# IMERYS REFRACTORY MINERALS SOUTH AFRICA (PTY) LTD – KRUGERSPOST ANDALUSITE MINE – KLIPFONTEIN MINE

# Final Closure Plan and Rehabilitation Plan As part of Closure Application

Based on Appendix 5 (Closure Plan) of the Environmental Impact Assessment
Regulations, 2014 and Appendix 4 (Minimum content of a final rehabilitation, decommissioning and closure plan) of the Regulations Pertaining to the Financial Provision for Prospecting, Exploration, Mining or Production
Operations, 2015 i.t.o. the National Environmental Management Act No 107 of 1998 (as amended), and regulation 60 of the Minerals and Petroleum
Resources Development Regulations, GN 527 of 2004 (as amended) i.t.o. the Minerals and Petroleum Resources Development Act No 28 of 2002

DMR ref: MP30/5/1/2/2/196MR DWS ref: 16/2/7/B400/C373

Location: Portions 31, 32, 36 and the remaining extent of Portion 1, of the farm Klipfontein 400KT, Thaba Chweu Local Municipality, Mpumalanga

June 2018

PO Box 72960, Lynnwood Ridge, 0040; Cell: 072 191 6074, Fax: 012 361 0645 E-mail: salome@becsenv.co.za

### OBJECTIVE OF THE FINAL REHABILITATION, DECOMMISSIONING AND MINE CLOSURE PLAN

The objective of the final rehabilitation, decommissioning and mine closure plan, which must be measurable and auditable, is to identify a post-mining land use that is feasible through—

- a) providing the vision, objectives, targets and criteria for final rehabilitation, decommissioning and closure of the project;
- b) outlining the design principles for closure;
- c) explaining the risk assessment approach and outcomes and link closure activities to risk rehabilitation;
- d) detailing the closure actions that clearly indicate the measures that will be taken to mitigate and/or manage identified risks and describes the nature of residual risks that will need to be monitored and managed post closure;
- e) committing to a schedule, budget, roles and responsibilities for final rehabilitation, decommissioning and closure of each relevant activity or item of infrastructure;
- f) identifying knowledge gaps and how these will be addressed and filled;
- g) detailing the full closure costs for the life of project at increasing levels of accuracy as the project develops and approaches closure in line with the final land use proposed; and
- h) outlining monitoring, auditing and reporting requirements.

#### **EXECUTIVE SUMMARY**

Imerys Refractory Minerals South Africa (Pty) Ltd (Imerys) – Krugerspost Mine, is an existing and alusite mine in the Mpumalanga Province. The purpose of this document is to provide sufficient information for the closure and rehabilitation of the mine.

Information regarding the background to the mine was taken from the approved Environmental Management Programme (EMP) (author unknown, 1999), the Hydrogeological Report (Shangoni Management Services, 2013) and various specialist studies conducted on the adjacent property. A site visit was held on 22 March 2018 to gather any additional information.

This Closure Plan is compiled in line with the requirements of the Minerals and Petroleum Resources Development Act (Act 28 of 2002 as amended) (MPRDA) contemplated in regulation 62 of the Minerals and Petroleum Resources Development Regulations, GN 527 of 2004 (as amended) i.t.o. the Minerals and Petroleum Resources Development Act No 28 of 2002 (MPRDR); regulation 19(6) & Appendix 5 of the Environmental Impact Assessment Regulations, GN 982 of 2014 i.t.o. the National Environmental Management Act No 107 of 1998 (as amended) NEMA); and regulations 6(b) & 12(2) & Appendix 4 of the Regulations Pertaining to the Financial Provision for Prospecting, Exploration, Mining or Production, GN 1147 of 2015 i.t.o. NEMA.

Attached as Addendum 1 is the Environmental Risk Assessment Report in line with the requirements of the MPRDA contemplated in regulation 60 of the MPRDR; regulations 6(c), 11(1)(c) & 12(3) & Appendix 5 of the Regulations Pertaining to the Financial Provision for Prospecting, Exploration, Mining or Production, GN 1147 of 2015 i.t.o. NEMA.

Attached as Addendum 2 to this report is the final EMP Performance Assessment contemplated in regulation 55(9) of the MPRDR.

Attached as Addendum 3 as a report on the ripping, re-vegetation, and alien control plan of all the areas to be rehabilitated as indicated in Section 4 of this report.

Attached as Addendum 4 is the Sloping and Earthworks Plan. Attached as Addendum 5 as the Asbestos Inventory of Asbestos Cement at the Samrec Krugerspost Mine in Lydenburg.

Attached as Addendum 6 is the public participation proof of the original plan.

No transfer of environmental liabilities and responsibilities will take place, Imerys will rehabilitate the mine.

#### Layout of document

Refer to the Table 1 below for a layout of this documents, considering the requirements as set out in regulation 62 of the MPRDR, Appendix 5 of GN 982, and Appendix 4 of GN 1147.

#### According to Appendix 4 of GN 1147:

'The final rehabilitation, decommissioning and mine closure plan must be measurable and auditable, must take into consideration the proposed post-mining end use of the affected area and must contain information that is necessary for the definition of the closure vision, objectives and design and relinquishment criteria, indicating what infrastructure and activities will ultimately be decommissioned, closed, removed and remediated and the risk drivers determining actions, indicating how the closure actions will be implemented to achieve closure relinquishment criteria and indicating monitoring, auditing and reporting requirements.'

		3(d)	Design principles, including:	3.2
			ii. closure vision, objectives and targets, which objectives and targets must reflect the local environmental and socio-economic	
			context and reflect regulatory and corporate requirements and stakeholder expectations	
		3(d)	Design principles, including:	3.3
			iii. a description and evaluation of alternative closure and post closure options where these exist that are practicable within the	
			socioeconomic and environmental opportunities and constraints in which the operation is located	
		3(d)	Design principles, including:	3.4
			iv. a motivation for the preferred closure action within the context of the risks and impacts that are being mitigated	
		3(d)	Design principles, including:	3.5
			v. a definition and motivation of the closure and post closure period, taking cognisance of the probable need to implement post	
			closure monitoring and maintenance for a period sufficient to demonstrate that relinquishment criteria have been achieved	
	1	3(d)	Design principles, including:	3.6
			vi. details associated with any on-going research on closure options	
		3(d)	Design principles, including:	3.7

GN	GN	GN	Description	Section
527	982	1147		
			vii. a detailed description of the assumptions made to develop closure actions in the absence of detailed knowledge on site	
			conditions, potential impacts, material availability, stakeholder requirements and other factors for which information is lacking	
		3(e)	A proposed final post-mining land use which is appropriate, feasible and possible of implementation, including:	4.1
			i. descriptions of appropriate and feasible final post-mining land use for the overall project and per infrastructure or activity and a	
			description of the methodology used to identify final post-mining land use, including the requirements of the operations	
			stakeholders	
		3(e)	A proposed final post-mining land use which is appropriate, feasible and possible of implementation, including:	4.1
			ii. a map of the proposed final post-mining land use	
		3(f)	Closure actions, including:	4.2
			i. the development and documenting of a description of specific technical solutions related to infrastructure and facilities for the	
			preferred closure option or options, which must include all areas, infrastructure, activities and aspects both within the mine lease	
			area and off of the mine lease area associated with mining for which the mine has the responsibility to implement closure actions	
		3(f)	Closure actions, including:	4.2
			ii. the development and maintenance of a list and assessment of threats and opportunities and any uncertainties associated with	
			the preferred closure option, which list will be used to identify and define any additional work that is needed to reduce the level	
			of uncertainty	
		3(g)	A schedule of actions for final rehabilitation, decommissioning and closure which will ensure avoidance, rehabilitation, management	4.2
			of impacts including pumping and treatment of extraneous water:	
			i. linked to the mine works programme, if greenfields, or to the current mine plan if brownfields	
		3(g)	A schedule of actions for final rehabilitation, decommissioning and closure which will ensure avoidance, rehabilitation, management	4.2
			of impacts including pumping and treatment of extraneous water:	
			ii. including assumptions and schedule drivers; and	
		3(g)	A schedule of actions for final rehabilitation, decommissioning and closure which will ensure avoidance, rehabilitation, management	4.2
			of impacts including pumping and treatment of extraneous water:	
			iii. including a spatial map or schedule, showing planned spatial progression throughout operations	
		3(h)	An indication of the organisational capacity that will be put in place to implement the plan, including:	4.2

GN	GN	GN	Description	Section
527	982	1147		
			i. organisational structure as it pertains to the plan	
		3(h)	An indication of the organisational capacity that will be put in place to implement the plan, including:	4.2
			ii. responsibilities	
		3(h)	An indication of the organisational capacity that will be put in place to implement the plan, including:	4.3
			iii. training and capacity building that may be required to build closure competence	
		3(i)	An indication of gaps in the plan, including an auditable action plan and schedule to address the gaps	4.4
		3(j)	Relinquishment criteria for each activity or infrastructure in relation to environmental aspects with auditable indicators	4.5
		3(k)	Closure cost estimation procedure, which ensures that identified rehabilitation, decommissioning, closure and post-closure costs,	6
			whether on-going or once-off, are realistically estimated and incorporated into the estimate, on condition that:	
			i. cost estimates for operations or components of operations that are more than 30 years from closure will be prepared as	
			conceptual estimates with an accuracy of ± 50 per cent. Cost estimates will have an accuracy of ± 70 per cent for operations or	
			components of operations, 30 or less years (but more than ten years) from closure and ± 80 per cent for operations, or	
			components of operations ten or less years (but more than five years) from closure. Operations with 5 or less years will have an	
			accuracy of ± 90 per cent. Motivation must be provided to indicate the accuracy in the reported number and as accuracy improves,	
			what actions resulted in an improvement in accuracy	
		3(k)	Closure cost estimation procedure, which ensures that identified rehabilitation, decommissioning, closure and post-closure costs,	6
			whether on-going or once-off, are realistically estimated and incorporated into the estimate, on condition that:	
			ii. the closure cost estimation must include:	
			(aa) an explanation of the closure cost methodology;	
			(bb) auditable calculations of costs per activity or infrastructure;	
			(cc) cost assumptions	
		3(k)	Closure cost estimation procedure, which ensures that identified rehabilitation, decommissioning, closure and post-closure costs,	6
			whether on-going or once-off, are realistically estimated and incorporated into the estimate, on condition that:	
			iii. the closure cost estimate must be updated annually during the operation's life to reflect known developments, including changes	
			from the annual review of the closure strategy assumptions and inputs, scope changes, the effect of a further year's inflation,	
			new regulatory requirements and any other material developments	

GN	GN	GN	Description	Section
527	982	1147		
		3(I)	Monitoring, auditing and reporting requirements which relate to the risk assessment, legal requirements and knowledge gaps as a	5
			minimum and must include:	
			i. a schedule outlining internal, external and legislated audits of the plan for the year, including:	
			(aa) the person responsible for undertaking the audit(s);	
			(bb) the planned date of audit and frequency of audit;	
			(cc) an explanation of the approach that will be taken to address and close out audit results and schedule	
		3(I)	Monitoring, auditing and reporting requirements which relate to the risk assessment, legal requirements and knowledge gaps as a	5
			minimum and must include:	
			ii. a schedule of reporting requirements providing an outline of internal and external reporting, including disclosure of updates of	
			the plan to stakeholders	
		3(I)	Monitoring, auditing and reporting requirements which relate to the risk assessment, legal requirements and knowledge gaps as a	5
			minimum and must include:	
			iii. a monitoring plan which outlines:	
			(aa) parameters to be monitored, the frequency of monitoring and period of monitoring;	
			(bb) an explanation of the approach that will be taken to analyse monitoring results and how these results will be used to	
			inform adaptive or corrective management and/or risk reduction activities	
	1	3(m)	Motivations for any amendments made to the final rehabilitation, decommissioning and mine closure plan, given the monitoring results	7
			in the previous auditing period and the identification of gaps as per 2(i).

#### 1.2 Details of Environmental assessment practitioner

Refer to Table 3 below for a description of the environmental assessment practitioner (EAP).

Name of company	BECS Environmental
Postal address	PO Box 72960, Lynnwood Ridge, 0040
Telephone number	012 361 9970
Cell phone number	072 191 6074
Facsimile number	012 361 0645
E-mail address	salome@becsenv.co.za
Name of responsible EAP	Salome Beeslaar
Expertise of EAP	B.Sc Environmental Science (UP), B.Sc Honours
	Geography (UP), M.Sc Geography (UP), Professional
	Scientist (Environmental Science), member of the
	International Associated of Impact Assessments South
	Africa.
Name of second responsible EAP	Deshree Pillay
Expertise of EAP	B. Sc Environmental Science (UP), B. Sc Honours
	Geography & Environmental Science (UP)

Table 3: Description of the environmental assessment practitioner

#### 1.2.1 Professional registrations and experience

#### Professional registration – Salome Beeslaar:

- Professional Scientist (Environmental Science), SACNASP (400385/14)
- Member of the International Associated of Impact Assessments South Africa (membership number 5853)

#### Experience:

- Rehabilitation plans for Samrec Anref Mine, SANRAL, Vergenoeg Mining Company, Rolfes Silica, Vereeniging Refractories (Rietfontein Mine and Marico Chrome), Boekenhout Sand, Krosa.
- Closure plans for Imerys Refractory Minerals South Africa, Petra Diamonds Sedibeng Mine.

I, Salome Beeslaar (8310190032081), hereby declare that I have no conflict of interest related to the work of this report. Specially, I declare that I have no business, personal, or financial interests in the property and/or mining right being assessed in this report and that I have no personal or financial connections to the relevant property owners or mine. I declare that the opinions expressed in this report are my own and a true reflection of my professional expertise and that there are no circumstances that may compromise my objectivity in performing such work.

Salome Beeslaar MSc – Geography SACNASP (400385/14) 4 June 2018

#### 1.3 Background on locality

Krugerspost Mine is located on portions 31, 32, 36 and the remaining extend (re) of portion 1 of the farm Klipfontein 400 KT in Thaba Chweu Local Municipality in the Mpumalanga Province. No active mining or processing is taking place.

The mine is in the B42E quaternary catchment of the Olifants Water Management Area and the Central Transvaal (Bushveld) Basin. Krugerspost is located at S24.937 and E30.436 (central coordinates). Approximately 978ha on the farm Klipfontein was used for the Krugerspost mining operations. The Spekboom River runs approximately 3km to the south west from the current mining activities.

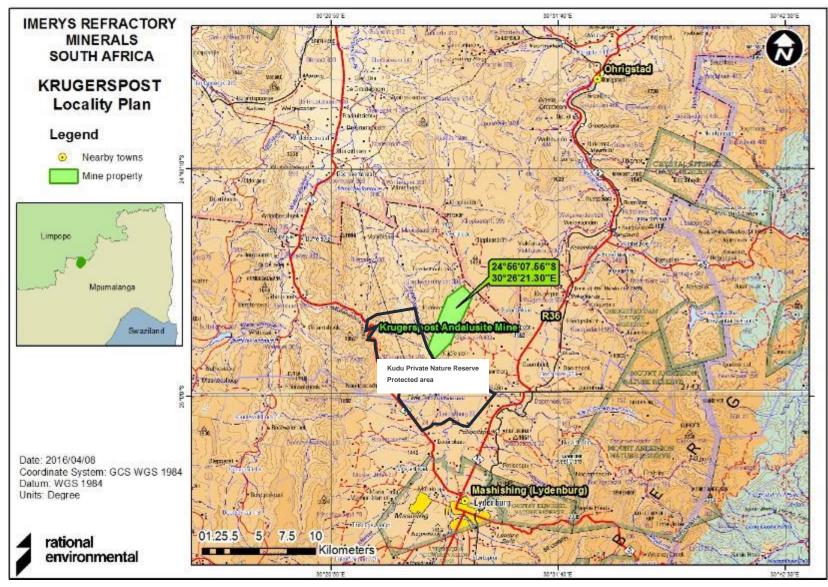

Figure 1: Locality map of Krugerspost Mine

**BECS** Environmental

#### **SECTION 2: THE CONTEXT OF THE PROJECT**

# 2.1 Material information and issues that have guided the development of the

#### plan

Information regarding the background to the mine was taken from the approved Environmental Management Programme (EMP) (author unknown, 1999), the Hydrogeological Report (Shangoni Management Services, 2013) and various specialist studies conducted on the adjacent property. A site visit was held on 18<sup>th</sup> January 2016 and a follow up on the rehabilitation monitoring was conducted on the 24<sup>th</sup> October 2017. Another site visit took place, this year on the 22<sup>nd</sup> March 2018 to gather any additional information.

# 2.2 The environmental context and the social context that may influence closure activities and post-mining land use or be influenced by closure activities and post-mining land use

The environmental context must include but not limited to air quality, quantity and quality of surface and groundwater, land, soils and biodiversity.

#### 2.2.1 Topography

The mine is situated on the eastern slope of a north / south water divide. Surface flow from the mine will, therefore, be in a south-eastern direction towards the natural drainage line and dams to the east which also acts as the mine surface water system. This water flows down south-west towards the north draining Spekboom River. Extracted from the Storm Water Management Plan (Shangoni Management Services, 2012)

#### 2.2.2 Soil

In the north-eastern sector, approximately 25% of the mining area was relatively good arable land. To the north, west and south of the mined area clay, boulder rich soils suitable for only grazing occurred. Approximately in the middle of the mined area, deep lowlands-type arable soils occurred. These soils were of poor quality due to the high silt content and moderate blocky structure. Extracted from the approved Environmental Management Programme (author unknown, 1999).

No mention is made of the residual impacts on the soil in any of the specialist studies. It is, however, assumed that the residual impacts on the soil will be significant. Very little topsoil was stockpiled during the mining activities. Topsoil is mixed with overburden and shows signs of erosion. Until such time that revegetation is completed, these areas will be prone to soil erosion.

#### 2.2.3 Pre-mining land capability and land use

10% of the mining area comprised pasture while the remaining 90% was wilderness land suitable for low density cattle grazing. No data on historical agricultural production is available. No evidence of

misuse exists. No existing structures occur within the mining area. Extracted from the approved Environmental Management Programme (author unknown, 1999).

#### 2.2.4 Natural vegetation

The area as described by Acocks is mixed bushveld, which is very mixed bush and may be characterised as "*Acacia nigresens* veld". The hill slopes are well wooded with a large variety of medium species of trees as well as shrubs and aloes. No endangered or rare species have been found. No invader species were identified prior to mining. Extracted from the approved Environmental Management Programme (author unknown, 1999).

According to the Vegetation Assessment for the adjacent mining right process (Classic Environmental Management Services, 2014), after closure, the rehabilitated soil could become infested with alien and invasive plant species. This is already evident on the existing mine. Lack of adequate rehabilitation of soils and vegetation could result in an area of vegetation with a low basal cover, prone to erosion and invasion by exotic and invasive plant species. In addition, the vegetation will stay in a pioneer stage and are unlikely to become more functional through succession, limiting the value of the vegetation for grazing or game farming.

#### 2.2.5 Animal life

The area has little remaining wildlife except on the outskirts of the mining area which are remote from habitation. There are no endangered or rare species. Extracted from the approved Environmental Management Programme (author unknown, 1999).

#### 2.2.6 Surface water

According to the Hydrogeological Report (Shangoni, 2013), after mine closure, surface runoff will drain in an easterly direction into the affected dams and eventually into the Spekboom River. Since the water table is so close to the surface, groundwater most probably daylights in this zone to the west of the mine. The surface water dams in this drainage line, therefore, act as a recharge boundary and pollutants will migrate with the groundwater into the surface water as *groundwater contribution baseflow*. Receptors which may be influenced by the mining activities include the users in the Spekboom River (aquatic species, livestock, wildlife).

The Spekboom river is a sensitive habitat and, in being part of the Olifants River Catchment area, it is of particular interest and concern. Rivers and drainage lines are longitudinal ecosystems, and therefore their condition at any point is a reflection of not only upstream activities but also of those within adjacent and upstream parts of the catchment (O'Keefe 1986). Any impact on the riverine area is therefore also likely to impact on the upstream and downstream area. Within the flood benches of the Waterval River, which is a tributary of the Spekboom River, subtropical freshwater wetlands exist. The Dorps River which joins the Spekboom River about 2km upstream from the mine is considered to be of high sensitivity and conservation importance owing to it being a remaining area of indigenous riparian

vegetation in Mpumalanga at risk of being replaced by alien invasive species. The ecological functioning and health of these rivers ensure a suitable habitat for indigenous vegetation as well as biological or dispersal corridors for remaining faunal species. It must also be noted that *Scilla natalensis* also occurs in the area which is an important plant harvested for indigenous medicinal use. Whilst not endemic to South Africa it is on SANBI's Red List of threatened plant species (Kudu Game Ranch, 2016).

#### 2.2.7 Groundwater

Extracted from the Hydrogeological Report (Shangoni Management Services, 2013).

A mining waste geochemical characterisation procedure was conducted on the waste generated by the andalusite mining activities to evaluate the potential risk it poses to the receiving surface and groundwater environments. At present, the mine disposes of the waste by backfilling into the open quarries and slimes dams. Backfilling of wastes do pose several advantages compared to surface storage and include:

- No erosion and therefore sedimentation risks towards the receiving environment.
- Vertical seepage will dominate during the operational phase due to the high hydraulic conductivity of fines thereby reducing horizontal seepage risks towards the matrix and receiving environment. Seepage loads from the slimes and tailings wastes will, therefore, most probably remain isolated during the operational phases.

Although it is expected that vertical seepage will dominate over horizontal seepage during the operational phases of the mine, it may nevertheless remain a potential risk towards the receiving environment. This would be especially true if large-scale fracturing and/ weathering are present in the host matrix.

A sampling and analysis strategy to obtain representative samples of the geological materials and mine wastes was implemented. The analysis strategy included static geochemical testing of the waste material and included:

- An Acid Rain leach to determine the geochemical composition of materials (major and trace elements) based on a worst-case scenario; and
- The acid rock drainage, neutralisation and leaching potential of metals.

The samples were submitted to the Waterlab Pty Ltd, a **SANAS accredited testing laboratory**. Analyses included ABA analyses, major cation and anion distribution and an ICP-OES scan for dissolved metal phases. The results of the analyses are appended as Appendix B to the report. It is unlikely that significant acid (if any) will be generated from the mine residue. The pH is likely to be neutral to slightly alkaline and heavy metal solubilisation will, therefore, be minimal. Further, it can be determined that the **waste present a slight/ low risk** to the environment posed by the backfilling material in the quarries. Despite the low risk, it is nevertheless recommended that a monitoring programme is implemented to reflect these and other standard elements.

Boreholes which are most susceptible to potential polluting effects are those drilled to the west of the natural drainage line in which the affected surface water features are located. Depending on the proximity and cone of depression formed because of pumping, boreholes drilled to the east thereof will remain unaffected. Receptors which may be influenced by the mining activities include KRBH01 (Borehole at Bagging Plant); KRBH02 (Borehole at workshop); House#2 (Tinashe's House); House#3 (Manie's House); House#4 (John's House); House#5 (Andriana's House); and selected boreholes on adjacent Klipplaatdrift.

Groundwater monitoring takes place at the HMS Plant, Quarry 2/3 and Barge dam. These qualities are the only indicators of water quality at the Office Slimes Dam. Per the last water results, various chemical levels are above the recommended limits as per the WUL (BECS Environmental, 2015).

#### 2.2.8 Socio-economic environment

Extracted from the Integrated Water and Waste Management Plan (Shangoni Management Services, 2014)).

Krugerspost Mine is situated within the Ehlanzeni District Municipality with the regional services council being the Thaba Chweu Local Municipality.

#### Demography

Per Statistics SA 2011 Census, 98 387 people formed part of the 33 352 households in the Thaba Chweu Local Municipality. The average household size is estimated to be 2.9 people per household while there are 105.1 males for every 100 females (Statistics SA, 2011).

#### Major economic activities

The major economic activities of the Thaba Chweu local municipality are summarised below:

- Mining 23.8%
- Community Services 19%
- Trade 14.6%
- Finance 14.1%
- Transport 10.9%
- Manufacturing 9.3%
- Agriculture 5.1%

- Construction 2.8%
- Electricity 0.5%
- Eco-tourism
- Conservation

#### Employment and unemployment

Per Statistics SA 2011 Census, the official unemployment rate is 20.5% and the youth unemployment rate (15-34 years) 27.7%. The dependency ratio is 43 per 100 people between ages of 15 and 64 years.

The Office Slimes Dam will have a low Zone of influence since no wet slimes are deposited on the dam anymore.

#### 2.2.9 Sensitive areas

It must be noted that the Spekboom River Valley, of which the mine falls part of, is a sensitive area.

#### 2.3 Stakeholder issues and comments that have informed the plan

This section must include:

- i. copies of any representations and comments received from registered interested and affected parties;
- ii. a summary of comments received from, and a summary of issues raised by registered interested and affected parties, the date of receipt of these comments and the response of the EAP to those comments;
- iii. the minutes of any meetings held by the EAP with interested and affected parties and other role players which record the views of the participants;
- iv. where applicable, an indication of the amendments made to the plan as a result of public participation processes conducted in terms of regulation 41 of these Regulations

This closure plan is an update of the closure plan which was submitted in 2016 to DMR. Kudu Game Ranch commented on the closure plan. See below their comments and the applicant's response.

Kudu Game Ranch comments	Response
As has already been previously advised to you (email dated 07	
November 2016), Kudu Private Nature Reserve (KPNR) is situated	
between latitudes 240 23' and 250 02'S, and longitudes 300 23' and	
300 28'E, adjacent to the south-western point of the Krugerspost Mine	
bordering the Spekboom River. KPNR was declared a Protected	
Area, as gazetted, on 10 May 2013 in terms of the NEM: Protected	
Areas Act, 57 of 2003 and is under the management authority of the	
Mpumalanga Tourism and Parks Agency (MPTA). As such KPNR has	
its own operational legal requirements in terms of the National	

Environment Management: Protected Areas Act No. 57 of 2003 (NEM: PAA) as laid out in a management plan which endorses the process of Adaptive Planning as laid down by the Department of Environmental Affairs and Tourism for setting norms and standards for protected areas (Grossman & Holden 2011). This requires that we: • negotiate to mitigate or improve the management of external potentially detrimental impacts; • as far as is possible, mitigate the impacts of aquatic pollution events through appropriate contingency planning; • encourage eco-friendly resource use and land management practices on adjacent properties Further to the above, a conservation agreement is in place with all KPNR neighbouring landowners. As the company's management authority Kudu Game Ranch Share Block (KGRSB) we are also required to act on behalf of shareholders' interests and respond to any direct impacts and risks as a result of activities on adjacent properties. As you have duly noted in the Closure Plan, the mine property landowner, Imerys Refractory Minerals South Africa (Pty) Ltd., has its own legislative obligations as detailed in Section 24R of the NEMA that "Every holder remains responsible for any environmental liability, pollution or ecological degradation, the pumping and treatment of closure there of notwithstanding the issuing of a closure certificate by the Minister responsible for mineral resources in terms of the MPRDA to the holder or owner concerned" Given the legislative context above, our comments and responses to the Krugerspost Mine Closure Plan are as follows: 1. Omissions in the content and scope of the Krugerspost Mine Closure Plan 2. Proposed mitigation efforts proposed in the plan to avoid aquatic pollution events 3. Environmental and visual sensitivities relating to the pump stations' infrastructure 4. Future land-use considerations following rehabilitation 11. Use of out-dated Locality Map resulting in the omission of Kudu Private Nature Reserve demarcation as a "Protected A	Kudu Game Ranch comments	Response

the location of the infrastructure and access roads is primarily in an	remain.
untransformed and unfragmented natural area of Ohrigstad Mountain	
Bushveld in which several protected species - Marula Sclerrocarya	
birrea subsp. caffra — occur. As such care must be taken when	
removing the infrastructure and rehabilitating the area and access	
roads. In addition, it needs to be noted that the second pump house	
acoustic enclosure was done and paid for by Kudu Game Ranch	
Share Block (KGRSB) in an agreement with then-owner, SAMREC	
(Pty) Ltd in an attempt to reduce the noise pollution from the pump	
stations operating late at night. This material is owned by KGRSB and	
must be returned to it when the structure is taken down and	
rehabilitated.	
2. Proposed mitigation efforts to avoid aquatic pollution events	
2.1 Slimes Dams: We note the activities put in place for the proper	The quarterly water monitoring report is
rehabilitation and long-term management and maintenance plans to	sent to Kudu Game Ranch.
prevent latent risks and threats such as seepage, erosion and	
collapse of the dams resulting in very serious pollution of the	
Spekboom River. The monthly testing of the Spekboom River water	
upstream and downstream of the mine for five years after	
rehabilitation as laid out in Addendum 3 of the Closure Plan is duly	
noted and welcomed.	
Comments: We would like it to be noted that a previous aquatic	
pollution event of the Spekboom River occurred in 2009 during	
SAMREC (Pty) Ltd ownership. The water analysis results categorised	
the water in the Class 4 Purple Range but the company accepted no	
liability despite the legislative obligations laid out in Section 24R of the	

Kudu Game Ranch comments	Response
NEMA. Whilst KPNR regularly monitors the water downstream of the	
mine's locality we would appreciate receipt of the monthly water	
monitoring results for the full five-year period after rehabilitation.	
2.2 Regarding Groundwater and Surface Water contamination risk,	Your comments on the Spekboom
you reference the Hydrogeological Report (Shangoni, 2013), stating	River has been included into the report.
that "after mine closure, surface runoff will drain in an easterly	
direction into the affected dams and eventually into the Spekboom	
River. Since the water table is so close to the surface, groundwater	
most probably daylights in this zone to the west of the mine. The	
surface water dams in this drainage line, therefore, act as a recharge	
boundary and pollutants will migrate with the groundwater into the	
surface water as groundwater contribution baseflaw. Receptors which	
may be influenced by the mining activities include the users in the	
Spekboom River (aquatic species, livestock, wildlife)" Note: My	
underlining.	
Comments: This statement as underlined fails to give due	
consideration to the importance of the Spekboom River being a	
sensitive habitat and that, in being part of the Olifants River	
Catchment area, it is of particular interest and concern. It takes no	
cognisance of rivers and drainage lines as longitudinal ecosystems,	
and that their condition at any point is a reflection of not only upstream	
activities but also of those within adjacent and upstream parts of the	
catchment (O'Keefe 1986). Any impact on the riverine area is	
therefore also likely to impact on the upstream and downstream area.	
Within the flood benches of the Waterval River, which is a tributary of	
the Spekboom River, subtropical freshwater wetlands exist. The	
Dorps River which joins the Spekboom River about two kms upstream	
from the mine is considered to be of high sensitivity and conservation	
importance owing to it being a remaining area of indigenous riparian	
vegetation in Mpurnalanga at risk of being replaced by alien invasive	
species. The ecological functioning and health of these rivers ensure	
a suitable habitat for indigenous vegetation as well as biological or	
dispersal corridors for remaining faunal species. The plan must give	
due consideration to the above and "receptors that may be influenced"	
need to be expanded to include the full biodiversity of the river's	
ecosystem not just "the users(aquatic species, livestock, wildlife)"	
It must also be noted that Scilla Natalensis also occurs in the area	
which is an important plant harvested for indigenous medicinal use.	
Whilst not endemic to South Africa it is on SANBI's Red List of	
threatened plant species.	
3. Further environmental and visual sensitivities relating to the po	ump stations' infrastructure

Kudu Game Ranch comments	Response
3.1 The condition of the lower pump station's infrastructure is in	Clean-up of this area has taken place.
complete disrepair. Please refer to photos in Addendum 1. Should the	Please let us know whether you have
Spekboom River experience flooding (as has happened in the early	any further comments on this area.
2000s) this infrastructure including the debris left lying around on the	
ground will be washed downstream to the detrimental effect of the	
river's ecosystem.	
Comment: This area must be cleared immediately of all loose debris,	
piping, poles and cabling that is in the reaches of flood waters to	
prevent an aquatic pollution event, followed by the removal of all other	
infrastructure as part of the Rehabilitation Plan for the mine's closure.	
3.2 Visual sensitivities and impacts of the mine's pump station's	Please be advised, the stations will
infrastructure and access roads are referenced in Addendum 1. The	remain. The mine is still going to use
degree of visual sensitivity of an area is closely related to the aesthetic	these stations. The access roads to
quality of the area, as well as to the value placed on the aesthetic	these stations will therefore also
quality of the landscape. All shareholder landowners of KGRSB place	remain.
immense value on the landscape and conservation aesthetics of the	
nature reserve. When the area was developed, the developers went	
to great lengths to ensure lookout points, game drive routes, hiking	
trails, picnic sites and shareholders sites were optimally positioned for	
the visual aesthetic value and appreciation of this unique landscape,	
its natural beauty and its views. In addition, the reserve has strict	
aesthetics rules that shareholders are forced to comply with when	
building their homesteads.	
Comment: The mine's pump station's structures and access roads are	
visually intrusive in terms of this landscape. The rehabilitation of these	
areas and roads, including the road cut in 2003 across the	
neighbouring property of the landowner, Buddy Roth, must be	
included in the Closure Plan, and Addendums 1 and 3	
3.3 During rehabilitation of pump stations infrastructure and roads	Extensive rehabilitation has already
Given that this mining infrastructure has been omitted from the	taken place. Please advise Imerys if the
Closure Plan the following comments are provided to guide the	contractor has breached any part of this
rehabilitation activities conducted in this area in addition to the	agreement.
comments made in 1.3 above.	
Comments: People assigned/contracted to work on the rehabilitation	
in this area need to take cognisance of the conservation sensitivity of	
the environment, particularly in and near the conservation land as laid	
out in the agreement with KGRSB. As per the agreement KPNR has	
with neighbouring landowners regarding the conservation land, the	
fences and gates will continue to be maintained and monitored by	
KPNR. This includes maintaining fire breaks along the fences and	
controlling gate access. Also due consideration in the rehabilitation	
blan must be given to avoid any destruction or disturbance of the habitat that could endanger: - the unique and extremely rare leopard	

Kudu Come Deneh commente	Desperates
Kudu Game Ranch comments	Response
species, the Red or Erythristic Leopard, found in the area, currently	
being studied by MTPA and the data deficient Golden Mole	
(Amblysomus hottentotus meesteri) the rare birds that are breeding in	
the area - the Verreauxs Eagle (Black Eagle), African Crowned Eagle,	
Cape Vulture, Denhams Bustard (Stanley's Bustard), Black-bellied	
Bustard, White-bellied Korhaan and Black Stork Cussonio	
Transvaalensis, which is endemic to SA and Argyrolobium Wilmsii	
which is endemic to Mpumalanga and Sala Natalensis	
This aspect of a sensitive environment needs to be included in	
Addendums 1 and 3 of the Closure Plan.	
4. Future land-use considerations following rehabilitation	
The Closure Plan states that the end land-use has been identified as	Future end land use will remain
grazing and game farming which is unfortunate given the largely	cattle/game or arable farming. The
untransformed and unfragmented natural area of the property that	mine cannot commit to a park.
exists below the main mining operation which could contribute	
significantly more to protection targets for Lydenburg Thornveld as	
well as Ohrigstad Mountain Bushveld, both of which are poorly	
protected.	
Comments: In light of the environmental sensitivity and conservation	
value of the area it is important that KPNR engage with Imerys	
Refractory Minerals (Pty) Ltd on decisions relating to final end-use.	
The Imerys Group's Sustainable Development Strategy on	
Biodiversity states, and I quote, "Our strategy consists of building our	
knowledge and understanding of the environment and, in sensitive	
zones, encouraging the development of biodiversity management	
plans. Approximately 15% of the Group's operations are located on or	
near zones recognized for their interest in terms of biodiversity. Our	
quarries, especially their end-of-life restoration, offer many	
opportunities to enrich biodiversity by reviving natural areas or helping	
to conserve endangered animal or plant species. Several examples	
of positive contributions to ecosystems on our sites demonstrate this	
phenomenon. Most of these examples result from partnerships with	
local environmental associations or NGOs". A special appeal is made	
to the mine owners to seriously consider the future end land-use of	
this area after rehabilitation for conservation and biodiversity	
management, thereby enhancing the wider biodiversity and ecological	
processes envisioned as part of Mpumalanga's Protected Areas	
Expansion Strategy. The NEM: Protected Areas Act provides an array	
of procedures with which to include or expand protected areas. Brian	
Morris is the Senior Manager for Protected Areas Expansion and	
Establishment at Mpurnalanga Tourism and Parks Authority (MTPA)	
whose role is to work with landowners to improve the provincial	
protected area network and to provide biodiversity information that	

Kudu Game Ranch comments	Response
supports land-use planning and helps to streamline and monitor	
environmental decision-making. As a Protected Area: National Parks	
and Nature Reserves, the management of Kudu Private Nature	
Reserve would be very willing to approach Brian Morris on behalf of	
the Imerys Group to request an opportunity for their engagement with	
him.	

#### 2.4 The mine plan and schedule for the full approved operations

This section must include:

- (aa) appropriate description of the mine plan;
- (bb) drawings and figures to indicate how the mine develops;
- (cc) what areas are disturbed; and
- (dd) how infrastructure and structures (including ponds, residue stockpiles etc.) develops during operations

The mine is currently non-operational. It was an opencast rip-and-doze operation along the gentle scarp slope of a range of low hills. The quarries have a total length of 2km and cut into the side of the hill along the weathering profile of the andalusite-bearing hornfels host rock. The ore was crushed and screened, removing fines and barren ore. The ore was then concentrated by Heavy Medium Separation, where after it was dried and magnetically separated to produce a pure final product. Krugerspost Mine consists of the following infrastructures (refer to Figure 2 for the site layout plan).

- Plant,
- Workshops,
- Offices,
- Scrap yard,
- Magnetic waste site,
- Office Slimes Dam,
- Old Slimes Dam;
- Quarries (1, 2, 3, 4, 6 and Hostel Quarry),
- Barge Dam,
- Spekboom Reservoir Dam,
- Borrow Pit Dam,
- Settling Dams (1 and 2), and
- Ericsson Dams (1 to 5).

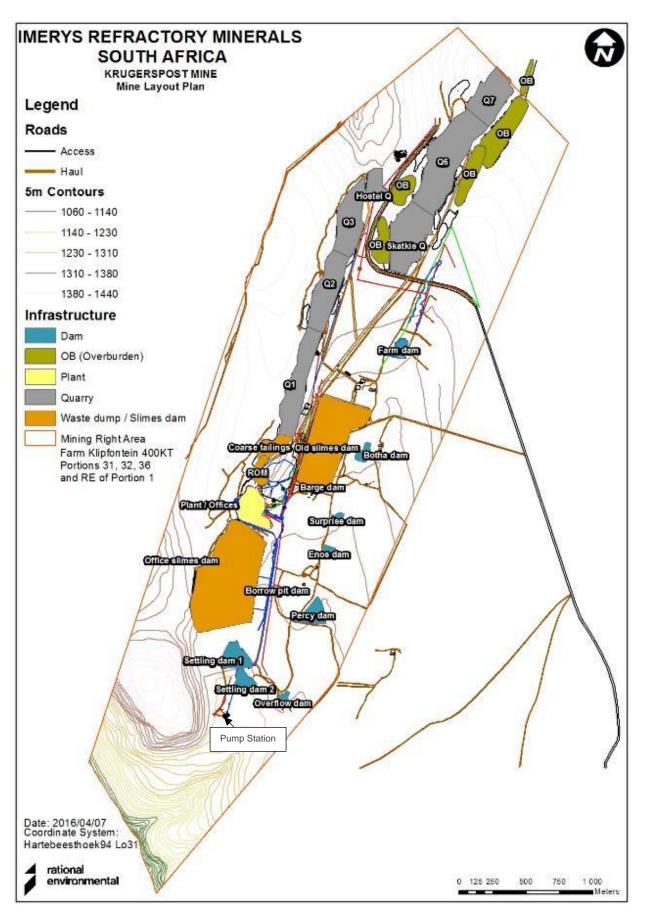

Figure 2: Site layout plan of the mining area

#### **SECTION 3: DESIGN PRINCIPLES**

#### 3.1 The legal and governance framework and interpretation of these requirements for the closure design principles

This section includes the legal and governance framework and interpretation of these requirements for the closure design principles. It also includes measures to rehabilitate the environment affected by the undertaking of any listed activity or specified activity and associated closure to its natural or predetermined state or to a land use which conforms to the generally accepted principle of sustainable development, including a handover report, where applicable

The requirements of closure are documented in various legislation. The various legislation and interpretation of these requirements for the closure design principles are discussed in Table 4 below.

Legislation	Requirements	Interpretation of these requirements for the closure design principles
Regulation 56 of	In accordance with applicable legislative requirements for mine closure, the	The approved EMP (1999) includes reference to rehabilitation and closure
MPRDR	holder of a mining right must ensure that -	of the mine. The mine has gathered information over the years to assess
	(a) the closure of a mining operation incorporates a process which must start	risks, including a Hydrogeological Report (Shangoni Management
	at the commencement of the operation and continue throughout the life of	Services, 2013). This is incorporated into this Closure Plan. Closure of the
	the operation;	mine will incorporate any necessary safety and health requirements in
	(b) risks pertaining to environmental impacts must be quantified and	terms of the MHSA. The residual and possible latent environmental impacts
	managed proactively, which includes the gathering of relevant information	are identified and quantified in this Closure Plan. The end land use is
	throughout the life of a mining operation;	discussed in Section 2.14 of this Closure Plan. Refer to Section 2 for the
	(c) the safety and health requirements in terms of the Mine Health and Safety	closing of all mining operations.
	Act, 1996 (Act No. 29 of 1996) (MHSA) are complied with;	
	(d) residual and possible latent environmental impacts are identified and	
	quantified;	
	(e) the land is rehabilitated, as far as is practicable, to its natural state, or to	
	a predetermined and agreed standard or land use which conforms with the	
	concept of sustainable development; and	
	(f) mining operations are closed efficiently and cost effectively.	

Table 4: Legislation and interpretation of these requirements for the closure design principles

Legislation	Requirements	Interpretation of these requirements for the closure design principles
Regulation 57 of	An application for a closure certificate by the holder of a mining right in terms	A form will be completed with this application. Refer to this Closure Plan as
MPRDR	of section 43(4) of the MPRDA must be completed in the form of Form P,	contemplated in regulation 62, Addendum 1 for the Environmental Risk
	contained in Annexure II.	Report as contemplated in regulation 60, Addendum 2 for the final
	(2) The application referred to in sub-regulation (1) must be accompanied by	Performance Assessment report contemplated in regulation 55(9). No
	the following documentation -	environmental liabilities will be transferred.
	(a) A closure plan contemplated in regulation 62;	
	(b) an environmental risk report contemplated in regulation 60;	
	(c) a final performance assessment report contemplated in regulation 55(9);	
	and	
	(d) a completed application form contemplated in regulation 58(1) to transfer	
	environmental liabilities and responsibilities, if the transfer of such liabilities	
	have been applied for.	
Regulation 61 of	Closure objectives form part of the draft environmental management	Closure objectives were included in the approved EMP (1999). The closure
MPRDR	programme and must -	costs are updated on an annual basis.
	(a) identify the key objectives for mine closure to guide the project design,	
	development and management of environmental impacts;	
	(b) provide broad future land use objective(s) for the site; and	
	(c) provide proposed closure costs.	
Section 43 of	Every holder remains responsible for any environmental liability, pollution or	The residual impacts are addressed in this Closure Plan.
MPRDA, Section	ecological degradation, the pumping and treatment of polluted or extraneous	
24R of NEMA	water, the management and sustainable closure thereof notwithstanding the	
	issuing of a closure certificate by the Minister responsible for mineral	
	resources in terms of the MPRDA to the holder or owner concerned.	
	When the Minister responsible for mineral resources issues a closure	Noted
	certificate, he or she must return such portion of the financial provision	
	contemplated in section 24P as the Minister may deem appropriate to the	
	holder concerned, but may retain a portion of such financial provision	

Legislation	Requirements	Interpretation of these requirements for the closure design principles
	referred to in subsection (1) for any latent, residual or any other	
	environmental impact, including the pumping of polluted or extraneous	
	water, for a prescribed period after issuing a closure certificate.	
	Every holder of works must plan, manage and implement such procedures	The mine will adhere to the requirements as set out in this Closure Plan,
	and requirements in respect of the closure of a mine as may be prescribed.	once approved by DMR.
	The Minister may, in consultation with the Minister responsible for mineral	Noted
	resources and by notice in the Gazette, identify areas where mines are	
	interconnected or their impacts are integrated to such an extent that the	
	interconnection results in a cumulative impact.	
	The Minister may, by notice in the Gazette, publish strategies to facilitate	Noted
	mine closure where mines are interconnected, have an integrated impact or	
	pose a cumulative impact.	
Regulation 19(6)	A closure plan must contain the information set out in Appendix 5 to these	This Closure Plan is based on the requirements of the MPRDA, Appendix
of GN 982	Regulations, and the closure plan must address the requirements as set in	5 of GN 982 as well as Appendix 4 of GN 1147.
	the regulations, pertaining to the financial provision for the rehabilitation,	
	closure and post closure of mining operations, made in terms of NEMA.	
Regulations 6(b)	An applicant must determine the financial provision through a detailed	The financial provision is included in Section 6 of the is Closure Plan.
of GN 1147	itemisation of all activities and costs, calculated based on the actual costs of	
	implementation of the measures required for final rehabilitation,	
	decommissioning and closure of the mining operations at the end of the life	
	of operations, as reflected in a final rehabilitation, decommissioning and	
	closure plan.	
Regulations	The final rehabilitation, decommissioning and closure plan must contain all	This Closure Plan is based on the requirements of the MPRDA, Appendix
12(2) of GN 1147	information set out in Appendix 4.	5 of GN 982 as well as Appendix 4 of GN 1147.

#### 3.2 Closure vision, objectives and targets

This section must reflect the local environmental and socio-economic context and reflect regulatory and corporate requirements and stakeholder expectations

Closure objectives form part of the draft EMP, and must:

- a. Identify the key objectives for mine closure to guide the project design, development and management of environmental impacts;
- b. Provide broad future land use objective(s) for the site; and
- c. Provide proposed closure costs.

Key closure objectives are necessary for mine closure, to guide the project design, development and management of environmental impacts. The closure objectives for the mine are as follow:

- 1. To rehabilitate the land to a level where natural topography, vegetation and land use approach the original state as closely as possible.
- 2. That stormwater control is permanent in view of the large volumes of fine erodible materials that have been created.
- 3. That the water quality and catchment yield return to the original state as closely as possible.

The rehabilitation of Krugerspost will focus on sloping of quarries and sloping and levelling of any additional overburden; removal of alien vegetation and establishment of natural vegetation on all disturbed areas to also prevent erosion; adequate stormwater control to prevent siltation and pollution of the Spekboom River; and removal of all old infrastructure. The rehabilitation plan will, therefore, be compatible with the closure objectives.

## 3.3 A description and evaluation of alternative closure and post closure options where these exist that are practicable within the socioeconomic and environmental opportunities and constraints in which the operation is located

The mine is already busy with closure; therefore, no alternatives are necessary.

# 3.4 A motivation for the preferred closure action within the context of the risks and impacts that are being mitigated

Refer to Section 4.2 for a complete description.

#### 3.5 A definition and motivation of the closure and post closure period

This must take cognisance of the probable need to implement post closure monitoring and maintenance for a period sufficient to demonstrate that relinquishment criteria have been achieved.

Refer to Section 4.2 for a complete description.

### **3.6 Details associated with any on-going research on closure options** Refer to Section 4.2 for a complete description.

3.7 A detailed description of the assumptions made to develop closure actions in the absence of detailed knowledge on site conditions, potential impacts, material availability, stakeholder requirements and other factors for which information is lacking

Refer to Section 4.2 for a complete description.

#### SECTION 4: FINAL REHABILITATION PLAN

# 4.1 **Proposed final post-mining land use which is appropriate, feasible and possible of implementation**

This section includes:

- a. descriptions of appropriate and feasible final post-mining land use for the overall project and per infrastructure or activity and a description of the methodology used to identify final postmining land use, including the requirements of the operations stakeholders; and
- b. a map of the proposed final post-mining land use

The end land-use has been identified as grazing and game farming. Water accumulating within the remaining quarries will be utilised and optimised to compliment the end land-use. Sloping should be at a safe angle for cattle and other animals to graze on site and provide easy access to the water. Sloping should allow for free drainage and prevent siltation of the water resources.

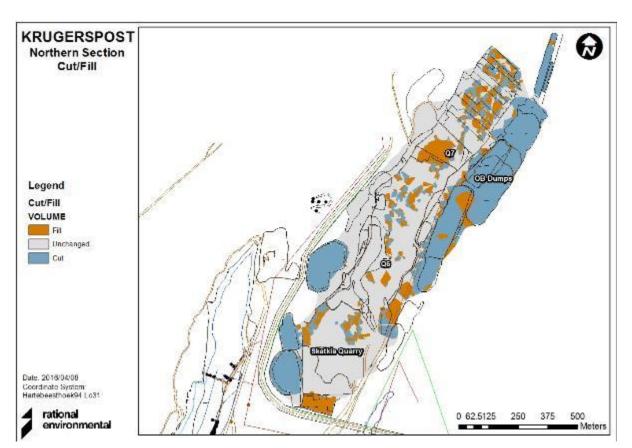

Figure 3: Final cut and fill of the northern section of the mine

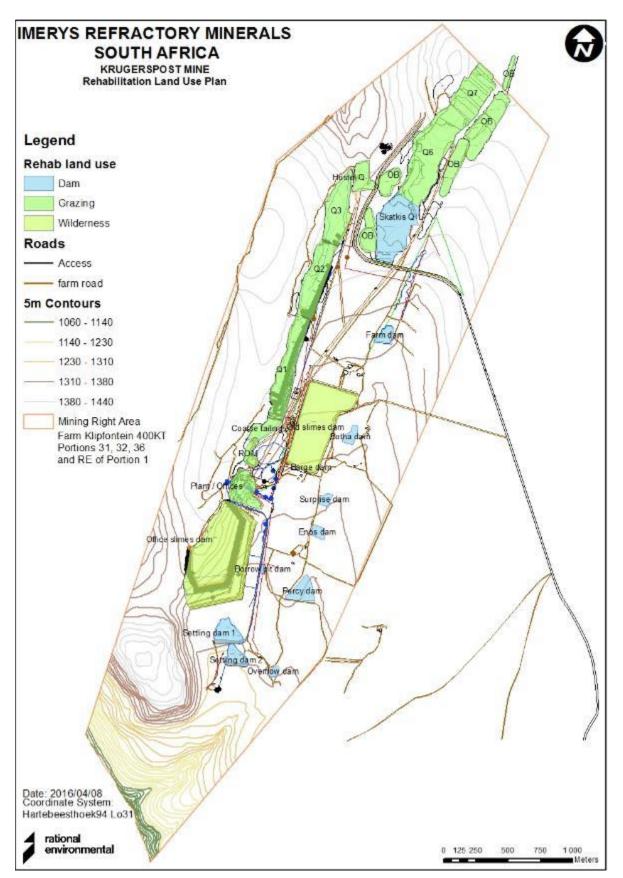

Figure 4: A sketch plan describing the final and future land use proposal and arrangements for the site

#### 4.2 Closure actions, and schedule of actions

The closure actions include:

- i. the development and documenting of a description of specific technical solutions related to infrastructure and facilities for the preferred closure option or options, which must include all areas, infrastructure, activities and aspects both within the mine lease area and off of the mine lease area associated with mining for which the mine has the responsibility to implement closure actions; and
- ii. the development and maintenance of a list and assessment of threats and opportunities and any uncertainties associated with the preferred closure option, which list will be used to identify and define any additional work that is needed to reduce the level of uncertainty

The schedule of actions for final rehabilitation, decommissioning and closure which will ensure avoidance, rehabilitation, management of impacts including pumping and treatment of extraneous water must be:

- i. linked to the mine works programme, if greenfields, or to the current mine plan if brownfields
- ii. including assumptions and schedule drivers; and
- iii. including a spatial map or schedule, showing planned spatial progression throughout operations

Resloping information was extracted from Sloping and Earthworks Plan (Rational Environmental, 2016). Refer to Figure 5 for the layout plan indicating the areas to be rehabilitated corresponding with the subsections below.

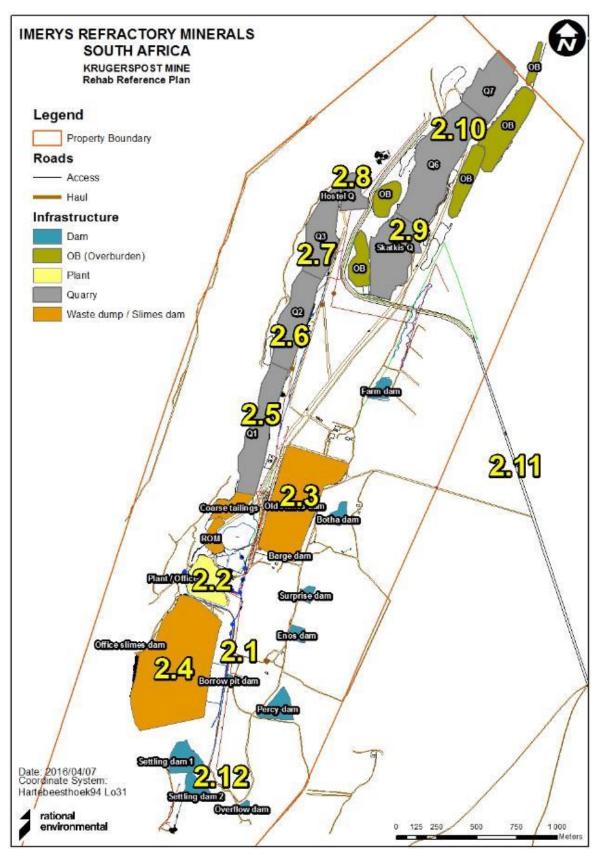

Figure 5: Areas to be rehabilitated

Table 5: Final rehabilitation action plans and schedule

Removal of pipelines	
Specificclosurevision,objectives and targets	To remove all pipes in accordance with all environmental principles as well as the requirements of the MHSA.
Original closure plan action plans	All steel pipes will be removed to other mines within the Imerys Group. These pipes will then be reused as part of their operations.
	All asbestos pipes will be removed per the requirements as stipulated in the Asbestos Regulations (GN 155) of 2001 of the Occupational
	Health and Safety Act (No 85 of 1993). All asbestos waste will be disposed of only on sites specifically designated for this purpose. All
	vehicles, re-usable containers or any other similar articles which have been in contact with asbestos waste will be cleaned and
	decontaminated after use. All persons occupied in the collection, transport and disposal of asbestos waste, will wear personal protective
	equipment (PPE).
Current situation	Pipelines were removed as per the closure plan. During a recent veld fire, various pipes were discovered which were previously not visible
	due to vegetation growth. This includes clay, steel and asbestos pipes. <b>Solution</b> <b>Solution</b> <b>Figure 6:</b> Some asbestos pipes in the veld (taken in 2017) There is also one last pipeline from the Office Slimes dam. This pipe will only be removed once the go-ahead is given by the engineer.

	Figure 7: Pipeline from Office Slimes dam (taken in 2017)
Updated action plans	Remove all pipes that have been discovered after the veld fire.
	Remove final pipeline from Office Slimes dam once an engineer has given the go-ahead.
Schedule	This is ongoing
Description and evaluation of	Not applicable.
alternative closure and post	
closure options	
Motivation for the preferred	The reuse of the steel pipes on other mines or by the contractor to reduce the generation of waste. Further, asbestos pipes must be

conditions, potential impacts,	
material availability, stakeholder	
requirements and other factors	
for which information is lacking.	
Removal of plant area and other	buildings
Specific closure vision,	To keep the existing terraces with only minor cut and fill operations; and
objectives and targets	To allow a gradual drainage to the east of the plant.
Original closure plan action plans	All hazardous materials such as hydrocarbons, fluorescent tubes, etc. will be removed by a licensed waste contractor to a licensed disposal
	area. The mine will obtain all the correct documentation such as safe disposal certificates and copy of the disposal site license. All asbestos
	cement will be removed. All salvageable material is being removed by either SA Metals or other mine operations. Concrete will be removed
	to a depth of 1m below surface. Building rubble (inert waste) could be used for backfilling of the quarries, however, the disposal of more
	than 25tons need a waste license excluding the disposal of such waste for the purposes of levelling which has been authorised by or under
	other legislation. This will be discussed with DMR prior to disposal.
	Once all remaining infrastructure is removed the sloping can be done with the aim to keep the existing terraces with only minor cut and fill
	operations by pushing the edges of the high wall down. Refer to the figure below marked as '1'.
	Sloping of the floor is recommended to be done towards the terraces to allow a gradual drainage to the east. Refer to the figure below
	marked as '2'.
L	

	Figure 9: Plant area (taken in 2018)

detailed knowledge on site	
conditions, potential impacts,	
material availability, stakeholder	
requirements and other factors	
for which information is lacking.	
Office Slimes Dam	
Specific closure vision,	To allow even distribution of runoff;
objectives and targets	To assist vegetation growth;
	To prevent ponding at the sealed penstock; and
	To prevent seepage from old slimes.
Original closure plan action plans	The penstock will be sealed. All berms are already paddocked therefore; no additional paddocks are necessary. The Office Slimes Dam
	has some vegetation already established on parts of the sidewalls. It will not be beneficial to disturb the slimes dam along the sidewalls. It
	is recommended to construct small berms on the top to allow even distribution of runoff to assist vegetation growth and prevent ponding
	at the sealed penstock. Refer to the figure below marked as '1'.

	Figure 12: Office slimes dam (taken in 2018)
Updated action plans	Vegetation of slimes dam is necessary. Assess what vegetation practices are efficient on this dam.
Schedule	Ongoing
Description and evaluation of	No alternative closure and post closure options are evaluated.

detailed knowledge on site	

conditions, potential impacts,	
material availability, stakeholder	
requirements and other factors	
for which information is lacking.	
Quarry 1	
Specific closure vision,	To allow free flowing of surface water;
objectives and targets	To promote even vegetation growth; and
	To ensure the safety of quarry for community and animals.
Original closure plan action plans	This quarry has been backfilled fairly flat with the natural topography on the eastern side. No major sloping is proposed. Only paddocks on
	the top surface are proposed to promote even vegetation growth.
Current situation	The replacement of soil is underway. This soil replacement is done by making berms to help with water retention.
	Figure 13: Quarry 1 (taken in 2017)

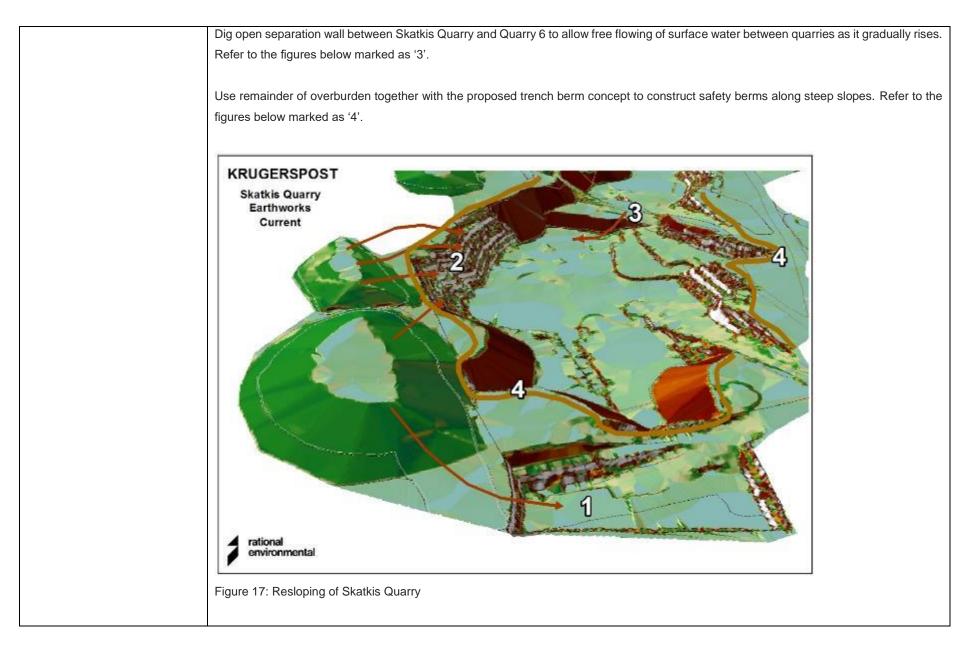

Updated action plans	Ensure revegetation. It is recommended that a surveyor ensure these quarries have been sloped to the angle as indicated in the closure
	plan.
Schedule	Ongoing
Description and evaluation of	No alternative closure and post closure options are evaluated.
alternative closure and post	
closure options	
Motivation for the preferred	The sloping of the quarry to ensure free-flowing of water and revegetation, as well as safety of the quarry, will ensure that the planned end
closure action within the context	land use can be obtained.

assumptions made to develop	
closure actions in the absence of	
detailed knowledge on site	
conditions, potential impacts,	
material availability, stakeholder	
requirements and other factors	
for which information is lacking.	
Quarries 2 & 3	
Specific closure vision,	To allow free flowing of surface water;
objectives and targets	To prevent ponding at the sealed penstock;
	To promote even vegetation growth; and
	To ensure the safety of quarry for community and animals.
Original closure plan action plans	No sloping to of Quarry 2 take place. The quarry will be revegetated.

	Small contour berms are suggested along all of the backfilled tailings quarries to runoff water to be dispersed as part of the vegetation establishment and prevent ponding at the sealed penstocks. Quarry 3 has been backfilled fairly flat with the natural topography on the eastern side. No major sloping is proposed. Only paddocks on the top surface are proposed to promote even vegetation growth. Paddocks should not commence without the approval of the responsible engineer as the dam is still draining through the penstock.
Current situation	Backfilling (sloping) of these quarries has been done. Topsoils is also being spread over the area and berms are incorporated to help with water retention. There is still some topsoil that can be worked into the area.

Updated action plans	Figure 15: Quarry 3 (taken in 2017 – similar in 2018)         Ensure revegetation. It is recommended that a surveyor ensure these quarries have been sloped to the angle as indicated in the closure
opuated action plans	plan.
Schedule	Ongoing
Description and evaluation of	No alternative closure and post closure options are evaluated.

for which information is lacking.	
Quarries 6 and 7	
Specific closure vision,	To allow free flowing of surface water;
objectives and targets	To promote even vegetation growth; and
	To ensure the safety of quarry for community and animals.
Original closure plan action plans	Quarries 6 should allow being free draining towards Skatkis Quarry to the south. The strategy is to safeguard the high walls, fill in some
	material to the western benches to allow vegetation growth. Finally, move overburden material into the quarry.
	Use overburden on the west to fill benches on the high wall for a more natural gradient. An estimated 134,256m <sup>3</sup> is to be moved from this
	stockpile. Refer to the figure below marked as '1'.
	Use overburden from the east to fill and gradually slope the northern floor of the quarry to produce a gradual contour within the quarry.
	This should provide free drainage to the south of the quarry with less ponding. The total estimated overburden to be moved from the east
	into the quarry is 245,000m <sup>3</sup> . Note that there are no detailed survey data available for the calculation of the volume above. Only the
	footprints of the overburden stockpiles are available. The volume is calculated based on the natural angle of repose for the overburden in
	the area together with a predetermined height of four metres. Refer to the figure below marked as '2'.
	Together with the gradual sloping using overburden, the remaining benches within the quarry should also be flattened to produce a more
	natural surface for vegetation. Refer to the figure below marked as '3'.
	Construct a safety berm along remaining high walls. Refer to the figure below marked as '4'.

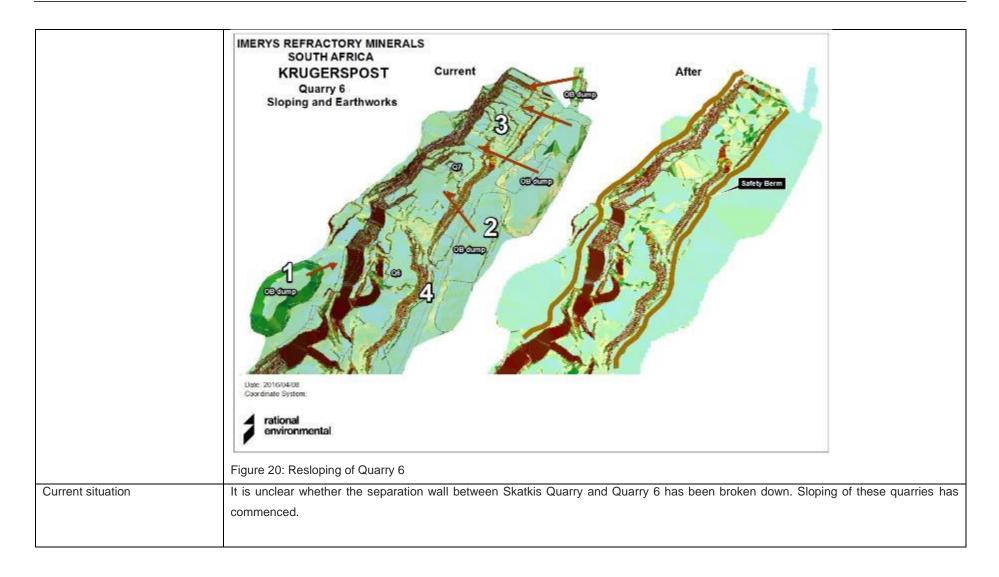

Figure 21: Quarries 6 & 7 (taken in 2017)	
Updated action plans Ensure separation wall is broken down. Construct safety berms. It is recommended that a sur	veyor ensure these quarries have been
sloped to the angle as indicated in the closure plan. for which information is lacking.	
Primary and secondary access	roads
Specific closure vision,	To remove any unnecessary roads.
objectives and targets	
Original closure plan action plans	Remove all hydrocarbon spillages and dispose of as hazardous waste. Rip all roads. Ripping is done by using a dozer with one or two
	ripper tines. Ripping must penetrate through soil into the underlying overburden materials to ensure free drainage and to ensure root
	penetration. Refer to Addendum 3 for a report on the ripping, re-vegetation, alien control, and monitoring plan of the area.
	The road to the pump stations will be kept because these stations will still be used.
Current situation	Most of these roads have already been ripped. These roads were seeded. However, due to a lack of rain, no grasses are yet visible.
Updated action plans	Follow up on seeding
Schedule	Ongoing
Description and evaluation of	No alternative closure and post closure options are evaluated.
alternative closure and post	
closure options	
Motivation for the preferred	The removal of unwanted roads will prevent erosion of these areas. Some roads will still be used by farmers and cannot be removed.

Clean-up of pump stations	
Specific closure vision,	The removal of any unwanted material and clean-up of the area.
objectives and targets	
Original closure plan action plans	No decommissioning will take place; however, all unwanted material will be removed. This area will be cleared immediately of all loose
	debris, piping, poles and cabling that is in the reaches of flood waters to prevent an aquatic pollution event.
	People assigned/contracted to work on the rehabilitation in this area need to take cognisance of the conservation sensitivity of the
	environment, particularly in and near the conservation land as laid out in the agreement with Kudu Game Range. As per the agreement
	KPNR has with neighbouring landowners regarding the conservation land, the fences and gates will continue to be maintained and
	monitored by KPNR. This includes maintaining fire breaks along the fences and controlling gate access. Any destruction or disturbance of
	the habitat will be avoided that could endanger:
	• the unique and extremely rare leopard species, the Red or Erythristic Leopard, found in the area, currently being studied by MTPA
	and the data deficient Golden Mole (Amblysomus hottentotus meesteri);
	• the rare birds that are breeding in the area – the Verrauxs Eagle (Black Eagle), African-Crowned Eagle, Cape Vulture, Denhams
	Bustard (Stanley's Bustard), Black-Bellied Bustard, White-Bellied Korhaan and Black Stork; and
	• Cussonia transvaalensis, which is endemic to South Africa and Argyrolobium wilmsii, which is endemic to Mpumalanga and Scilla
	natalensis.

# 4.3 The indication of the organisational capacity that will be put in place to implement the plan

This section must include:

- i. the organisational structure as it pertains to the plan
- ii. responsibilities
- iii. training and capacity building that may be required to build closure competence

The mining contractor and the contractor removing the infrastructure will be responsible for rehabilitation. The operational management of Imerys will ultimately be responsible for final rehabilitation. No training has been done.

# 4.4 An indication of gaps in the plan, including an auditable action plan and schedule to address the gaps

The work conducted in this report is compiled from specialist studies and the EMP. There is nothing additional that is done.

# 4.5 Relinquishment criteria for each activity or infrastructure in relation to environmental aspects with auditable indicators

The area will only be relinquished once adequate drainage and natural vegetation is retained, with no erosion on roads to be removed.

# SECTION 5: POST REHABILITATION ACTIVTIES

Information for this section was taken from 'Rehabilitation Recommendations after Alien Plant Control' (Campbell, 2001). Post rehabilitation will take place after closure of the mine. These activities will be in the form of maintenance and monitoring.

### 5.1 Monitoring plan

Monitoring of any rehabilitation is absolutely necessary to ensure that the integrity and performance of the rehabilitation method are still in line with the original objectives and purposes of the method. It is very important that monitoring takes place continuously throughout and after rehabilitation. The main goals of a monitoring program are (van Deventer, 2009):

- To meet legal requirements. In the EMP, a description of methods to be followed to monitor compliance with the approved rehabilitation plan is included. Closure application should also be substantiated with adequate monitoring data. Closure objectives must be specified upfront and accepted by all parties. Objectives must be prescribed for at least the following:
  - Topographical reshaping
  - Erosion (surface stability);
  - Vegetation cover (species diversity, abundance);
  - Surface water drainage systems;

- Surface water quality
- Groundwater quality
- Mine residue characteristics with respect to plant growth (soil quality)
- 2. Evaluating mine residue and vegetation quality. Dynamic assessment requires a monitoring system to provide a regular surveillance of mine residue and vegetation quality attributes or indicators.
- 3. Land management. The annual results of the monitoring program will determine the actions to be taken for the following year to ensure the site is improving in the direction of the stipulated end result.
- Improving our understanding of new ecosystems. For the new ecosystem, the biological productivity, stocks and exchange of nutrients, and the regulation of other ecological processes need to be characterized, quantified and modelled.

Refer below for the parameters of monitoring. This includes an explanation of the approach that will be taken to analyse monitoring results and how these results will be used to inform adaptive or corrective management and/or risk reduction activities.

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
Topographical reshaping				
After reshaping the resultant topography must be	Once after	Once after	Mine	Deviations from plan must be documented, and the final reshaped surface should be
surveyed to determine the degree to which the final	reshaping	reshaping	surveyor	signed off by the responsible person prior to the replacement of topsoil.
topography meets planned objectives, particularly in				
terms of surface drainage and in terms of slope				
required to meet land capability objectives.				
Erosion monitoring	1	L	•	
The primary objective of the closure of any sloped area	Monthly	Five years	Mine	It is much simpler, and cheaper, to treat this type of erosion in the early stages of
is to create a rehabilitated surface and topography that		after	manager	formation than to try to repair the damage once a deep gulley has formed. Small ruts that
has the capacity to be stabilised under all		rehabilitation		are just starting to open up can be easily controlled by filling them with brush, straw,
environmental conditions e.g. severe rain events, veld				manure or even stones.
fires, droughts etc. Erosion status of the rehabilitated				
land should be monitored and zones with excessive				Treatments should be concentrated in areas of clearly active soil erosion, rather than
erosion should be identified for remedial action.				relatively stable (vegetated) gulleys).
Erosion can be quantified by insertion of marked				
stakes into the rehabilitated profile and recording the				An extremely important principle with any soil erosion control method is that when natural
rate at which the stakes are uncovered. However, the				materials are gathered for use in control structures, care must be taken to ensure that the
norm is simply the recording of the existence of				removal (for example, of stones) does not become the cause of a new erosion problem
erosion in a particular location. Key objectives to				at the source of the material. Stones, for example, should only be collected along roads,
improve surface stability are;				where they are displaced during road-making, or from piles of stones cleared off irrigation
• The minimisation of surface erosion (wind and				lands. Similarly, natural vegetation should not be destroyed by vehicles collecting or
water)				delivering materials for gulley control.
• Establishment of a plant community that is self-				(http://www.ostrichsa.co.za/downloads/bio_diversity/rehabilitation.pdf)
sustaining or any other cover material which				
complies with surface stability				
Achievement of these objectives should be				
demonstrated by monitoring of the rehabilitated areas.				
The key objective of surface stability monitoring lies in				

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
being able to demonstrate in a quantified manner the				
stability of surface rehabilitation works. The monitoring				
programme should be developed such that loss of soil				
can be quantified and the stability of the vegetated				
areas be assessed.				
Vegetation monitoring	I	1		
Vegetation establishment on new ecosystems or on	Refer to	Five years	Mine	Refer to step 4 and 5 in parameters to be monitored
disturbed systems should yield a self-sustaining	Figure 26	after	manager	
community that is dynamic and able to change as the	below.	rehabilitation		
rehabilitated site ages and matures. The success of re-				
established plant community must be demonstrated				
through appropriate monitoring. The monitoring				
program must quantify the established plant				
community in terms of:				
1. Species abundance (diversity)				
a. Improvement on contact cover				
b. Canopy cover				
c. Rooting depth				
d. Reproductive performance -				
Sexual reproduction				
2. Asexual reproduction				
a. Microbial activity and biomass				
b. Frequency – once a year				
c. Remarks				
The vegetation-monitoring programme must be				
developed for each case of implementation, without				

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
compromising the integrity of data gathered. A				
qualified ecologist with experience in assessment of				
rehabilitated plant communities must design the				
monitoring programme.				
The rehabilitation of grass species will potentially take				
place over 5 years depending on the progress of the				
rehabilitation plan. After this initial monitoring, a less				
comprehensive monitoring will be done. Refer to				
Figure 26 for a diagram of the vegetation monitoring to				
be done on the site. It is important to note that				
throughout all the monitoring phases, alien vegetation				
should be noted and included in an Alien Invasive				
Vegetation Control Programme.				
It is the objective to eradicate all alien plants during the				
control programme; however, it is very likely that alien				
vegetation will re-occur after such initial control. To				
-				
combat this, an Alien Invasive Vegetation Control				
Programme is set out. There are five steps to this				
control programme. They are as follows: Please note,				
this alien vegetation monitoring must also be done				
after concurrent rehabilitation and the re-vegetation				
and removal of plants during concurrent rehabilitation				
has taken place.				
Step 1: Information gathering				

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
This first step is done to create a map, indicating the				
different infestation areas on the site. The following				
should be done to create such a map:				
1. Alien plant infestations should be divided into				
control areas. To do this, natural or man-made				
barriers can be used. These barriers include				
roads, rivers and fences. These barrier areas				
should be numbered for record purposes.				
2. A detailed alien plant survey should be done in				
each area. The following should be recorded –				
All alien plant species present and				
their growth habit (shrubs, trees,				
coppice, saplings, seedlings),				
Percent density of each alien plant				
species (75-100% is very dense, 50-				
75% is dense, 25-50% is medium				
dense, 5-25% is sparse and 0-5% is				
scattered),				
The terrain.				
3. Rank the areas into high, medium and low priority				
areas. This depends on the biodiversity, water				
yield and carrying capacity.				
4. Identify suitable grass species for establishment				
and availability, per land use aims.				
5. Place all above information on a 1:1 000 maps.				
Step 2: Planning				

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
This step is to establish integrated control strategies in				
each control (barrier) area as identified in Step 1. The				
following should be done:				
1. List the required resources for each high priority				
control area (e.g. labour, herbicides, and				
equipment) and the current management				
practices on the property.				
2. Evaluated and select appropriate control				
methods, using registered herbicides.				
3. Calculate the costs for the high priority control				
areas.				
4. Secure a long-term commitment to rehabilitation.				
Step 3: Management				
1. Draw up an Annual Plan of Operations (APO) for				
high priority control areas. This plan must be				
updated each year. It includes a budget for the				
required resources for control strategies during				
the first year. This determines the scale of work.				
a. 75% for follow-up work and				
rehabilitation of previously cleared				
areas'				
b. 20% for initial control of new area' and				
c. 5% for an emergency.				
2. Establish an emergency fund to cope with				
catastrophes such as mass seeding generation,				
fire, flood, etc.				
3. Allocate resources to high priority control areas.				

Parameters to be monitored	Frequency	Period of	Responsible	Explanation of the approach that will be taken to address and close out audit
	of	monitoring	person	results and schedule
	monitoring			
4. Draw up timetables for control operations,				
including a "catch-up" for in case operations fall				
behind.				
5. The plan must be flexible and adjusted as				
progress is made.				
Step 4: Implementation				
Train the labourers in correct control and grass				
planting methods.				
Step 5: Record keeping				
1. Keep simple records of daily operations, e.g.				
record of labour days, herbicide used and				
volumes and equipment used.				
2. Monitor progress with the control work (after the				
first year) by recording information on maps.				
3. The information from these records must be fed				
back into the budget to update and amend the				
APO for the following year.				
Surface water drainage systems

### 5.2 Internal, external and legislated audits of the monitoring plan

The monitoring plan will be audited to ensure effective implementation.

#### 5.2.1 Person responsible for undertaking the audit

Health Safety and Environmental Manager for internal audits and consultant for external audits.

#### 5.2.2 Planned date of audit and frequency of audit

Annually.

# 5.2.3 An explanation of the approach that will be taken to address and close out audit results and schedule

Refer to the monitoring plan in section 5.1 for an approach that will be taken to address and close out audit results and schedule.

#### 5.2.4 Disclosure of updates of the plan to stakeholders

The audit report will be sent to all stakeholders once finalised, therefore on a quarterly basis.

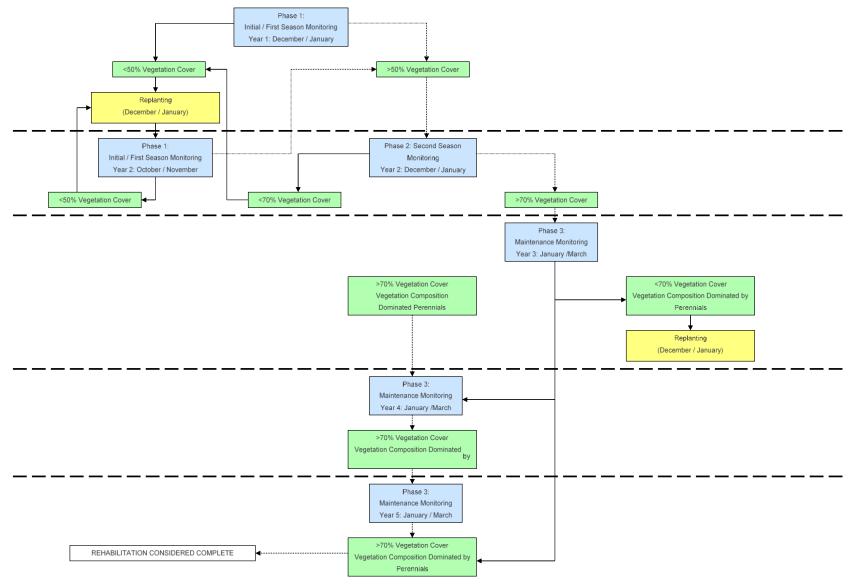

Figure 26: Summary of vegetation monitoring

**BECS** Environmental

## SECTION 6: MINE CLOSURE FINANCIAL PROVISION UPDATE

The annual forecasted financial provision calculation must include an explanation of the financial provision methodology; auditable calculations per activity or infrastructure; and financial provision assumptions.

#### 6.1 Financial provision methodology

The following is extracted from the Annesley Andalusite Mine Closure Liability Update (Shangoni Management Services, 2016):

The CES Group was contracted by Shangoni to acquire rates for demolition and rehabilitation of mining activities. Procurement of budget pricing approached by identifying reputable demolition companies, various sites of varying sizes at various locations and identifying local companies in the study area with the ability to work on similar scale project. A bill of quantities (BoQ) was distributed to the various companies. The table below indicates the number of contractors to which the BoQ was distributed and the number of tenders received afterwards.

Area	Number of contractors identified	Tenders received
National	6	1
North West	6	3
Free State	5	1
Northern Cape	7	2
Limpopo	5	3 (One joint venture with national based company)
Total	29	10

#### Table 6: Results of rate acquisition process

The prices received from contractors were reviewed by the CES Group, after which average and meridian rates were drawn rates to correctly establish a baseline rate. The following methods to establish the baseline rates were followed:

- Price A Average if priced across the board average of rates received per category;
- Price B Median pricing "middle" rate of all rates in series per category;
- Price C Average between Price A & B;
- Price D Average rate excluding top and bottom rates per category.
- Price D rate category that was used in the financial provision calculation, unless otherwise indicated in the financial provision spreadsheet "Rate" sheet.

The financial provision consists of the following areas:

Physical - Demolition of infrastructure where infrastructure does not form part of end land use. The potential for transfer to the third party was identified.

Biophysical - Actions to safeguard (making safe and stable) and re-establish the biophysical to ensure a sustainable landform and mitigate identified risks. This includes levelling of the dumps, seeding of the trees and grass.

#### 6.2 Auditable calculations of financial provision per activity or infrastructure

### 6.3 Financial provision estimation

The following table contains a summary of the calculations made for the financial provision based on the rehabilitation monitoring plan.

Table 8: Summary of the financial provision estimation until closure

Item	Size (m / m <sup>2</sup> / m <sup>3</sup> )	Rate	Final cost
Sloping with topsoil			
Overburden		R 8.89	R -
Quarries	77,904.00	R 8.89	R 692,566.56
Infrastructure	I		I
Access roads		R 14.89	R -
Pit perimeter berm	3,603.00	R 22.55	R 81,247.65
Pipes	Estimate	R 36,000.00	R 36,000.00
Office	450.00	R 435.00	R 195,750.00
Vegetation	I		I
Seeding	731,647.00	R 3.36	R 2,458,333.92
Removal of alien vegetation	Estimate	R 30,000.00	R 30,000.00
Monitoring	1	1	
Soil erosion, vegetation growth, and alien vegetation monitoring	5 Years	R 30,000.00	R 150,000.00

Item	Size (m / m <sup>2</sup> / m <sup>3</sup> )	Rate	Final cost
Groundwater monitoring	Quarterly for 5 years	R 30,000.00	R 600,000.00
Sub-total	years		R 4,243,898.13
P&G (13.5%)			R 572,926.25
Contingency (10%)			R 424,389.81
Total			R 5,241,214.19

#### 6.4 Financial provision assumptions

Extensive rehabilitation has already taken place. Refer to the rehabilitation monitoring report for an update on the rehabilitation on site.

- Pipes were removed, however; more pipelines were uncovered after a veldfire. Some of these pipes are asbestos pipes. A previous quotation of R36,000 was used to remove asbestos pipes. All steel pipes will be removed to other mines within the Imerys Group. These pipes will then be reused as part of their operations.
- The entire plant area has been removed and sloped. Only the offices are still intact. The site offices are approximately 450m<sup>2</sup>.
- The old slimes dam has been revegetated. No additional rehabilitation is envisaged.
- Most of the structures on the Office slimes dam has been removed. Vegetation is still limited. The side must be revegetated. The area for seeding is approximately 144,337m<sup>2</sup>.
- Quarries 1, 2 and 3 have been sloped and topsoil cover is underway. The area for seeding is approximately 161,034m<sup>2</sup> for quarries 1 and 2 and 78,613m<sup>2</sup>.
- Topsoil replacement on Hostel Quarry has taken place. Revegetation must now be done. The area for seeding is approximately 24,867m<sup>2</sup>.
- Sloping at Skatkis Quarry has taken place. It is unclear whether the separation wall between Skatkis Quarry and Quarry 6 has been broken down.
- Sloping of quarries 6 and 7 has commenced. Final sloping of approximately 77,904m<sup>2</sup> (at a depth of 1m) must still take place and seeding of an area of 267,336m<sup>2</sup>.
- Most of the roads have already been ripped. These roads were seeded. However, due to a lack of rain, no grasses are yet visible.
- Barge dam has been removed. This area is now a wetland area. The settling dams will remain intact.
- The pump station area has been cleaned with some pipes and other rubble still remaining to be removed. The contractors take rubble away and resell.
- Sloping and replacement of topsoil is underway on the coarse tailings and run of mine. Reseeding of an area of 55,460m<sup>2</sup> is necessary.
- Enviroberm around quarries 6 and 7 and Skatkis quarry with an approximate perimeter of 3,603m.

# SECTION 7 MOTIVATIONS FOR ANY AMENDMENTS MADE TO THE FINAL REHABILITATION, DECOMMISSIONING AND MINE CLOSURE PLAN, GIVEN THE MONITORING RESULTS IN THE PREVIOUS AUDITING PERIOD AND THE IDENTIFICATION OF GAPS AS PER 2(I)

None.
