall be implemented where deemed necessary;<br>In general, all steep slopes steeper than 1:3 or where the soils are more prone to erosion must be stabilised;<br>Institute adequate sedimentation control measures where necessary when excavation or disturbance of the riverbanks takes place;<br>The time in which soils are exposed during construction activities;<br>If stockpiles are not going to be used immediately the stockpiles shall be rehabilitated to prevent erosion and resulting in the increase in turbidity;<br>Runoff from stockpiles shall be detained in order to support growth of vegetation;<br>Runoff from the stockpiles shall be suitably managed to ensure that the runoff volumes and velocities are similar to pre disturbed levels;<br>Vegetation shall be used to promote infiltration of water into the stockpile instead of increasing runoff;   |   |                                |
| Ablution Facility              |  |              | 0.02 ha   | A monitoring programme will be implemented if the stockpiles are not used within the first year whereby the vegetation of the stockpiles is monitored in terms of basal cover and species diversity;<br>If it is noticed that the vegetation on the stockpiles is not sustainable, appropriate corrective actions shall be taken to rectify the situation;<br>Stockpiles shall be maintained until the topsoil is required for rehabilitation purposes;<br><u>Loss of natural vegetation in the affected areas:</u><br>Use sites with most disturbed vegetation cover for the development;<br>No strip of topsoil and vegetation will be allowed during site establishment;<br>Ensure minimal disturbance of vegetation when conducting geophysical surveys and geological mapping;<br>Use existing track and roads in all instances as far as is practicable;<br>As part of the drilling programme, no tracks will be cleared for once-off access to drilling |   |                                |
|                                |  |              |   | The implementation of mitigation measures will ensure that the establishment of the prospecting site and associated infrastructure/equipment do not have detrimental impact on the   |   |                                |

|  |  |  |  |   |   |  |
|--|--|--|--|---|---|--|
|  |  |  |  | <p>sites;<br/>                 Avoid significant vegetation such as trees and large shrubs in the event that driving through the veld is required to access an identified sampling site;<br/>                 Any area that may result into the disturbance of the vegetation cover must be rehabilitated immediately on discovery;<br/>                 The Contractor shall be on the lookout for SCC and any floral SCC encountered within the development footprint, are to be relocated to areas with suitable habitat outside the disturbance footprint;<br/>                 Floral species of conservation concern, if encountered within the development footprint, are to be handled with care and the relocation of sensitive plant species to suitable similar habitat is to be overseen by a botanist;<br/>                 The proposed development footprint shall be kept to the minimum;<br/>                 All disturbed areas must be concurrently rehabilitated during construction;<br/>                 Prohibit the collection of any plant material for firewood or medicinal purposes;<br/>                 The existing integrity of flora surrounding the study area shall be upheld and no activities shall be carried out outside the footprint of the construction areas;<br/>                 Edge effect control shall be implemented to avoid further habitat degradation outside of the proposed footprint area;<br/>                 All sensitive open space areas will be demarcated and access into these areas shall be prohibited;<br/>                 Protected floral species occurring within the vicinity of the study area, but outside the disturbance footprint shall be fenced for the duration of the construction activities;<br/>                 Construction vehicles shall only be allowed on designated roadways to limit the ecological footprint of the project;<br/>                 Implementation of an Alien Invasive Plant Species Management plan;<br/>                 Edge effects of activities including erosion and alien/ weed control will be strictly managed in the affected areas;<br/>                 All sites disturbed by construction activities shall be monitored for colonisation by exotic or invasive plants;<br/>                 Exotic or invasive plants shall be controlled as they emerge;<br/>                 An alien vegetation control program must be developed and implemented within all disturbed areas;<br/> <u>Migration of animal life due to disturbance caused proposed project:</u><br/>                 The proposed development footprint areas shall remain as small as possible and where possible be confined to already disturbed areas;<br/>                 Site activities will be conducted during daytime hours 07h00 – 17h30 to avoid night-time noise disturbances and night-time collisions with fauna;<br/>                 Vehicle speed will be reduced, particularly in highly vegetated areas to avoid deaths by vehicle impacts;<br/>                 No trapping or hunting of fauna shall be permitted;<br/>                 Edge effects of all construction and operational activities, such as erosion and alien plant species proliferation, which may affect faunal habitat, need to be strictly managed;<br/>                 Should any faunal SCC be encountered within the study area, these species will be relocated to similar habitat within or in the vicinity of the study area with the assistance of a suitably qualified specialist;<br/>                 No informal fires in the vicinity of construction areas shall be permitted;<br/>                 An alien vegetation control plan must be developed and implemented in order to manage alien plant species occurring within the study area, and to prevent further faunal habitat loss;<br/>                 Poaching will be prohibited at the prospecting site;<br/> <u>Deterioration of water quality in in the nearby streams and within the groundwater regime:</u><br/>                 No site establishment shall be permitted within sensitive landscapes;<br/>                 No construction activities shall be permitted within 100 meters of water courses and/or drainage lines and within 500 m of riparian zones without consent from the DWS;<br/>                 Avoid stripping of areas within the construction sites;<br/>                 Rehabilitate areas that may have been mistakenly stripped;<br/>                 Storm water upslope of the campsite and drill sites should be diverted around these sites;<br/>                 Proper waste management facilities will be put in place at the campsite and drilling site.</p> | <p>area's flora, in particular indigenous species and species that are of conservation importance.</p> <p>Mitigation measures will ensure that the animal life within in the project is not affected by the proposed project.</p> <p>Implementation of the mitigation measures will ensure that the quality of streams and groundwater within the site will comply with the target DWS target water quality objective and construction will be in</p> |  |
|--|--|--|--|---|---|--|

|  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|
|  |  |  |  | <p>Any hydrocarbon spill from the site establishment will be remediated as soon as possible;<br/>                 No washing of vehicles shall be allowed outside demarcated areas. Washing bays for vehicles and other equipment shall be provided with appropriate soakaways, will be clearly demarcated and will not be allowed to contaminate any surface runoff;<br/>                 Sufficient areas shall be provided for the maintenance and washing of vehicles;<br/>                 Refuelling of vehicles will only be allowed in designated areas;<br/>                 All construction equipment shall be parked in a demarcated area Drip trays shall be used when equipment is used for some time;<br/>                 On surface bulk storage of hydrocarbons must be situated in a dedicated area which will include a bund or a drain where necessary to contain any spillages during the use, loading and off-loading of the material;<br/>                 Bunded areas shall contain 110% of the stored volume;<br/>                 Bund areas must be impermeable;<br/>                 Bund area must have a facility such as a valve/sump to drain or remove clean stormwater,<br/>                 Contaminated water shall be pumped into a container for removal by an approved service provider;<br/>                 Regular inspections shall be carried out to ensure the integrity of the bundwalls;<br/>                 All preventative servicing of earth moving equipment and construction vehicles shall be conducted off site;<br/>                 Runoff from this area shall be contained;<br/>                 Spill kits shall be made available, and all personnel shall be trained, and training records shall be made available on request;<br/>                 Ensure that topsoil is properly stored, away from the streams and drainage areas;<br/>                 Vehicle and personnel movement within watercourses and riparian areas shall be strictly prohibited;<br/>                 Adequate stormwater management must be incorporated into the design of the project in order to prevent contamination of water courses from dirty water;<br/> <u>Water abstraction:</u><br/>                 Any abstraction of water for construction purposes must be approved by DWS'.<br/><br/> <u>Riparian and Aquatic Ecosystem Ecology destruction and loss of habitat:</u><br/>                 Construction activities will be limited to be more than 500 m from the edge of the riparian areas without consent from the DWS;<br/>                 Adequate stormwater management must be incorporated into the design of the project in order to prevent erosion and the associated sedimentation of the aquatic system;<br/>                 No vehicles may be allowed to indiscriminately drive through the riparian areas or within the active stream channels;<br/>                 All disturbed areas shall be re-vegetated with indigenous species;<br/>                 All construction materials shall be kept out of the riparian areas;<br/>                 All vehicles shall be regularly inspected for leaks. Re-fuelling must take place outside the project area, on a sealed surface area to prevent ingress of hydrocarbons into topsoil and aquatic ecosystem;<br/> <u>Air pollution through air pollutants' emissions, from the construction site:</u><br/>                 Wet suppression using will be conducted at areas with excessive dust emissions;<br/>                 Dust suppression measures shall be implemented on dry weather days and periods of high wind velocities;<br/>                 Rehabilitation of disturbed areas shall be undertaken in tandem with construction activities;<br/>                 A speed limit of 40 km/hr shall apply to limit vehicle entrained dust from the unpaved roads;<br/>                 All construction equipment must be scheduled for preventative maintenance to ensure the functioning of the exhaust systems to reduce excessive emissions and limit air</p> | <p>Compliance with the regulations under the GN704.<br/><br/>                 Water abstraction will not be permitted unless authorisation is granted by DWS. Obtain all necessary authorisations in terms of Section 21 of the National Water Act (No.36 of 1998).<br/><br/>                 Implementation of mitigation measures will assist with maintaining the current state of the sensitive landscapes within the project area and will enable the project to comply with the requirements of the NWA.<br/><br/>                 With the implementation of the mitigation measures, the construction will be undertaken such that the ambient air quality does not exceed the National Air Quality Standards.</p> |  |
|--|--|--|--|--|--|--|

|  |  |  |  |   |   |  |
|--|--|--|--|---|---|--|
|  |  |  |  | <p>pollution;<br/>                 Appropriate dust suppression measures may include limiting the extent of open areas, reducing the frequency of disturbance and spraying with water;<br/>                 Odours:<br/>                 Putrescible waste must be handled, stored and disposed of before the probability of it generating odours;<br/>                 Chemical toilets must be emptied / serviced on a regular basis. Proof of this must be provided to the Engineer;<br/>                 All the construction vehicles shall undergo maintenance on a regular basis to improve on the combustion engine vehicle efficiency;<br/>                 Traffic will be restricted to demarcated areas and traffic volumes and speeds within the construction site will be controlled;<br/> <u>Increased nuisance noise levels:</u><br/>                 The maximum speed limit shall be limited to 40 km/hr subject to risk assessment;<br/>                 Less noisy equipment will be used, the equipment will be kept in good working order and the equipment will be fitted with correct and appropriate noise abatement measures;<br/>                 Ensure that the employees are issued with earplugs and that they are instructed to use them;<br/>                 Educate employees on the dangers of hearing loss due to mine machinery noise;<br/>                 Adjacent landowners must be advised of any work that will take place outside of normal working hours, that may be disruptive (e.g., noise) in advance;<br/>                 Surrounding communities must be notified in advance of noisy construction activities;<br/>                 All equipment should be provided with standard mufflers;<br/>                 Muffling units on vehicles and equipment must be kept in good working order;<br/>                 Construction staff working in areas where the 8-hour ambient noise levels exceed 85 Dba should wear ear protection equipment;<br/>                 Where possible, operation of several equipment and machinery must be avoided;<br/>                 All equipment must be kept in good working order, with immediate attention being paid to defective silencers, slipping fanbelts, worn bearings and other sources of noise;<br/>                 Equipment must be operated within specifications and capacity (e.g., no overloading of machines);<br/>                 Regular maintenance of equipment must be undertaken, particularly with regard to lubrication;<br/>                 Equipment must be operated in such a way that the equipment is operated throughout the working periods instead of operating several items simultaneously;<br/>                 Equipment shall be switched off when not in operation;<br/>                 Appropriate directional and intensity settings must be maintained on all hooters and sirens;<br/>                 The Contractor must ensure that the employees conduct themselves in an appropriate manner while on site;<br/>                 Adjacent landowners shall be notified in writing if work needs to be carried out after hours;<br/>                 Noise/vibration producing activities shall be limited to daylight hours (Monday to Friday 07H00 to 18H00 and Saturday 07H00 -14H00);<br/> <u>Visual impacts on the surrounding communities and road users from the construction:</u><br/>                 The landowners will be informed on the type of machinery and equipment to be used at the prospecting sites;<br/>                 Lighting will be conducted in a manner that will reduce the impacts on visual aspects at night times;<br/>                 The number of construction vehicles and machinery to be used shall be kept to a minimum;<br/>                 Movement of vehicles shall be kept to outside busy hours to minimise the visual impacts on the residents;<br/>                 Where possible, rehabilitation of the work areas shall be undertaken in tandem with construction to ensure that areas stripped of vegetation are kept to a minimum;<br/> <u>Damage or destruction of sites with archaeological and cultural significance:</u><br/>                 Prior to the site establishment, a heritage impact assessment must be undertaken and mitigation and /or management measures for the protection of such resources must be</p> | <p>The mitigation measures ensure that the noise levels from the construction sites will be managed and measures will be taken to ensure that noise levels are below the National Noise Control Regulations, SANS 10103:2008 Guidelines and will ensure that the noise levels emanating from the construction sites will not have detrimental effects on the prospecting staff and surrounding communities/landowners.</p> <p>Measures will be undertaken to ensure that the visual aspects from the site are complying with the relevant visual standards and objectives and ensure that all operations during the construction phase do not result in detrimental visual impacts on surrounding properties, communities and road users.</p> <p>The construction will be undertaken in compliance with the requirements of the National Heritage Resources Act, 1999 (Act 25 of 1999) and recommendations from the</p> |  |
|--|--|--|--|---|---|--|

|  |  |  |  |  |   |  |
|--|--|--|--|--|---|--|
|  |  |  |  | <p>implemented.</p> <p>If archaeological sites or graves are exposed during construction work, it should immediately be reported to a heritage practitioner so that an investigation and evaluation of the finds can be made;</p> <p>The establishment of the sites will be away from any identified grave site or heritage sites. A buffer of 50 m will be created between the sites and the proposed camp and drilling sites;</p> <p><u>Impact from the influx of job seekers and employment of farm labourers:</u></p> <p>Recruitment will not be undertaken on site;</p> <p>Recruitment process shall favour locals, but farm labourers will not be employed unless agreed to with the farm owners;</p> <p>Where required, liaise with the SAPD to ensure safety of landowners in the areas;</p> <p><u>Waste Management:</u></p> <p><i>Separation of waste</i></p> <p>All waste shall be separated into general waste and hazardous waste;</p> <p>Hazardous waste shall not be mixed with general waste and in doing so increase the quantities of hazardous waste to be managed;</p> <p>General waste can further be separated in waste that can be recycled and or reused;</p> <p>No littering shall be allowed in and around the site, a sufficient number of bins shall be provided for the disposal of waste;</p> <p>Where necessary dedicate a storage area on site for collection of construction waste.</p> <p><i>Storage of waste:</i></p> <p>No stockpiling of material shall be permitted within 100 m of water courses and/or drainage lines, or within 500 m of riparian areas;</p> <p>General waste will be collected in an adequate number of litter bins located throughout the construction site Bins shall be located no more than 50 m from construction sites;</p> <p>Bins must have lids in order to keep rainwater out;</p> <p>Bins shall be emptied regularly to prevent the bins from overflowing;</p> <p>All work areas shall be kept clean and tidy at all times;</p> <p>All waste management facilities will be maintained in good working order;</p> <p>Waste shall be stored in demarcated areas according to type of waste;</p> <p>Runoff from any area demarcated for waste will be contained, treated and reused;</p> <p>Flammable substances must be kept away from sources of ignition and from oxidizing agents;</p> <p>Waste shall not be buried or burned on site; and</p> <p>The maximum retention time for temporary storage of waste generated shall not exceed 30 days, provided the waste does not present a health hazard or risk of odour;</p> <p><i>Disposal of hazardous waste:</i></p> <p>No dumping shall be allowed in or near the construction site;</p> <p>Hazardous containers shall be disposed of at an appropriate licensed site;</p> <p>Hazardous waste will be removed and managed by an approved service provider;</p> <p>A safe disposal certificate will be provided by the approved service provider as proof of responsible disposal of hazardous waste; and</p> <p>The safe disposal certificate shall be stored and provided on request;</p> <p><i>Disposal of general waste:</i></p> <p>No dumping shall take place in or near the construction site;</p> <p>All general waste shall be disposed of to the nearest licensed landfill site;</p> <p>Demolition waste and builder's rubble shall be disposed of to an appropriate licensed landfill site; and</p> <p>The necessary permissions must be obtained to dispose of waste to a registered landfill site;</p> <p><u>Traffic:</u></p> <p>Where existing public roads are used to access the construction areas, adequate construction signage is in place to inform the public of increased construction activities in the affected areas by placing adequate signage;</p> <p>Traffic signs should warn community road users of the presence of construction vehicles;</p> | <p>specialist. The mitigation measures will ensure that the construction activities do not have detrimental impacts on the heritage sites.</p> <p>The identified mitigation measures will result in minimal influx of job seekers to the site.</p> <p>The mitigation measures will result in reduced the amounts of waste produced, will encourage re-use of material where possible and recycling of the material where possible. Disposal will be utilised as the last resort. The mitigation measures will also ensure that the management of waste will be in accordance with the National Environmental Management: Waste Act, 2008 (Act 51 of 2008)</p> <p>Implementing mitigation measure will ensure road safety along the public roads and onsite and to increase awareness of slow-moving vehicles.</p> |  |

|                              |                       |           |              |   |   |  |
|------------------------------|-----------------------|-----------|--------------|---|---|--|
|                              |                       |           |              | <p>Local speed limits and traffic laws shall apply at all times to minimise the occurrences of accidents on public roads;</p> <p>Where possible the transportation of construction materials and rubbish shall be undertaken outside traffic peak hours to minimise inconveniencing residents;</p> <p>The number of construction vehicles and trips shall be kept to a minimum.</p> <p>Materials transported on public roads must be covered.</p>   |   |  |
| RC and Diamond Core Drilling | Drilling and Sampling | Operation | 30 Boreholes | <p><u>Soil profile disruption, contamination of soils, destruction of natural vegetation and loss of land use:</u></p> <p>The drilling of the exploration boreholes will be undertaken in such a manner that the environment is protected from probable spillages and contamination by carbonaceous material.</p> <p>All boreholes and sumps will be rehabilitated to pre-drilling conditions.</p> <p>Tarpaulins will be placed on the ground to prevent oil, grease, hydraulic fluid and diesel spills during emergency repairs.</p> <p>All oil spills will be remedied using approved methodologies.</p> <p>The contaminated soils will be removed and disposed of at a licensed waste disposal facility.</p> <p>All waste generated from the drilling sites and the campsite will be collected in proper receptacles and removed to registered disposal facilities e.g., sewage treatment plant, solid waste disposal site or hydrocarbon recycling or treatment facilities.</p> <p>No topsoil shall be stored within 100 m of water courses and drainage lines or within 500 m of riparian areas.</p> <p>The soils must be used for the backfilling and rehabilitation of the sumps.</p> <p>The rehabilitated sump must be seeded with recommended seed mix.</p> <p><u>Migration of animal life due to disturbance caused proposed project:</u></p> <p>Where possible drill sites shall be located within degraded environments.</p> <p>Poaching will be prohibited at the prospecting sites.</p> <p><u>The drilling operation and use of campsite may result in the generation of surface water runoff contaminated with silt (sedimentation) and possibly hydrocarbon fluids should</u></p> | <p>The implementation of the mitigation measures will ensure that the land use and capability of the sites where the operations will be undertaken will continue after the proposed project.</p> <p>Maintenance of the current status on animal life within the project area.</p> | <p>Upon cessation of the individual activity</p> <p>Throughout the operation phase</p> |

|                 |  |  |  |   |  |  |
|-----------------|--|--|--|---|--|--|
| <p>Sampling</p> |  |  |  | <p><u>spillages occur:</u><br/>                 No prospecting operations will be undertaken within 100 metres from the nearby streams and 500 meters from the riparian areas.<br/>                 Sumps will be excavated for the collection mud and excess water from the drilling sites. The sump will be sized such that it will be able to contain the water and mud that will be generated during the prospecting operation.<br/>                 Storm water generated around the drilling site will be diverted away to the clean water environment.<br/>                 No vehicle maintenance will be allowed on site. All hydrocarbons will be stored on protected storage areas away from the streams.<br/>                 The drilling of the exploration boreholes will be undertaken done in such a manner that the environment is protected from probable spillages and contamination by carbonaceous material.<br/>                 Tarpaulins will be placed on the ground to prevent oil, grease, hydraulic fluid and diesel spills during emergency repairs. All oil spills will be remedied using approved methodologies. The contaminated soils will be removed and disposed of at a licensed waste disposal facility.<br/>                 The landowners' borehole water quality and yield will be closely monitored during the drilling operation.<br/>                 Should it be proven that the operation is affecting the quantity and quality of groundwater available to users and surrounding water resources, the affected parties must be compensated.<br/>                 All boreholes and sumps will be rehabilitated to pre-drilling conditions.<br/>                 All waste generated from the drilling sites and the campsite will be collected in proper receptacles and removed to a registered disposal facility e.g., sewage treatment plant, solid waste disposal site or hydrocarbon recycling or treatment facilities.<br/>                 The contaminated soils will be removed and disposed of at a licensed waste disposal facility.<br/>                 All waste generated from the drilling sites and the campsite will be collected in proper receptacles and removed to registered disposal facilities e.g., sewage treatment plant, solid waste disposal site or hydrocarbon recycling or treatment facilities.<br/> <u>Generation of dust and fuel fumes by vehicular movement:</u><br/>                 Dust suppression must be conducted during the operational phase of the project.<br/>                 Vehicle maintenance must be conducted regularly to avoid excessive diesel fumes.<br/>                 Maintain a speed limit of 20km/hr during the dry season and or when the wind velocity is likely to result in an increased nuisance dust.<br/>                 Materials transported on public roads must be covered.</p> | <p>The mitigation measures will ensure that the drilling operation does not have detrimental impacts on the surface and ground water environment, and that the activities will comply with the provisions of the NWA.</p>  |  |
|                 |  |  |  | <p><u>Increased noise levels:</u><br/>                 Limit the maximum speed to 40 km/h or less, subject to risk assessment.<br/>                 Less noisy equipment will be used, the equipment will be kept in good working order and the equipment will be fitted with correct and appropriate noise abatement measures.<br/>                 Ensure that the employees are issued with earplugs and that they are instructed to use them.<br/>                 Educate employees on the dangers of hearing loss due to mine machinery noise.<br/>                 Drill sites shall be located as far from private property as is possible to minimise noise impacts.<br/> <u>Visual impacts on the surrounding communities and road users from the construction:</u><br/>                 The landowners will be informed on the type of machinery and equipment to be used at the prospecting sites.<br/>                 Lighting will be conducted in manner that will reduce the impacts on visual aspects at night times.<br/>                 Materials transported on public roads must be covered.<br/>                 The number of construction vehicles and machinery to be used shall be kept to a minimum.<br/>                 Movement of vehicles shall be kept to outside busy hours to minimise the visual impacts on the residents.</p>  | <p>The air quality in the vicinity of the drilling sites and sites' access routes will be maintained to stay within the national air quality standards.</p> <p>The mitigation measures will ensure that the noise levels from the sites will be managed and measures will be taken to ensure that noise levels are below the National Noise Control Regulations, SANS 10103:2008 guidelines.</p> <p>Measures will be undertaken by the mine to ensure that the visual aspects from the site are complying with the relevant visual standards and objectives.</p> |  |

|  |  |  |  |   |   |  |
|--|--|--|--|---|---|--|
|  |  |  |  | <p>All lighting shall be kept to a minimum within the requirements of safety and efficiency. Where such lighting is deemed necessary, low-level lighting, which is shielded to reduce light spillage and pollution, shall be used.</p> <p>No naked light sources shall be directly visible from a distance. Only reflected light shall be visible from outside the site.</p> <p>External lighting shall use down-lighters shielded in such a way as to minimise light spillage and pollution beyond the extent of the area that needs to be lit.</p> <p>Security and perimeter lighting shall be shielded so that no light falls outside the area needing to be lit.</p> <p>Drill rigs shall be located in areas with adequate tree and bush cover to minimise the visual impact on residents.</p> <p>Where no adequate vegetation cover is available for the drill rigs, shade cloths can be used to screen off the drill rigs.</p> <p>Where possible, rehabilitation of the work areas shall be undertaken in tandem with construction to ensure that areas stripped of vegetation are kept to a minimum.</p> <p><u>Damage or destruction of sites with archaeological and cultural significance:</u></p> <p>The drilling sites will be situated away from any identified grave site or heritage sites. A 50 m buffer will be created between the sites and the proposed camp and drilling sites.</p> <p><u>Safety, intrusion livelihood impacts on the landowners and occupiers:</u></p> <p>Residents shall be informed of any road closures and other disruptions and maintain roads used for the operation in good order. Clear signage shall be installed around the project area indicating the type of disruption and the time during which the disruptions will occur.</p> <p>Communication with landowners and land occupiers shall be kept open during the operational phase of the project. A record of such communication shall be kept on site.</p> <p>Ensure that negotiations on compensation are undertaken before the drilling programme can commence. This will include any other conditions that the landowners may deem necessary for the prospecting operation. The outcomes of the negotiations shall be recorded and kept in a file on site.</p> <p>Ensure that safety measures are implemented to prevent impacts on landowners and occupiers.</p> <p>Access to private property, outside of the demarcated drill sites, without landowner consent shall be strictly prohibited.</p> <p><u>Traffic:</u></p> <p>Local speed limits and traffic laws shall apply at all times to minimise the occurrences of accidents on public roads;</p> <p>Where possible the transportation of materials and rubbish shall be undertaken outside traffic peak hours to minimise inconveniencing residents;</p> <p>The number of construction vehicles and trips shall be kept to a minimum.</p> <p>All the construction vehicles shall undergo maintenance on a regular basis to improve on the combustion engine vehicle efficiency.</p> <p><u>Flora:</u></p> <p>All disturbed areas must be concurrently rehabilitated.</p> <p>Prohibit the collection of any plant material for firewood or medicinal purposes.</p> <p>The existing integrity of flora surrounding the study area shall be upheld and no activities shall be carried out outside the footprint of the construction areas.</p> <p>Edge effect control shall be implemented to avoid further habitat degradation outside of the proposed footprint area.</p> <p>All sensitive open space areas will be demarcated and access into these areas shall be</p> | <p>With the implementation of the mitigation measures, the drilling operations will be undertaken in compliance with the requirements of the National Heritage Resources Act, 1999 (Act 25 of 1999) and recommendations from the specialist.</p> <p>The mine will ensure that all safety standards are met and that access to landowners and occupiers are not detrimentally affected.</p> <p>The objective is to warn the general public of construction traffic, and to manage traffic on site and implementing the mitigation measures will ensure road safety along the public roads and onsite and to increase awareness of slow-moving vehicles.</p> <p>The implementation of mitigation measures will ensure that the drilling and sampling activities do not have detrimental impact on the area's flora.</p> |  |
|--|--|--|--|---|---|--|

|   |   |                             |  |                        |  |   |   |
|---|---|-----------------------------|--|------------------------|--|---|---|
|   |   |                             |  |                        | <p>prohibited.</p> <p>Protected floral species occurring within the vicinity of the study area, but outside the disturbance footprint shall be fenced for the duration of the drilling activities.</p> <p>Monitoring of relocation success will be conducted during the operational phase.</p> <p>Monitoring of relocation success shall continue during and beyond the decommissioning and closure phase.</p> <p>All disturbed areas shall be re-vegetated with indigenous riparian species.</p> <p>As much vegetation growth as possible must be promoted in order to protect soils. In this regard, special mention is made of the need to use indigenous vegetation species where hydro seeding, rehabilitation planting (where applicable) is to be implemented.</p> <p><u>Fauna:</u></p> <p>The rehabilitation of the disturbed areas must be conducted such that the rehabilitated areas will encourage the migration of animals back into the rehabilitated areas.</p> <p>The proposed development footprint areas shall remain as small as possible and where possible be confined to already disturbed areas.</p> <p>No trapping or hunting of fauna shall be permitted.</p> <p>Edge effects of all operational activities, such as erosion and alien plant species proliferation, which may affect faunal habitat, need to be strictly managed.</p> <p>No informal fires in the vicinity of construction areas shall be permitted.</p> <p>An alien vegetation control plan must be developed and implemented in order to manage alien plant species occurring within the study area, and to prevent further faunal habitat loss.</p> <p>Poaching of wild animals and livestock will be prohibited.</p>  |   |   |
| Data Analysis                           | Feasibility Studies   |                             |  | N/A                    | N/A  | N/A   | N/A   |
| Feasibility Studies Report              |   |                             |  | N/A                    | N/A  | N/A   | N/A   |
| Borehole capping                        | Closure and Rehabilitation of borehole and infrastructure sites | Decommissioning and Closure |  | All the affected sites | <p><u>Compaction and contamination of soils within the rehabilitation site:</u></p> <p>All vehicles and machinery used at the rehabilitation site will be kept in good working order.</p> <p>No repairs of vehicles or machinery will be conducted at the rehabilitation site unless it is emergency repairs, which will be conducted on protected ground.</p> <p>Movement of mine vehicles and machinery will be limited to demarcated routes, which will be rehabilitated when no longer in use.</p> <p><u>Re-instatement of soil productivity, land capability and land use:</u></p> <p>All infrastructure will be removed from the site in accordance with the rehabilitation plan.</p> <p>Contaminated soils shall be cleaned or disposed of at a registered landfill site in terms of the requirements of the NEM: WA.</p> <p><u>Pollution of surface water environment:</u></p> <p>The site area will be rehabilitated to be free draining.</p> <p>Erosion protection measures such as the use of contour berms and repair of gullies will be undertaken until such time that the rehabilitated surfaces can be shown to be sustainable.</p> <p>Existing roads should be used where possible and new disturbed areas should be minimised.</p> <p><u>Air pollution from rehabilitation site:</u></p> <p>Where necessary, wet suppression will be conducted at areas with excessive dust emissions.</p> <p>Vehicles and machinery will be well maintained.</p> <p>The traffic volumes and speed within the rehabilitation site will be controlled.</p> <p><u>Nuisance Noise:</u></p> <p>Smaller or less noisy equipment should where possible be used when working near receptors.</p> <p>Equipment will be well maintained and fitted with the correct and appropriate noise abatement measures.</p> <p><u>Damage or destruction of sites with Archaeological and cultural significance:</u></p> | Rehabilitated areas will be maintained to comply with the closure objectives.   | Upon cessation of the aggregate stone-dolerite, Clay and sand prospecting |
| Removal of equipment and infrastructure |   |                             |  |                        |  | <p>Rehabilitated areas will be maintained to comply with the closure objectives.</p> <p>The surface water leaving the rehabilitation site will comply with the DWS target water quality parameters.</p> <p>Decommissioning and rehabilitation of the site will be conducted in such a manner that the ambient air quality does not exceed the air quality standards.</p> <p>Ensure that the noise from the rehabilitation activities do not exceed the SANS 10103 Rating Level.</p> |   |

|  |  |  |  |  |   |   |  |
|--|--|--|--|--|---|---|--|
|  |  |  |  |  | A 50m buffer will be maintained between any site and the archaeological site. | Should heritage sites be identified, rehabilitation in close proximity to the sites will not be damaged or destroyed by the rehabilitation activities |  |
|--|--|--|--|--|---|---|--|

## 35 Impact Management Outcomes

Table 35-1: Impact Management

| NAME OF ACTIVITY               |  | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | ASPECTS AFFECTED                    | PHASE In which impact is anticipated | MITIGATION TYPE   | Standard to be achieved  |
|--------------------------------|--|---|-------------------------------------|--------------------------------------|---|--|
| Data Collection and Assessment | Desktop Study  | None  | N/A                                 | Planning                             | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.                 | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Geological Mapping             |  | None  | N/A                                 | Planning                             | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.                 | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Planning for Drilling Surveys  |  | None  | N/A                                 | Planning                             | Control potential deviations from the approved EMPr through the effective implementation of the data acquisition and desktop study.                 | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Access Roads                   | Physical surveying of the site and pegging of drilling boreholes | Loss of soils, erosion of the soils and impacts on landowners' livelihood.  | Soils, Land capability and Land use | Construction                         | Rehabilitation of areas cleared of vegetation and dust control  | Retain topsoil integrity for the reuse in rehabilitation.<br>Vegetation clearance shall be kept to a minimum. No clearance of vegetation outside demarcated areas  |
| Drill Sites                    |  | Contamination of groundwater from hydrocarbon spillages   | Groundwater                         | Construction                         | Control through management and monitoring of spillages. Where spillages occur, the soil must be stripped and disposed of as stipulated in the EMPr. | Comply with the EMPr.<br>Retain topsoil integrity for the reuse in rehabilitation.<br>Where required, disposal of contaminated soils shall be undertaken in terms of the National Environmental Management: Waste Act, 2008 (Act 59 of 2008) (NEM: WA) |
| Temporary Soil Storage Area    |  | Contamination of surface water due to erosion of soils which will lead to increased turbidity as well as contamination from hydrocarbon spillages | Surface water                       | Construction                         | Monitoring through rehabilitation and management of spoil sites   | Retain topsoil integrity for the reuse in rehabilitation.<br>Comply with the requirements of the NWA: no construction activities within 100 m of water courses and 500m off riparian zones without consent from the DWS.                               |
| Vegetation Clearance           |  | None  | N/A                                 | Construction                         | Control of access to riparian areas and within the regulated 500 m buffer.  | National Water Act, 1998 (Act 36 of 1998)<br>No construction activities may be conducted within 500 m of riparian zones without approval from the DWS.   |
| Vehicle Parking Area           |  | None  | N/A                                 | Construction                         | Control through clear demarcation of prospecting areas to ensure avoidance of graves and other heritage sites                                       | No destruction/loss of heritage resources  |
| Contractors Camp               |  | None  | N/A                                 | Construction                         | Management of drill sites. Should any fossils be discovered, operations must cease and SAHRA must be notified                                       | No destruction/loss of fossils   |
| Ablution Facility              |  | Loss of natural vegetation in the affected areas  | Flora                               | Construction                         | Rehabilitation of areas cleared of vegetation.<br>Control of alien invasive plant species   | Comply with existing legislation National Environmental Management: Biodiversity Act 2004 (Act No 10 of 2004) and Alien and Invasive Species Regulations, 2014.<br>No vegetation clearance outside of demarcated areas                                 |
|                                |  | Migration of fauna due to disturbance caused by the proposed project  | Fauna                               | Construction                         | Relocation of affected species of conservation importance   | Remain within the designated area demarcated for prospecting activities.<br>Ensure minimal clearance of vegetation   |

| NAME OF ACTIVITY             | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts) | ASPECTS AFFECTED  | PHASE In which impact is anticipated | MITIGATION TYPE | Standard to be achieved  |  |
|------------------------------|---|---|--------------------------------------|-----------------|--|--|
|                              |   | Air pollution through nuisance dust, PM 10 and PM2.5 as well as emissions from construction vehicles and machinery.   | Air Quality                          | Construction    | Dust control measures  | Comply with the requirements of the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural communities.<br>Comply with the requirements of the Minimum Emission Standards  |
|                              |   | Increase in ambient noise due to movement of construction vehicles and machinery  | Noise                                | Construction    | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers<br>Control through the limiting of the activities to the daytime and the implementation of an open and transparent channel of communication | Remain within the Noise Regulation Standards for Rural Areas.  |
|                              |   | Visual impacts as a result of vegetation clearance  | Visual                               | Construction    | Rehabilitation of areas cleared of vegetation  | Vegetation clearance must be limited to demarcated areas only  |
|                              |   | Increased traffic on the roads due to additional construction vehicles  | Traffic, Socio-economic              | Construction    | Speed control and limitation of the times when construction vehicles may be on the roads   | Minimise the number of vehicles used during construction.<br>Movement of construction vehicles shall be limited to outside of busy hours   |
|                              |   | Impact of carbon dioxide (GHG) produced by construction vehicles on the local climate   | Climate Change                       | Construction    | Control and keep to a minimal the number of vehicles used for construction. Vehicles must be maintained to ensure efficient use of fuel.   | Comply with the EMPr.<br>Minimise the number of vehicles used during construction.<br>Regular maintenance of vehicles and machinery to improve fuel efficiency.<br>Comply with requirements of the National Environmental Management: Air Quality Act, 2004  |
| RC and Diamond core drilling | Drilling and Sampling   | It is expected that during the operation phase the project will not result in the creation of employment as prospecting requires highly specialised personnel. The applicant will make use of qualified contractors for the drilling and sampling of the sites. The community will however continue to benefit because of the continued boost in small local businesses.<br>Drilling has potential to affect the day-to-day operations by affected landowners   | Socio-Economic                       | Operation       | Control of times during which operation activities will take place   | Maintain a 100% crime free area within the control of the prospecting.<br>No complaints from landowners due to prospecting activities. Should there be conflicts, these must be resolved   |
|                              |   | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from vehicles and machinery. This will result in the contamination of soils and groundwater.<br>The prospecting operations will require the drilling of boreholes, which may result in the drawdown, which may affect the yield to the surrounding groundwater users. Material used for backfilling boreholes may leach pollutants, which will result in the contamination of surrounding groundwater regime. This may spread beyond the backfilling site via plume migration. | Groundwater                          | Operation       | Rehabilitation of affected areas and control using bunds   | No soil contamination as a result of hydrocarbon spillages<br>Rehabilitation and disposal of contaminated soils conducted in terms of the NEM: WA  |
| Sampling                     |   | Drilling operations may result in the generation of surface water runoff contaminated with drill muds and cuttings, should spillage occur.<br>The sedimentation and possible contamination with carbonaceous material will have negative impacts on the water quality due to increase turbidity and an increase in acidity of the water in the streams. This will have an impact on aquatic habitats.   | Surface Water                        | Operation       | Control through management and monitoring of surface runoff  | Retain topsoil integrity for the reuse in rehabilitation.<br>No dirty runoff/stormwater entering water courses.<br>The NWA: No activities within 100 m of watercourses and drainage without consent from the DWS.<br>No soil contamination as a result of hydrocarbon spillages<br>Rehabilitation and disposal of contaminated soils conducted in terms of |

| NAME OF ACTIVITY | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | ASPECTS AFFECTED                   | PHASE In which impact is anticipated | MITIGATION TYPE  | Standard to be achieved |   |
|------------------|---|------------------------------------|--------------------------------------|--|-------------------------|---|
|                  |   |                                    |                                      |  |                         | the NEM: WA   |
|                  | Uncontrolled movement within riparian zones may have an impact on the aquatic ecological habitat, ecological functioning and structure.   | Aquatic Ecosystems                 | Operation                            | Avoidance of riparian areas  |                         | NWA: No activities shall be permitted within 500 m of riparian areas without prior approval from the DWS.<br>Comply with requirements of the NWA  |
|                  | The project may result in the following impacts on the floral environment during the operation phase:<br>Destruction of potential floral habitats as a result of continual disturbance of soil, leading to altered floral habitats, erosion and sedimentation;<br>Impact on floral diversity as a result of possible uncontrolled fires;<br>Potential spreading of alien invasive species as a result of floral disturbance; and<br>Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase | Flora                              | Operation                            | Rehabilitation of affected areas<br>Monitoring of rehabilitated areas to ensure success.   |                         | No invasive plant species in rehabilitated areas<br>No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation and/or removal of contaminated soils            |
|                  | The project may result in the following impacts on the faunal environment during the operation phase:<br>Migration of fauna from the prospecting area due to noise as a resulting of drilling activities;<br>Loss of faunal due to collisions with vehicles and machinery;<br>Loss of faunal diversity and ecological integrity as a result of poaching and faunal species trapping;<br>Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase.  | Fauna                              | Operation                            | Rehabilitation of affected areas<br>Drill holes must be temporarily plugged immediately after drilling is completed and remain plugged until they are permanently plugged below ground to eliminate the risk posed to fauna by open drill holes.<br>Drill holes must be permanently capped as soon as is practicable |                         | No removal of vegetation outside of demarcated areas.<br>Successful plugging of drill holes, with no faunal casualties as a result of holes being left open                                   |
|                  | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from the vehicles and machinery. This will result in the contamination of soils. The materials removed from the drilling sites will contain carbonaceous material, which has potential for contamination should it not be managed properly. The material from the drilling site may result in the contamination of soils, which may render the land not usable after backfilling operation.  | Soils Land use and Land Capability | Operation                            | Rehabilitation of affected areas   |                         | Retain topsoil integrity for the reuse in rehabilitation.   |
|                  | The movement of vehicles and drilling machinery will likely result in an increase in nuisance dust, PM10 and PM2.5.<br>There is also potential for increase in carbon emissions and ambient air pollution due to the movement of vehicles and construction machinery.   | Air Quality                        | Operation                            | Dust control measures  |                         | Remain within the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural as well as Minimum Air Emissions Standards                                   |
|                  | The drill rigs and towers used during the drilling operation phase will be visible from nearby locations and will have visual impact on the local communities in close proximity to the prospecting area.   | Visual                             | Operation                            | Strategic location of rigs and towers to areas where there may be some tree cover, as far as practicable   |                         | No removal of vegetation outside de of demarcated area to ensure as much vegetation cover for the rigs, as possible.<br>Make use of rigs that have earthy cover to minimise the visual impact |
|                  | The drilling operations may result in the destruction of graves and other heritage resources.   | Heritage Resources                 | Operation                            | Control through clear demarcation of prospecting areas to ensure avoidance of graves and other heritage sites  |                         | No destruction/loss of heritage resources<br>Comply with requirements of the SAHRA  |

| NAME OF ACTIVITY                        |   | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | ASPECTS AFFECTED                    | PHASE In which impact is anticipated | MITIGATION TYPE   | Standard to be achieved   |
|---|---|--|-------------------------------------|--------------------------------------|---|---|
|   |   | Earth moving activities may result in the destruction of fossils (if any).   | Palaeontological Resources          | Operation                            | Management of drill sites. Should any fossils be discovered, operations must cease and SAHRA must be notified   | No destruction/loss of fossils<br>Comply with requirements of the SAHRA   |
|   |   | The use of vehicles and machinery may result in an increase in noise in the immediate vicinity of the project. The drilling activities will also result in an increase in noise in the vicinity of the project.  | Noise                               | Operation                            | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers  | Remain within the Noise Regulation Standards for Rural Areas.<br>National Noise Control Regulations, SANS10103:2008 guidelines.   |
|   |   | The movement of vehicles in the project area will result in an increase in traffic on the roads.   | Traffic                             | Operation                            | Speed control and limitation of the times when construction vehicles may be on the roads  | Minimise the number of vehicles on the roads and movement of vehicles shall be kept to outside busy times   |
|   |   | The movement of vehicles and machinery may result in the production of carbon dioxide (Green House Gas), which may have an impact on the climate in the area.  | Climate                             | Operation                            | Control and keep to a minimal the number of vehicles used for operations. Vehicles must be maintained to ensure efficient use of fuel.  | Remain within the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural as well as Minimum Air Emissions Standards<br>Minimise the number of vehicles              |
|   |   | Drilling ground vibrations may result in possible damage to infrastructure.  | Drilling and Vibrations             | Operation                            | Drill sites must be located as far from infrastructure as is possible to avoid damage to infrastructure   | No private infrastructure shall be damaged/lost due to drilling vibrations  |
| Data Analysis                           | Feasibility Studies   | None   | N/A                                 | Operation                            | N/A   | N/A   |
| Feasibility Studies Report              |   | None   | N/A                                 | Operation                            | N/A   | N/A   |
| Borehole capping                        | Closure and Rehabilitation of borehole and infrastructure sites | The removal of the campsite equipment and the rehabilitation of the drilling sites and associated access infrastructure will result in the affected soil and land use being restored. This will also result in the resumption of the use of the land since the infrastructure would have been removed.   | Soils, Land Capability and Land Use | Decommissioning and Closure          | N/A   | No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation of contaminated soils.<br>Rehabilitation of land to a state it was before prospecting activities                  |
| Removal of equipment and infrastructure |   | Positive impacts will result due to the reduction in areas of disturbance and the return of land use of the affected areas and making available an area that was covered by the campsite and drilling sites.   | Land Use                            | Decommissioning and Closure          | N/A   | No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation of contaminated soils.<br>Rehabilitation of land to a state it was before prospecting activities                  |
|   |   | The use of vehicles/machinery during the rehabilitation of the exploration sites may result compaction of soils and in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination and destruction of the vegetation cover and soils.  | Soils and Vegetation                | Decommissioning and Closure          | Control and prohibit access of vehicles and machinery to areas outside of established access tracks.<br>Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system. Control through the implementation of a soil management programme in terms of the correct tops oil removal, stockpiling and rehabilitation practices as discussed in the EMPr. | Vehicle movement shall be limited to areas demarcated as access tracks.<br>Comply with the requirements of the EMPr   |
|   |   | During the decommissioning and closure phases equipment will be removed, stockpiled soils will be used for rehabilitation, remaining sumps will be backfilled, levelled, top soiled and the area re-seeded. During the process of rehabilitation surface water runoff from the rehabilitation site may have elevated silt load, which may cause pollution of the nearby water environment. | Surface Water                       | Decommissioning and Closure          | Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system.<br>Control through the implementation of the NWA GN 704 water management principles.   | Maintain the water quality of water course in the project area.<br>Ensure that dirty stormwater and runoff is diverted from the water courses and riparian areas.<br>Comply with the requirements of GN704. |

| NAME OF ACTIVITY |  | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | ASPECTS AFFECTED | PHASE In which impact is anticipated | MITIGATION TYPE  | Standard to be achieved   |
|------------------|--|--|------------------|--------------------------------------|--|---|
|                  |  | Rehabilitation and removal of the prospecting sites and equipment will require vehicular movement. This will result in the generation of dust by movement of vehicles and due to blowing winds. Vehicles and machinery will also be generated diesel or petrol fumes. Generated dust will migrate towards the predominant wind direction and may settle on surrounding properties including nearby vegetation. | Air Quality      | Decommissioning and Closure          | Dust control measures and rehabilitation of areas stripped of vegetation   | Comply with the requirements of the National Environmental Management Air Quality Act, 2004 Dust Regulation guidelines for rural communities. |
|                  |  | Noise will be generated during the removal of equipment and rehabilitation of the sites. This noise is not expected to exceed occupational noise limits and will be short lived.   | Noise            | Decommissioning and Closure          | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers | Comply with the Noise Regulation Standards for Rural Areas.   |

## 36 Impact Management Actions

Table 36-1: Impact management actions

| NAME OF ACTIVITY               |  | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | MITIGATION TYPE  | Time Period for Implementation  | Compliance with standards  |
|--------------------------------|--|---|--|---|--|
| Data Collection and Assessment | Desktop Study  | None  | Control potential deviations from the approved Prospecting Works Programme through the effective implementation of the data acquisition and desktop study. | Planning  | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Geological Mapping             |  | None  | Control potential deviations from the approved Prospecting Works Programme through the effective implementation of the data acquisition and desktop study. | Planning  | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Planning for Drilling Surveys  |  | None  | Control potential deviations from the approved Prospecting Works Programme through the effective implementation of the data acquisition and desktop study. | Planning  | Remain within the ambits of the EMPr and Environmental Authorisation.  |
| Access Roads                   | Physical surveying of the site and pegging of drilling boreholes   | Loss of soils, erosion of the soils and impacts on landowners' livelihood.  | Rehabilitation of areas cleared of vegetation and dust control   | Construction  | Retain topsoil integrity for the reuse in rehabilitation.<br>Vegetation clearance shall be kept to a minimum. No clearance of vegetation outside demarcated areas  |
| Drill Sites                    |  | Contamination of groundwater from hydrocarbon spillages   | Control through management and monitoring of spillages. Where spillages occur, the soil must be stripped and disposed of as stipulated in the EMPr.        | Construction  | Comply with the EMPr.<br>Retain topsoil integrity for the reuse in rehabilitation.<br>Where required, disposal of contaminated soils shall be undertaken in terms of the National Environmental Management: Waste Act, 2008 (Act 59 of 2008) (NEM: WA) |
| Temporary Soil Storage Area    |  | Contamination of surface water due to erosion of soils which will lead to increased turbidity as well as contamination from hydrocarbon spillages | Monitoring through rehabilitation and management of spoil sites  | Construction  | Retain topsoil integrity for the reuse in rehabilitation.<br>Comply with the requirements of the NWA: no construction activities within 100 m of water courses and 500m of riparian zones without consent from the DWS.                                |
| Vegetation Clearance           |  | None  | N/A  | Construction  | National Water Act, 1998 (Act 36 of 1998)<br>No construction activities may be conducted within 500 m of riparian zones without approval from the DWS.   |
| Vehicle Parking Area           |  | None  | N/A  | Construction  | No destruction/loss of heritage resources  |
| Mobile office                  |  | None  | N/A  | Construction  | No destruction/loss of fossils   |
| Ablution Facility              |  | Loss of natural vegetation in the affected areas  | Rehabilitation of areas cleared of vegetation.<br>Control of alien invasive plant species  | Construction  | Comply with existing legislation National Environmental Management: Biodiversity Act 2004 (Act No 10 of 2004) and Alien and Invasive Species Regulations, 2014.<br>No vegetation clearance outside of demarcated areas                                 |
|                                | Migration of fauna due to disturbance caused by the proposed project   | Relocation of affected species of conservation importance   | Construction   | Remain within the designated area demarcated for prospecting activities.<br>Ensure minimal clearance of vegetation  |  |
|                                | Air pollution through nuisance dust, PM 10 and PM 2.5 as well as emissions from construction vehicles and machinery. | Dust control measures   | Construction   | Comply with the requirements of the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural communities.<br>Comply with the requirements of the Minimum Emission Standards |  |

| NAME OF ACTIVITY             |                       | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | MITIGATION TYPE  | Time Period for Implementation | Compliance with standards  |
|------------------------------|-----------------------|---|--|--------------------------------|--|
|                              |                       | Increase in ambient noise due to movement of construction vehicles and machinery  | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers<br>Control through the limiting of the activities to the daytime and the implementation of an open and transparent channel of communication | Construction                   | Remain within the Noise Regulation Standards for Rural Areas.  |
|                              |                       | Visual impacts as a result of vegetation clearance  | Rehabilitation of areas cleared of vegetation  | Construction                   | Vegetation clearance must be limited to demarcated areas only  |
|                              |                       | Increased traffic on the roads due to additional construction vehicles  | Speed control and limitation of the times when construction vehicles may be on the roads   | Construction                   | Minimise the number of vehicles used during construction.<br>Movement of construction vehicles shall be limited to outside of busy hours   |
|                              |                       | Impact of carbon dioxide (GHG) produced by construction vehicles on the local climate   | Control and keep to a minimal the number of vehicles used for construction. Vehicles must be maintained to ensure efficient use of fuel.   | Construction                   | Comply with the EMPr.<br>Minimise the number of vehicles used during construction.<br>Regular maintenance of vehicles and machinery to improve fuel efficiency.<br>Comply with requirements of the National Environmental Management: Air Quality Act, 2004  |
| RC and Diamond Core Drilling | Drilling and Sampling | It is expected that during the operation phase the project will not result in the creation of employment as prospecting requires highly specialised personnel. The applicant will make use of qualified contractors for the drilling and sampling of the sites. The community will however continue to benefit as a result of the continued boost in small local businesses.<br>Drilling has potential to affect the day-to-day operations by affected landowners   | Control of times during which operation activities will take place   | Operation                      | Maintain a 100% crime free area within the control of the prospecting.<br>No complaints from landowners due to prospecting activities. Should there be conflicts, these must be resolved   |
|                              |                       | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from vehicles and machinery. This will result in the contamination of soils and groundwater.<br>The prospecting operations will require the drilling of boreholes, which may result in the drawdown, which may affect the yield to the surrounding groundwater users. Material used for backfilling boreholes may leach pollutants, which will result in the contamination of surrounding groundwater regime. This may spread beyond the backfilling site via plume migration. | Rehabilitation of affected areas and control using bunds   | Operation                      | No soil contamination as a result of hydrocarbon spillages<br>Rehabilitation and disposal of contaminated soils conducted in terms of the NEM: WA  |
| Sampling                     |                       | Drilling operations may result in the generation of surface water runoff contaminated with drill muds and cuttings, should spillage occur.<br>The sedimentation and possible contamination with carbonaceous material will have negative impacts on the water quality due to increase turbidity and an increase in acidity of the water in the streams. This will have an impact on aquatic habitats.   | Control through management and monitoring of surface runoff  | Operation                      | Retain topsoil integrity for the reuse in rehabilitation.<br>No dirty runoff/stormwater entering water courses.<br>The NWA: No activities within 100 m of watercourses and drainage without consent from the DWS.<br>No soil contamination as a result of hydrocarbon spillages<br>Rehabilitation and disposal of contaminated soils conducted in terms of the NEM: WA |
|                              |                       | The project may result in the following impacts on the floral environment during the operation phase:<br>Destruction of potential floral habitats as a result of continual disturbance of soil, leading to altered floral habitats, erosion and sedimentation;<br>Impact on floral diversity as a result of possible uncontrolled fires;  | Avoidance of riparian areas  | Operation                      | NWA: No activities shall be permitted within 500 m of riparian areas without prior approval from the DWS.<br>Comply with requirements of the NWA   |

| NAME OF ACTIVITY | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)   | MITIGATION TYPE  | Time Period for Implementation | Compliance with standards   |
|------------------|---|--|--------------------------------|---|
|                  | Potential spreading of alien invasive species as a result of floral disturbance; and<br>Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase   |  |                                |   |
|                  | The project may result in the following impacts on the faunal environment during the operation phase:<br>Migration of fauna from the prospecting area due to noise as a result of drilling activities;<br>Loss of faunal due to collisions with vehicles and machinery;<br>Loss of faunal diversity and ecological integrity as a result of poaching and faunal species trapping;<br>Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase. | Rehabilitation of affected areas<br>Monitoring of rehabilitated areas to ensure success.   | Operation                      | No invasive plant species in rehabilitated areas<br>No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation and/or removal of contaminated soils            |
|                  | The project may result in the following impacts on the faunal environment during the operation phase:<br>Migration of fauna from the prospecting area due to noise as a result of drilling activities;<br>Loss of faunal due to collisions with vehicles and machinery;<br>Loss of faunal diversity and ecological integrity as a result of poaching and faunal species trapping;<br>Failure to initiate a rehabilitation plan and alien control plan during the construction phase may lead to further impacts during the operation phase. | Rehabilitation of affected areas<br>Drill holes must be temporarily plugged immediately after drilling is completed and remain plugged until they are permanently plugged below ground to eliminate the risk posed to fauna by open drill holes.<br>Drill holes must be permanently capped as soon as is practicable | Operation                      | No removal of vegetation outside of demarcated areas.<br>Successful plugging of drill holes, with no faunal casualties as a result of holes being left open                                   |
|                  | The use of vehicles during the drilling of the exploration boreholes may result in the spillages of hydrocarbons from the vehicles and machinery. This will result in the contamination of soils. The materials removed from the drilling sites will contain carbonaceous material, which has potential for contamination should it not be managed properly. The material from the drilling site may result in the contamination of soils, which may render the land not usable after backfilling operation.                                | Rehabilitation of affected areas   | Operation                      | Retain topsoil integrity for the reuse in rehabilitation.   |
|                  | The movement of vehicles and drilling machinery will likely result in an increase in nuisance dust, PM10 and PM2.5.<br>There is also potential for increase in carbon emissions and ambient air pollution due to the movement of vehicles and construction machinery.   | Dust control measures  | Operation                      | Remain within the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural as well as Minimum Air Emissions Standards                                   |
|                  | The drill rigs and towers used during the drilling operation phase will be visible from nearby locations and will have visual impact on the local communities in close proximity to the prospecting area.   | Strategic location of rigs and towers to areas where there may be some tree cover, as far as practicable   | Operation                      | No removal of vegetation outside de of demarcated area to ensure as much vegetation cover for the rigs, as possible.<br>Make use of rigs that have earthy cover to minimise the visual impact |
|                  | The drilling operations may result in the destruction of graves and other heritage resources.   | Control through clear demarcation of prospecting areas to ensure avoidance of graves and other heritage sites  | Operation                      | No destruction/loss of heritage resources<br>Comply with requirements of the SAHRA  |
|                  | Earth moving activities may result in the destruction of fossils (if any).  | Management of drill sites. Should any fossils be discovered, operations must cease and SAHRA must be notified  | Operation                      | No destruction/loss of fossils<br>Comply with requirements of the SAHRA   |

| NAME OF ACTIVITY                        |   | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | MITIGATION TYPE  | Time Period for Implementation | Compliance with standards  |
|---|---|--|--|--------------------------------|--|
|   |   | The use of vehicles and machinery may result in an increase in noise in the immediate vicinity of the project. The drilling activities will also result in an increase in noise in the vicinity of the project.  | Management and maintenance of construction vehicles. Management using noise dissipating technologies e.g., noise mufflers  | Operation                      | Remain within the Noise Regulation Standards for Rural Areas.<br>National Noise Control Regulations, SANS10103:2008 guidelines.  |
|   |   | The movement of vehicles in the project area will result in an increase in traffic on the roads.   | Speed control and limitation of the times when construction vehicles may be on the roads   | Operation                      | Minimise the number of vehicles on the roads and movement of vehicles shall be kept to outside busy times  |
|   |   | The movement of vehicles and machinery may result in the production of carbon dioxide (Green House Gas), which may have an impact on the climate in the area.  | Control and keep to a minimal the number of vehicles used for operations. Vehicles must be maintained to ensure efficient use of fuel.   | Operation                      | Remain within the National Environmental Management: Air Quality Act, 2004: Dust Regulation guidelines for rural as well as Minimum Air Emissions Standards<br>Minimise the number of vehicles         |
|   |   | Drilling ground vibrations may result in possible damage to infrastructure.  | Drill sites must be located as far from infrastructure as is possible to avoid damage to infrastructure  | Operation                      | No private infrastructure shall be damaged/lost due to drilling vibrations   |
| Data Analysis                           | Feasibility Studies   | None   | N/A  | Operation                      | N/A  |
| Feasibility Studies Report              |   | None   | N/A  | Operation                      | N/A  |
| Borehole capping                        | Closure and Rehabilitation of borehole and infrastructure sites | The removal of the campsite equipment and the rehabilitation of the drilling sites and associated access infrastructure will result in the affected soil and land use being restored. This will also result in the resumption of the use of the land since the infrastructure would have been removed.   | N/A  | Decommissioning and Closure    | No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation of contaminated soils.<br>Rehabilitation of land to a state it was before prospecting activities             |
| Removal of equipment and infrastructure |   | Positive impacts will result due to the reduction in areas of disturbance and the return of land use of the affected areas and making available an area that was covered by the campsite and drilling sites.   | N/A  | Decommissioning and Closure    | No removal of vegetation outside of demarcated areas.<br>Ensure successful rehabilitation of contaminated soils.<br>Rehabilitation of land to a state it was before prospecting activities             |
|   |   | The use of vehicles/machinery during the rehabilitation of the exploration sites may result compaction of soils and in the spillages of hydrocarbon liquids from the vehicles and machinery. This will result in the contamination and destruction of the vegetation cover and soils.  | Control and prohibit access of vehicles and machinery to areas outside of established access tracks.<br>Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system.<br>Control through the implementation of a soil management programme in terms of the correct tops oil removal, stockpiling and rehabilitation practices as discussed in the EMPr. | Decommissioning and Closure    | Vehicle movement shall be limited to areas demarcated as access tracks.<br>Comply with the requirements of the EMPr  |
|   |   | During the decommissioning and closure phases equipment will be removed, stockpiled soils will be used for rehabilitation, remaining sumps will be backfilled, levelled, top soiled and the area re-seeded. During the process of rehabilitation surface water runoff from the rehabilitation site may have elevated silt load, which may cause pollution of the nearby water environment.                     | Control through the clear delineation of the prospecting area.<br>Control through the implementation of environmental induction and toolbox talks, as well as the implementation of a fine system.<br>Control through the implementation of the NWA GN 704 water management principles.  | Decommissioning and Closure    | Maintain the water quality of water course in the project area.<br>Ensure that dirty stormwater and runoff is diverted from the water courses riparian areas.<br>Comply with the requirements of GN704 |
|   |   | Rehabilitation and removal of the prospecting sites and equipment will require vehicular movement. This will result in the generation of dust by movement of vehicles and due to blowing winds. Vehicles and machinery will also be generated diesel or petrol fumes. Generated dust will migrate towards the predominant wind direction and may settle on surrounding properties including nearby vegetation. | Dust control measures and rehabilitation of areas stripped of vegetation   | Decommissioning and Closure    | Comply with the requirements of the National Environmental Management Air Quality Act, 2004 Dust Regulation guidelines for rural communities.  |

| NAME OF ACTIVITY | POTENTIAL IMPACT (Including the potential impacts for cumulative impacts)  | MITIGATION TYPE  | Time Period for Implementation | Compliance with standards                                   |
|------------------|--|--|--------------------------------|---|
|                  | Noise will be generated during the removal of equipment and rehabilitation of the sites. This noise is not expected to exceed occupational noise limits and will be short lived. | Management and maintenance of construction vehicles. Management through the use of noise dissipating technologies e.g., noise mufflers | Decommissioning and Closure    | Comply with the Noise Regulation Standards for Rural Areas. |

## 37 Financial Provision

### 37.1 Determination of the amount of Financial Provision.

#### 37.1.1 Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under the Regulation.

Every phase of the prospecting activities is dependent on the success of the preceding phase. The prospecting drilling will be initiated based on the outcome of the desktop and geological mapping phase. The location and extent of the drill and infrastructure sites cannot be determined at this stage. Mapping of the actual prospecting activities cannot be undertaken.

The rehabilitation plan was developed on the basis that the rehabilitated areas will be left safe, stable, non-polluting and able to support a self-sustaining ecosystem similar to the surrounding natural environment. To ensure that the rehabilitation plan is aligned with the closure objective, a high-level risk assessment of the prospecting components was undertaken to establish the potential risks associated therewith.

The closure objectives are to:

- Eliminate any safety risks associated with drill hole and sumps through adequate drill hole capping and backfilling;
- Remove and/or rehabilitate all pollution and pollution sources such as waste materials and spills;
- To establish a rehabilitated area that is not susceptible to soil erosion which may result in the loss of soil, degradation of water resources and aquatic environments;
- Restore disturbed areas and re-vegetate these areas with plant species naturally occurring the area to restore the ecological function of such areas, as far as is practicable; and
- To eradicate all alien invasive plant species that may colonise the areas that have been cleared of vegetation.

#### 37.1.2 Confirm specifically that the environmental objectives in relation to closure have been consulted with landowner and interested and affected parties.

All registered I&APs will have access to the draft BAR and EMPr for a 30-day review and comment period. All comments received and responses provided to the stakeholders will be incorporated into the final BAR and EMPr and will be collated into a Comments and Responses Register.

#### 37.1.3 Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main mining activities, including the anticipated mining area at the time of closure.

Every phase of the prospecting activities is dependent on the success of the preceding phase. Depending on the outcome of the desktop and geological mapping phase, the prospecting drilling will be initiated. The location and extent of the drill and infrastructure sites cannot be determined at this stage. Mapping of the actual prospecting activities cannot be undertaken.

As a result of the nature of the activities, the potential impacts will be limited in spatial extent and will be of short duration. The management plan is provided in such a manner as to ensure concurrent rehabilitation. The areas for drilling purposes will be the main area experiencing impacts. The impacts will be temporary in nature, and a detailed management plan has been provided to address the potential impacts associated with these activities.

The only rehabilitation that will specifically be required is borehole capping and revegetation:

- Borehole Capping: Drill holes will be permanently capped as soon as is practicable.
- Re-vegetation: A suitably qualified ecologist will be appointed to determine the appropriate species that may be used for re-vegetating the area.
- Re-vegetation efforts will be monitored every second month for a period of 6 months after the initial seeding. An effective vegetation cover of 45% must be achieved. Re-seeding will be undertaken if the vegetation cover has not been achieved after 6 months.

#### **37.1.4 Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives.**

Due to the nature of the activities, the impacts will be very limited and of short duration. The management plan is in such a manner as to ensure concurrent rehabilitation. The areas for drilling purposes will be the main areas that will require rehabilitation at the end of the prospecting activities. The impacts of the drilling activities will be temporary in nature and a detailed management plan has been provided to address potential impacts.

#### **37.1.5 Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline.**

The financial provision for the environmental rehabilitation and closure of any mine/prospecting and its associated operations forms an integral part of the MPRDA. Sections 41 (1) and, 41 (2), 41 (3) and 45 of the MPRDA deal with the financial provision for rehabilitation and closure. During 2012, the DMR made updated rate available for the calculation of the closure costs, where contractor's costs are not available, these apply.

The "Guideline Document for the Evaluation of Financial Provision made by the Mining Industry" was developed by the DMR in January 2005 to empower the personnel at Regional DMR offices to review the quantum determination for the rehabilitation and closure for mining sites.

With the determination of the quantum for closure, it must be assumed that the infrastructure had no salvage value (clean closure). The closure cost estimate (clean closure) was determined in accordance with the DMR guidelines. The closure costs were calculated to be R 102 364,00.

**Table 37-1: Cost Estimate Expenditure**

| CALCULATION OF THE QUANTUM |   |             |            |             |                         |                    |                |
|----------------------------|---|-------------|------------|-------------|-------------------------|--------------------|----------------|
| Applicant:                 | Manyeleti Consulting SA (Pty) Ltd   | DMR Ref No: | NC12745PR  |             |                         |                    |                |
| Evaluators:                | Ndi Geological Consulting Services (Pty) Ltd  | Date:       | 2021/04/23 |             |                         |                    |                |
| No.                        | Description   | Unit        | A          | B           | C                       | D                  | E=A*B*C*D      |

**37.1.6 Confirm that the financial provision will be provided as determined.**

Manyeleti will fund the operation and hereby undertakes to fund the operations and to manage the operations. The applicant (Manyeleti) hereby confirms that the financial provision will be provided as determined in Table 37-1.

## **38 Mechanisms for monitoring compliance with and performance assessment against the environmental management programme and reporting thereon, including.**

### **38.1 Monitoring of Impact Management Actions**

Please refer to Table 38-1.

### **38.2 Monitoring and Reporting Frequency**

Please refer to Table 38-1.

### **38.3 Responsible Persons (Roles and Responsibilities)**

Generic roles that require to be defines for the project include:

- Project Developer;
- Environmental Control Officer;
- Environmental Health and Safety (EHS) Manager; and
- Site Manager.

The typical requirements of each of the roles are provided in the following sections.

#### **38.3.1 Project Developer**

The Project Developer (Manyeleti) is the 'owner' of the project and as such is responsible for ensuring that the conditions of the Environmental Authorisation issued in terms of NEMA (should the project receive such authorisation) are fully complied with, as well as ensuring that any other necessary permits or licenses are obtained and complied with. It is expected that Manyeleti will appoint the Environmental Control Officer, EHS Manager and Site Manager.

#### **38.3.2 Environmental Control Officer**

An independent Environmental Control Officer (ECO) must be appointed to monitor the compliance of the proposed project with the conditions of Environmental Authorisation (should such authorisation be granted by DMR) during the construction phase (and possibly the operational phase, depending on the requirements of DMR). The ECO must also monitor compliance of the proposed project with environmental legislation and conditions of the EMPr. The roles and responsibilities of the ECO should include the following:

- The ECO must undertake periodic environmental audits during the relevant phases of the proposed project to monitor and record environmental impacts and non-conformances. It is recommended that weekly or bi-weekly environmental audits be undertaken by the ECO during the construction phase.
- Environmental compliance reports must be submitted by the ECO to the DMR on an annual basis or as stipulated by the DMR.
- The ECO must maintain a diary of site visits and audits, a copy of the Environmental Authorisation (should such authorisation be granted by DMR) and relevant permits for

reference purposes, a non-conformance register, a public complaint register, and a copy of previous environmental audits undertaken.

- Prior to the commencement of construction, the ECO must meet on site with the Site Manager to confirm the construction procedure and designated construction areas.

### **38.3.3 Environmental Health and Safety (EHS) Manager**

The EHS Manager will be appointed to fulfil the roles of the Environmental Officer during the construction phase and the Environmental Manager during the operational phase. The responsibility of the EHS Manager include overseeing the implementation of the EMPr during the construction and operational phases, monitoring environmental impacts, record-keeping and updating of the EMPr as and when necessary. The EHS Manager is also responsible for monitoring compliance with the conditions of the Environmental Authorisation that may be issued to Manyeleti.

The lead contractor and sub-contractors may have their own Environmental Officers or designate Environmental Officer functions to certain personnel.

During construction, the EHS Manager will be responsible for the following:

- Meeting on site with the Site Manager prior to the commencement of construction activities to confirm the construction procedure and sites allocated for the drill sites and infrastructure required for the project.
- Daily or weekly monitoring of site activities during construction to ensure adherence to the specifications contained in the EMPr and Environmental Authorisation (should such authorisation be granted by DMR), using a monitoring checklist that is to be prepared at the start of the construction phase.

### **38.3.4 Site Manager**

The site manager will be responsible for the following:

- Overall construction programme, project delivery and quality control for the construction of the facility.
- Overseeing compliance with the Health, Safety and Environmental Responsibilities specific to the project construction.
- Promoting total job safety and environmental awareness by employees, contractors and sub-contractors and ensuring that all employees and contractors and sub-contractors are aware of the importance that the project proponent attaches to safety and the environment.
- Ensuring that each subcontractor employ an Environmental Officer (or have a designated Environmental Officer function) to monitor and report on the daily activities on-site during the construction period.
- Ensuring that safe, environmentally acceptable working methods and practices are implemented, and that sufficient plant and equipment is made available, is properly operated and maintained in order to facilitate proper access and enable any operation to be carried out safely.
- Meeting on site with the EHS Manager prior to the commencement of construction activities to confirm the construction procedure and designated activity zones.
- Ensuring that all appointed contractors and sub-contractors are aware of this EMPr and their responsibilities in relation to the programme.

- Ensuring that all appointed contractors and sub-contractors repair, at their own cost, any environmental damage as a result of a contravention of the specifications contained in the EMPr, to the satisfaction of the EHS Manager.

### **38.4 Time Period for Implementing Impact Management Actions**

Please refer to Table 38-1.

### **38.5 Mechanism for Monitoring Compliance**

Please refer to Table 38-1.

**Table 38-1: Mechanisms for Monitoring**

| SOURCE ACTIVITY  | IMPACTS REQUIRING MONITORING PROGRAMMES   | FUNCTIONAL REQUIREMENTS FOR MONITORING  | ROLES AND RESPONSIBILITIES (FOR THE EXECUTION OF THE MONITORING PROGRAMMES) | MONITORING AND REPORTING FREQUENCY AND TIME PERIODS FOR IMPLEMENTING IMPACT MANAGEMENT ACTIONS   |
|--|---|---|---|--|
| Site Clearance and removal of vegetation<br>Drilling of prospecting boreholes (RC)<br>Stockpiling material from site clearance<br>Discarding material from drill sites<br>Construction of temp/mobile site infrastructure and access routes<br>Stormwater management<br>Waste generation and management.<br>Demolition and/or removal of temporary infrastructure/equipment<br>Rehabilitation and restoration of disturbed areas | Soil Erosion  | Management and monitoring of soil stockpiles. Soils must be stored properly and revegetated to prevent erosion and to enable re-use during rehabilitation.<br>Stockpiles must be visually inspected daily to ensure that no erosion is taking place   | ECO, Site Manager   | Daily Monitoring and Monthly Reporting   |
|  | Loss of Indigenous plant Species  | A suitably ecologist or horticulturist will be required to make recommendations regarding the collection, propagation/storage and transplantation of plants is advised.   | ECO, Site Manager   | Monthly monitoring and reporting. Monitoring will be required at all the construction and operational activities until such time that rehabilitation is completed, and sustainability of vegetation cover is achieved. |
|  | Faunal Habitat Loss   | Adhere to law and best practice guidelines regarding the displacement and relocation of CI fauna.<br>Where required fauna shall be relocated to an area with a similar habitat as the project area<br>Time construction activities to minimise faunal mortality.<br>Poaching of fauna shall be prohibited.<br>Uncontrolled fires shall not be permitted on site and persecution or hunting of fauna | ECO, Site Manager   | Monthly monitoring and reporting. Monitoring will be required at all the construction and operational activities until such time that rehabilitation is completed, and sustainability of vegetation cover is achieved. |
|  | Proliferation of alien invasive species   | Declared weeds and alien invasive species must be eradicated. Management of alien invasive plant shall be undertaken throughout the   | ECO, Site Manager   | Monthly monitoring and reporting. Monitoring will be required at all the construction and operational activities until such time that rehabilitation is completed and sustainable.                                     |
|  | Nuisance dust and air emissions generation  | During dry seasons, ensure that cleared (excavated) areas and unpaved surfaces are sprayed with water obtained from an approved source to minimise dust generation.<br>Set up PM 2.5 and PM10 Monitoring sites in the area to monitor dust fall.  | ECO, Site Manager   | Monthly monitoring and reporting   |
|  | Loss of arable land/land for grazing  | Ensure proper rehabilitation measures are adhered to in order to return the soil quality to its natural state.  | ECO, Site Manager   | Monitor monthly and report on an annual basis. Monitoring will be required until such time that rehabilitation is completed.   |
|  | Soil and groundwater contamination  | Manage through the EMPr and develop a groundwater management programme.<br>Collection of baseline hydrochemistry samples for analysis.  | ECO, Site Manager   | Monthly monitoring and reporting   |
|  | Groundwater extractions   | Ensure that no groundwater extraction is undertaken without approval from the DWS.<br>Monitoring water levels of the boreholes found in close proximity to the proposed mining site, through a flow meter and water level data logger.  | ECO, Site Manager   | Monthly monitoring and reporting   |
|  | Visual Intrusion and loss of sense of place   | Ensure that infrastructure is kept to its most "natural" state and keep a tidy visually ordered site.<br>Rubble/litter/waste removal and disposal to be monitored throughout construction.<br>Complaints about night lights should be investigated and documented in a register   | ECO, Site Manager   | Monthly monitoring and reporting   |
|  | Increased pressure on the road network  | Speed control and limitation of the times when construction vehicles may be on the roads  | ECO, Site Manager   | Monthly monitoring and reporting   |
| Soil disturbance resulting in the spread of alien  | Alien invasive vegetation monitoring and control through Alien Invasive Management Plan | ECO, Site Manager   | Monthly monitoring and reporting  |  |

| SOURCE ACTIVITY | IMPACTS REQUIRING MONITORING PROGRAMMES      | FUNCTIONAL REQUIREMENTS FOR MONITORING   | ROLES AND RESPONSIBILITIES (FOR THE EXECUTION OF THE MONITORING PROGRAMMES) | MONITORING AND REPORTING FREQUENCY AND TIME PERIODS FOR IMPLEMENTING IMPACT MANAGEMENT ACTIONS   |
|-----------------|--|--|---|--|
|                 | Surface water contamination                  | Monitor surface water quality upstream and downstream of the prospecting area to ensure that the prospecting activities are not contamination water resources  | ECO, Site Manager   | Monthly monitoring and reporting   |
|                 | Riparian Area and Aquatic Ecosystem Loss     | Ensure that there are construction activities that will be located within any riparian and aquatic ecosystem areas.  | ECO, Site Manager   | Monthly monitoring and reporting   |
|                 | Destruction of graves and cultural resources | No drilling sites shall impact graves and sites of heritage or cultural importance   | ECO, Site Manager   | Monthly monitoring and reporting   |
|                 | Water Use                                    | No water may be sources from rivers and streams without approval from the DWS.<br>No clean water shall be used for dust suppression  |   |  |
|                 | Nuisance Noise                               | Measure noise levels routinely to ensure the noise levels are being kept within the acceptable ISO standards.  | ECO, Site Manager   | Monthly monitoring and reporting   |
|                 | Health and safety of personnel               | Routine safety checks, safety training and Inspections to be carried out during the construction and operation phase to enforce the use of Personnel Protective Equipment (PPE). This must also be included in the safety requirements of the Contract.              | ECO, Site Manager   | Routine inspection and Quarterly reporting   |
|                 | Waste Management                             | Maintain a waste manifest book to record volumes of waste leaving the site, including recyclables.<br>Keep safe disposal certificates on file on site for Hazardous waste.<br>Way Bridge slips must be obtained for all other waste streams and kept on file on site | ECO, Site Manager   | Monthly daily and report on a monthly basis  |
|                 | Stormwater Management                        | Visual monitoring based on sediment.<br>Clean water must be kept separate from contaminated water emanating from the project sites   | ECO, Site Manager   | Monthly daily and report on a monthly basis  |
|                 | Rehabilitation                               | Monitoring of the following: <ul style="list-style-type: none"> <li>• Basal Cover</li> <li>• Arial Cover</li> <li>• Species diversity</li> </ul>   | ECO, Site Manager   | Rehabilitation will be undertaken throughout all the project phases. The final rehabilitation will be undertaken when the prospecting activities have been finalised.<br>The ECO shall inspect the affected areas 6 months after finalisation of rehabilitation to assess the success of the rehabilitation. |

### **39 Indicate the frequency of the submission of the performance assessment/ environmental audit report.**

Environmental audits must be undertaken every year to ensure compliance with the EMPr and EA. The audit reports must also include the financial provision. The reports must be submitted to the DMR.

## 40 Environmental Awareness Plan

### 40.1 Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work.

An Environmental Awareness and Risk Assessment Schedule has been developed and is outlined in Table 40-1. The purpose of this schedule is to ensure that onsite employees are not only trained, but that the principles are continuously re-enforced.

**Table 40-1: Environmental Training and Awareness Schedule**

| Frequency  | Time allocation   | Objective   |
|--|---|---|
| Induction (all staff and workers)                          | 1-hour training on environmental awareness training as part of site induction | <p>Develop an understanding of what is meant by the natural environmental and social environment and establish a common language as it relates to environmental, health, safety and community aspects.</p> <p>Establish a basic knowledge of the environmental legal framework and consequences of non-compliance.</p> <p>Clarify the content and required actions for the implementation of the Environmental Management Plan.</p> <p>Confirm the spatial extent of areas regarded as sensitive and clarify restrictions.</p> <p>Provide a detailed understanding of the definition, the method for identification and required response to emergency incidents.</p> |
| Monthly Awareness Talks (all staff and workers)            | 30 minutes awareness talks  | Based on actual identified risks and incidents (if occurred) reinforce legal requirements, appropriate responses and measures for the adaptation of mitigation and/or management practices.   |
| Risk Assessments (supervisor and workers involved in task) | Daily task-based risk assessment  | Establish an understanding of the risks associated with a specific task and the required mitigation and management measures on a daily basis as part of daily toolbox talks.  |

### 40.2 Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment.

As advised in Table 40-1, Task/Issue based Risk Assessments must be undertaken with all workers involved in the specific tasks to establish an understanding of the risks associated with a specific task and the required mitigation and management measures contained in this report.

Environmental Awareness Training Content- Induction Training: The following environmental awareness training will be provided to all staff and workers who will be involved in prospecting activities:

- Description of the approved prospecting activities and content of the prospecting right;
- An overview of the applicable legislation and regulations as they relate to environmental, health, safety and community;

Content and implementation of the approved EMPr specifically:

- Allocated roles and responsibilities;

- Management and mitigation measures; and
- Identification of risks and requirements adaptation.

Sensitive environments and features:

- Description of environmentally sensitive areas and features; and
- Prohibitions as it relates to activities in or in proximity to such areas.

Emergency Situations and Remediation:

- Methodology for the identification of areas where accidents and emergencies may occur, communities and individuals that may be affected;
- An overview of the response procedure;
- Equipment and resources;
- Designate of responsibilities;
- Communication, including communication with the potentially affected communities and responsible authorities; and
- Training schedule to ensure effective response.

Development of procedures and checklists: The following procedures will be developed, and all staff and workers will be adequately trained on the content and implementation thereof:

Emergency Preparedness and Response: The procedure will be developed to specifically include risk identification, preparedness, response measures and reporting. The procedure will specifically include spill and fire risk, preparedness and response measures. The appropriate emergency control centres (fire department, hospitals etc.) will be identified and the contact numbers obtained and made available on site. The procedure must be developed in consultation will potentially affected landowners.

Should risks be identified, which may affect adjacent landowners (or other persons), the procedure will include appropriate communication strategy to inform such persons and provide response measures to minimize the impact.

Procedure for Reporting Incident: Incident reporting will be undertaken in accordance with an established incident reporting procedure to:

Provide details of the responsible person, including any person who:

- Is responsible for the incident;
- Owns any hazardous substance involved in the incident;
- Was in control when the incident occurred.
- Provide details of the incident (time, date, location);
- The details of the cause of incident;
- Identify aspects of the environment affected;
- The details of corrective action taken; and
- The identification of any potential residual or secondary risks that must be monitored and corrected or managed.

Environmental and Social Audit Checklist: An environmental audit checklist will be established to include the environmental and social mitigation and management measures as developed and

approved as part of the EMPr. Non-conformances will be identified, and corrective action taken where required.

### **40.3 Specific information required by the Competent Authority.**

No specific information was required by the Competent Authority.

## 41 UNDERTAKING

The EAP herewith confirms.

- a) the correctness of the information provided in the reports;
- b) the inclusion of comments and inputs from stakeholders and I&APs;
- c) the inclusion of inputs and recommendations from the specialist reports where relevant;   
and
- d) that the information provided by the EAP to interested and affected parties and any responses by the EAP to comments or inputs made by interested and affected parties are correctly reflected herein.
