### BASIC ASSESSMENT REPORT

Submitted in terms of the Environmental Impact Assessment Regulations, 2010 promulgated in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998)

This template may be used for the following applications:

- **Environmental Authorization** subject to basic assessment for an activity that is listed in Listing Notices 1 or 3, 2010 (Government Notices No. R 544 or No. R 546 dated 18 June 2010); or
- Waste Management Licence for an activity that is listed in terms of section 20(b) of the National Environmental Management: Waste Act, 2008 (Act No. 59 of 2008) for which a basic assessment process as stipulated in the EIA Regulations must be conducted as part of the application (refer to the schedule of waste management activities in Category A of Government Notice No. 718 dated 03 July 2009).

### Kindly note that:

- This basic assessment report meets the requirements of the EIA Regulations, 2010 and is meant to streamline applications. This report is the format prescribed by the KZN Department of Agriculture & Environmental Affairs. Please make sure that this is the latest version.
- The report must be typed within the spaces provided in the form. The size of the spaces provided is not indicative of the amount of information to be provided. The report is in the form of a table that can extend itself as each space is filled with text.
- 3. Where required, place a cross in the box you select.
- 4. An incomplete report will be returned to the applicant for revision.
- 5. The use of "not applicable" in the report must be done with circumspection because if it is used in respect of material information that is required by the competent authority for assessing the application, it will result in the rejection of the application as provided for in the regulations.
- 6. No faxed or e-mailed reports will be accepted.
- 7. The report must be compiled by an independent environmental assessment practitioner ("EAP").
- 8. Unless protected by law, all information in the report will become public information on receipt by the competent authority. Any interested and affected party should be provided with the information contained in this report on request, during any stage of the application process.
- 9. The KZN Department of Agriculture & Environmental Affairs may require that for specified types of activities in defined situations only parts of this report need to be completed.
- 10. The EAP must submit this basic assessment report for comment to all relevant State departments that administer a law relating to a matter affecting the environment. This provision is in accordance with Section 24 O (2) of the National Environmental Management Act 1998 (Act 107 of 1998) and such comments must be submitted within 40 days of such a request.

11. Please note that this report must be handed in or posted to the District Office of the KZN Department of Agriculture & Environmental Affairs to which the application has been allocated (please refer to the details provided in the letter of acknowledgement for this application).

### SECTION B: ACTIVITY INFORMATION

### 1. PROJECT TITLE

Describe the project title as provided on the application form for environmental authorization:

Basic Assessment Process for the Proposed Nkandla Bulk Infrastructure Project, KwaZulu-Natal.

### 2. PROJECT DESCRIPTION

Provide a detailed description of the project:

### 1. INTRODUCTION

The Ingonyama Trust Board is proposing to construct new Bulk Infrastructure between Nkandla and Eshowe in the KwaZulu Natal Province. The proposed project is located between the Lindela and Mamba areas under chieftainships of Inkosi Shange and Inkosi Nxamalala. These two areas fall in the Nkandla Local Municipality which is located within the King Cetshwayo District Municipality. The site is approximately 30km south of the town of Nkandla, approximately 30km north-east of the town of Kranskop, 30km west of Eshowe town and approximately 15 km east of the Tugela River (Refer to Figures 1 and 2 below). The installation of bulk infrastructure is intended to eventually support the establishment and access to structured precincts for community services, public facilities including government service Departments, health and safety, education facilities, retail as well as commercial developments. The installation of bulk infrastructure can also serve to stimulate agricultural activities. The bulk infrastructure project will comprises of

- Sower network:
- Sewerage Pump station:
- Construction of various access roads;
- Construction of a stormwater network, including a Stormwater Management Facility

Figure 1: Broader Study Area

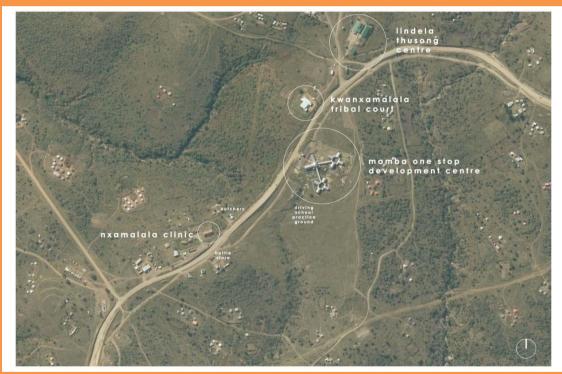

Figure 2: Proposed site in existing state at Umlalazi-Nkandla. (Feasibility Study Report, MRA, 2011).

The Lindela Thusong Centre, the Mamba Centre, Nxamalala Clinic, Traditional Court and Driving School are existing civic facilities clustered along the bend in the main road.

It must be noted, that given the preliminary stage that the project is currently at, this Basic Assessment (BA) applies only for the bulk infrastructure services and hence covers only planning requirements. This BA applies for linear bulk infrastructure to support further development in the area. Therefore, future individual developments within the project area will all be considered in respect of full engineering details at the time of definition of each of those developments. Any environmental triggers that may develop as a result associated with those developments will be subject to the relevant additional legislated processes, environmental applications and so forth which may be applicable.

### 1.1. Technical Description

### 1.1.1. Sewer Network

The sewer network layout is largely dictated by the positions of buildings and roads. Two sewer network possibilities have been investigated for the proposed development. As a result of the prevailing topography, a portion of the outfall system will be fed to a pump station where effluent will be pumped to a point where it can again gravitate to a treatment plant. Effluent shall therefore be treated in a sewerage package plant, which does not form part of this Basic Assessment process. The preferred alternative has been chosen for lowest energy demand to pump sewage by a lower elevation difference and also to avoid impacting on the storm water attenuation pond.

Design criteria for the proposed sewer system have been taken from the Guidelines for Human Settlements Planning and Design, 'Redbook'. The total estimated demand once peak factors have been applied is approximately 54 l/s. Minimum pipe gradients will be 1:80 or 1.25%. It will be attempted to generally keep to maximum gradients of 1:20 or 5%. The minimum pipes sizes for reticulation networks (160 mm), whose capacity is more than the expected flow, have been chosen in line with Red Book recommendations. Refer to Appendix C3 and C4.

The sewer network layout is approximately 3200m of 160 mm diameter uPVC pipe. The construction servitude is estimated at 10m. This translates to a total area of **3.2ha**. The waste water treatment works as indicated above does not form part of this application and is not applied for in this Basic Assessment.

### 1.1.2. Water

An existing local pump station near Mkhalazi will supply water. The estimated average daily demand of water for the proposed development will be 1.6 Mega litres per day (Ml/day) once fully developed.

### 1.1.3. Roads

Access to the proposed development shall be *via* provincial road P15-2. Additional access roads to the site shall be Class 5a access collectors with a 6 m gravel surfaced width, while short access courts and cul-de-sacs shall have a reduced width of 5 m. The road reserve width shall be 26m. Road geometry shall be in accordance with accepted design standards such as the 'Guideline for Human Settlement Planning and Design (Redbook), or similar approved standard (Refer to Appendix C5).

Appropriate surface drainage in the form of open drains feeding into a pipe network shall be applied to intercept surface runoff and discharge this water in a controlled manner so as to reduce erosion. The pavement design for the proposed roads shall be determined from the anticipated fairly low traffic volumes. Generally they will comprise 450 mm layer work, with a 150 mm wearing course of approved gravel. Wherever possible road materials should be of local origin, ideally from the same location. Where the local material is not suitable for the road then imported material should be chosen for its cost and strength. Roads are upgradeable to bituminous surface once vehicle volumes justify. The table below provides a brief summary of the proposed road network, broken down to indicate road widths.

Table 3: Road design dimensions

| ROAD   | RESERVE SIZE (M) | LENGTH (M) | MIDTH (M) | MATERIAL<br>DESCRIPTION |
|--------|------------------|------------|-----------|-------------------------|
| Road 1 | 26.0             | 590.0      | 6.0       | Gravel                  |

| Subtotal: 5.0m wide |                  | 432.0      |           |                         |
| Total: Roads        |                  | 5708.0     |           |                         |

The total area to be transformed by new access road construction is **3.38 ha** as per the above table.

### 1.1.4. Stormwater

Prior to commencement of construction a detailed stormwater management plan shall be undertaken to accurately assess catchments and the associated runoff to confirm sizing of the various elements of the network determined during preliminary stages. Major systems shall be sized to accommodate flows generated by the 1:50 year event while minor systems shall accommodate the 1:10 year event.

The proposed stormwater network identified during the preliminary assessment comprises of a pipe network of approximately 4 400 m in length, with approximate construction servitude of 10m. This translates to a **4.4ha** development footprint. A minimum pipe diameter of 450 mm has been determined. Pipes shall be concrete spigot and socket. All piped systems shall be designed for self-cleaning flow velocities. Storm water runoff shall be intercepted and attenuated where possible. An attenuation pond will allow for controlled release of runoff and further act as a sediment trap. An attenuation pond can further be used for rainwater harvesting, if desired. The proposed Stormwater Management Facility is indicated in the drawing, with a capacity of 9 000 cubic metres, at a maximum estimated footprint of **1.5ha Refer to Appendix C1.** 

### 3. ACTIVITY DESCRIPTION

Describe each listed activity in Listing Notice 1 (GNR 544, 18 June 2010), Listing Notice 3 (GNR 546, 18 June 2010) which is being applied for as per the project description:

### **COMPARISON OF 2010 and 2017 REGULATIONS**

| EIA Regulations, GNR.544 of June 2010, Listing Notice 1 (Activity 9)   | EIA Regulations (as amended in 2017),<br>GNR.327 of April 2017, Listing Notice 1<br>(Activity 9)  | Applicability   |
|--|---|---|
| The construction of facilities or infrastructure exceeding 1000 metres in length for the bulk transportation of water, sewage or storm water –  (i) with an internal diameter of 0,36 metres or more; or  (ii) with a peak throughput of 120 litres per second or more   | The development of infrastructure exceeding 1000 metres in length for the bulk transportation of water or storm water— (i) with an internal diameter of 0,36 metres or more; or (ii) with a peak throughput of 120 litres per second or more; | The proposed stormwater network comprises of a pipe network of approximately 4 400 m. A minimum pipe diameter of 450 mm has been determined.  The estimated average daily demand of bulk water for the proposed development will be 1.6 Ml/day once fully developed. An existing local pump station near Mkhalazi will supply water. Bulk supply shall be provided through a 300 mm diameter uPVC line. Minimum pipe diameters will be 75mm in the reticulation to allow for both domestic use and fire demand. |
| excluding where: a. such facilities or infrastructure are for bulk transportation of water, sewage or storm water or storm water drainage inside a road reserve; or b. where such construction will occur within urban areas but further than 32 metres from a watercourse, measured from the edge of the watercourse. | excluding where—  a) such infrastructure is for bulk transportation of water or storm water or storm water drainage inside a road reserve or railway line reserve; or  b) where such development will occur within an urban area.             | The sewer network layout is approximately 3200m of 160 mm diameter uPVC pipe.   |
| EIA Regulations, GNR.544 of June 2010, Listing Notice 1 (Activity 11)  | EIA Regulations (as amended in 2017),<br>GNR.327 of April 2017, Listing Notice 1<br>(Activity 12)   | Applicability   |

| The construction of (iv) Dams (vi) Bulk storm water outlet structures; (x) Buildings exceeding 50m² in size; (xi) Infrastructure or structures covering 50m² or more where such construction occurs within a water course or within 32 metres of a watercourse, measured from the edge of the watercourse, excluding where such development will occur behind the setback line. | The development of—  i. dams or weirs, where the dam or weir, including infrastructure and water surface area, exceeds 100 square metres; or  ii. infrastructure or structures with a physical footprint of 100 square metres or more;  where such development occurs—  (a) within a watercourse; (b) in front of a development setback; or (c) if no development setback exists, within 32 metres of a watercourse, measured from the edge of a watercourse; | The development will include an attenuation pond/dam and bulk infrastructure within 32 metres from tributaries and the Mbamba River. The development will include stormwater structures along roads and pipelines. The aforementioned will be within 32 m from the river. The expected size of the attenuation pond is expected to not exceed 1.5 hectares.  |
|---|---|--|
| EIA Regulations, GNR.544 of June 2010, Listing Notice 1 (Activity 18)   | EIA Regulations (as amended in 2017),<br>GNR.327 of April 2017, Listing Notice 1<br>(Activity 19)   | Applicability  |
| The infilling or depositing of any material of more than 5m³ into, or the dredging, excavation, removal or moving of soil, sand, shells, shell grit, pebbles or rock or more than 5m³ from:  (i) a watercourse  | The infilling or depositing of any material of more than 10 cubic meters or the dredging, excavation, removal or moving of soil, sand, shells, shell grit, pebbles or rock of more than 10 cubic metres from a watercourse.   | For the construction of the linear infrastructure there will occur infilling or depositing of in-situ material, as well as dredging, excavation or removal of soil.  |
| EIA Regulations, GNR.544 of June 2010, Listing Notice 1 (Activity 22)   | EIA Regulations (as amended in 2017),<br>GNR.327 of April 2017, Listing Notice 1<br>(Activity 24)   | Applicability  |
| The construction of a road outside urban areas  (i) with a reserve wider than 13,5 meters or,  (ii) where no reserve exists where the road is wider than 8 metres,  | The development of a road— (ii) with a reserve wider than 13,5 meters, or where no reserve exists where the road is wider than 8 metres;  | Access to the proposed development shall be <i>via</i> provincial road P15-2. Access roads shall be Class 5a access collectors with 6 m gravel surfaced width, while short access courts and cul-de-sacs shall have a reduced width of 5 m. The road reserve width shall be 26 m. In total 18 access roads will be constructed with a total length of 5276m. |
| EIA Regulations, GNR.546 of June 2010, Listing Notice 3 (Activity 4)  | EIA Regulations (as amended in 2017),<br>GNR.324 of April 2017, Listing Notice 3<br>(Activity 4)  | Applicability  |

19 0000 2017

The construction of a road wider than 4m The development of a road wider than 4 Access to the proposed development shall be via provincial road P15-2. Access metres with a reserve less than 13.5 metres. roads shall be Class 5a access collectors with a 6 m gravel surfaced width, while (d) In KwaZulu-Natal: short access courts and cul-de-sac shall have a reduced width of 5 m. The maximum (i) Outside Urban Areas, in: (viii) Critical biodiversity areas as identified in road reserve width shall be 26 m. The development will occur within the Eastern systematic biodiversity plans adopted by the Valley Bushveld. The development falls within 9km from the protected Nkandla competent authority or in bioregional plans. Forest Reserve. plans adopted by the competent xii. Outside urban areas: (aa) Areas within 10 kilometres from national EIA Regulations (as amended in 2017), 2010 EIA Regulations, GNR.546 of **Applicability** GNR.324 of April 2017, Listing Notice 3 June 2010, Listing Notice 3 (Activity 12) (Activity 12) The clearance of an area of 300 square The clearance of an area of 300 square This is included as transformation of indigenous vegetation, more than 300m2 but less than 20ha will occur for the development. It should also be noted that the meters or more of vegetation where 75% metres or more of indigenous vegetation or more of vegetative cover constitutes except where such clearance of proposed bulk infrastructure development is mostly linear in nature Indigenous vegetation is required for indigenous vegetation. maintenance purposes undertaken in accordance with a maintenance management a) Within any critically endangered or plan, in KZN endangered ecosystem listed in terms the publication of such a list, within an iii. Biodiversity Stewardship Programme area that has been identified as Biodiversity Agreement areas critically endangered in the National iv) A protected area identified in terms of NEMPAA, excluding conservancies v. | The construction of  (iii) buildings with a footprint exceeding  10 square metres in size; or  (v) Infrastructure covering 10 square metres or more  where such construction occurs within a watercourse or within 32 metres of a watercourse, measured from the edge of a watercourse, excluding where such construction will occur behind the development setback line.  (d) In KwaZulu-Natal:  (ii) Outside urban areas, in  (ff) Critical biodiversity areas or ecosystem service areas as identified in systematic biodiversity plans adopted by the competent authority or in bioregional plans;  (hh) Areas within 10 kilometres from national parks or world heritage sites or 5 kilometres from any other protected area identified in terms of NEMPAA or from the core area of a biosphere reserve; | The development of infrastructure or structures with a physical footprint of 10 square metres or more; where such development occurs— (d) In KwaZulu-Natal: (vii) Critical biodiversity areas as identified in systematic biodiversity plans adopted by the competent authority or in bioregional plans. x. Outside urban areas: (aa) Areas within 10 kilometres from national parks. | The development will include an attenuation pond/dam and bulk infrastructure within 32 metres from tributaries and the Mbamba River. The development will include stormwater structures along roads and pipelines. This will be within 32 m from the river. This will occur within the Eastern Valley Bushveld. The development falls within 9km from the protected Nkandla Forest Reserve. |

### 4. FEASIBLE AND REASONABLE ALTERNATIVES

"alternatives", in relation to a proposed activity, means different means of meeting the general purpose and requirements of the activity, which may include alternatives to—

- (a) the property on which or location where it is proposed to undertake the activity;
- (b) the type of activity to be undertaken;
- (c) the design or layout of the activity;
- (d) the technology to be used in the activity;
- (e) the operational aspects of the activity; and
- (f) the option of not implementing the activity.

Describe alternatives that are considered in this report. Alternatives should include a consideration of all possible means by which the purpose and need of the proposed activity could be accomplished in the specific instance taking account of the interest of the applicant in the activity. The no-go alternative must in all cases be included in the assessment phase as the baseline against which the impacts of the other alternatives are assessed. The determination of whether site or activity (including different processes etc.) or both is appropriate needs to be informed by the specific circumstances of the activity and its environment. After receipt of this report the competent authority may also request the applicant to assess additional alternatives that could possibly accomplish the purpose and need of the proposed activity if it is clear that realistic alternatives have not been considered to a reasonable extent.

There are no site alternatives. The planned bulk infrastructure development will spill around the Mamba One Stop Centre. This is an area identified as under-developed with the potential to give opportunities to the previously disadvantaged communities of South Africa, and has no fatal flaws associated with the area.

There have, however, been two design alternatives (stormwater and sewer reticulation designs) assessed as part of this basic assessment process. No alternatives were considered for the road.

Despite the change in scope of the project, the specialist studies undertaken are still relevant as the specialists have assessed the study area in its entirety, given the magnitude of the proposed development.

Sections B 5 – 15 below should be completed for each alternative.

### 5. ACTIVITY POSITION

Indicate the position of the activity using the latitude and longitude of the centre point of the site for each alternative site. The co-ordinates should be in degrees, minutes and seconds. List alternative sites were applicable.

In the case of linear activities:

### STORMWATER MAIN LINE ALTERNATIVES

| Alternative:                            |     | Latitude (S): |        |     | Longitude (E): |        |  |
|---|-----|---------------|--------|-----|----------------|--------|--|
| Alternative S1 (preferred)              |     |               |        |     |                |        |  |
| Starting point of the activity          | 28° | 50'           | 02.12" | 31º | 06'            | 56.76" |  |
| Middle/Additional point of the activity | 28° | 49'           | 51.93" | 31º | 07'            | 11.55" |  |
| End point of the activity               | 28° | 49'           | 41.26" | 31º | 07'            | 22.42" |  |

There are two stormwater design alternatives assessed as part of this project. These alternatives are depicted in Figures 3 and 4 below. Alternatives 1 and 2 for stormwater reticulation are relatively similar. Alternative 1, the layout is determined to best suit the low and high points of the piece of land, with a Stormwater Management Facility at the low point. These alternatives can be differentiated by that Alternative 2 does not include the Stormwater Management Facility.

Figure 3: Stormwater layout Alternative 1 (depicted in blue) (preferred alternative) and associated infrastructure

Figure 4: Stormwater layout Alternative 2 and associated infrastructure (no stormwater attenuation pond)

### **SEWER RETICULATION ALTERNATIVES**

| Alternative:                            |     | Latitude (S): |        |     | Longitude (E): |        |  |
|---|-----|---------------|--------|-----|----------------|--------|--|
| Alternative S1 (preferred)              |     |               |        |     |                |        |  |
| Starting point of the activity          | 28° | 49'           | 46.53" | 31º | 06'            | 46.34" |  |
| Middle/Additional point of the activity | 28° | 49'           | 59.78" | 31º | 07'            | 02.35  |  |
| End point of the activity               | 28° | 49'           | 44.45" | 31º | 07'            | 17.46" |  |

19 0000 2017

Two sewer reticulation alternatives have been identified and assessed. Alternative 1, the preferred alternative (refer to Figure 5 below), the pump station is located at the low point in the southeast point. Alternative 2, the second alternative (Figure 6) has the pump station which is located at the northwest point with a rising main to the pump station. Alternative 1 does not need a rising main.

It must be noted that the waste water treatment works does not form part of this development and is not applied for in this Basic Assessment process.

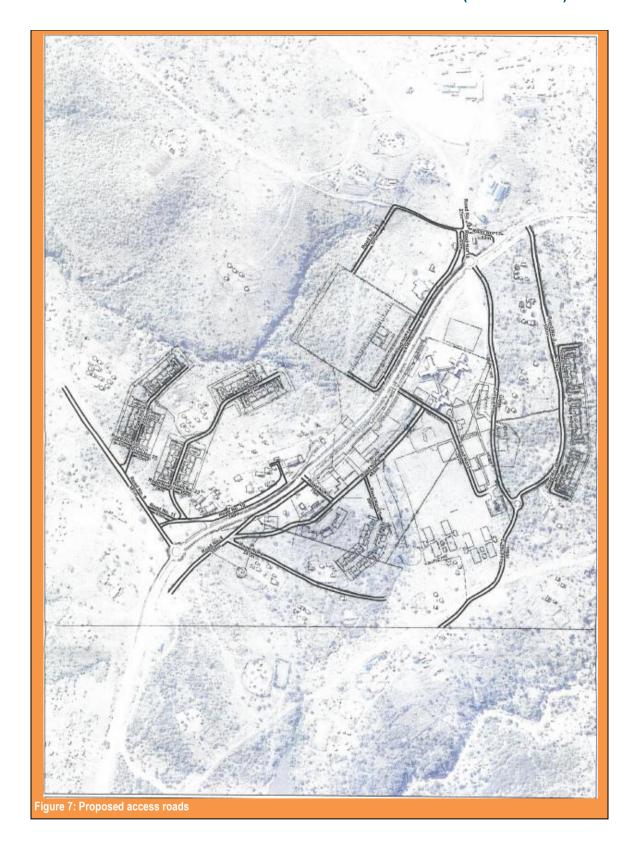

Figure 5: The sewer reticulation preferred Alternative 1

Figure 6: The sewer reticulation Alternative 2

### ROAD INFRASTRUCTURE - MAIN (ONLY ALTERNATIVE)

| Alternative                    | Latitude (S | S)  |        | Longitude (E | Ξ)  |        |
|--------------------------------|-------------|-----|--------|--------------|-----|--------|
| Alternative (S1) preferred     | 28°         | 50' | 22.14" | 31º          | 07' | 00.07" |
| Starting point of the activity | 28°         | 50' | 10.95" | 31º          | 07' | 29.20" |
| Middle point of the activity   | 28°         | 49' | 57.52" | 31º          | 08' | 10.89" |
| End point of the activity      | 28°         | 50' | 22.14" | 31°          | 07' | 00.07" |

For route alternatives that are longer than 500m, please provide an addendum with co-ordinates taken every 500m along the route for each alternative alignment.

### 6. PHYSICAL SIZE OF THE ACTIVITY

These sizes refer to the development at large and are not limited to the linear infrastructure alone.

Indicate the physical size of the preferred activity/technology as well as alternative activities/technologies (footprints):

Alternative: Size of the activity:

Alternative A1<sup>1</sup> (preferred activity alternative)

Alternative A2 (if any)

Alternative A3 (if any)

or, for linear activities:

Alternative:

Alternative 2 (Stormwater)

Alternative 1 (Sewer reticulation preferred)

Alternative 1 (Stormwater preferred)

Alternative 2 (Sewer)

Only Alternative (Roads)

Approximately 12.48 ha

### Length of the activity:

Approx. 4 400 m

Approx. 4 400 m

approx. 5 Zuu III

Approx. 3 200 m

Approx. 5 708 i

Indicate the size of the alternative sites or servitudes (within which the above footprints will occur):

Alternative: Size of the site/servitude:

Alternative S1 (preferred activity alternative)

Approximately 12.48 ha

### 7. SITE ACCESS

Does ready access to the site exist?

If NO, what is the distance over which a new access road will be built Describe the type of access road planned:

Access to the proposed development shall be *via* provincial road P15-2. In areas of the development where access roads are required, these will be Class 5a access collectors with a 6m gravel surfaced width, while short access courts and cul-de-sacs shall have a reduced width of 5m.

Include the position of the access road on the site plan and required map, as well as an indication of the road in relation to the site.

### 8. SITE OR ROUTE PLAN

A detailed site or route plan(s) must be prepared for each alternative site or alternative activity. It must be attached as **Appendix A** to this report.

The site or route plans must indicate the following:

- 8.1. the scale of the plan which must be at least a scale of 1:500;
- 8.2. the property boundaries and numbers/ erf/ farm numbers of all adjoining properties of the site;

**GIBELA UMKHUMBI OLWA NOBUBHA** 

T&PMD1278R001F0.3

<sup>&</sup>lt;sup>1</sup> "Alternative A.." refer to activity, process, technology or other alternatives.

- 8.3. the current land use as well as the land use zoning of each of the properties adjoining the site or sites;
- 8.4. the exact position of each element of the application as well as any other structures on the site;
- 8.5. the position of services, including electricity supply cables (indicate above or underground), water supply pipelines, boreholes, street lights, sewage pipelines, storm water infrastructure and telecommunication infrastructure:
- 8.6. walls and fencing including details of the height and construction material;
- 8.7. servitudes indicating the purpose of the servitude;
- 8.8. sensitive environmental elements within 100 metres of the site or sites including (but not limited thereto):
  - rivers, streams, drainage lines or wetlands;
  - the 1:100 year flood line (where available or where it is required by DWA);
  - ridges:
  - cultural and historical features;
  - areas with indigenous vegetation including protected plant species (even if it is degraded or infested with alien species);
- 8.9. for gentle slopes the 1 metre contour intervals must be indicated on the plan and whenever the slope of the site exceeds 1:10, the 500mm contours must be indicated on the plan; and
- 8.10. the positions from where photographs of the site were taken.

### 9. SITE PHOTOGRAPHS

Colour photographs from the centre of the site must be taken in at least the eight major compass directions with a description of each photograph. Photographs must be attached under <u>Appendix B</u> to this report. It must be supplemented with additional photographs of relevant features on the site, if applicable.

### 10. FACILITY ILLUSTRATION

A detailed illustration of the facility must be provided at a scale of 1:200 and attached to this report as **Appendix C**. The illustrations must be to scale and must represent a realistic image of the planned activity/ies.

### 11. ACTIVITY MOTIVATION

### 11.1. Socio-economic value of the activity

While the socio-economic benefits of this project is difficult to demonstrate and quantify due to the fact this BA process applies for linear infrastructure, the provision of these basic services such as stormwater and sewer reticulation and roads will be laying the foundation for further developments which will lead to the source of income for the impoverished people of Lindela and Nkandla areas.

What is the expected capital value of the activity on completion?

What is the expected yearly income that will be generated by or as a result of the activity?

Will the activity contribute to service infrastructure?

Is the activity a public amenity?

How many new employment opportunities will be created in the development phase of the activity?

What is the expected value of the employment opportunities during the development phase?

What percentage of this will accrue to previously disadvantaged individuals?

How many permanent new employment opportunities will be created during the operational phase of the activity?

What is the expected current value of the employment opportunities during the first 10 years? What percentage of this will accrue to previously disadvantaged individuals?

# R76 827 356.88 R12 600 000.00 YES YES 100 R10 Million 100% 20 R126 000 000.00 N/A

### 11.2. Need and desirability of the activity

Motivate and explain the need and desirability of the activity (including demand for the activity):

Ingonyama Trust Board has identified an opportunity for a Bulk Infrastructure development in the area of Lindela under the chieftainships of Inkosi Shange and Inkosi Nxamalala. The site is identified as indigent and therefore provides the ultimate opportunity for community development.

This development is intended to realise the establishment and access to structured bulk infrastructure facilities. In a previously disadvantaged community and undeveloped area, such development is needed in order to develop the community and provide basic amenities. The development is also flagged as a high priority project for integrated development of the Nkandla–Umlalazi sites. This application specifically is for the basic bulk infrastructure required as a prerequisite to realising the development of further land uses in the area.

Indicate any benefits that the activity will have for society in general:

The development will provide the community with basic amenities and services that are currently unavailable and needed for the development of the community. Such amenities include stormwater management, sewer reticulation and road infrastructure. Indigent areas such as these are in need of infrastructure which will initiate growth and stimulate the economy. In order for the development to occur, basic services and infrastructure are required.

Indicate any benefits that the activity will have for the local communities where the activity will be located:

The locals of the Nkandla and Umlalazi areas will be provided with basic infrastructure such as roads, stormwater and sewer reticulation which will at a later stage lead to the provision of amenities and services that are currently unavailable and needed for the development of the community.

### 12. APPLICABLE LEGISLATION, POLICIES AND/OR GUIDELINES

List all legislation, policies and/or guidelines of any sphere of government that are relevant to the application as contemplated in the EIA regulations, if applicable:

| TITLE OF LEGISLATION, POLICY OR GUIDELINE:  | ADMINISTERING AUTHORITY:         | DATE:         |
|---|----------------------------------|---------------|
| 2010 EIA Regulations under NEMA (and a consideration of subsequent EIA Regulations amendments in 2017). | National & Provincial Government | 2010 and 2017 |
| Constitution of the Republic of South Africa (1996)   | National & Provincial Government | 1996          |
| National Environmental Management Act (No 107 of 1998 (as amended))                                     | National & Provincial Government | 1998          |
| National Water Act (No 36 of 1998)(as amended)  | National & Provincial Government | 1998          |
| Conservation of Agricultural Resources Act (Act No. 43 of 1983).  | National & Provincial Government | 1983          |
| National Environmental Management: Air Quality Act (No 39 of 2004)                                      | National & Provincial Government | 2004          |
| National Environmental Management: Waste Act (No 59 of 2008)(as amended)                                | National & Provincial Government | 2008          |
| The National Heritage Resources Act (Act No. 25 of 1999)  | National & Provincial Government | 1999          |

In addition to the above, a cross comparison exercise with the EIA Regulations (2017) was undertaken

### 13. WASTE, EFFLUENT, EMISSION AND NOISE MANAGEMENT

A waste management license is not being applied for and no Waste Water Treatment works are proposed as part of this Basic Assessment process. A separate environmental authorization & waste license process will be undertaken for the waste water treatment facilities at a later stage with the competent Environmental Authority once relevant design and other information becomes available.

### 13.1. Solid waste management

Will the activity produce solid construction waste during the construction/initiation phase? If yes, what estimated quantity will be produced per month?

How will the construction solid waste be disposed of? (describe)

Waste skips/bins will be provided throughout the construction site with separate skips/bins made available for road construction debris and domestic related solid waste. Solid waste that is unsuitable for re-use by construction will be transported to a registered disposal facility to avoid the pollution of surrounding areas and roads, as well as to minimize nuisance impacts such as dust and odours.

Where will the construction solid waste be disposed of? (provide details of landfill site)

Will the activity produce solid waste during its operational phase? If yes, what estimated quantity will be produced per month? How will the solid waste be disposed of? (provide details of landfill site) Where will the solid waste be disposed if it does not feed into a municipal waste stream (describe)? If the solid waste (construction or operational phases) will not be disposed of in a registered landfill site or be taken up in a municipal waste stream, then the applicant should consult with the competent authority to determine the further requirements of the application. Can any part of the solid waste be classified as hazardous in terms of the relevant legislation? If yes, contact the KZN Department of Agriculture & Environmental Affairs to obtain clarity regarding the process requirements for your application. Is the activity that is being applied for a solid waste handling or treatment facility? If yes, contact the KZN Department of Agriculture & Environmental Affairs to obtain clarity regarding the process requirements for your application. 13.2. Liquid effluent Will the activity produce effluent, other than normal sewage, that will be disposed of in a municipal sewage system? If ves, what estimated quantity will be produced per month? Will the activity produce any effluent that will be treated and/or disposed of on site? If yes, contact the KZN Department of Agriculture & Environmental Affairs to obtain clarity regarding the process requirements for your application. Will the activity produce effluent that will be treated and/or disposed of at another facility? If yes, provide the particulars of the facility: Facility name: Contact person: Postal address: Postal code: Telephone: Cell: E-mail: Fax: Describe the measures that will be taken to ensure the optimal reuse or recycling of waste water, if any: 13.3. Emissions into the atmosphere

Will the activity release emissions into the atmosphere?

If yes, is it controlled by any legislation of any sphere of government?

YES NO

If yes, contact the KZN Department of Agriculture & Environmental Affairs to obtain clarity regarding the process requirements for your application.

If no, describe the emissions in terms of type and concentration:

There will be limited dust emissions during the construction phase due to the off-loading of construction material such as sand and cement as well as the movement of construction vehicles. Should a mobile asphalt plant be required, the necessary registration thereof will be undertaken

### 13.4. Generation of noise

Will the activity generate noise?

If yes, is it controlled by any legislation of any sphere of government?

If yes, the applicant should consult with the competent authority to determine whether it is necessary to change to an application for scoping and EIA.

If no, describe the noise in terms of type and level:

The noise generated on site will be limited to working hours (07h00 to 17h00) and would comprise of excavators and other machinery. Construction noise levels are unlikely to exceed 75 decibels (dB) for extended periods.

### 14. WATER USE

Please indicate the source(s) of water that will be used for the activity by ticking the appropriate box(es):

Note that water from the Mamba River cannot be used for construction purposes unless a water use license in terms of section 21 [a] is applied for and obtained prior to construction. Section 21 (c) and (l) water use authorisations will also be obtained for any impacts on wetlands and watercourses at a later stage. All relevant studies in support of this WULA application will be undertaken in future prior to construction.

Municipal

If water is to be extracted from groundwater, river, stream, dam, lake or any other natural feature, please indicate the volume that will be extracted per month:

Does the activity require a water use permit from the Department of Water and Sanitation?

NO

If YES, please submit the necessary application to the Department of Water and Sanitation and attach proof thereof to this report.

### 15. ENERGY EFFICIENCY

Describe the design measures, if any, that have been taken to ensure that the activity is energy efficient:

There will not be any energy efficient methods or applications used for the proposed project.

Describe how alternative energy sources have been taken into account or been built into the design of the activity, if any:

Not Applicable

### SECTION C: SITE/ AREA/ PROPERTY DESCRIPTION

### Important notes:

For linear activities (pipelines, etc) as well as activities that cover very large sites, it may be necessary to
complete this section for each part of the site that has a significantly different environment. In such cases
please complete copies of Section C and indicate the area, which is covered by each copy No. on the Site
Plan.

Section C Copy No. (e.g. A):

- Subsections 1 6 below must be completed for each alternative.
- 1. GRADIENT OF THE SITE

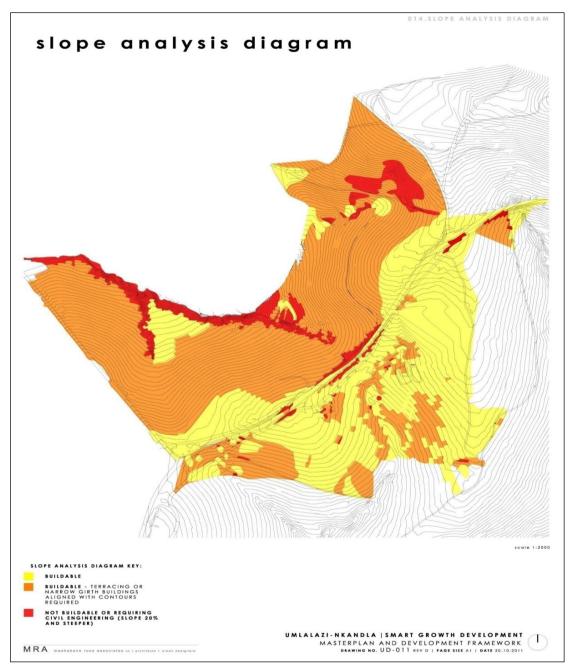

Figure 7: Indicate the general gradient of the site.

The site is undulating with extreme topographical variation between (3 - 25%). The northern non-perennial line is situated adjacent to a rocky slope (>20-25%). The highest point is situated on the north-eastern boundary and the lowest on the southwestern boundary along the lower-lying Mamba River.

### Alternative S1:

Alternative S2 (if any):

Alternative S3 (if any):

### 2. LOCATION IN LANDSCAPE

Indicate the landform(s) that best describes the site (**Please cross the appropriate box**). Alternative S1 (preferred site):

| Ridgeline                | Side slope of hill/mountain | Open<br>valley | Plain | Undulating plain/low hills |  |
|--------------------------|-----------------------------|----------------|-------|----------------------------|--|
| Alternative S2 (if any): |                             |                |       |                            |  |
|                          |                             |                |       |                            |  |

### 3. GROUNDWATER, SOIL AND GEOLOGICAL STABILITY OF THE SITE

The geology of the site is characterized by thin accumulations of colluvial and residual soils which are underlain by completely weathered granite gneiss and to lesser extent *amphibolites* of the Natal Metamorphic Province. Consequently, lab test results indicate that normal construction foundations (strip footing or slab on ground) are suitable as typical conditions prevail. Variations will be assessed on site as encountered. Furthermore good practice principles to ensure that in-situ moisture content of the founding horizons are maintained.

Figure 9: Aquatic resources observed within the proposed project site. Four non-perennial or seasonal drainage lines flow into the perennial Mamba River.

### Has a specialist been consulted for the completion of this section?

Clayton Cook was appointed to conduct a River and Riparian Assessment as well as an Ecological Assessment. The data presented on soil and geological stability is sourced from the feasibility study specialist input and supporting studies.

YES

If YES, please complete the following:

Is the site(s) located on any of the following (cross the appropriate boxes)?

If you are unsure about any of the above or if you are concerned that any of the above aspects may be an issue of concern in the application, an appropriate specialist should be appointed to assist in the completion of this section. (Information in respect of the above will often be available as part of the project information or at the planning sections of local authorities. Where it exists, the 1:50 000 scale Regional Geotechnical Maps prepared by the Council for Geo Science may also be consulted).

### 4. GROUNDCOVER

Has a specialist been consulted for the completion of this section? If YES, please complete the following: Name of the specialist: MSc. Zoology and Pr. Sci. Nat. 400084/08 Qualification(s) of the specialist: Postal address: 226 Girdwood Street, Munster Postal code: Telephone: Cell: E-mail: Fax: giant.bullfrog@gmail.com Are there any rare or endangered flora or fauna species (including red data species) NO present on any of the alternative sites? No red data flora species were observed during the brief field survey although suitable habitat remains within these protected wooded pockets for certain red listed plant species. Two protected tree species were specify and recorded namely several scattered Marula (Sclerocarva birrea subsp. Caffra) and Shepherd's Tree (Boscia explain:

Possible existence of Southern African Python (Python natalensis) which has an SA Red Data and IUCN status of Vulnerable. However, It is unlikely that pythons will retain this threat classification when reassessed using the latest IUCN criteria, since it appears to be relatively common in certain areas and has a widespread distribution (Alexander and Marais; 2007). It is regarded as unlikely that study area comprises a critical habitat for Southern African Pythons, at a global or provincial scale, or that the proposed development of the transformed and degraded hill slopes of the site will have an impact of more than low significance on the conservation status of this species should it indeed occur (Cook, 2012).

Several threatened bird species have been recorded in the grid square within which the study area is situated. No threatened bird species were recorded during the brief survey within the proposed site area due to high levels of habitat transformation and degradation as well as human disturbances. The site may occasionally be utilised for temporary foraging areas for Lanner Falcons as well as Martial Eagles. The woodlands along the Mamba River form marginally suitable foraging habitat for African Crowned Eagles. All raptors that are perceived as a threat to chickens and livestock are killed. If however the unlikely occurrence of any threatened bird species it is highly unlikely that the transformed and heavily degraded areas of the proposed bulk infrastructure project will form critical habitat for any threatened bird species or negatively impact on any threatened bird species. The conservation and adequate rehabilitation of the Mamba River and the non-perennial drainage lines could potentially benefit remaining bird species.

Are there any special or sensitive habitats or other natural features present on any of the alternative sites?

YES

If YES, specify and explain: The majority of riparian trees are indigenous species and must be considered as a sensitive habitat. The perennial Mamba River as well as non-perennial drainage lines and associated riparian vegetation are considered to be of conservation importance for the following reasons: The indigenous riparian vegetation along rivers within Kwazulu-Natal and rivers in general throughout the Savanna Biome, is in danger of being completely replaced by alien invasive species. Any remaining areas of indigenous riparian vegetation within Kwazulu-Natal must therefore be regarded as sensitive and of high conservation importance.

Rivers and drainage lines are longitudinal ecosystems, and their condition at any point is a reflection of not only upstream activities, but also of those within adjacent and upstream parts of the catchment (O'Keefe; 1986). Any impact on the riverine area within the study area is therefore also likely to impact on upstream and downstream areas.

Riparian zones have the capacity to act as biological corridors connecting areas of suitable habitat in birds (Whitaker & Metevecchi, 1997), mammals (Cockle & Richardson; 2003) reptiles and amphibians (Maritz & Alexander; 2007). Riparian zones may act as potential *refugia* for certain fauna and could allow for possible re-colonisation of rehabilitated habitats. The riparian vegetation plays a vital role in the re-colonisation of aquatic macro-invertebrates as well as reptiles and amphibians (Maritz & Alexander; 2007). The riparian vegetation provides vital refuge, foraging and migratory passages for species migrating to and away from the rivers. The riparian zone comprises plant communities contiguous to and affected by surface and subsurface hydrological features of perennial or intermittent water bodies (rivers and streams).

The riparian vegetation is dependant on the river for a number of functions including growth, temperature control, seed dispersal, germination and nutrient enrichment. Riparian vegetation comprises a distinct composition of species, often different from that of the surrounding terrestrial vegetation. Tree species are positioned according to their dependence or affinity for water, with the more mesic species (water-loving) being located closest to the river channel, often with their roots in the water, and the less water-loving terrestrial species further away from the river.

Are any further specialist studies recommended by the specialist?

If YES, specify:

If YES, is such a report(s) attached in Appendix D?

Signature of specialist:

Claylon Com

Date: 30 July 2012.

NOTE: This assessment was revised in July 2015 and submitted with the Amended Final BAR in August 2015. It was confirmed by the specialist that while the study was done in the dry season, the recommendations offered would mitigate for the fact that the study was not done in summer. The specialist defends the seasonality of the assessment with the mitigations provided and confirms that it has been updated.

The location of all identified rare or endangered species or other elements should be accurately indicated on the site plan(s).

If any of the boxes marked with an "E "is ticked, please consult an appropriate specialist to assist in the completion of this section if the environmental assessment practitioner doesn't have the necessary expertise.

### 5. LAND USE CHARACTER OF SURROUNDING AREA

Cross the land uses and/or prominent features that currently occur within a 500m radius of the site and give a description of how this influences the application or may be impacted upon by the application:

| Land use character                       |     |    | Description                    |
|--|-----|----|--------------------------------|
| Natural area                             | YES |    | Some areas remain undeveloped. |
| Low density residential                  | YES |    | Informal homesteads.           |
| Medium density residential               |     | NO |                                |
| High density residential                 |     | NO |                                |
| Informal residential                     | YES |    | Rural Nkandla and uMlalazi.    |
| Retail commercial & warehousing          |     | NO |                                |
| Light industrial                         |     | NO |                                |

### 6. CULTURAL/ HISTORICAL FEATURES

Are there any signs of culturally or historically significant elements, as defined in section 2 of the National Heritage Resources Act, 1999, (Act No. 25 of 1999), including archaeological or palaeontological sites, on or within 20m of the site?

If YES, contact a specialist recommended by AMAFA to conduct a heritage impact assessment. The heritage impact assessment must be attached as an appendix to this report.

Briefly explain the recommendations of the specialist:

the following actions should be taken immediately:

- should cease. This distance should be increased at the discretion of supervisory staff if heavy machinery or explosives could cause must be marked using clearly visible means, such as barrier tape,
- A guard should be appointed to enforce this no-go area if there is

- project, the head of archaeology at Amafa's Pietermaritzburg office should be contacted; telephone 033 3946 543).
- remains are identified. No SAPS official may disturb or exhume
- All parties concerned should respect the potentially sensitive and
- vegetation and/or earth clearance should be subject to prior assessment by a qualified heritage practitioner, taking into account all information gathered during this initial heritage impact

Will any building or structure older than 60 years be affected in any way? Is it necessary to apply for a permit in terms of the National Heritage Resources Act, 1999 (Act 25 of 1999)?

NO

If YES, please submit the necessary application to AMAFA and attach proof thereof to this report.

### SECTION D: PUBLIC PARTICIPATION

### 1. ADVERTISEMENT

The person conducting a public participation process must take into account any guidelines applicable to public participation as contemplated in section 24J of the Act and must give notice to all potential interested and affected parties of the application which is subjected to public participation by—

- fixing a notice board (of a size at least 60cm by 42cm; and must (a) display the required information in lettering and in a format as may be determined by the competent authority) at a place conspicuous to the public at the boundary or on the fence of
  - the site where the activity to which the application relates is or is to be undertaken; and

- (ii) any alternative site mentioned in the application;
- (b) giving written notice to—
  - (i) the owner or person in control of that land if the applicant is not the owner or person in control of the land:
  - (ii) the occupiers of the site where the activity is or is to be undertaken or to any alternative site where the activity is to be undertaken;
  - (iii) owners and occupiers of land adjacent to the site where the activity is or is to be undertaken or to any alternative site where the activity is to be undertaken;
  - (iv) the municipal councillor of the ward in which the site or alternative site is situated and any organisation of ratepayers that represent the community in the area;
  - (v) the local and district municipality which has jurisdiction in the area;
  - (vi) any organ of state having jurisdiction in respect of any aspect of the activity (as identified in the application form for the environmental authorization of this project); and
  - (vii) any other party as required by the competent authority;
- (c) placing an advertisement in—
  - (i) one local newspaper; or
  - (ii) any official *Gazette* that is published specifically for the purpose of providing public notice of applications or other submissions made in terms of these Regulations;
- (d) placing an advertisement in at least one provincial newspaper or national newspaper, if the activity has or may have an impact that extends beyond the boundaries of the metropolitan or district municipality in which it is or will be undertaken: Provided that this paragraph need not be complied with if an advertisement has been placed in an official *Gazette* referred to in subregulation 54(c)(ii); and
- (e) using reasonable alternative methods, as agreed to by the competent authority, in those instances where a person is desiring of but unable to participate in the process due to—
  - (i) illiteracy;
  - (ii) disability; or
  - (iii) any other disadvantage.

### 2. CONTENT OF ADVERTISEMENTS AND NOTICES

A notice board, advertisement or notices must:

- (a) indicate the details of the application which is subjected to public participation; and
- (b) state—
  - (i) that an application for environmental authorization has been submitted to the KZN Department of Agriculture & Environmental Affairs in terms of the EIA Regulations, 2010;(ii)
  - (ii) a brief project description that includes the nature and location of the activity to which the application relates;
  - (iii) where further information on the application can be obtained; and
  - (iv) the manner in which and the person to whom representations in respect of the application may be made.

### 3. PLACEMENT OF ADVERTISEMENTS AND NOTICES

Where the proposed activity may have impacts that extend beyond the municipal area where it is located, a notice must be placed in at least one provincial newspaper or national newspaper, indicating that an application will be submitted to the competent authority in terms of these regulations, the nature and location of the activity, where further information on the proposed activity can be obtained and the manner in which representations in respect of the application can be made, unless a notice has been placed in any *Gazette* that is published specifically for the purpose of providing notice to the public of applications made in terms of the EIA regulations.

Advertisements and notices must make provision for all alternatives.

### 4. DETERMINATION OF APPROPRIATE PROCESS

The EAP must ensure that the public participation process is according to that prescribed in regulation 54 of the EIA Regulations, 2010, but may deviate from the requirements of subregulation 54(2) in the manner agreed by the KZN Department of Agriculture & Environmental Affairs as appropriate for this application. Special attention should be given to the involvement of local community structures such as Ward Committees, ratepayers associations and traditional authorities where appropriate.

<u>Please note</u> that public concerns that emerge at a later stage that should have been addressed may cause the competent authority to withdraw any authorisation it may have issued if it becomes apparent that the public participation process was inadequate.

### 5. COMMENTS AND RESPONSE REPORT

The practitioner must record all comments and respond to each comment of the public before this application is submitted. The comments and responses must be captured in a comments and response report as prescribed in the EIA regulations (regulation 57 in the EIA Regulations, 2010) and be attached as Appendix E to this report.

### 6. PARTICIPATION BY DISTRICT, LOCAL AND TRADITIONAL AUTHORITIES

District, local and traditional authorities (where applicable) are all key interested and affected parties in each application and no decision on any application will be made before the relevant local authority is provided with the opportunity to give input. The planning and the environmental sections of the local authority must be informed of this application and provided with an opportunity to comment.

Has any comment been received from the district municipality?

NO

If "YES", briefly describe the feedback below (also attach any correspondence to and from this authority with regard to this application):

Has any comment been received from the local municipality?

If "YES", briefly describe the feedback below (also attach any correspondence to and from this authority with regard to this application):

Has any comment been received from a traditional authority?

If "YES", briefly describe the feedback below (also attach any correspondence to and from this authority with regard to this application):

### 7. CONSULTATION WITH OTHER STAKEHOLDERS

Any stakeholder that has a direct interest in the site or property, such as servitude holders and service providers, should be informed of the application and be provided with the opportunity to comment.

Has any comment been received from stakeholders?

NO

If "YES", briefly describe the feedback below (also attach copies of any correspondence to and from the stakeholders to this application):

### SECTION E: IMPACT ASSESSMENT

The assessment of impacts must adhere to the requirements in the EIA Regulations, 2010, and should take applicable official guidelines into account. The issues raised by interested and affected parties should also be addressed in the assessment of impacts.

### 1. ISSUES RAISED BY INTERESTED AND AFFECTED PARTIES

List the main issues raised by interested and affected parties.

Response from the practitioner to the issues raised by the interested and affected parties (A full response must be given in the Comments and Response Report that must be attached as Appendix E to this report):

### IMPACTS THAT MAY RESULT FROM THE PLANNING AND DESIGN, CONSTRUCTION, OPERATIONAL, DECOMMISSIONING AND CLOSURE PHASES AS WELL AS PROPOSED MANAGEMENT OF IDENTIFIED IMPACTS AND PROPOSED MITIGATION MEASURES

The impacts assessed are those impacts which could potentially arise from the impacts of linear infrastructure and the construction thereof. In order to allow for an objective assessment of the impacts directly associated with what is applied for as part of this development (i.e. bulk service infrastructure and transformation of land for development); the impacts pertinent only to this are assessed in this BAR.

The following methodology is used to assess the impacts

The following parameters are used to describe the impact/issues in this assessment:

### 1. Nature

This is a brief written statement of the environmental aspect being impacted upon by a particular action or activity.

### 2. Extent (E)

Extent refers to the area over which the impact will be expressed. Typically, the severity and significance of an impact have different scales and as such bracketing ranges are often required. This is often useful during the detailed assessment phase of a project in terms of further defining the determined significance or intensity of an impact.

- Site (1) Within the construction site.
- Local (2) Within a radius of 2 km of the construction site.
- Regional (3) the scale applies to impacts on a provincial level and parts of neighbouring provinces.
- National (4) the scale applies to impacts that will affect the whole South Africa.

### 3. Duration (D)

Duration indicates what the lifetime of the impact will be.

- Short-term (1) less than 5 years
- Medium-term (2) between 5 and 15 years
- Long-term (3) between 15 and 30 years
- Permanent (4) over 30 years and resulting in a permanent and lasting change that will always be there

### 4. Intensity (I)

Intensity describes whether an impact is destructive or benign.

- · Very High (4) Natural, cultural and social functions and processes are altered to extent that they permanently cease.
- High (3) Natural, cultural and social functions and processes are altered to extent that they temporarily cease.
- Moderate (2) Affected environment is altered, but natural, cultural and social functions and processes continue albeit in a modified way.
- Low (1) Impact affects the environment in such a way that natural, cultural and social functions and processes are not affected.

### 5. Probability (P)

19 0000 2017

Probability describes the likelihood of an impact actually occurring

Improbable (1) - Likelihood of the impact materialising is very low

- Possible (2) The impact may occur.
- Highly Probable (3) Most likely that the impact will occur.
- Definite (4) Impact will certainly occur.

### 6. Cumulative (C

In relation to an activity, means the impact of an activity that in itself may not be significant but may become significant when added to the existing and potential impacts eventuating from similar or diverse activities or undertakings in the area.

### 7. Significance (S)

Significance is determined through a synthesis of impact characteristics. Significance is an indication of the importance of the impact in terms of both physical extent and time scale, and therefore indicates the level of mitigation required. The total number of points scored for each impact indicates the level of significance of the impact. The above scores are added to provide an overall significance score which has the following explanation assigned to the scores:

| Score              |                       | Elaboration  |
|--------------------|-----------------------|--|
| - (13 - 16 points) | NEGATIVE<br>VERY HIGH | Permanent and important impacts. The design of the site may be affected. Intensive remediation is needed during construction and/or operational phases. Any activity which results in a "very high impact" is likely to be a fatal flaw.   |
| - (10 - 12 points) | NEGATIVE<br>HIGH      | These are impacts which individually or combined pose a significantly high negative risk to the environment. These impacts pose a high risk to the quality of the receiving environment. The design of the site may be affected. Mitigation and possible remediation are needed during the construction and/or operational phases. The effects of the impact may affect the broader environment.   |
| - (7 - 9 points)   | NEGATIVE<br>MODERATE  | These are impacts which individually or combined pose a moderate negative risk to the quality of health of the receiving environment. These systems would not generally require immediate action but the deficiencies should be rectified to avoid future problems and associated cost to rectify once in HIGH risk. Aesthetically and/or physically non-compliance can be expected over a medium term. In this case the impact is medium term, moderate in extent, mildly intense in its effect and probable. Mitigation is possible with additional design and construction inputs.                                |
| - (4 - 6 points)   | NEGATIVE<br>LOW       | These are impacts which individually or combined pose a deleterious or adverse impact and low negative risk to the quality of the receiving environment, and may lead to potential health, safety and environmental concerns. Aesthetically and/or physical non-compliance can be expected for short periods. In this case the impact is short term, local in extent, not intense in its effect and may not be likely to occur. A low impact has no permanent impact of significance. Mitigation measures are feasible and are readily instituted as part of a standing design, construction or operating procedure. |
| 0                  | NEUTRAL               | Impact is neither beneficial nor adverse. These are impacts which cannot be classified as either positive or negative or classified and null and void in the case of a negative impact being adequately mitigated to a state where it no longer renders a risk.  |
| +(4 - 6 points)    | POSITIVE<br>LOW       | These are impacts which individually or combined pose a low positive impact to the quality of the receiving environment and health, and may lead to potential health, safety and environmental benefits. In this case the impact is short term, local in extent, not intense in its effect and may not be likely to occur. A low impact has no permanent impact of significance.   |
| +(7 - 9 points)    | POSITIVE<br>MODERATE  | These are impacts which individually or combined pose a moderate positive effect to the quality of health of the receiving environment. In this case the impact is medium term, moderate in extent, mildly intense in its effect and probable.   |
| +(10 - 12 points)  | POSITIVE<br>HIGH      | These are impacts which individually or combined pose a significantly high positive impact on the environment. These impacts pose a high benefit to the quality of the receiving environment and health, and may lead to potential health, safety and environmental benefits. In this case the impact is longer term, greater in extent, intense in its effect and highly likely to occur. The effects of the impact may affect the broader environment.   |

+ (13 - 16 points)

POSITIVE VFRY HIGH

These are permanent and important beneficial impacts which may arise. Individually or combined, these pose a significantly high positive impact on the environment. These impacts pose a very high benefit to the quality of the receiving environment and health, and may lead to potential health, safety and environmental benefits. In this case the impact is long term, greater in extent, intense in its effect and highly likely or definite to occur. The effects of the impact may affect the broader environment.

#### A. IMPACTS THAT MAY RESULT FROM THE PLANNING AND DESIGN PHASE

#### a. Site alternatives

N.B. There are no site alternatives as the development is proposed for the Nkandla-Umlalazi Bulk Infrastructure project and will spill around the Mamba One Stop Centre. This is an indigent area with the proposed development having the potential to present opportunities to the previously disadvantaged community/ies within the area. There are also no fatal flaws associated with the proposed project.

List the potential impacts associated with site alternatives that are likely to occur during the planning and design phase:

#### **Alternative S1 (Only Site)**

| No. | Impact  | Alternative     | Mitigation            | Extent        | Duration        | Intensity | Probability | Significance =<br>E+D+I+P | Interpretation                          |  |  |

#### B. IMPACTS THAT MAY RESULT FROM THE CONSTRUCTION PHASE

#### a. Site alternatives

N.B. There are no site alternatives as the development is proposed for the Nkandla-Umlalazi Node and will spill around the Mamba One Stop Centre. This is an indigent area with the proposed development having

List the potential impacts associated with site alternatives that are likely to occur during the Construction phase:

| 1101 | Mitigation: Ideally, a minimum distance of 10   |                  |                       |                 |                 | •               |                 |                           | •                                   |  |  |  |
|      | area is 10-15 metres, the grave requires clear  |                  |                       |                 |                 |                 |                 |                           |                                     |  |  |  |
|      | 10 metres, the grave requires permanent fer   | cing as describe | ed below, at the      | cost of the de  | eveloper, prior | to the start of | any constructio | n activities. If a        | grave is located within 5 metres of |  |  |  |
|      | construction activities consideration should fin  |                  |                       |                 |                 |                 |                 |                           |                                     |  |  |  |
|      | and fenced as described above. A heritage practitioner should consult with the project manager and engineers in this regard. If the site layout plan cannot be amended and physical impact on a grave is unavoidable, it should be exhumed and reinterred, with permission from the next-of-kin and a permit from Amafa. Preferred fencing materials are metal corner and straining posts and fencing wire, to a minimum height of 1.2 metres. The fence must be located at a minimum distance of 2 metres from the nearest grave and have an access gate. No construction may occur within a minimum distance of 3 metres from the edge of the fence. If graves are located close to one another, they should be fenced as a group rather than individually. |                  |                       |                 |                 |                 |                 |                           |                                     |  |  |  |

|      | Mitigation: In order to minimise artificially generated surface stormwater runoff, total sealing of paved areas such as the photovoltaic modules, parking lots, driveways, pavements an walkways should not be permitted. Permeable material should rather be utilized for these purposes. In addition, runoff rain water from all roofs should be collected in water tanks. Special  |                  |                       |                 |                 |                 |                 |                           |                                     |  |  |  |

#### C. IMPACTS THAT MAY RESULT FROM THE OPERATIONAL PHASE

#### a. Site alternatives

N.B. There are no site alternatives as the development is proposed for the Nkandla-Umlalazi <u>Project</u> and will spill around the Mamba One Stop Centre. This is an indigent area with the proposed development having the potential to give opportunities to the previously disadvantaged communities of South Africa, and the area has no fatal flaws associated with it.

List the potential impacts associated with site alternatives that are likely to occur during the Operational phase:

### **Alternative S1 (Only Site)**

| No. | Impact   | Alternative                            | Mitigation                       | Extent                        | Duration                       | Intensity                     | Probability                   | Significance<br>= E+D+I+P           | Interpretation  |  |  |
|-----|--|--|----------------------------------|-------------------------------|--------------------------------|-------------------------------|-------------------------------|-------------------------------------|---|--|--|
|     | Phase: Operational Site Impacts  |  |                                  |                               |                                |                               |                               |                                     |   |  |  |
|     | Sub-phase: Direct Impacts  |  |                                  |                               |                                |                               |                               |                                     |   |  |  |
|     | Erosion from poor storm water management and inadequate vegetation cover.  Mitigation: Adequate storm water managem sedimentation of the Mamba River. Sheet replacement of berms. Mitigation: It is important that the proposed activities within the Mamba River and non-perennial drainage lines are strictly managed. Low disturbance activities such as hiking, bird watching and hiking are recommended for these sensitive areas. No quad-bikes, motorcycles or off-road vehicles should be permitted within the riparian zone adjacent to the Mamba River and non-perennial drainage lines. No animals are to be intentionally killed or destroyed and poaching and hunting should not be permitted on the site. No air rifles or pellet guns should be permitted. The baiting of selected predators (caracal and black-backed jackal) and subsequent capturing and possible destroying of caught animals should not be allowed. Ideally no fences should occur along the Mamba River and non-perennial drainage lines or alternatively an outer barbed wire fence should be erected preventing livestock (especially goats). Fences should not restrict the natural migratory movements of certain animals and must be restricted to the immediate area of the proposed development.

#### D. IMPACTS THAT MAY RESULT FROM THE DECOMISSIONING OR CLOSURE PHASE

The closure and decommissioning time for the project is unknown at this stage and is likely to extend well into the future. However, when closure and decommissioning does take place for the Bulk Infrastructure, i will be cross verified against the applicable EIA Regulations in force at the time, and if required, a separate EIA process will be initiated for decommissioning and/or closure.

#### a. Site alternatives

List the potential impacts associated with site alternatives that are likely to occur during the decommissioning or closure phase:

### Alternative S1 (preferred alternative)

| Alternative S2            |       |  |  |
|---------------------------|-------|--|--|
|                           |       |  |  |
|                           |       |  |  |
| No-go alternative (compul | sory) |  |  |
|                           |       |  |  |

Indicate mitigation measures to manage the potential impacts listed above:

| Alternative S1                                      | Alternative S2                                 |  |
|---|--|--|
|   |  |  |
| b. Process, technolog                               | y, layout or other alternatives                |  |
| List the impacts associate alternative separately): | d with process, technology, layout or other a  | Iternatives that are likely to occur during the decommissioning or closure phase (please list impacts associated with each |

| Alternative   |  |  |
| No-go alternative (comp                             | ulsory)  |  |
| Indicate mitigation measur                          | res to manage the potential impacts listed abo | ove:   |
| Alternative A1                                      | Alternative A                                  | A2   |

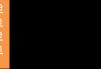

#### E. PROPOSED MONITORING AND AUDITING

For each phase of the project and for each alternative, please indicate how identified impacts and mitigation will be monitored and/or audited.

#### Alternative S1 (only site)

**Alternative S2** 

An Environmental Control Officer (ECO) will be appointed by the project Applicant to monitor the construction activities and the implementation of the EMPr conditions on the monthly basis. The appointed Contractor is required to employ the Environmental Site Officer (ESO) who will assist in the implementation of the EMPr conditions on a daily basis. The ESO will also advise the Contractor on environmental matters.

#### Stormwater and Sewer Reticulation Alternatives 1 and 2

An Environmental Control Officer (ECO) will be appointed by the project Applicant to monitor the construction activities and the implementation of the EMPr conditions on the monthly basis. The appointed Contractor is required to employ the Environmental Site Officer (ESO) who will assist in the implementation of the EMPr conditions on a daily basis. The ESO will also advise the Contractor on environmental matters.

19 0000 2017

#### 2. ENVIRONMENTAL IMPACT STATEMENT

Taking the assessment of potential impacts into account, please provide an environmental impact statement that summarises the impact that the proposed activity and its alternatives may have on the environment after the management and mitigation of impacts have been taken into account, with specific reference to types of impact. duration of impacts, likelihood of potential impacts actually occurring and the significance of impacts.

#### SITE ALTERNATIVES: Alternative S1 (preferred site)

There are no site alternatives as the development will take place on the land which has been identified for this

and will therefore be for a limited period and can be adequately mitigated to have a low or insignificant impact. No fatal flaws were identified during the Basic Assessment process, which included a comprehensive Public Participation Process with a public meeting and stakeholder consultation.

#### **Ecology Assessment Findings:**

as well as extensive overgrazing by livestock (especially goats). Existing impacts occurring within the Nkandla-Umlalazi site

- Extensive vegetation degradation due to overgrazing 5) cannot are supported by the soil erosion (surface, rill and gully) especially along the non-perennial drainage lines as well as macro-channel banks of the Mamba River. This is due to poor storm water management as well as uncontrolled livestock drinking activities along the river as well as removal of the riparian vegetation during wood harvesting activities.
- Wood harvesting and tree clear-felling.

- Riparian zone degradation due to removal of majority of tree species for wood harvesting.

  Reed invasion in certain sections of the Mamba River due to increased phosphates levels due to washing activities as well as siltation and sedimentation due to poor vegetation and soil conservation around the site.

- Extensive dumping and littering especially adjacent to homesteads.
- Deterioration in water quality due to presence of pit-latrines as well as washing and bathing activities within the Mamba

with limited faunal diversity due to habitat destruction and habitat fragmentation.

#### **Heritage Assessment Findings:**

19 0000 2017

There were no heritage artefacts and objects identified in the proximity of the proposed development. However, it must be noted that should these be identified a heritage specialist must be consulted to conduct an investigation.

Based on the findings above, the proposed development will in fact prove highly beneficial to the surrounding communities of the Umlalazi - Nkandla site

#### **DESIGN ALTERNATIVES: Stormwater and Sewer Reticulation Alternatives 1 (preferred)**

ensure the best engineering design. They also represent the most cost effective options. The most suitable layouts were provided as they encourage positive socio-economic impacts while being environmentally sustainable and will have less of an

#### **DESIGN ALTERNATIVES: Stormwater and Sewer Reticulation Alternatives 2**

result in more environmental related impacts

#### **SUMMARY OF DESIGN ALTERNATIVES QUANTIFIABLE ASSESSMENT:**

| Planning and Design Phase  |          |                    |
|--|----------|--------------------|
| Average for Stormwater Alternative 1 without mitigation                                    | 0.67     | Positive low       |
| Average for Stormwater Alternative 1 with mitigation                                       | 4.78     | Positive low       |
| Average for Stormwater Alternative 2 without mitigation                                    | -0.11    | Negative low       |

### **SUMMARY IMPACT TABLE FOR ALL THREE PHASES**

| ALTERNATIVES  | PLANNING | CONSTRUCTION | OPERATION | TOTAL |
|---|----------|--------------|-----------|-------|
| Stormwater Alternative 1 (with mitigation measures) | 4.78     | -5.44        | 5.58      | 4.92  |
| Stormwater Alternative 2 (with mitigation measures  | 3.11     | -6.89        | 5.89      | 2.11  |
| Sewer Reticulation Alternative 1 (with mitigation)  | 4.78     | -5.44        | 4.42      | 3.76  |

Sewer Reticulation Alternative 2 (with mitigation) 1.14 -6.89 2.75

From the above summary impact table, it can be seen that alternatives 1 with a total scoring points of 4.92 and 3.76 for both stormwater and sewer reticulation respectively will result in less environmental impacts. Therefore these alternatives are preferred from the environmental perspective.

#### No-go alternative (compulsory)

ailure to promote development in the area will prevent all the positive impacts (e.g. employment opportunities and provision of basic services) that can be associated with a well planned development such as this in the region. Therefore the no go

### SECTION FRECOMMENDATION OF FAP

Is the information contained in this report and the documentation attached hereto in the view of the EAP sufficient to make a decision in respect of this report?

If "NO", please contact the KZN EDTEA regarding the further requirements for your report.

If "YES", please attach the draft EMPr as Appendix F to this report and list any recommended conditions, including mitigation measures that should be considered for inclusion in any authorisation that may be granted by the competent authority in respect of the application:

assessment process. It must be noted though, that alternatives 1 for both stormwater and sewer reticulation emerged as the preferred alternatives. The development is designed at the planning stage to be environmentally cognisant and to utilise natura

This BAR lays the foundation for any further development to be supported by adequate bulk infrastructure, and in the EAPs opinior should be favourably considered. The total footprint and area to be transformed for the bulk infrastructure project is also considered not to be significant, measured against the positive impacts which the development will bring.

application is only for the linear bulk infrastructure and for the transformation of land where the latter refers to the attenuation pond.

Bushveld dominated by anthropogenic grasses and pioneer weedy plant species and invaded by alien invasive plant species. The remnant patches of bushveld occur adjacent to the non-perennial drainage lines as well as riparian zone of the Mamba River Therefore the development of the site for the upliftment and support of indigent communities is supported.

of the community. It is however emphasised that there must be integration between government Departments and Local Authorities

The following may be considered for inclusion in the environmental authorisation:

- The EMPr and conditions thereto should be adhered to.
- An ECO must be appointed and all contractor staff to be trained on the EMPr and Environmental Authorisation requirements prior to commencement of activities.
- Alien weeds and invader species within vicinity of construction to be removed and indigenous vegetation, where appropriate to be introduced and managed in accordance with the recommendation outlined in the preliminary ecological report.
- Should it be deemed required, the ecological and biodiversity specialist should re-assess the site and the EMPr should be
- Environmental monitoring to be conducted during construction and incidents recorded and addressed accordingly.
- The indigenous species identified as per the Ecological Specialist Report must be demarcated and protected during construction and not removed for the purposes of development or any other purpose.

- This application is focused on the overall planning activities required for the **Bulk Infrastructure Project**.
- All recommendations in the EMPr must be updated and submitted for approval to the Competent Authority and all specifications therein must be adhered to at all times.

  Additional items from Section E (1) of this BAR may be considered for inclusion.

  All road fill material must be sourced from a registered borrow pit with or a mining permit need to be obtained prior to construction activities.

# RESPONSE REQUIRED IN TERMS OF SECTION G: AMAFA APPLICATION FORM

### **DEVELOPMENT PERMIT FORM NID**

(Needs and desirability)

• In terms of the KwaZulu Natal Heritage Act No. 4 of 2008 and the National Heritage Resources Act No.25 of 1999 (Section 38 (1)), a permit is required to carry out certain listed activities.

It is an offence in terms of section 34 of the KwaZulu Natal Heritage Act, to make false statement or fail to provide required information in this application.

ALL APPLICATION FORMS AND PROOF OF PAYMENT ARE TO BE FORWARDED TO: AMAFA KWAZULU NATAL, ARCHAEOLOGY DEPARTMENT, 195 LANGALIBALELE STREET, PIETERMARITZBURG, 3201/BOX 2685 PIETERMARITZBURG 3200.

#### Kindly note that:

- 1. The Audit process requires that hard copies of this and all subsequent documentation be submitted
- 2. Kindly note that with effect from 1<sup>st</sup> of April 2010 an application fee will be charged for Needs & Desirability applications and Permit applications. This fee may be reviewed annually.
- 3. Incomplete applications will not be processed.
- 4. All information filled in on this form will become public information on receipt by this department. Any interested and affected party can be provided with information contained in this application on request, during any stage of the application process.
- 5. One Printed Copy (not faxed) and one electronic copy is required to be submitted
- SUBMISSION FEES

• SUDIVIIOSION I EL

Regulations make provision for the agency to charge a submission fee. A administration fee of **R600.00** is payable to **Amafa aKwaZulu Natali** by postal order or bank deposit / EFT prior to the processing of this application. Banking Details in case of direct deposits:
