Letter

In terms of Section 35(4) of the National Heritage Resources Act (Act 25 of 1999)

Attention: Prof. Jennifer Botha

University of the Witwatersrand - Evolutionary Studies Institute

Evolutionary Studies Institute,

University of the Witwatersrand,

Johannesburg, 2050

No study has investigated the bone microanatomy pattern of a large sample of Anomodontia. The present study seeks to elucidate the different bone microanatomies of various anomodont taxa spanning the entire clade. The aim of the study is to assess the lifestyle, phylogeny, and biomechanics of anomodont therapsids using bone microanatomy. The objectives of the study are to (1) quantitatively describe the patterns in the bone microanatomy of South African anomodonts and (2) investigate possible reasons for the differences and/or similarities in the microanatomy. This is an important study as recent research has suggested that the infilling of medullary cavities indicates an aquatic lifestyle and as most anomodonts have infilled medullary cavities, this would suggest that the anomodont clade was aquatic. As the historical literature indicates that anomodonts were terrestrial, it is important that we resolve this issue regarding anomodont palaeobiology.

Dear Prof J Botha,

Thank you for submitting a permit report for 16300 and 16492. Kindly provide us with photos of the specimens after the sampling was completed.

We are aware of your email stating that the specimens are in the National Museum Bloemfontein while you are now in your new position at Wits and that it may take a while to take the photos. We are simply responding to each email and permit in order to keep track of the report submission/reviewing process.

Should you have any further queries, please contact the designated official using the case number quoted above in the case header.

Yours faithfully
