	-	rally occurring rocks can be inst t to attempt to limit immediate e	•

- Á Flow diffusing mechanisms should be implemented (e.g. baffles) to limit any potential erosion and sedimentation likely to be facilitated by the discharge volume of the outfall; and
- Á Revegetation should occur in sections that have been washed out due to the increased flow. This should also occur in severe cases of erosion where rehabilitation of impacted watercourse banks should take place simultaneously with revegetation.

6.2.2Á Operational Phase Mitigation Measures

EXECUTIVE SUMMARY

Sasol Mining (Pty) Ltd (hereinafter Sasol) has appointed Digby Wells Environmental (hereinafter Digby Wells) to conduct a wetland health assessment of an area associated with significant disturbance within the Sigma Defunct Colliery mining right area. The area in question has been disturbed due to infilling and deposition of coal, excavation and clearance of wetland vegetation. Sasol plans to dismantle an existing conveyor route and associated infrastructure and a new conveyor gantry will be constructed to transfer coal to Sasol Chemical Industries (Pty) Ltd. Recommendations have been made in this report to ensure that the impacts to wetland areas, as a consequence of the proposed activities, are minimised.

The affected wetland area covers approximately 4.1ha and is classified as a channelled valley bottom wetland. The channelled valley bottom extends into the adjacent municipal grounds to the east and terminates just before the fine ash dam to the west. The watercourse associated with the wetland was previously assigned a PES of 'E', indicating that it was in a very poor condition and was seriously modified. The wetland area was assessed as a unit for this study and was a reassigned a PES of 'F', indicating that it is critically modified. The EIS of the wetland was rated as 'D', indicating that it has a low ecological importance.

The impact of the infilling and sedimentation activities was rated as moderate. To rehabilitate the wetland area, the following recommendations have been made:

- A dedicated waste disposal site should be established for the inert demolition waste from the conveyor. Steel and any other material that has salvage value should be sold and removed from the site.
- All coal and fine carbonaceous material up to 300mm from the natural ground should be removed from the wetland and stockpiled. Stockpiled waste should be collected with a back-actor, parked on a safe place on the edge of the infilled areas. The remaining 300mm of waste material should be loaded manually (using spade) into the skip of the back-actor to limit any impacts on the existing soils, and;
- A list of suitable plant species has been provided for rehabilitation.

The Department of Water and Sanitation (DWS) and Department of Environmental Affairs (DEA) should be notified about the incident in the wetland area on site as soon as possible. The rehabilitation interventions should be implemented as a priority and the DWS and DEA should be informed of the timing and details of the rehabilitation planning procedure. The area should be monitored monthly by a wetland specialist for six months after construction to ensure that erosion and alien plant invasion does not take place.

For the proposed new conveyor gantry, the supports should cover as small an area as possible and should be located outside of the wetland area and the conveyor should be fitted with a cover to prevent spillage into the wetland.

LIST OF APPENDICES

Appendix A: National Freshwater Ecosystems Priority Areas

1 Introduction

Wetlands are sensitive ecosystems that perform many complex functions including the maintenance of water quality, carbon storage, stream-flow regulation, flood attenuation, various social benefits, such as water supply for human use, supporting hunting and recreational fishing activities, use for tourism and supply of natural resources, as well as the maintenance of biodiversity (Kotze *et al.*, 2008).

The Ramsar Convention on Wetlands refers to wetlands as one of the most important life support systems on earth owing to the services provided. Wetlands are defined according to the National Water Act (NWA), 1998 (No. 36 of 1998) as:

"Land which is transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is periodically covered with shallow water, and which land in normal circumstances supports or would support vegetation typically adapted to life in saturated soil."

1.1 Project Description

Sasol Mining (Pty) Ltd (hereinafter Sasol) has appointed Digby Wells Environmental (hereinafter Digby Wells) to conduct a wetland health assessment of an area associated with significant disturbance within the Sigma Defunct Colliery mining right area. The area in question has been disturbed due to infilling and deposition of coal, excavation and clearance of wetland vegetation. The objectives of the study were as follows:

- To conduct an infield assessment of the delineated wetlands (Digby Wells, 2016) within, upstream and downstream of the affected area in order to determine:
 - The Present Ecological State (PES) of the wetlands;
 - The Ecological Importance and Sensitivity (EIS) of the wetlands;
 - Conduct a Risk Assessment on the affected wetlands;
 - Recommend rehabilitation interventions based on the findings of PES, EIS and Risk Assessments of affected wetlands
- Compile a report that describes the baseline state of the wetland and recommend wetland rehabilitation interventions to rehabilitated affected wetlands with main to improve the wetland ecological state.

2 Terms of Reference

The agreed terms of reference includes a wetland assessment report detailing the following:

- The updated Present Ecological Status (PES) of the wetlands, detailing all current impacts within, upstream and downstream of the wetlands where the disturbance occurred; and
- Recommended rehabilitation interventions to improve the affected wetlands to the recommended ecological state.

3 Expertise of the Specialist

Crystal Rowe specialises in flora and wetland ecology and was the wetland specialist lead for this project. She achieved a BSc in Botany and Geology and a BSc Hons in Botany at Nelson Mandela Metropolitan University (NMMU). Key experience includes ecological impact assessments, baseline vegetation assessments, estuarine ecological state assessments and wetland health assessments. Project experience includes various countries such as: the DRC, Ethiopia, the Ivory Coast, Mali, Mozambique, Sierra Leone and extensively within South Africa. Crystal is competent in plant identification and is experienced in IFC compliant assessments. She is also certified to complete wetland Ecosystem Services and is a registered professional natural scientist in South Africa (Reg. No. 400090/15).

Megan Edwards is an Environmental Specialist in the GIS Unit at Digby Wells and was responsible for the mapping component of this project. She graduated with a BSc. in Geography, Geology and Environmental Management (2007) and BSc (Hons) in Geology (2008) from the University of Johannesburg as well as a BSc (Hons) in Hydrogeology (2011) from the University of the Free State. Megan joined the GIS team at Digby Wells in April 2015 and is responsible for assisting specialists with data capture and manipulation, graphical map production, volumetric calculations, spatial and temporal modelling and creating photo-montages using ArcGIS and GIMP software. Previously Megan has worked as an exploration geologist with Reptile Uranium Namibia and Rio Tinto, and as a Hydrogeologist with Digby Wells and First Quantum Minerals.

Danie Otto manages the Specialist Departments at Digby Wells. He holds an M.Sc in Environmental Management with B.Sc Hons (Limnology, Geomorphology, GIS and Environmental Management) and B.Sc (Botany and Geography & Environmental Management). He is a biogeomorphologist that specialises in ecology of wetlands and rehabilitation. He has been a registered Professional Natural Scientist since 2002. Danie has 17 years of experience in the mining industry in environmental and specialist assessments, management plans, audits, rehabilitation, and research. He has experience in 8 countries and his experience is in the environmental sector of coal, gold, platinum (PGMs), diamonds, asbestos, rock, clay & sand quarries, copper, phosphate, andalusite, base metals, heavy minerals (titanium), uranium, pyrophyllite, chrome, nickel etc. He has wetland and geomorphology working experience across Africa including specialist environmental input into various water resource related studies. These vary from studies of the wetlands of the Kruger National Park to swamp forests in central Africa to alpine systems in Lesotho.

4 Study Area

The site is located within the Sigma Defunct Colliery mining right boundary adjacent to the town of Sasolburg in the Fezile Dabi District Municipality, Free State Province (Figure 4-1). The wetland system is traversed by a defunct conveyor that is to be dismantled and removed (Figure 4-2). Further to this, an additional conveyor route will be determined to transfer coal from the Mooikraal Coal Mine to Sasol Chemical Industries Ltd.

The area experiences a maximum temperature of 23°C and a minimum of 9°C on average. The average monthly rainfall is 32 mm with the maximum rainfall recorded in December and the minimum in June (zero rainfall).

The western portion of the site falls within the Soweto Highveld Grassland and the eastern portion falls within the Central Free State Grassland vegetation type. Wetlands are scattered throughout the landscape, representing vegetation characteristic of the Eastern Temperate Freshwater Wetlands. The project area falls within the quaternary catchment C22K (Figure 4-3). This catchment is situated within the Upper Vaal Water Management Area.

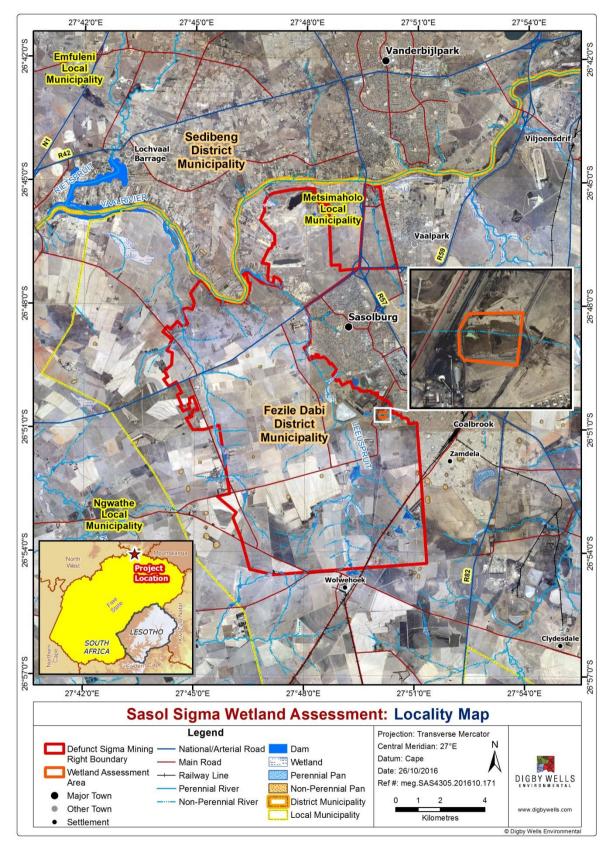

Figure 4-1: Site locality

Figure 4-2: Landscape images of the conveyor and abandoned pipes in the wetland area

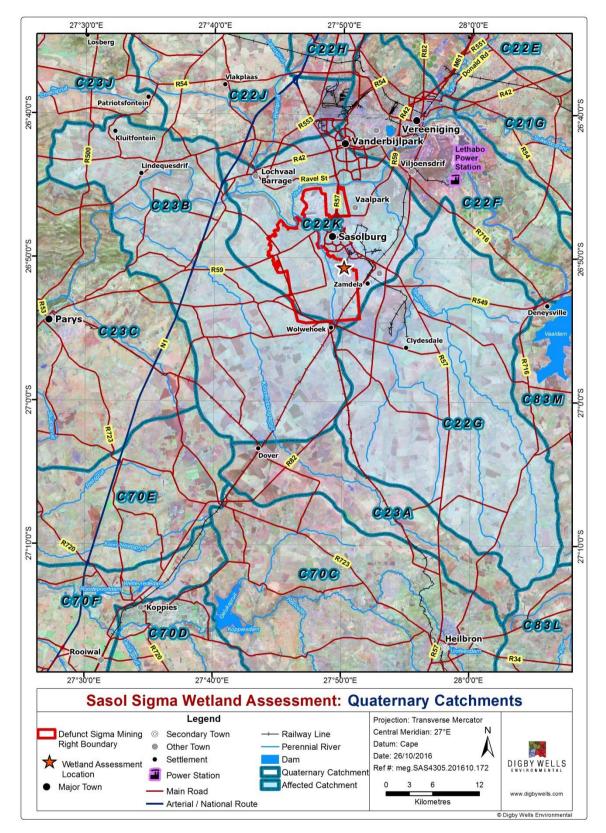

Figure 4-3: Quaternary catchments

5 Methodology

5.1 Wetland Delineation

The wetland delineation was completed for the Draft Ecological Assessment of Wetlands Associated with the Sasol Defunct Sigma Coal Mine: For Mine Closure (Digby Wells, 2016). The DWAF (2005) methodology was applied and the area was identified as a channelled valley bottom wetland.

5.2 Wetland Present Ecological State

The PES methodology prescribed by Duthie (1999) was used to assess the wetland area. This is an intermediate level assessment, using a modified habitat integrity approach developed by Kleynhans (1999). The following aspects of the wetland are considered:

- Surrounding land use;
- Hydrology;
- Water quality;
- Erosion and sedimentation;
- Exotic species (flora and fauna), and;
- An analysis of aerial imagery.

The PES is rated according to the scores and categories represented in Table 5-1.

Table 5-1: Present Ecological State Categories

Description	Combined Impact Score	PES Category
Unmodified, natural.	0-0.9	А
Largely natural with few modifications. A slight change in ecosystem processes is discernible and a small loss of natural habitats and biota has taken place.	1-1.9	В
Moderately modified. A moderate change in ecosystem processes and loss of natural habitats has taken place but the natural habitat remains predominantly intact.	2-3.9	С
Largely modified. A large change in ecosystem processes and loss of natural habitat and biota has occurred.	4-5.9	D
The change in ecosystem processes and loss of natural habitat and biota is great but some remaining natural habitat features are still recognisable.	6-7.9	E
Modifications have reached a critical level and ecosystem processes have been modified completely with an almost complete loss of natural habitat	8-10	F

Description	Combined Impact Score	PES Category
and biota.		

5.3 Wetland Ecological Importance and Sensitivity

The Ecological Importance and Sensitivity (EIS) tool was derived to assess the system's ability to resist disturbance and its capability to recover from disturbance once it has occurred. The purpose of assessing importance and sensitivity of water resources is to be able to identify those systems that provide higher than average ecosystem services, biodiversity support functions or are especially sensitive to impacts. Water resources with higher ecological importance may require managing such water resources in a better condition than the present to ensure the continued provision of ecosystem benefits in the long term. The methodology outlined by DWAF (1999) and updated in Rountree and Kotze, (2012), in Rountree *et al.* (2012) was used for this study.

For this method there are three suites of importance criteria; namely:

- Ecological Importance and Sensitivity: incorporating the traditionally examined criteria used in EIS assessments of other water resources by DWS and thus enabling consistent assessment approaches across water resource types;
- Hydro-functional Importance: which considers water quality, flood attenuation and sediment trapping ecosystem services that the wetland may provide; and
- Importance in terms of Basic Human Benefits: this suite of criteria considers the subsistence uses and cultural benefits of the wetland system.

These determinants are assessed for the wetlands on a scale of 0 to 4, where 0 indicates no importance and 4 indicates very high importance. It is recommended that the highest of these three suites of scores be used to determine the overall Importance and Sensitivity category of the wetland system, as defined in Table 5-2.

Table 5-2: Interpretation of Overall EIS Scores for Biotic and Habitat Determinants (Rountree & Kotze, 2012)

Ecological Importance and Sensitivity Category (EIS)	Range of Scores
Very high	
Wetlands that are considered ecologically important and sensitive on a national or even international level. The biodiversity of these systems is usually very sensitive to flow and habitat modifications. They play a major role in moderating the quantity and quality of water of major rivers.	>3 and <=4
<u>High</u>	
Wetlands that are considered to be ecologically important and sensitive. The biodiversity of these systems may be sensitive to flow and habitat modifications. They play a role in moderating the quantity and quality of water of major rivers.	>2 and <=3
Moderate	
Wetlands that are considered to be ecologically important and sensitive on a provincial or local scale. The biodiversity of these systems is not usually sensitive to flow and habitat modifications. They play a small role in moderating the quantity and quality of water of major rivers.	>1 and <=2
Low/marginal	
Wetlands that are not ecologically important and sensitive at any scale. The biodiversity of these systems is ubiquitous and not sensitive to flow and habitat modifications. They play an insignificant role in moderating the quantity and quality of water of major rivers.	>0 and <=1

5.4 Risk Ratings

Standardised impact assessment methodology was employed for rating the impacts of the bypass extension project on wetlands associated with the proposed activities. To assess each of the factors for each impact, the ranking scales in Table 5-3 were applied.

Table 5-3: Ranking scales for risk assessment

Severity	
Insignificant/non-harmful	1
Small/potentially harmful	2
Significant/slightly harmful	3
Great/harmful	4

Disastrous/extremely harmful and/or wetland(s) involved	5
Spatial Scale	
Area specific (at impact site)	1
Whole site (entire surface right)	2
Regional/neighbouring areas (downstream within quaternary catchment)	3
National (impacting beyond secondary catchment or provinces)	4
Global (impacting beyond SA boundary)	5
Duration	
One day to one month, PES, EIS and/or REC not impacted	1
One month to one year, PES, EIS and/or REC impacted but no change in status	2
One year to 10 years, PES, EIS and/or REC impacted to a lower status but can be improved over this period through mitigation	3
Life of the activity, PES, EIS and/or REC permanently lowered	4
More than life of the organisation/facility, PES and EIS scores, a E or F	5
Frequency of the activity	
Annually or less	1
6 monthly	2
Monthly	3
Weekly	4
Daily	5
Frequency of the incident/ impact	
Almost never/almost impossible/>20%	1

Infrequent/unlikely/seldom/>60% 3 Often/regularly/likely/possible/>80% 4 Daily/highly likely/definitely/>100% 5 Legal Issues 5	3
Daily/highly likely/definitely/>100% 5	
	1
Legal Issues	5
No legislation 1	1
Fully covered by legislation (wetlands are legally governed) 5	5
Detection	
Immediately 1	1
Without much effort 2	2
Need some effort 3	3
Remote and difficult to observe 4	1
Covered 5	5

The maximum value of significance is 300. Environmental risks could therefore be rated as either high (H), moderate (M), or low (L) significance on the following basis:

- More than 170 points indicates high (H) environmental significance.
- Between 56 169 points indicate moderate (M) environmental significance.
- Less than 55 points indicates low (L) environmental significance.

Table 5-4: Rating classes

Rating	Class	Management Description				
1 – 55	(L) Low Risk	Acceptable as is or consider requirement for mitigation. Impact to watercourses and resource quality small and easily mitigated. Wetlands may be excluded.				
56 – 169	M) Moderate Risk	Risk and impact on watercourses are notably and require mitigation measures on a higher level, which costs more and require specialist input. Wetlands are excluded.				
170 – 300	(H) High Risk	Always involves wetlands. Watercourse(s) impacts by the activity are such that they impose a long-term threat on a large scale and lowering of the Reserve.				

The methodology determines the environmental significance using the following equations:

Table 5-5: Calculations

Consequence =	Severity + Spatial Scale + Duration		
Likelihood=	Frequency of Activity + Frequency of Incident +Legal Issues + Detection		
Significance \Risk=	Consequence X Likelihood		

The consequence of an impact can be derived from the following factors:

- Spatial scale;
- Duration of impact; and
- Severity/magnitude.

Significance is obtained by multiplying the consequence of the impact with the probability of occurrence, as follows:

Significance = Consequence x Likelihood

The maximum score that can be obtained is 300 significance points (Table 5-3). Environmental impacts are rated as major, moderate, minor and negligible based on the significance scoring.

6 Description of Wetland Area

The affected wetland area covers approximately 4.1ha and is classified as a channelled valley bottom wetland. The channelled valley bottom extends into the adjacent municipal grounds to the east and terminates just before the fine ash dam to the west.

The wetland has been identified by the National Freshwater Ecosystems Priority Areas (NFEPA) (Nel *et al.* 2011) as a rank 6 valley flat (Appendix A), which indicates that it is not regarded on a national scale as particularly significant for biodiversity.

The wetland area forms part of a watercourse that was previously assigned a PES of 'D' (Digby Wells, 2014), though it is more likely that the stretch of watercourse associated with the impacted wetland for this report held a PES of 'E' due to mining impacts.

The wetland area has been colonised by a single species, namely: *Phragmites australis* (Common Reed), which is a native invader. Due to the excess sedimentation of the system, *P. australis* has become dominant, since this species is tolerant of a range of environmental conditions and is particularly adapted to increased sedimentation. Further to this, *P. australis* is an effective remediator of water quality as it allows for diffuse infiltration of flow and promotes bacterial activity at the root zone. Examples of the assessed wetland area are depicted in Figure 6-1 and the wetland delineation and buffer zone of 100m is shown in Figure 6-2. The wetland has been significantly altered due to excavation, channelisation and deposition of coal material. These are historical activities dating back some decades.

Sasol Mooikraal Conveyor in the Sigma Defunct Coal Mining Right Area Proposed Conveyor Route: Wetland Assessment

SAS4305

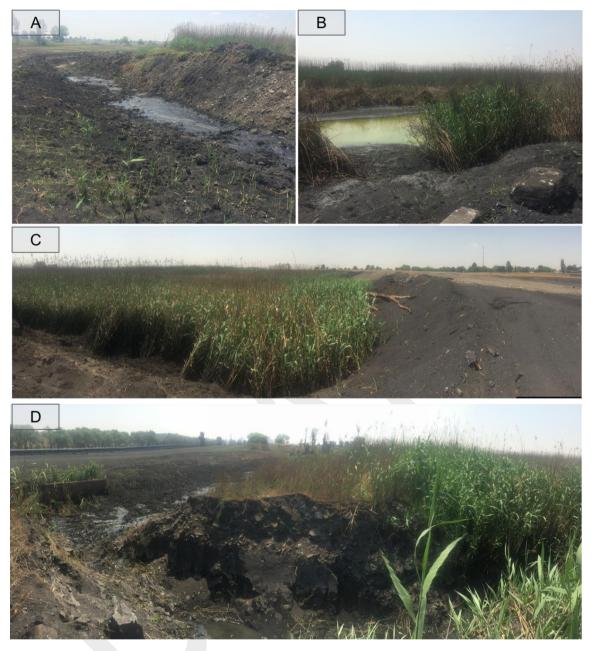

Figure 6-1: Examples of the wetland area and impacts identified on site (A: channelisation along the northern boundary of the wetland; B: excavation gully; C: coal deposition in wetland area and D; gulley erosion adjacent to an access route)

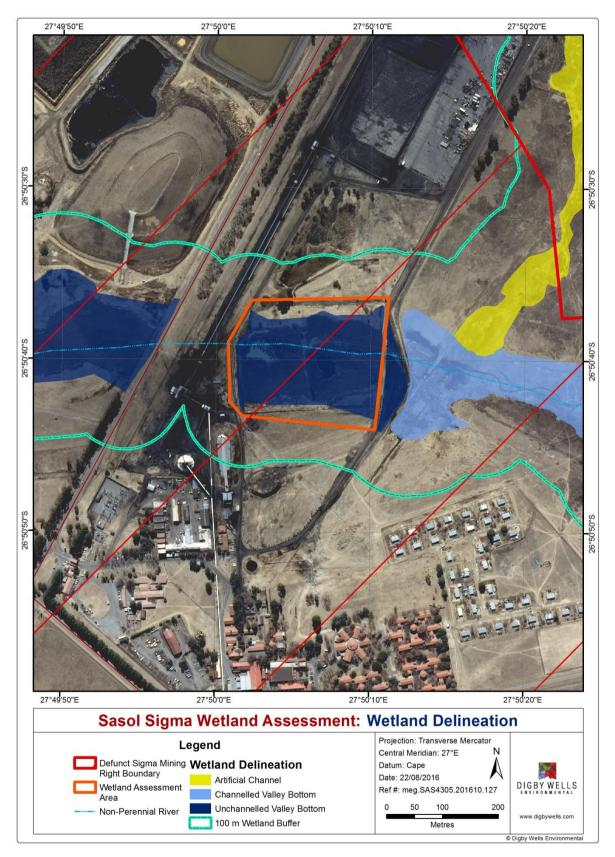

Figure 6-2: Wetland Delineation

6.1 Wetland Integrity and Functionality

The watercourse associated with the wetland was previously assigned a PES of 'E', indicating that it was in a very poor condition and was seriously modified. The wetland area was assessed as a unit for this study and was a reassigned a PES of 'F', indicating that it is critically modified. The EIS of the wetland was rated as 'D', indicating that it has a low ecological importance. Major impacts identified include the following:

- Coal sedimentation and deposition into the wetland;
- Numerous excavations, resulting in exposed surfaces and increased erosion;
- A channel that has been dug out along the length of the wetland;
- Roads traversing the wetland, hindering natural hydrological functioning, and;
- Low plant diversity.

Table 6-1: Wetland integrity and functionality results

۵ ۱	Score	Category	Rating
Н	0 - 1	F	Critically modified
<u>N</u>	Score	Category	Rating
Ē	0	D	Low Importance

7 Rehabilitation Interventions

The overall objective of the wetland rehabilitation strategy is to improve the ecological state of the wetland area. Rehabilitation interventions should be SMART: Simple, Measureable, Achievable, Realistic and Time-bound (Kotze *et al.* 2008). The priority would be to remove the stressors (see descriptions below) that are causing wetland degradation to take place, including removal of all coal from within the affected wetland area and buffer zone and preventing further erosion of exposed surfaces.

The buffer zone of the wetland area in Figure 6-2 should be clearly demarcated with stakes positioned in the ground (preferably painted white) and this area should be regarded as 'no-go' for future development. Table 7-1 shows the Recommended Ecological Class for the wetland area after rehabilitation interventions have been completed. It is expected that the overall wetland PES can be improved by two categories from an 'F' (critical) to an 'E' (impacts are great) or 'D' (largely modified).

Aspect	PES	REC		
Hydrology	F	E		
Water quality	F	D		
Erosion and sedimentation	F	D		
Species diversity	F	С		
Overall PES	F	D		

Table 7-1: Recommended Ecological Class

7.1 Demolition of Existing Infrastructure

A dedicated waste disposal site should be established for the inert demolition waste from the conveyor. Steel and any other material that has salvage value should be sold and removed from the site.

7.2 Removal of Coal

All coal and fine carbonaceous material up to 300mm from the natural ground should be removed from the wetland and stockpiled. Stockpiled waste should be collected with a backactor, parked on a safe place on the edge of the infilled areas. The remaining 300mm of waste material should be loaded manually (using spade) into the skip of the back-actor to limit any impacts on the existing soils.

The subsoil should be levelled according to the landscape represented in Figure 7-1 to promote functional hydrology. Wetland soils that can be preserved from the excavated areas associated with the site should be levelled over the area and gently compacted manually.

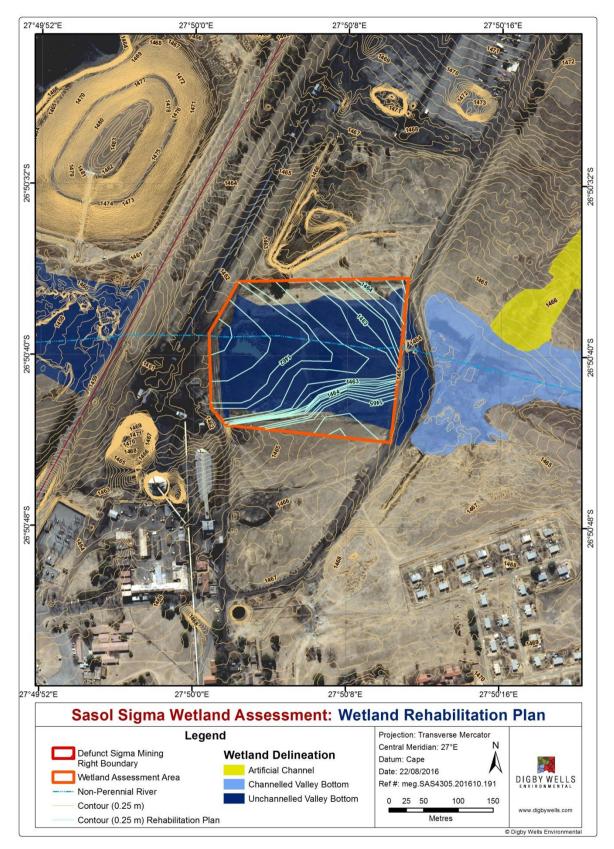

Figure 7-1: Proposed post-rehabilitation topography

7.3 Revegetation

Revegetation should ideally take place in the wet season, as far as possible, to promote successful germination. Table 7-2 lists plant species that would be suitable for revegetation. Many of these species (if not all of them) can be found on site and seed can be harvested manually.

Alternatively, for species that are stoloniferous, individual 'plugs' can be planted in 0.5x0.5m grids; examples include: *Imperata cylindrica* and *Cynodon dactylon*. Sedge species are likely to naturally colonise the area in time as the substrate becomes saturated.

The buffer zone of the wetland should also be revegetated with terrestrial species as listed in the table below. It is important to keep a vegetated buffer strip intact adjacent to the wetland to intercept overland flow and prevent erosion and sedimentation.

Geotextiles (also referred to erosion control blankets/mats) may be placed over exposed substrate for reseeding in steep areas if necessary. This will prevent erosion and act as a temporary means of stabilising the soil.

Plant Species	Common Name	Wetland Zone				
Cynodon dactylon	Couch Grass	Edge of wetland channel and in dry zones				
Digitaria eriantha	Digit Grass	Edge of wetland channel and in dry zones				
Imperata cylindrica	Cottonwool Grass	Channel				
Ischaemum fasciculatum	Hippo Grass	Edge of wetland channel				
Phragmites australis	Common Reed	Channel				
Setaria sphacelata	Golden Bristle Grass	Edge of wetland channel				
Themeda triandra	Red Grass	Dry zones				
Typha capensis	Common Bulrush	Channel				

Table 7-2: Plant species for rehabilitation

8 Risk Rating

Due to excavation within the wetland area, as well as infilling with various material including coal fines, soil and rubble, the wetlands associated with the study area have undergone considerable alteration from their former state. Only the impacts of these recent activities will be rated in this section. The wetland is not regarded as pristine prior to these activities, since the wetland was in a poor state due to various historical mining-related activities.

The risk rating can be reduced from 140 to 98 if mitigation measures prescribed in this report are followed. Further to this, any additional development should be excluded from the wetland area and buffer zones where possible. The risk rating is represented in Table 8-1.

Table 8-1: Risk rating for the excavation and infilling activities

Activity/Impact	Excavation and infilling of a wetland area						
Criteria	Details / Discussion						
Deterioration of wetland integrity and functionality	The excavation and infilling of the wetland has resulted in a deterioration of wetland PES from 'D' (largely modified, to 'F' (critically modified). The EIS remains unchanged and is low due to long-term disturbance. The major impacts include disturbance of wetland soils and habitat, sedimentation, water quality deterioration, erosion and altered natural flow.						
Mitigation required	 The following mitigation measures will be required: The delineated wetlands should be demarcated clearly with pegs in the ground (painted white for easy visibility); All coal fines and foreign material should be removed from the wetland, as outlined in this report; The area should be levelled with topsoil and clay, and; The area should be revegetated with native hydrophilic species. 						
Parameters	Severity	Spatial Scale	Duration	Frequency (activity)	Frequency (impact)	Legal Issues	Detection
Pre-Mitigation	5	1	3	4	5	5	4
Rating Class:	(140) MODERATE RISK						
Post-Mitigation	3	1	2	1	5	5	4
Rating Class	(98) MODERATE RISK						

Sigma Defunct Colliery Proposed Conveyor Route: Wetland Assessment SAS4305

9 Discussion and Conclusions

The affected wetland area falls within the Sigma Defunct Colliery Mining Right area and is situated in the quaternary catchment C22K. The wetland in question has already been altered from its natural state prior to the recent impacts investigated for this report and was assigned a PES of 'D' (largely modified). Any deterioration to water resources should be avoided since wetlands of all ecological classes are protected under the NWA.

Due to the impact of the excavation and infilling activities, the wetland area has deteriorated to a critical state (PES: F), however, the functionality can be considerably restored through appropriate rehabilitation interventions. The following recommendations have been made from this study:

- The DWS and Department of Environmental Affairs (DEA) should be notified about the incident in the wetland area on site as soon as possible. The rehabilitation interventions should be implemented as a priority and the DWS and DEA should be informed of the timing and details of the rehabilitation planning procedure. The area should be monitored monthly by a wetland specialist for six months after construction to ensure that erosion and alien plant invasion does not take place.
- For the proposed new conveyor gantry, the supports should cover as small an area as possible and should be located outside of the wetland area;
- The proposed conveyor gantry should be covered.

Dry season findings:

Abundances:	
-------------	--

- 1 = 1 individual
- A = 2 10 individuals
- B = 11 100 individuals
- C = 101 1000 individuals
- D = >1000 individuals

Reference Frequency:

- 1 = low probability of collection/observation
 - 2 = low-to-moderate probability of collection/observation
- 3 = moderate probability of collection/observation
 - 4 = moderate-to-high probability of collection/observation
 - 5 = high probability of collection/observation
