**Prepared by:**

J A van Schalkwyk (D Litt et Phil),

- Heritage Consultant: ASAPA Registration No.: 164 - Principal Investigator: Iron Age, Colonial Period, Industrial Heritage.
- Postal Address: 62 Coetzer Avenue, Monument Park, 0181; Tel: 076 790 6777; E-mail: jvschalkwyk@mweb.co.za

**Report No:** 2022/JvS/008

- Status: Final
- Date: March 2022
- Revision No: 1
- Date: August 2022

**Submission of the report:**

It remains the responsibility of the client to submit the report to the South African Heritage Resources Agency (SAHRA) or relevant Provincial Heritage Resources Agency (PHRA) by means of the online SAHRIS System.

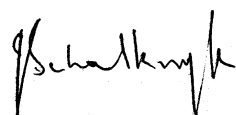

**Copyright:**

This report is intended solely for the use of the individual or entity to whom it is addressed or to whom it was meant to be addressed. It is provided solely for the purposes set out in it and may not, in whole or in part, be used for any other purpose or by a third party, without the author's prior written consent.

The copyright of all photographs used for background illustration purposes, unless otherwise indicated, is retained by the author of this report. This does not include photographs that resulted as a direct consequence of the project, which is available for use by the client, but only in relation to the current project.

**Specialist competency:**

Johan A van Schalkwyk, D Litt et Phil, heritage consultant, has been working in the field of heritage management for more than 40 years. Originally based at the National Museum of Cultural History, Pretoria, he has actively done research in the fields of anthropology, archaeology, museology, tourism and impact assessment. This work was done in Limpopo Province, Gauteng, Mpumalanga, North West Province, Eastern Cape Province, Northern Cape Province, Botswana, Zimbabwe, Malawi, Lesotho and Swaziland. Based on this work, he has curated various exhibitions at different museums and has published more than 70 papers, most in scientifically accredited journals. During this period, he has done more than 2000 impact assessments (archaeological, anthropological, historical and social) for various government departments and developers. Projects include environmental management frameworks, roads, pipeline-, and power line developments, dams, mining, water purification works, historical landscapes, refuse dumps and urban developments.

J A van Schalkwyk  
Heritage Consultant

**SPECIALIST DECLARATION**

---

I, J A van Schalkwyk, as the appointed independent specialist, in terms of the 2014 EIA Regulations (as amended), hereby declare that I:

- I act as the independent specialist in this application;
- I perform the work relating to the application in an objective manner, even if this results in views and findings that are not favourable to the applicant;
- regard the information contained in this report as it relates to my specialist input/study to be true and correct, and do not have and will not have any financial interest in the undertaking of the activity, other than remuneration for work performed in terms of the NEMA, the Environmental Impact Assessment Regulations, 2014 (as amended) and any specific environmental management Act;
- I declare that there are no circumstances that may compromise my objectivity in performing such work;
- I have expertise in conducting the specialist report relevant to this application, including knowledge of the Act, Regulations and any guidelines that have relevance to the proposed activity;
- I will comply with the Act, Regulations and all other applicable legislation;
- I have no, and will not engage in, conflicting interests in the undertaking of the activity;
- I have no vested interest in the proposed activity proceeding;
- I undertake to disclose to the applicant and the competent authority all material information in my possession that reasonably has or may have the potential of influencing - any decision to be taken with respect to the application by the competent authority; and the objectivity of any report, plan or document to be prepared by myself for submission to the competent authority;
- I have ensured that information containing all relevant facts in respect of the specialist input/study was distributed or made available to interested and affected parties and the public and that participation by interested and affected parties was facilitated in such a manner that all interested and affected parties were provided with a reasonable opportunity to participate and to provide comments on the specialist input/study;
- I have ensured that the comments of all interested and affected parties on the specialist input/study were considered, recorded and submitted to the competent authority in respect of the application;
- all the particulars furnished by me in this specialist input/study are true and correct; and
- I realise that a false declaration is an offence in terms of regulation 48 and is punishable in terms of section 24F of the Act.

Signature of the specialist

## EXECUTIVE SUMMARY

**Phase 1 Cultural Heritage Impact Assessment:  
THE PROPOSED PROSPECTING RIGHT COMBINED WITH A WASTE LICENCE APPLICATION  
TO PROSPECT FOR DIAMONDS ALLUVIAL (DA), DIAMONDS GENERAL (D) AND  
DIAMONDS IN KIMBERLITE (DK) ON THE REMAINING EXTENT, PORTION 1, PORTION 2  
AND PORTION 3 (BOORWATER) OF THE FARM BULTFONTEIN 327, REGISTRATION  
DIVISION: HAY, NORTHERN CAPE PROVINCE**

*Milnex 189 CC Environmental Consultants* was contracted by *Morgenson Mining (Pty) Ltd* as the independent environmental consultant to undertake the Scoping and EIA process for the proposed prospecting right combined with a waste licence application to prospect for diamonds alluvial (DA), diamonds general (D) and diamonds in kimberlite (DK) on the Remaining Extent, Portion 1, Portion 2 and Portion 3 (Boorwater) of the Farm Bultfontein 327, registration division: Hay, Northern Cape Province.

In accordance with Section 38 of the NHRA, an independent heritage consultant was appointed by *Milnex CC Environmental Consultants* to conduct a cultural heritage assessment to determine if the development of the centre pivots would have an impact on any sites, features or objects of cultural heritage significance.

This report describes the methodology used, the limitations encountered, the heritage features that were identified and the recommendations and mitigation measures proposed relevant to this. The HIA consisted of a desktop study (archival sources, database survey, maps and aerial imagery) and a physical survey that included the interviewing of relevant people. It should be noted that the implementation of the mitigation measures is subject to SAHRA/PHRA's approval.

The cultural landscape qualities of the region are made up of a pre-colonial element consisting of Stone Age and a much later colonial (farmer) component, which eventually also gave rise to an industrial (mining) component which manifest in a number of sites spread across the larger landscape.

### Identified sites

During the survey, the following sites, features or objects of cultural significance were identified.

- 7.1.1 Change finds: A very low number of stone tools dating mostly to the Middle Stone Age have been identified as surface material.
- 7.3.1.1 – 7.3.1.7 Burial sites: A total of seven burial sites were identified. All the sites are known to current land owners, although it seems as if visitation by descendants is very limited.
- 7.3.2.1 Farmstead: A single farmstead was identified that is older than sixty years. It is built in a style that is commonly referred to as Karoo style. It is abandoned and is falling apart.
- 7.3.2.2 Old mine where asbestos was mined – probably Crocidolite, as it is very distinctive blue in colour and is visible in the spoil heaps at the processing plant. The site was probably abandoned during the early 1960s.

### Impact assessment and proposed mitigation measures

Impact analysis of cultural heritage resources under threat of the proposed prospecting activities is based on the present understanding of the project:

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.1.1		Section 35		Low (14)

	Archaeological resources		Generally protected 4C: Low significance - Requires no further recording before destruction.	Low (14)
<b>Mitigation:</b> (5) No further action required				

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.1.1 – 7.3.1.7	Graves, Cemeteries and Burial Grounds	Section 36	Generally protected 4A: High / Medium significance	Medium (36) Low (16)
<b>Mitigation:</b> (1) Avoidance/Preserve: A minimum buffer of 100m must be established around the burial sites for the duration of the prospecting/mining phase.				

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.2.1	Structures older than 60 years	Section 34	Generally protected 4B: Medium significance	Low (20) Low (12)
<b>Mitigation:</b> (2) Archaeological investigation: This option should be implemented when it is impossible to avoid impacting on an identified site or feature.				

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.2.2	Structures older than 60 years	Section 34	Generally protected 4B: Medium significance	Low (20) Low (12)
<b>Mitigation:</b> (2) Archaeological investigation: This option should be implemented when it is impossible to avoid impacting on an identified site or feature.				

#### Legal requirements

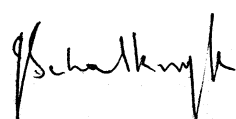

- The legal requirements related to heritage specifically are specified in Section 3 of this report. For this proposed project, the assessment has determined that sites, features or objects of heritage significance occur in the project area, therefore various permits, depending on the type of site to be impacted on would be required.
- If heritage features are identified during prospecting activities, as stated in the management recommendation, these finds would have to be assessed by a specialist, after which a decision will be made regarding the application for relevant permits.

#### Reasoned opinion as to whether the proposed activity should be authorised:

- From a heritage point of view, it is recommended that the proposed prospecting activities be allowed to continue on acceptance of the proposed mitigation measures and the conditions proposed below.

#### Conditions for inclusion in the environmental authorisation:

- The Palaeontological Sensitivity Map (<https://sahris.sahra.org.za/map/palaeo>) indicate that the project area has a rather complex geological make-up, with large sections either having a moderate or high possibility of fossil remains to be found and therefore it is recommended that a desktop palaeontological assessment should be done.
- Should archaeological sites or graves be exposed during prospecting work, it must immediately be reported to a heritage practitioner so that an investigation and evaluation of the finds can be made.

## GLOSSARY OF TERMS AND ABBREVIATIONS

### TERMS

**Bioturbation:** The burrowing by small mammals, insects and termites that disturb archaeological deposits.

**Cumulative impacts:** “Cumulative Impact”, in relation to an activity, means the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may become significant when added to existing and reasonably foreseeable impacts eventuating from similar or diverse activities.

**Debitage:** Stone chips discarded during the manufacture of stone tools.

**Factory site:** A specialised archaeological site where a specific set of technological activities has taken place – usually used to describe a place where stone tools were made.

**Historic Period:** Since the arrival of the white settlers - c. AD 1830 - in this part of the country.

**Holocene:** The most recent time period, which commenced c. 10 000 years ago.

**Iron Age** (also referred to as **Early Farming Communities**): Period covering the last 1800 years, when new people brought a new way of life to southern Africa. They established settled villages, cultivated domestic crops such as sorghum, millet and beans, and they herded cattle as well as sheep and goats. As they produced their own iron tools, archaeologists call this the Iron Age.

Early Iron Age	AD 200 - AD 900
Middle Iron Age	AD 900 - AD 1300
Later Iron Age	AD 1300 - AD 1830

**Midden:** The accumulated debris resulting from human occupation of a site.

**Mitigation,** means to anticipate and prevent negative impacts and risks, then to minimise them, rehabilitate or repair impacts to the extent feasible.

**National Estate:** The collective heritage assets of the Nation.

**Pleistocene:** Geological time period of 3 000 000 to 20 000 years ago.

**Stone Age:** The first and longest part of human history is the Stone Age, which began with the appearance of early humans between 3-2 million years ago. Stone Age people were hunters, gatherers and scavengers who did not live in permanently settled communities. Their stone tools preserve well and are found in most places in South Africa and elsewhere.

Early Stone Age	2 500 000 - 250 000 Before Present
Middle Stone Age	250 000 - 40 000 - 25 000 BP
Later Stone Age	40-25 000 - until c. AD 200

**Tradition:** As used in archaeology, it is a seriated sequence of artefact assemblages, particularly ceramics.

**COMPLIANCE WITH APPENDIX 6 OF THE 2014 EIA REGULATIONS (AS AMENDED)**

<b>Requirements of Appendix 6 – GN R982</b>	<b>Addressed in the Specialist Report</b>
1. (1) A specialist report prepared in terms of these Regulations must contain-	
a) details of-	
i. the specialist who prepared the report; and	Front page
ii. the expertise of that specialist to compile a specialist report including a curriculum vitae;	Page i Addendum Section 5
b) a declaration that the specialist is independent in a form as may be specified by the competent authority;	Page ii
c) an indication of the scope of, and the purpose for which, the report was prepared;	Section 1
(cA) an indication of the quality and age of base data used for the specialist report;	Section 4
(cB) a description of existing impacts on the site, cumulative impacts of the proposed development and levels of acceptable change;	Section 7
d) the duration, date and season of the site investigation and the relevance of the season to the outcome of the assessment;	Section 4.2.2
e) a description of the methodology adopted in preparing the report or carrying out the specialised process inclusive of equipment and modelling used;	Section 4
f) details of an assessment of the specific identified sensitivity of the site related to the proposed activity or activities and its associated structures and infrastructure, inclusive of a site plan identifying site alternatives;	Section 7; Figure 13
g) an identification of any areas to be avoided, including buffers;	Section 8
h) a map superimposing the activity including the associated structures and infrastructure on the environmental sensitivities of the site including areas to be avoided, including buffers;	Figure 13 Section 7
i) a description of any assumptions made and any uncertainties or gaps in knowledge;	Section 2
j) a description of the findings and potential implications of such findings on the impact of the proposed activity or activities;	Section 7
k) any mitigation measures for inclusion in the EMPr;	Section 8 & 10
l) any conditions for inclusion in the environmental authorisation;	Section 10
m) any monitoring requirements for inclusion in the EMPr or environmental authorisation;	Section 9
n) a reasoned opinion-	
i. whether the proposed activity, activities or portions thereof should be authorised;	Section 10
(iiA) regarding the acceptability of the proposed activity or activities; and	
ii. if the opinion is that the proposed activity, activities or portions thereof should be authorised, any avoidance, management and mitigation measures that should be included in the EMPr, and where applicable, the closure plan;	Section 8, 10
o) a description of any consultation process that was undertaken during the course of preparing the specialist report;	-
p) a summary and copies of any comments received during any consultation process and where applicable all responses thereto; and	-
q) any other information requested by the competent authority.	-
(2) Where a government notice by the Minister provides for any protocol or minimum information requirement to be applied to a specialist report, the requirements as indicated in such notice will apply.	-

**Phase 1 Cultural Heritage Impact Assessment:  
THE PROPOSED PROSPECTING RIGHT COMBINED WITH A WASTE LICENCE APPLICATION  
TO PROSPECT FOR DIAMONDS ALLUVIAL (DA), DIAMONDS GENERAL (D) AND  
DIAMONDS IN KIMBERLITE (DK) ON THE REMAINING EXTENT, PORTION 1, PORTION 2  
AND PORTION 3 (BOORWATER) OF THE FARM BULTFONTEIN 327, REGISTRATION  
DIVISION: HAY, NORTHERN CAPE PROVINCE**

## **1. INTRODUCTION**

### **1.1 Background**

*Milnex 189 CC Environmental Consultants* was contracted by *Morgenson Mining (Pty) Ltd* as the independent environmental consultant to undertake the Scoping and EIA process for the proposed prospecting right combined with a waste licence application to prospect for diamonds alluvial (DA), diamonds general (D) and diamonds in kimberlite (DK) on the Remaining Extent, Portion 1, Portion 2 and Portion 3 (Boorwater) of the Farm Bultfontein 327, registration division: Hay, Northern Cape Province.

South Africa's heritage resources, also described as the 'national estate', comprise a wide range of sites, features, objects and beliefs. However, according to Section 27(18) of the National Heritage Resources Act (NHRA), No. 25 of 1999, no person may destroy, damage, deface, excavate, alter, remove from its original position, subdivide or change the planning status of any heritage site without a permit issued by the heritage resources authority responsible for the protection of such site.

In accordance with Section 38 of the NHRA, an independent heritage consultant was appointed by *Milnex CC Environmental Consultants* to conduct a cultural heritage assessment to determine if the development of the centre pivots would have an impact on any sites, features or objects of cultural heritage significance.

This report forms part of the Environmental Impact Assessment (EIA) as required by the EIA Regulations in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) as amended and is intended for submission to the South African Heritage Resources Agency (SAHRA).

### **1.2 Terms and references**

*The aim of a full HIA investigation is to provide an informed heritage-related opinion about the proposed development by an appropriate heritage specialist. The objectives are to identify heritage resources (involving site inspections, existing heritage data and additional heritage specialists if necessary); assess their significances; assess alternatives in order to promote heritage conservation issues; and to assess the acceptability of the proposed development from a heritage perspective.*

*The result of this investigation is a heritage impact assessment report indicating the presence/absence of heritage resources and how to manage them in the context of the proposed development.*

*Depending on SAHRA's acceptance of this report, the developer will receive permission to proceed with the proposed development, on condition of successful implementation of proposed mitigation measures.*

#### **1.2.1 Scope of work**

The aim of this study is to determine if any sites, features or objects of cultural heritage significance occur within the boundaries of the area where the development of the prospecting activities is to take place. This included:

- Conducting a desk-top investigation of the area;
- A visit to the proposed development area.

The project area includes the following properties:

- Remaining Extent, Portion 1, Portion 2 and Portion 3 (Boorwater) of the Farm Bultfontein 327.

The objectives were to:

- Identify possible archaeological, cultural and historic sites within the proposed development areas.
- Identify any potential 'fatal flaws' related to the proposed development.
- Evaluate the potential impacts of construction, operation and maintenance of the proposed development on archaeological, cultural and historical resources.
- Recommend mitigation measures to ameliorate any negative impacts on areas of archaeological, cultural or historical importance.
- Provide guideline measures to manage any impacts that might occur during the construction phase as well as the implementation phase.

### 1.2.2 Assumptions and Limitations

The investigation has been influenced by the following factors:

- It is assumed that the description of the proposed project, provided by the client, is accurate.
- The unpredictability of buried archaeological remains.
- No subsurface investigation (i.e. excavations or sampling) were undertaken, since a permit from SAHRA is required for such activities.
- It is assumed that the public consultation process undertaken as part of the Environmental Impact Assessment (EIA) is sufficient and that it does not have to be repeated as part of the heritage impact assessment;
- The vegetation cover encountered during a site visit can have serious limitations on ground visibility, obscuring features (artefacts, structures) that might be an indication of human settlement.

## 2. LEGISLATIVE FRAMEWORK

---

### 2.1 Background

Heritage Impact Assessments are governed by national legislation and standards and International Best Practise. These include:

- South African Legislation
  - National Heritage Resources Act, 1999 (Act No. 25 of 1999) (NHRA);
  - Mineral and Petroleum Resources Development Act, 2002 (Act No. 22 of 2002) (MPRDA);
  - National Environmental Management Act 1998 (Act No. 107 of 1998) (NEMA); and
  - National Water Act, 1998 (Act No. 36 of 1998) (NWA).
- Standards and Regulations
  - South African Heritage Resources Agency (SAHRA) Minimum Standards;
  - Association of Southern African Professional Archaeologists (ASAPA) Constitution and Code of Ethics;
  - Anthropological Association of Southern Africa Constitution and Code of Ethics.
- International Best Practise and Guidelines

- ICOMOS Standards (Guidance on Heritage Impact Assessments for Cultural World Heritage Properties); and
- The UNESCO Convention concerning the Protection of the World Cultural and Natural Heritage (1972).

## 2.2 Heritage Impact Assessment Studies

South Africa's unique and non-renewable archaeological and palaeontological heritage sites are 'generally' protected in terms of the National Heritage Resources Act (Act No 25 of 1999, Section 35) and may not be disturbed at all without a permit from the relevant heritage resources authority.

The National Heritage Resources Act (Act No. 25 of 1999, Section 38) provides guidelines for Cultural Resources Management and prospective developments:

*"38 (1) Subject to the provisions of subsections (7), (8) and (9), any person who intends to undertake a development categorised as:*

- (a) the construction of a road, wall, powerline, pipeline, canal or other similar form of linear development or barrier exceeding 300m in length;*
- (b) the construction of a bridge or similar structure exceeding 50m in length;*
- (c) any development or other activity which will change the character of a site:*
  - (i) exceeding 5 000 m<sup>2</sup> in extent; or*
  - (ii) involving three or more existing erven or subdivisions thereof; or*
  - (iii) involving three or more erven or divisions thereof which have been consolidated within the past five years; or*
  - (iv) the costs of which will exceed a sum set in terms of regulations by SAHRA or a provincial heritage resources authority;*
- (d) the re-zoning of a site exceeding 10 000 m<sup>2</sup> in extent; or*
- (e) any other category of development provided for in regulations by SAHRA or a provincial heritage resources authority, must at the very earliest stages of initiating such a development, notify the responsible heritage resources authority and furnish it with details regarding the location, nature and extent of the proposed development."*

And:

*"38 (3) The responsible heritage resources authority must specify the information to be provided in a report required in terms of subsection (2)(a): Provided that the following must be included:*

- (a) The identification and mapping of all heritage resources in the area affected;*
- (b) an assessment of the significance of such resources in terms of the heritage assessment criteria set out in section 6(2) or prescribed under section 7;*
- (c) an assessment of the impact of the development on such heritage resources;*
- (d) an evaluation of the impact of the development on heritage resources relative to the sustainable social and economic benefits to be derived from the development;*
- (e) the results of consultation with communities affected by the proposed development and other interested parties regarding the impact of the development on heritage resources;*
- (f) if heritage resources will be adversely affected by the proposed development, the consideration of alternatives; and*
- (g) plans for mitigation of any adverse effects during and after the completion of the proposed development."*

## 3. HERITAGE RESOURCES

---

### 3.1 The National Estate

The National Heritage Resources Act (No. 25 of 1999) defines the heritage resources of South Africa which are of cultural significance or other special value for the present community and for future generations that must be considered part of the national estate to include:

- places, buildings, structures and equipment of cultural significance;
- places to which oral traditions are attached or which are associated with living heritage;
- historical settlements and townscapes;
- landscapes and natural features of cultural significance;
- geological sites of scientific or cultural importance;
- archaeological and palaeontological sites;
- graves and burial grounds, including-
  - ancestral graves;
  - royal graves and graves of traditional leaders;
  - graves of victims of conflict;
  - graves of individuals designated by the Minister by notice in the Gazette;
  - historical graves and cemeteries; and
  - other human remains which are not covered in terms of the Human Tissue Act, 1983 (Act No. 65 of 1983);
- sites of significance relating to the history of slavery in South Africa;
- movable objects, including-
  - objects recovered from the soil or waters of South Africa, including archaeological and palaeontological objects and material, meteorites and rare geological specimens;
  - objects to which oral traditions are attached or which are associated with living heritage;
  - ethnographic art and objects;
  - military objects;
  - objects of decorative or fine art;
  - objects of scientific or technological interest; and
  - books, records, documents, photographic positives and negatives, graphic, film or video material or sound recordings, excluding those that are public records as defined in section 1(xiv) of the National Archives of South Africa Act, 1996 (Act No. 43 of 1996).

### 3.2 Cultural significance

In the NHRA, Section 2 (vi), it is stated that “cultural significance” means aesthetic, architectural, historical, scientific, social, spiritual, linguistic or technological value or significance. This is determined in relation to a site or feature’s uniqueness, condition of preservation and research potential.

According to Section 3(3) of the NHRA, a place or object is to be considered part of the national estate if it has cultural significance or other special value because of

- its importance in the community, or pattern of South Africa's history;
- its possession of uncommon, rare or endangered aspects of South Africa's natural or cultural heritage;
- its potential to yield information that will contribute to an understanding of South Africa's natural or cultural heritage;
- its importance in demonstrating the principal characteristics of a particular class of South Africa's natural or cultural places or objects;
- its importance in exhibiting particular aesthetic characteristics valued by a community or cultural group;
- its importance in demonstrating a high degree of creative or technical achievement at a particular period;
- its strong or special association with a particular community or cultural group for social, cultural or spiritual reasons;

- its strong or special association with the life or work of a person, group or organisation of importance in the history of South Africa; and
- sites of significance relating to the history of slavery in South Africa.

A matrix (see Section 2 of Addendum) was developed whereby the above criteria were applied for the determination of the significance of each identified site. This allowed some form of control over the application of similar values for similar identified sites.

#### 4. PROJECT DESCRIPTION

##### 4.1 Site location

The project area is located approximately 31km northwest of Prieska in the Pixley Ka Seme District Municipality of Northern Cape Province. (Fig. 1). For more information, see the Technical Summary on p. V above.

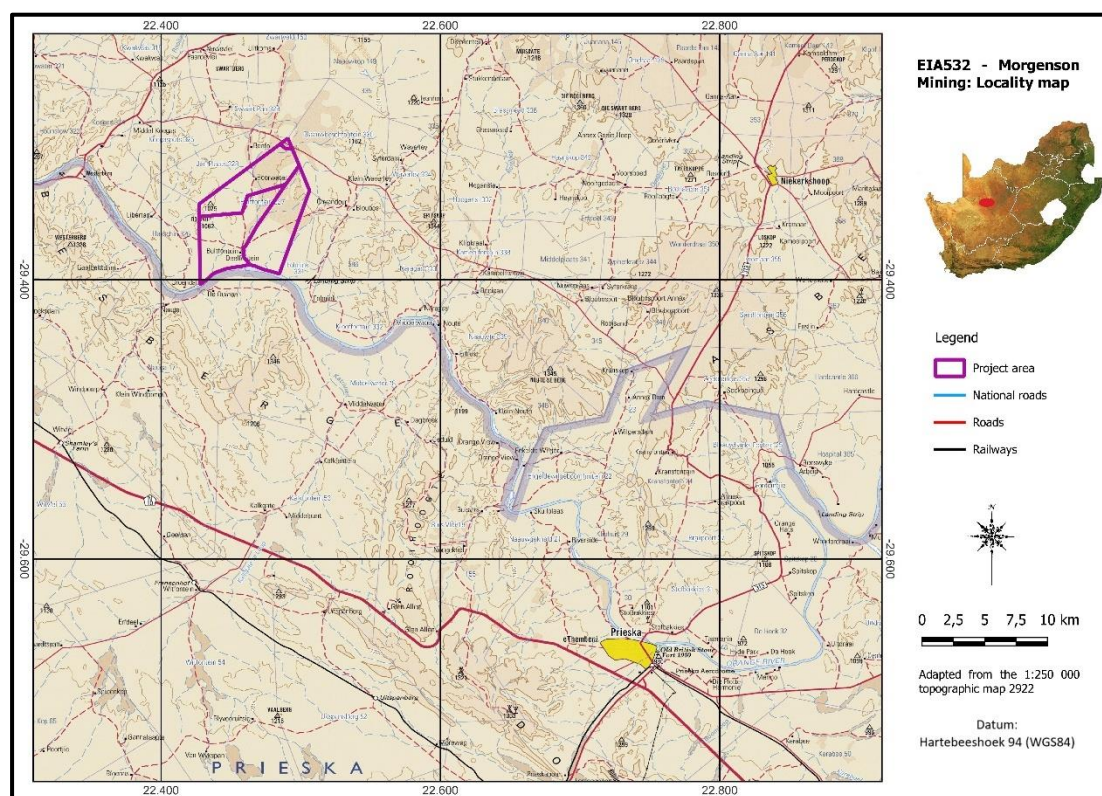

Figure 1. Location of the project area in regional context

##### 4.2 Development proposal

The description of the activities to be undertaken including associated structures and infrastructure was taken from the scoping report prepared by Milnex CC (2021):

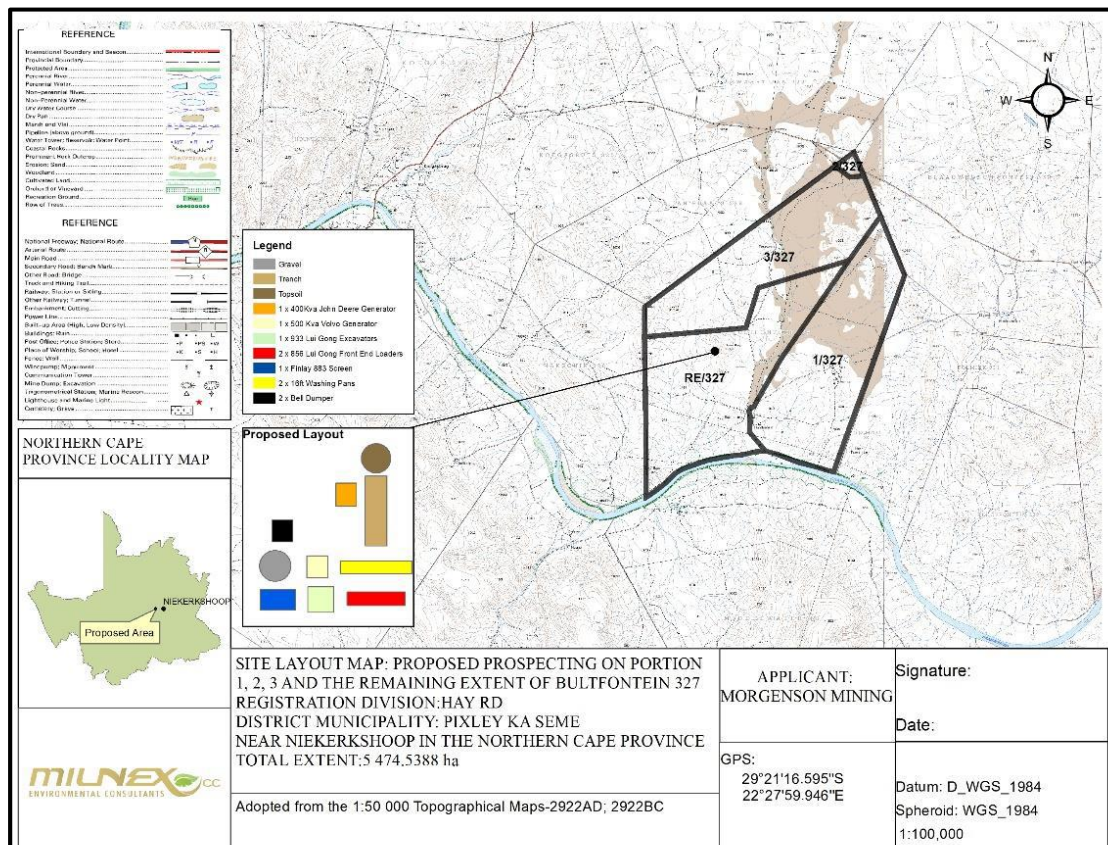

Figure 2. Layout of the project area  
(Map supplied by Milnex CC)

### Phase 1 – Site Visits

The applicant will appoint Pierre de Jager as the project geologist to conduct the site visit. A formal site visit will be done within 90 days after the prospecting right has been executed. It is foreseen that more than one site visit will be conducted on the farms.

The purpose of the site visit is to assist the applicant to be familiar with the environment and with the assessment of the topography and the general geology before invasive prospecting activities. During this process the applicant will also review all documentation that has been received in relation to the geology of the area.

### Phase 2 – Desktop Studies

Desktop studies will be undertaken after a site investigation is done to determine the target areas including the identification of any infrastructure to be build and any potential problems that may need to be addressed.

This phase involves reviewing the literature surveys, interpretation of aerial photographs, satellite images and ground validation of targets. A preliminary analysis of the environment will be obtained which will improve the project's efficiency and cost by providing a clearer understanding of the challenges may be encountered. Compilation of the results of analysis will be done by the geologist after the finalization of the desktop studies.

### Phase 3 – Pitting

A trial pit / test pit or inspection pit investigation is a highly effective way of obtaining data on the sub surface soil and rock conditions which underlie a prospecting sight. It allows for the various soils and rock types to be locked, the soil to be sampled and a preliminary assessment to be made.

To dig the pits the applicant will make use of the systems of Pierre de Jager, the appointed project geologist.

- The applicant will at the end of the pitting process have locked the pits with the following information:
- A description of the soil and rock types from ground level to the base of the pits;
- Record of rock head depth and refusal depth, a list of where the samples will be taken, a record of where ground water seepage will be recorded;
- A general note of the geology and conditions in the vicinity of the test pits
- Pitting will be done within the period of 24 months once the prospecting right has been granted.

#### Calculations

It is planned that 90 pits will be dug (it may be less depending on the results) at an extent of 3m (length) x 3m (breadth) x 4m (depth).

- $90 \text{ pits} / 2 \text{ years} = 45 \text{ pits dug per year}$
- $\text{Total area to be disturbed per year} = 45 \text{ pits} \times (3\text{m} \times 3\text{m}) / 10\,000 = 0.04\text{Ha disturbed per year}$
- $\text{Total area disturbed for 24 months} = 90 \text{ pits} \times (3\text{m} \times 3\text{m}) / 10\,000 = 0.081 \text{ Ha disturbed}$

#### Phase 4 – Trenches

Due to nature of the alluvial diamond deposit, samples are not taken for assay as would be normal practice to evaluate hard rock precious or base-metal prospects. The diamond distribution pattern grade of alluvial diamonds is also of such a nature that there is no repeatability of sample results, even from adjacent samples.

Bulk samples will have to be taken to determine the average sample grade. By taking of the bulk samples, the applicant foresees to determine the grade of the diamond deposits as the number of carats contained in 100 tons (cpht) of gravel and to determine the average diamond sizes.

During these activities the applicant will then find out the size and value distribution of trenches. Diamond distribution patterns of alluvial deposits varies to such a nature that there is no repeatability of sample results even from adjacent samples

Alluvial diamond deposits can only be sampled through bulk sampling comprising thousands of cubic meters of gravel. Given the extent of the area and the grades expected to be very low, the applicant will have to process bulk samples of approximately 158 400 tonnes.

The appointed geologist will advise where the samples will be taken. Bulk samples will not be taken along a systematic grid as in the case of drilling. As the anticipated mining plan for the properties will be based on high volumes (low grades), the bulk samples will have to address average recovery.

As indicated, the bulk sampling exercise has to be conducted to determine the grades (cpht), the diamond size distribution and thereafter to sell the diamonds to determine the diamond values.

The plant/ bulk sampling technique will be that of a typical South African alluvial diamond mining operation. The method is a strip mining process with oversize material and tailings recovered from the plant will be used as backfill material prior to final rehabilitation. Gravels are excavated, loaded and transported to the treatment facility using dump trucks.

The bulk sampling operation will be conducted using a fleet of conventional open pit mining equipment comprising of dump trucks supported by appropriate excavators and front-end- loaders. All equipment is planned to be diesel driven.

Before excavation commences vegetation will be cleared from the proposed bulk sampling block. These will be done as per environmental regulations. Top soil will then be removed and stored separately for later use for rehabilitation.

The bulk samples will be made in the form of box cuts the dimensions of these individual box cuts will on average be 40m long x 40m wide.

It is estimated that the bulk samples will be 3 m in depth.

Gravel will be removed by excavators and will be loaded directly into dump trucks. Ore will be hauled to the screening plant. The material will be screened where after the screened material will be moved to the processing plant where the gravel will be processed. Concentrate will be moved to the sorting plant where the concentrate will be sorted.

It is estimated that pitting and trenching will take approximately 48 months.

#### Calculations

It is planned that 45 trenches will be dug at an extent of 40m (length) x 40m (breadth) x 3m (depth).

- 45 trenches / 2 years = 22.5 trenches dug per year
- Total area to be disturbed per month = 22.5 trenches x (40m x 40m) / 10 000 = 3.6 Ha disturbed per year.
- Total area disturbed for 48 months = 45 trenches x (40m x 40m) / 10 000 = 7.2 Ha disturbed

#### Phase 5 – Consolidation and Interpretation of Results Data

The prospecting activities will be conducted to determine an inferred diamond resource and an indicated diamond resource. An inferred diamond resource has a lower level of confidence than that applying to an indicated diamond resource. The inferred resource indication will be where the geological and or grade continuity could not be confidently interpreted. It cannot be assumed that an inferred resource will necessarily be upgraded to an indicated resource. Such a resource is normally also not sufficient to enable an evaluation of economic viability.

To obtain an indicated resource the confidence level of information obtained from the prospecting will have to be sufficient for the information to be applied to mine design, mine planning to enable an evaluation of economic viability.

The project geologist, Pierre de Jager, will monitor the program and consolidate and process the data and amend the program depending on the results received after each phase of prospecting. The DMR will be updated of any amendments made. This will be a continuous process throughout the prospecting work program.

Each physical phase of prospecting will be followed by desktop studies involving interpretation and modelling of all data gathered. These studies will determine the manner in which the work programme is to be proceeded with in terms of the activity, quantity, resources, expenditure and duration.

A GIS data base will be constructed capturing all the exploration data. All data will be consolidated and processed to determine the diamond bearing resource on the property.

## **5. STUDY APPROACH AND METHODOLOGY**

---

### **5.1 Extent of the Study**

This survey and impact assessment cover all facets of cultural heritage located in the project area as presented in Section 4 above and illustrated in Figures 1 & 2.

## 5.2 Methodology

### 5.2.1 Pre-feasibility assessment

The objectives of this review were to:

- Gain an understanding of the cultural landscape within which the project is located;
- Inform the field survey.

#### 5.2.1.1 Survey of the literature

A survey of the relevant literature was conducted with the aim of reviewing the previous research done and determining the potential of the area. In this regard, various anthropological, archaeological and historical sources were consulted – see list of references in Section 11.

- Information on events, sites and features in the larger region were obtained from these sources.

#### 5.2.1.2 Survey of heritage impact assessments (HIAs)

A survey of HIAs done for projects in the region by various heritage consultants was conducted with the aim of determining the heritage potential of the area – see list of references in Section 11.

- Information on sites and features in the larger region were obtained from these sources.

#### 5.2.1.3 Data bases

The *Heritage Atlas Database*, various SAHRA databases, the *Environmental Potential Atlas*, the *Chief Surveyor General* and the *National Archives of South Africa* were consulted.

- Database surveys produced a number of sites located in the larger region of the proposed prospecting activities.

#### 5.2.1.4 Other sources

Aerial photographs and topocadastral and other maps were also studied - see the list of references below.

- Information of a very general nature were obtained from these sources

The results of the above investigation are summarised in Table 1 and Figure 3 below – see list of references in Section 11 – and can be summarised as follows:

- Stone Age tools, dating to the MSA occur as surface scatters on the banks of the river, near outcrops and on valley floors in the larger region;
- Historic structures, inclusive of buildings, fortifications, monuments and bridges, occur mostly in an urban environment, although they also occur sporadically on farms;
- Formal burial sites occur in an urban setting, with a number of informal ones occurring sporadically throughout the countryside.

*Based on the above assessment, the probability of cultural heritage sites, features and objects occurring in the project area is deemed to be **low** but **possible**.*

**Table 1: Pre-Feasibility Assessment**

Category	Period	Probability	Reference

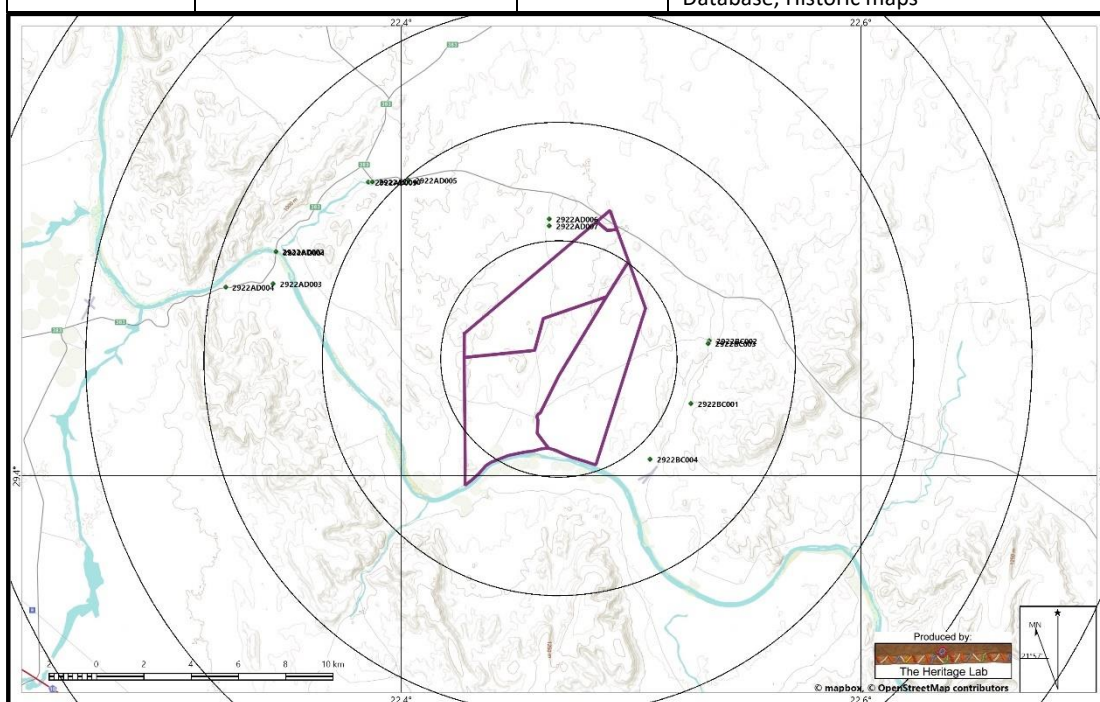

Figure 3. Location of known heritage sites and features in relation to the project area (Circles spaced at 5km: heritage sites = coded green dots)

### 5.2.2 Field survey

The field survey was done according to generally accepted archaeological practices, and was aimed at locating all possible sites, objects and structures. The area that had to be investigated was identified by the *Milnex CC Environmental Consultants* by means of maps and .kml files indicating the project area. This was loaded onto a Samsung digital device and used in Google Earth during the field survey to access the area.

The site was visited on 2 and 3 March 2022. During the site visit, archaeological visibility was much limited due to the dense vegetation cover which resulted from unseasonably high rains in the preceding weeks – see Fig. 4 below.

During the site visit, all land owners and some of their workers were interviewed as to the occurrence of heritage sites and features:

- Mr Jannie Fourie
- Mrs A Pretorius & Mr M Lotriet
- Mr H de Bot

Not all areas are easily accessible as no tracks or roads exist. During the second survey the following principle was implemented:

- I completed a **controlled-exclusive surface survey**, where ‘sufficient information exists on an area to make solid and defensible assumptions and judgements about where [heritage resource and] sites may and may not be’ and ‘an inspection of the surface of the ground, wherever this surface is visible, is made, with no substantial attempt to clear brush, turf, deadfall, leaves or other material that may cover the surface and with no attempt to look beneath the surface beyond the inspection of rodent burrows, cut banks and other exposures that are observed by accident’ (King 1978).

Focus was placed on red dune areas, stream banks, valleys rocky outcrops. None of these areas produced any material of significance and in line with the principles of the controlled-exclusive survey, it is assumed that this would hold true for other areas as well.

This approach is supported by the application of information contained in a personal database (Heritage Atlas Database). During the 1970s, Prof Revil Mason, formerly of the archaeology department at Wits University, got me interested in predictive modelling in archaeology (e.g. see Mason 1972). Aspects such as proximity to water, cultivatable soil, rock shelters for staying in, outcrops for accessing stone for building purposes, etc. are factored in to generate a picture of the possible human occupation of a region. Over the years I have built up a database of heritage sites in the country that runs into tens of thousands of sites (see Fig. 3 above). This has, over the past decade, been digitised, ground-truthed and annotated by means of publications and photographs.

Figure 4. Map indicating the track log of the field survey (Project area = blue polygons; track log = green lines)

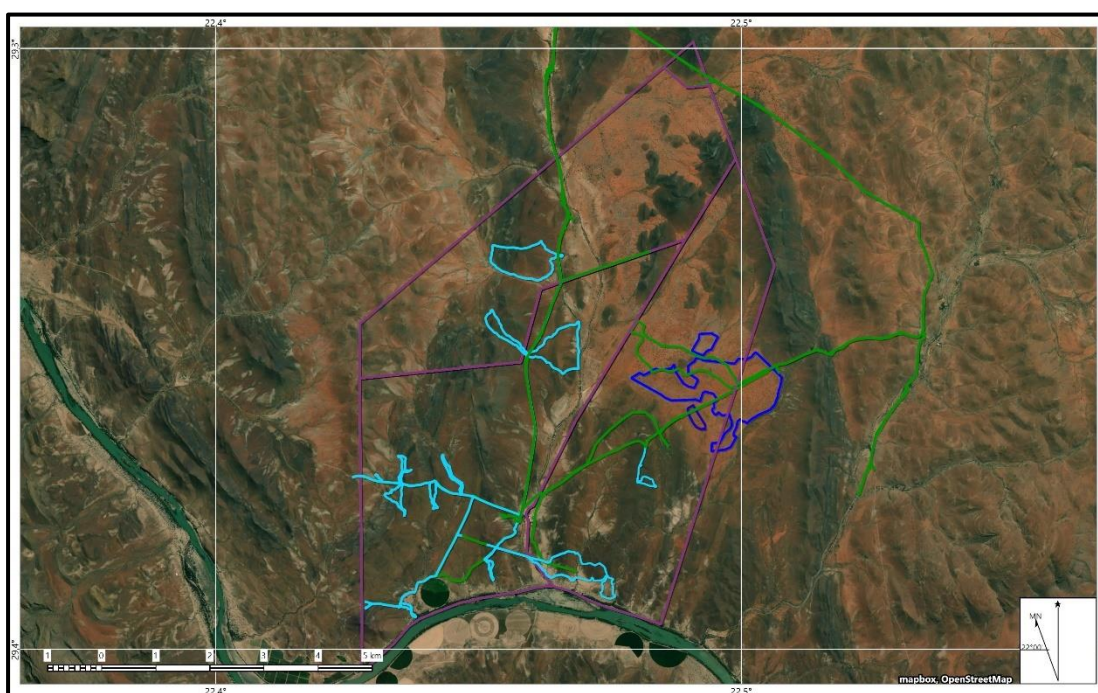

Figure 5. The track log for the additional survey  
(green = original survey, light blue = July 2022 survey; dark blue = Rossouw (2019) survey)

### 5.2.3 Documentation

All sites, objects and structures that are identified are documented according to the general minimum standards accepted by the archaeological profession. Coordinates of individual localities are determined by means of the *Global Positioning System* (GPS) and plotted on a map. This information is added to the description in order to facilitate the identification of each locality. Map datum used: Hartebeeshoek 94 (WGS84).

The track log and identified sites were recorded by means of a Garmin Oregon 550 handheld GPS device. Photographic recording was done by means of a Canon EOS 550D digital camera. Geo-rectifying of the aerial photographs and historic maps was done by means of a professional software package: ExpertGPS.

## 6. DESCRIPTION OF THE AFFECTED ENVIRONMENT

### 6.1 Natural Environment

The present Orange River between Douglas and Prieska displays a meandering channel morphology, best developed in areas underlain by the Dwyka Group. All the different fluvial terrace deposits are covered by Rooikoppie gravels, which represent mobile, multi-cycle deflation and gravitational deposits and/or elevated (inverted) fluvial deposits and preserved and recycled repeatedly from one successive land surface to the next. Only the most durable silicic clast Branded iron formation (BIF, quartzite, chert, etc.) survived this deflation recycling and diamonds are only present where the Rooikoppie gravels recycled older diamondiferous fluvial deposits.

Vegetation of the region is classified as Lower Gariep Broken Veld, which falls in the Nama-Karoo Biome, which forms part of the Bushmanland Bioregion. In the project area, this is impacted on by the silt that is deposited by the Orange River when in flood its banks.

The general ground view of the area consists of calcrete and/or scree surface gravels, with aeolian sand deposits in the more eastern section of the project area. It is significant to compare the environment which Rossouw encountered during his 2019 survey, where basically no vegetation occurs on the site, with the situation during the current, March 2022, survey where lush grass cover and shrub growth makes ground visibility basically impossible.

Figure 6. Views over the project area

The Palaeontological Sensitivity Map (<https://sahris.sahra.org.za/map/palaeo>) indicate that the project area has a rather complex geological make-up (Fig. 7), with large sections either having a moderate or

high possibility of fossil remains to be found and therefore it is recommended that a desktop palaeontological assessment should be done.

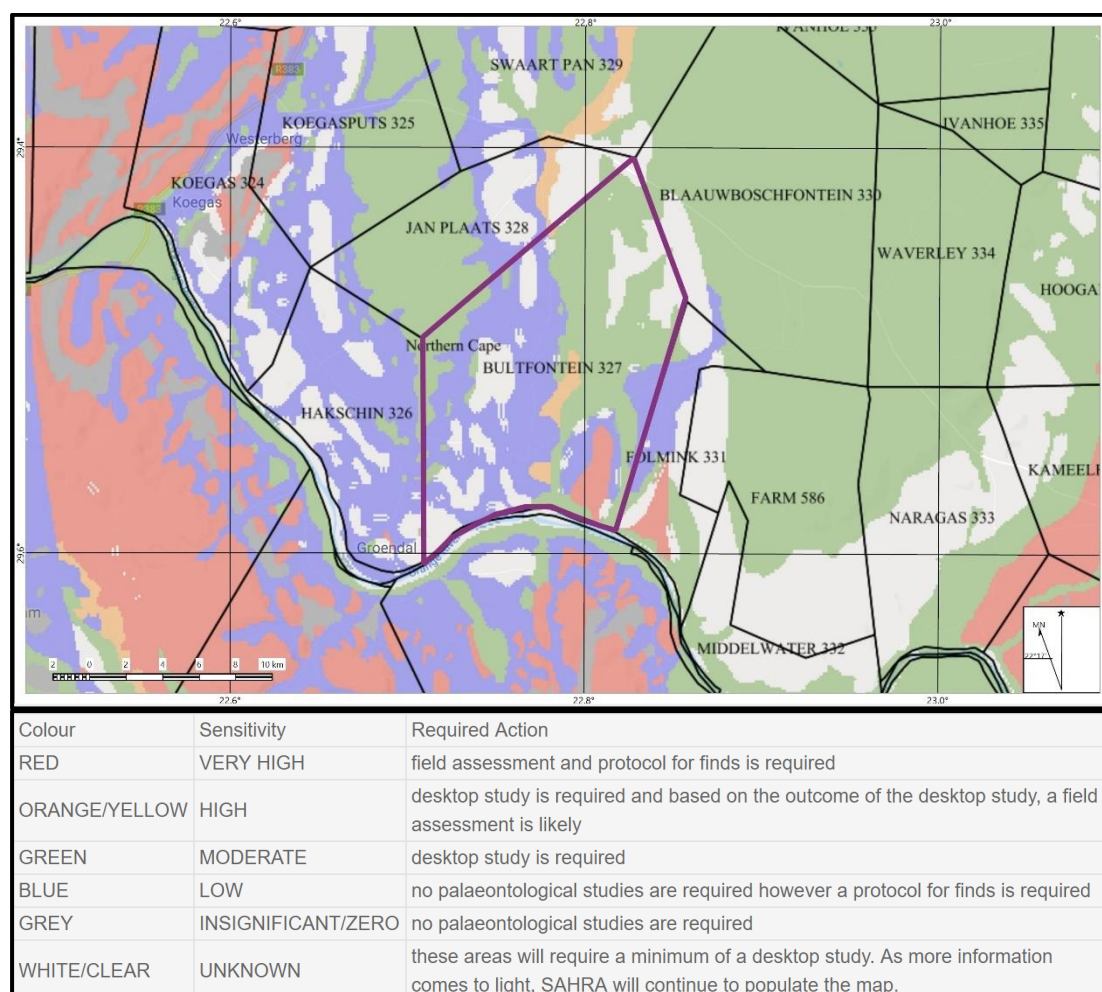

Figure 7. The Palaeontological sensitivity of the project area

## 6.2 Cultural Landscape

*The aim of this section is to present an overview of the history of the larger region in order to eventually determine the significance of heritage sites identified in the project area, within the context of their historic, aesthetic, scientific and social value, rarity and representivity.*

The cultural landscape qualities of the region are made up of a pre-colonial element consisting of Stone Age and a much later colonial (farmer) component, which eventually also gave rise to an industrial (mining) component which manifest in a number of sites spread across the larger landscape.

### 6.2.1 Stone Age

Surveys in the area have revealed that the archaeological record is temporarily confined to the Early and Middle Stone Age, with a smaller number dating to the Later Stone Age and is spatially concentrated on the different terraces along the Orange River, around the rims of many pans as well as on the banks of stream beds (Morris 2005).

Less obvious in its presence are the Later Stone Age sites, some of which are indicated by Beaumont & Vogel (1984). They equate these sites, some which occur in the larger region, with Cape Coastal pottery associated with amorphous LSA (herders) or Wilton (hunter-gatherers) in the period 100 BC to AD 1900.

### 6.2.2 Iron Age

Early Iron Age occupation did not take place in the region and seems as if the earliest people to have settled here were those of Tswana-speaking origin (Tlhaping and Tlharo) that settled mostly to the north and a bit to the west of Kuruman. However, they continued spreading westward and by the late 18<sup>th</sup> century some groups occupied the Langeberg region. With the annexation of the Tswana areas by the British in 1885, the area became known as British Bechuana Land. A number of reserves were set up for these people to stay in. In 1895 the Tswana-speakers rose up in resistance to the British authority as represented by the government of the Cape Colony. They were quickly subjected, and their land was taken away, divided up into farms and given out to white farmers to settle on (Snyman 1986).

### 6.2.3 Historic period

One of the first whites to access the region was Dr. Hinrich Lichtenstein, a German explorer that, on his journey to the north crossed the Orange River in the vicinity of Prieska in 1804. The area was largely under the control of the Griekwa, with the well-known Nicholaas Waterboer as their leader. These people led a near nomadic lifestyle, ranging over large areas with their stock. White farmer that entered the area by the late 19<sup>th</sup> century seemed to have stuck close to the various rivers where they farmed with sheep as well as some irrigation farming.

The date of the founding of the town of Prieska is not clear, but by 1911 it had a total population of 1648. By this time the asbestos and nitrates occurring in the region was already being mined.

The discovery of diamonds in the larger region during the 1860s would drastically alter the history of the region. Diamonds were first discovered near Hopetown in 1867 and a year later large numbers were discovered in the confluence area of the Vaal and Harts Rivers. By 1870 a few thousand miners were already active along the river, with most in the Pniel and Klipdrift regions. The discovery of the ‘Star of South Africa’ in 1871 led to the development of mining activities in Kimberly and surrounding areas.

These discoveries gave rise to claims being made by various groups for possession of the diamond fields – the Griekwa, the government of the Orange Free State, the government of the Transvaal Republic, as well as some Tswana-speaking groups in the region. After long discussions, R.W. Keates, Lieutenant-Governor of Natal, was appointed as arbiter. He decided in favour of the Waterboer (Griekwa) claim. However, this did not last very long and in 1871 the British annex the whole area, including the Kimberley diamond fields, as part of the Cape Colony.

## 6.3 Site specific review

*Although landscapes with cultural significance are not explicitly described in the NHRA, they are protected under the broad definition of the National Estate (Section 3): Section 3(2)(c) and (d) list “historical settlements and townscapes” and “landscapes and natural features of cultural significance” as part of the National Estate.*

*The examination of historical maps and aerial photographs help us to reconstruct how the cultural landscape has changed over time as it shows how humans have used the land.*

The farms in the region were surveyed in 1882 by the famous J M Orpen (Fig. 8). By the end of the 19<sup>th</sup> century, little information regarding this area existed, as is presented on the military map dating to

1900 (Fig. 9). This is probably the result of the fact that this was largely a rural area consisting of white owned farms.

The official aerial photograph (Fig. 10) dating to 1957 shows, apart from the various farmsteads and the asbestos mine, shows no signs of development in the project area. Even more than ten years later, in 1970 the topographic map (Fig. 11) shows no further development. This changes sometime later and on the 2021 aerial image (Fig. 12), agricultural fields, roads, structures and mining activities can be seen.

The occurrence of asbestos (cf. crocidolite) in the Prieska region was first reported on in 1805 by the early traveller Hinrich<sup>2</sup> Lichtenstein. However, the mining of this mineral in the region commenced only in 1893 on the farms Westerberg and Koegas, west of the project area. From there the mining activities spread in a northerly direction, following the various reefs and outcrops. Although all smaller mines were closed down by 1962, the Westerberg Mine continued production until 1980 after all payable reefs had been mined out (Alhers & Vorster 1998).

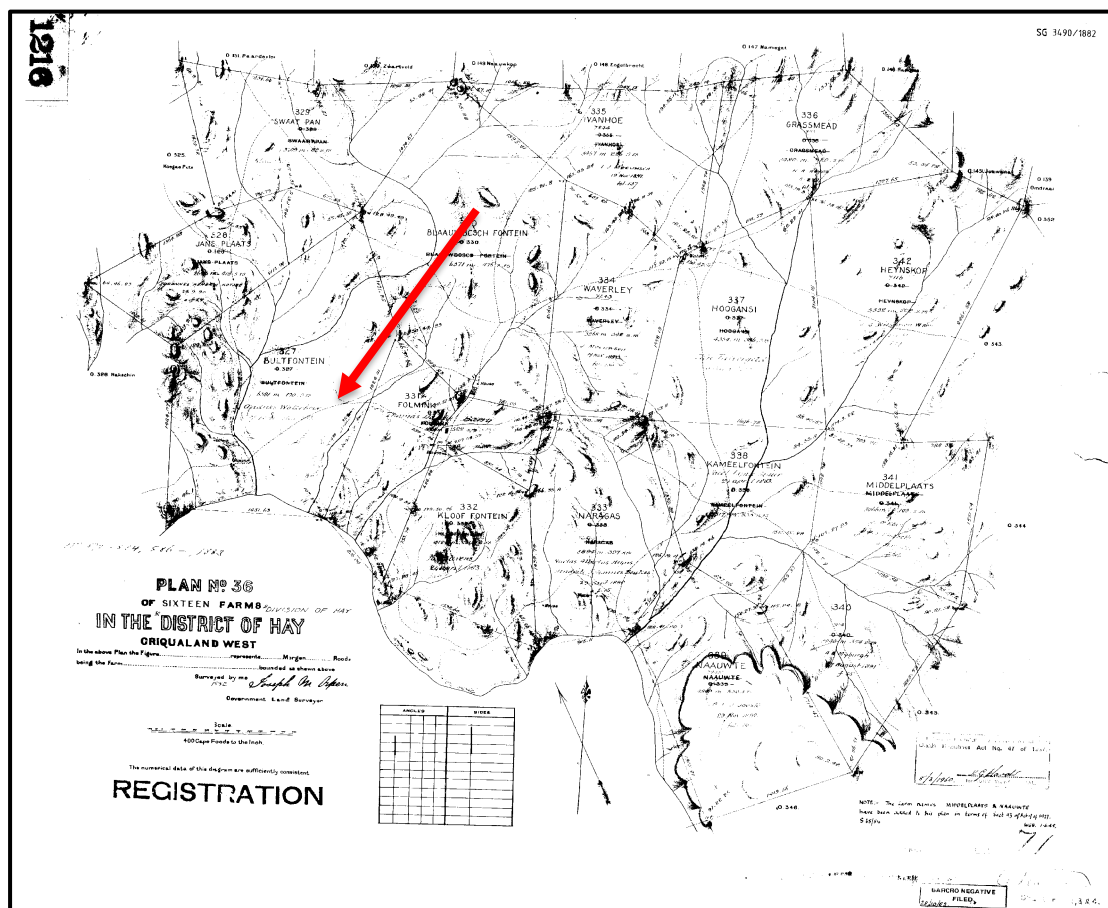

Figure 8. Plan of the different farms in the region as surveyed by J M Orpen in 1882 (CS-G: 100XYA01; study area indicated by the red arrow)

<sup>2</sup> Sometimes incorrectly referred to as Heinrich.

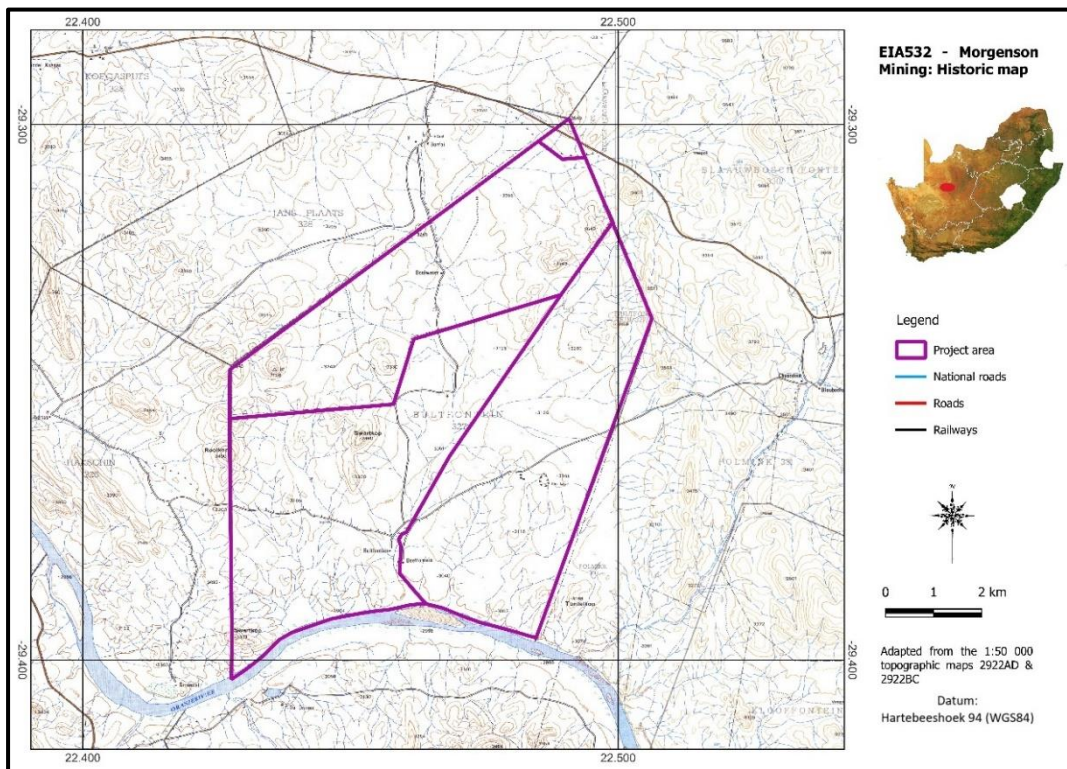

Figure 11. The project area as seen on the 1970 topographic map

(Image: Google Earth)

## 7. SURVEY RESULTS

During the physical survey, the following sites, features and objects of cultural significance were identified in the project area (Fig. 13).

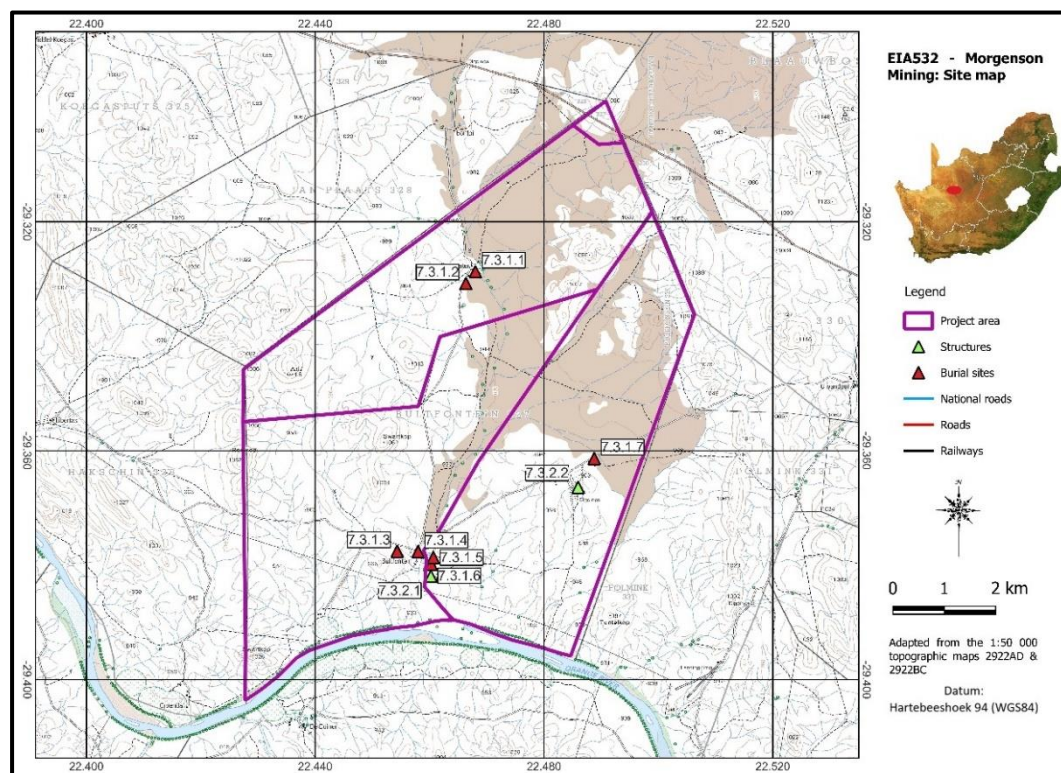

Figure 13. Location of heritage sites in the project area

### 7.1 Stone Age

NHRA Category	Archaeological resources – Section 35
<b>7.1.1 Type:</b> Stone Age chance finds	
<b>Description:</b> Some poorly formed stone tools, classified as side- and end scrapers, dating to the Middle Stone Age was identified. Its density is very low, probably one in 1000m <sup>2</sup> . This absence of Stone Age material has been commented on by researchers that surveyed the same farm or adjacent ones.	
<b>Significance of site/feature</b>	Generally protected 4C: Low significance - Requires no further recording before destruction.
<b>Reasoned opinion:</b> This material is rated to have low significance due to their low numbers as well as the fact that it is surface material and is not in its primary position anymore.	
<b>References:</b> Kruger (2018); Rossouw (2019); Van Vollenhoven (2018); Van Schalkwyk (2016, 2019, 2020)	
<b>Illustrations</b>	

Figure 14. The type of lithics and type of areas where they most commonly occur

## 7.2 Iron Age

- No sites, features or objects of cultural significance dating to the Iron Age were identified in the project area.

## 7.3 Historic period

NHRA Category		Graves, Cemeteries and Burial Grounds - Section 36		
Number	Name	Farm name	Latitude	Longitude
7.3.1.1	Burial site	Bultfontein 327 (Boorwater)	-29.3287190	22.4680050
7.3.1.2	Burial site	Bultfontein 327 (Boorwater)	-29.3307820	22.4663420
7.3.1.3	Burial site	Bultfontein 327	-29.3775690	22.4543350
7.3.1.4	Burial site	Bultfontein 327	-29.3776300	22.4579960
7.3.1.5	Burial site	Bultfontein 327	-29.3786420	22.4606560
7.3.1.6	Burial site	Bultfontein 327	-29.3798220	22.4602790
7.3.1.7	Burial site	Bultfontein 327	-29.3613500	22.4579960
Description				
7.3.1.1	Informal burial site with 5 graves. Apparently, it is the graves of former landowners. The site is fenced off and is well maintained. It is located in close proximity to the farmstead.			
7.3.1.2	Informal burial site with 2 graves. Apparently, it is the graves of former workers. The site is fenced off and is well maintained. It is located in close proximity to the ESKOM distribution line.			
7.3.1.3	Informal burial site with probably 30 graves. It is difficult to establish the exact size, extent and number of graves in the burial site due to the fact that all are marked only with stone cairns, with some of the stones having been dislodged over time by grazing cattle and uncontrolled vegetation growth. No visits by descendants to the site for cleaning or commemorating could be seen.			
7.3.1.4	A single grave marked with formal headstone indicating that it belongs to a JN Noethe that died in 1951. The site is fenced off and is located in close proximity to the farmstead.			
7.3.1.5	Informal burial site with probably more than 30 graves. It is difficult to establish the exact size, extent and number of graves in the burial site due to the fact that all are marked only with stone cairns, with some of the stones having been dislodged over time by grazing cattle and uncontrolled vegetation growth. No visits by descendants to the site for cleaning or commemorating could be seen. Local oral history has it that these graves were 'investigated' by people associated with a university (also see Gous & Wahl 1989). To what extent this took place is unknown but			

	based on the publication referred to the graves were excavated and documented. It is unknown if the remains were removed. <sup>3</sup>
7.3.1.6	<p>A burial site with probably more than 70 graves. It is difficult to establish the exact size, extent and number of graves in the burial site due to the fact that only a few are marked headstones, whereas the rest are only marked with stone cairns, with some of the stones having been dislodged over time by grazing cattle and uncontrolled vegetation growth. No visits by descendants to the site for cleaning or commemorating could be seen. The site used to be fenced off with a stone wall.</p> <p>It is possible that some of these graves were also investigated at the same time when those indicated in 7.3.1.5 were investigated.</p>
7.3.1.7	<p>Informal burial site with probably 40 graves. It is difficult to establish the exact size, extent and number of graves in the burial site due to the fact that all are marked only with stone cairns, with some of the stones having been dislodged over time by grazing cattle and uncontrolled vegetation growth. No visits by descendants to the site for cleaning or commemorating could be seen.</p>
<b>Significance of site/feature</b>	Generally protected 4A: High/medium significance - Should be mitigated before destruction.
<b>Reasoned opinion:</b> Burial sites are viewed as having high emotional and sentimental value. However, mitigation is possible if proper procedures have been followed.	
<b>References:</b> Gous & Wahl (1989)

## 8. IMPACT ASSESSMENT RATINGS AND MITIGATION MEASURES

### 8.1 Impact assessment

Heritage impacts are categorised as:

- Direct or physical impacts, implying alteration or destruction of heritage features within the project boundaries;
- Indirect impacts, e.g. restriction of access or visual intrusion concerning the broader environment;
- Cumulative impacts that are combinations of the above.

#### 7.1.1 Type: Chance find Stone Age material.

**Impact assessment:** Although this material is found inside the project area, their low significance as well as the fact that the area has already extensively been disturbed as surface occurrences flooding the plain, the impact is viewed to be very low.

	Without mitigation	With mitigation
Extent	Local area (1)	Local area (1)
Duration	Permanent (5)	Permanent (5)
Intensity	Low (1)	Low (1)
Probability	Improbable (2)	Improbably (2)
Significance	Low (14)	Low (14)
Status (positive or negative)	Negative	Neutral
Reversibility	Non-reversible	Non-reversible
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated	No	
Mitigation: None		
Cumulative impact: Loss of limited amount of similar features in the larger landscape.		

#### 7.3.1.1 – 7.3.1.7 Type: Burial sites

##### Impact assessment

These sites are located inside the larger project area and therefore it might be impacted on by the proposed prospecting activities.

	Without mitigation	With mitigation
Extent	Site (1)	Site (1)
Duration	Permanent (5)	Permanent (5)
Intensity (Magnitude)	Moderate (6)	Minor (2)
Probability	Probable (3)	Improbable (2)

Significance	Medium (36)	Low (16)
Status (positive or negative)	Negative	Neutral
Reversibility	Non-reversible	Non-reversible
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated	Yes	
Cumulative impact: Loss of a limited number of similar features in the larger landscape.		

**7.3.2.1 Type: Farmstead****Impact assessment**

Although this feature is located inside the larger project area, it is unlikely that it would be impacted on by the proposed prospecting activities.

	Without mitigation	With mitigation
Extent	Site (1)	Site (1)
Duration	Permanent (5)	Permanent (5)
Intensity (Magnitude)	Low (4)	Small (0)
Probability	Improbable (2)	Improbable (2)
Significance	Low (20)	Low (12)
Status (positive or negative)	Neutral	Neutral
Reversibility	Non-reversible	Non-reversible
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated	Yes	
Cumulative impact: Loss of a limited number of similar features in the larger landscape.		

**7.3.2.2 Type: Industrial remains – Asbestos Mine****Impact assessment**

Although this feature is located inside the larger project area, it is unlikely that it would be impacted on by the proposed prospecting activities due to the danger that the asbestos contamination poses.

	Without mitigation	With mitigation
Extent	Site (1)	Site (1)
Duration	Permanent (5)	Permanent (5)
Intensity (Magnitude)	Low (4)	Small (0)
Probability	Improbable (2)	Improbable (2)
Significance	Low (20)	Low (12)
Status (positive or negative)	Neutral	Neutral
Reversibility	Non-reversible	Non-reversible
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated	Yes	
Cumulative impact: Loss of a limited number of similar features in the larger landscape.		

**8.2 Mitigation measures**

*Mitigation: means to anticipate and prevent negative impacts and risks, then to minimise them, rehabilitate or repair impacts to the extent feasible.*

- For the current study, the following mitigation measures are proposed.

**7.1.1 Type: Chance finds Stone Age material****Mitigation**

(5) No further action required: This is applicable only where sites or features have been rated to be of such low significance that it does not warrant further documentation, as it is viewed to be fully documented after inclusion in this report.

**7.3.1.1 – 7.3.1.7 Type: Burial sites****Mitigation**

(1) Avoidance/Preserve: This is viewed to be the primary form of mitigation and applies where any type of development occurs within a formally protected or significant or sensitive heritage context and is likely to have a high negative impact. This measure often includes the change / alteration of development planning and therefore impact zones in order not to impact on resources.

- If it is decided to retain the burial site, it should be fenced off permanently by means of a wire fence or brick wall, with a buffer zone of at least 100m.

#### Requirements

In the event of an impact occurring on the identified burial site, a permit for mitigation and/or destruction must be obtained from SAHRA/PHRA prior to any work being carried out.

- The appropriate steps to take are indicated in Section 9 of the report, as well as in the **Management Plan: Burial Grounds and Graves, with reference to general heritage sites**, in the Addendum, Section 13.5.

#### 7.3.2.1 Type: Farmstead

##### Mitigation

(2) Archaeological investigation: This is appropriate where development occurs in a context of heritage significance and where the impact is such that it can be mitigated. Mitigation is to document the site (map and photograph) and analyse the recovered material to acceptable standards.

- This option should be implemented when it is impossible to avoid impacting on an identified site or feature.

**Requirements:** In the event of an impact occurring on the identified site or feature, a permit for mitigation and/or destruction must be obtained from SAHRA/PHRA prior to any work being carried out.

#### 7.3.2.2 Type: Asbestos mine

##### Mitigation

(1) Avoidance: This site should be avoided for reasons other than its possible heritage value, i.e. the potential health hazard that asbestos pollution poses.

**Requirements:** In the event of an impact occurring on the identified site or feature, a permit for mitigation and/or destruction must be obtained from SAHRA/PHRA prior to any work being carried out.

## 9. MANAGEMENT MEASURES

Heritage sites are fixed features in the environment, occurring within specific spatial confines. Any impact upon them is permanent and non-reversible. Those resources that cannot be avoided and that are directly impacted by the proposed development can be excavated/recorded and a management plan can be developed for future action. Those sites that are not impacted on can be written into the management plan, whence they can be avoided or cared for in the future.

Sources of risk were considered with regards to development activities defined in Section 2(viii) of the NHRA that may be triggered and are summarised in Table 2A and 2B below. These issues formed the basis of the impact assessment described. The potential risks are discussed according to the various phases of the project below.

### 9.1 Objectives

- Protection of archaeological, historical and any other site or land considered being of cultural value within the project boundary against vandalism, destruction and theft.

- The preservation and appropriate management of new discoveries in accordance with the NHRA, should these be discovered during construction activities.

The following shall apply:

- Known sites should be clearly marked in order that they can be avoided during construction activities.
- The contractors and workers should be notified that archaeological sites might be exposed during the construction activities.
- Should any heritage artefacts be exposed during excavation, work on the area where the artefacts were discovered, shall cease immediately and the Environmental Control Officer shall be notified as soon as possible;
- All discoveries shall be reported immediately to a heritage practitioner so that an investigation and evaluation of the finds can be made. Acting upon advice from these specialists, the Environmental Control Officer will advise the necessary actions to be taken;
- Under no circumstances shall any artefacts be removed, destroyed or interfered with by anyone on the site; and
- Contractors and workers shall be advised of the penalties associated with the unlawful removal of cultural, historical, archaeological or palaeontological artefacts, as set out in the National Heritage Resources Act (Act No. 25 of 1999), Section 51. (1).

## 9.2 Control

In order to achieve this, the following should be in place:

- A person or entity, e.g. the Environmental Control Officer, should be tasked to take responsibility for the heritage sites and should be held accountable for any damage.
- Known sites should be located and isolated, e.g. by fencing them off. All construction workers should be informed that these are no-go areas, unless accompanied by the individual or persons representing the Environmental Control Officer as identified above.
- In areas where the vegetation is threatening the heritage sites, e.g. growing trees pushing walls over, it should be removed, but only after permission for the methods proposed has been granted by SAHRA. A heritage official should be part of the team executing these measures.

**Table 2A: Construction Phase: Environmental Management Programme for the project**

<b>Action required</b>	Protection of heritage sites, features and objects		
<b>Potential Impact</b>	The identified risk is damage or changes to resources that are generally protected in terms of Sections 27, 28, 31, 32, 34, 35, 36 and 37 of the NHRA that may occur in the proposed project area.		
<b>Risk if impact is not mitigated</b>	Loss or damage to sites, features or objects of cultural heritage significance		
<b>Activity / issue</b>	<b>Mitigation: Action/control</b>	<b>Responsibility</b>	<b>Timeframe</b>
1. Removal of Vegetation 2. Construction of required infrastructure, e.g. access roads, water pipelines	See discussion in Section 9.1 above	Environmental Control Officer	During construction only
<b>Monitoring</b>	See discussion in Section 9.2 above		

**Table 2B: Operation Phase: Environmental Management Programme for the project**

<b>Action required</b>	Protection of heritage sites, features and objects		
<b>Potential Impact</b>	It is unlikely that the negative impacts identified for pre-mitigation will occur if the recommendations are followed.		
<b>Risk if impact is not mitigated</b>	Loss or damage to sites, features or objects of cultural heritage significance		
<b>Activity / issue</b>	<b>Mitigation: Action/control</b>	<b>Responsibility</b>	<b>Timeframe</b>
1. Removal of Vegetation 2. Construction of required infrastructure, e.g. access roads, water pipelines	See discussion in Section 9.1 above	Environmental Control Officer	During construction only
<b>Monitoring</b>	See discussion in Section 9.2 above		

## 10. CONCLUSIONS AND RECOMMENDATIONS

This report describes the methodology used, the limitations encountered, the heritage features that were identified and the recommendations and mitigation measures proposed relevant to this. The HIA consisted of a desktop study (archival sources, database survey, maps and aerial imagery) and a physical survey that included the interviewing of relevant people. It should be noted that the implementation of the mitigation measures is subject to SAHRA/PHRA's approval.

The cultural landscape qualities of the region are made up of a pre-colonial element consisting of Stone Age and a much later colonial (farmer) component, which eventually also gave rise to an industrial (mining) component which manifest in a number of sites spread across the larger landscape.

### Identified sites

During the survey, the following sites, features or objects of cultural significance were identified.

- 7.1.1 Change finds: A very low number of stone tools dating mostly to the Middle Stone Age have been identified as surface material.
- 7.3.1.1 – 7.3.1.7 Burial sites: A total of seven burial sites were identified. All the sites are known to current land owners, although it seems as if visitation by descendants is very limited.
- 7.3.2.1 Farmstead: A single farmstead was identified that is older than sixty years. It is built in a style that is commonly referred to as Karoo style. It is abandoned and is falling apart.
- 7.3.2.2 Old mine where asbestos was mined – probably Crocidolite, as it is very distinctive blue in colour and is visible in the spoil heaps at the processing plant. The site was probably abandoned during the early 1960s.

### Impact assessment and proposed mitigation measures

Impact analysis of cultural heritage resources under threat of the proposed prospecting activities is based on the present understanding of the project:

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.1.1	Archaeological resources	Section 35	Generally protected 4C: Low significance - Requires no further recording before destruction.	Low (14) Low (14)
<b>Mitigation:</b> (5) No further action required				

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.1.1 – 7.3.1.7	Graves, Cemeteries and Burial Grounds	Section 36	Generally protected 4A: High / Medium significance	Medium (36) Low (16)

**Mitigation:** (1) Avoidance/Preserve: A minimum buffer of 100m must be established around the burial sites for the duration of the prospecting/mining phase.

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.2.1	Structures older than 60 years	Section 34	Generally protected 4B: Medium significance	Low (20)
				Low (12)

**Mitigation:** (2) Archaeological investigation: This option should be implemented when it is impossible to avoid impacting on an identified site or feature.

Site No.	Site type	NHRA category	Field rating	Impact rating: Before/After mitigation
7.3.2.2	Structures older than 60 years	Section 34	Generally protected 4B: Medium significance	Low (20)
				Low (12)

**Mitigation:** (2) Archaeological investigation: This option should be implemented when it is impossible to avoid impacting on an identified site or feature.

### Legal requirements

- The legal requirements related to heritage specifically are specified in Section 3 of this report. For this proposed project, the assessment has determined that sites, features or objects of heritage significance occur in the project area, therefore various permits, depending on the type of site to be impacted on would be required.
- If heritage features are identified during prospecting activities, as stated in the management recommendation, these finds would have to be assessed by a specialist, after which a decision will be made regarding the application for relevant permits.

### Reasoned opinion as to whether the proposed activity should be authorised:

- From a heritage point of view, it is recommended that the proposed prospecting activities be allowed to continue on acceptance of the proposed mitigation measures and the conditions proposed below.

### Conditions for inclusion in the environmental authorisation:

- The Palaeontological Sensitivity Map (<https://sahris.sahra.org.za/map/palaeo>) indicate that the project area has a rather complex geological make-up, with large sections either having a moderate or high possibility of fossil remains to be found and therefore it is recommended that a desktop palaeontological assessment should be done.
- Should archaeological sites or graves be exposed during prospecting work, it must immediately be reported to a heritage practitioner so that an investigation and evaluation of the finds can be made.

## **12. ADDENDUM**

---

### **1. Indemnity and terms of use of this report**

The findings, results, conclusions and recommendations given in this report are based on the author's best scientific and professional knowledge as well as available information. The report is based on survey and assessment techniques which are limited by time and budgetary constraints relevant to the type and level of investigation undertaken and the author reserve the right to modify aspects of the report including the recommendations if and when new information may become available from ongoing research or further work in this field, or pertaining to this investigation.

Although all possible care is taken to identify all sites of cultural importance during the investigation of project areas, it is always possible that hidden or sub-surface sites could be overlooked during the study. The author of this report will not be held liable for such oversights or for costs incurred as a result of such oversights.

Although the author exercises due care and diligence in rendering services and preparing documents, he accepts no liability and the client, by receiving this document, indemnifies the author against all actions, claims, demands, losses, liabilities, costs, damages and expenses arising from or in connection with services rendered, directly or indirectly by the author and by the use of the information contained in this document.

This report must not be altered or added to without the prior written consent of the author. This also refers to electronic copies of this report which are supplied for the purposes of inclusion as part of other reports, including main reports. Similarly, any recommendations, statements or conclusions drawn from or based on this report must make reference to this report. If these form part of a main report relating to this investigation or report, this report must be included in its entirety as an appendix or separate section to the main report.

## 2. Assessing the significance of heritage resources and potential impacts

A system for site grading was established by the NHRA and further developed by the South African Heritage Resources Agency (SAHRA 2007) and has been approved by ASAPA for use in southern Africa and was utilised during this assessment.

### 2.1 Significance of the identified heritage resources

According to the NHRA, Section 2(vi) the **significance** of a heritage sites and artefacts is determined by it aesthetic, architectural, historical, scientific, social, spiritual, linguistic or technical value in relation to the uniqueness, condition of preservation and research potential. It must be kept in mind that the various aspects are not mutually exclusive, and that the evaluation of any site is done with reference to any number of these.

#### Matrix used for assessing the significance of each identified site/feature

1. SITE EVALUATION				
<b>1.1 Historic value</b>				
Is it important in the community, or pattern of history				
Does it have strong or special association with the life or work of a person, group or organisation of importance in history				
Does it have significance relating to the history of slavery				
<b>1.2 Aesthetic value</b>				
It is important in exhibiting particular aesthetic characteristics valued by a community or cultural group				
<b>1.3 Scientific value</b>				
Does it have potential to yield information that will contribute to an understanding of natural or cultural heritage				
Is it important in demonstrating a high degree of creative or technical achievement at a particular period				
<b>1.4 Social value</b>				
Does it have strong or special association with a particular community or cultural group for social, cultural or spiritual reasons				
<b>1.5 Rarity</b>				
Does it possess uncommon, rare or endangered aspects of natural or cultural heritage				
<b>1.6 Representivity</b>				
Is it important in demonstrating the principal characteristics of a particular class of natural or cultural places or objects				
Importance in demonstrating the principal characteristics of a range of landscapes or environments, the attributes of which identify it as being characteristic of its class				
Importance in demonstrating the principal characteristics of human activities (including way of life, philosophy, custom, process, land-use, function, design or technique) in the environment of the nation, province, region or locality.				
<b>2. Sphere of Significance</b>		High	Medium	Low
International				
National				
Provincial				
Regional				
Local				
Specific community				
<b>3. Field Register Rating</b>				
1.	National/Grade 1: High significance - No alteration whatsoever without permit from SAHRA			
2.	Provincial/Grade 2: High significance - No alteration whatsoever without permit from provincial heritage authority.			
3.	Local/Grade 3A: High significance - Mitigation as part of development process not advised.			

4.	Local/Grade 3B: High significance - Could be mitigated and (part) retained as heritage register site	
5.	Generally protected 4A: High/medium significance - Should be mitigated before destruction	
6.	Generally protected 4B: Medium significance - Should be recorded before destruction	
7.	Generally protected 4C: Low significance - Requires no further recording before destruction	

## 2.2 Significance of the anticipated impact on heritage resources

All impacts identified during the HIA stage of the study will be classified in terms of their significance. Issues would be assessed in terms of the following criteria:

### Nature of the impact

A description of what causes the effect, what will be affected and how it will be affected.

### Extent

The physical **extent**, wherein it is indicated whether:

- 1 - The impact will be limited to the site;
- 2 - The impact will be limited to the local area;
- 3 - The impact will be limited to the region;
- 4 - The impact will be national; or
- 5 - The impact will be international.

### Duration

Here it should be indicated whether the lifespan of the impact will be:

- 1 - Of a very short duration (0–1 years);
- 2 - Of a short duration (2-5 years);
- 3 - Medium-term (5–15 years);
- 4 - Long term (where the impact will persist possibly beyond the operational life of the activity); or
- 5 - Permanent (where the impact will persist indefinitely).

### Magnitude (Intensity)

The magnitude of impact, quantified on a scale from 0-10, where a score is assigned:

- 0 - Small and will have no effect;
- 2 - Minor and will not result in an impact;
- 4 - Low and will cause a slight impact;
- 6 - Moderate and will result in processes continuing but in a modified way;
- 8 - High, (processes are altered to the extent that they temporarily cease); or
- 10 - Very high and results in complete destruction of patterns and permanent cessation of processes.

### Probability

This describes the likelihood of the impact actually occurring and is estimated on a scale where:

- 1 - Very improbable (probably will not happen);
- 2 - Improbable (some possibility, but low likelihood);
- 3 - Probable (distinct possibility);
- 4 - Highly probable (most likely); or
- 5 - Definite (impact will occur regardless of any prevention measures).

### Significance

The significance is determined through a synthesis of the characteristics described above (refer to the formula below) and can be assessed as low, medium or high:

$S = (E+D+M) \times P$ ; where

S = Significance weighting

E = Extent  
 D = Duration  
 M = Magnitude  
 P = Probability

Significance of impact		
Points	Significant Weighting	Discussion
< 30 points	Low	Where this impact would not have a direct influence on the decision to develop in the area.
31-60 points	Medium	Where the impact could influence the decision to develop in the area unless it is effectively mitigated.
> 60 points	High	Where the impact must have an influence on the decision process to develop in the area.

### Confidence

This should relate to the level of confidence that the specialist has in establishing the nature and degree of impacts. It relates to the level and reliability of information, the nature and degree of consultation with I&AP's and the dynamic of the broader socio-political context.

- High, where the information is comprehensive and accurate, where there has been a high degree of consultation and the socio-political context is relatively stable.
- Medium, where the information is sufficient but is based mainly on secondary sources, where there has been a limited targeted consultation and socio-political context is fluid.
- Low, where the information is poor, a high degree of contestation is evident and there is a state of socio-political flux.

### Status

- The status, which is described as either positive, negative or neutral.

### Reversibility

- The degree to which the impact can be reversed.

### Mitigation

- The degree to which the impact can be mitigated.

Irreplaceable loss of resources?		
Can impacts be mitigated		

### 3. Mitigation measures

- *Mitigation: means to anticipate and prevent negative impacts and risks, then to minimise them, rehabilitate or repair impacts to the extent feasible.*

Impacts can be managed through one or a combination of the following mitigation measures:

- Avoidance
- Investigation (archaeological)
- Rehabilitation
- Interpretation
- Memorialisation
- Enhancement (positive impacts)

For the current study, the following mitigation measures are proposed, to be implemented only if any of the identified sites or features are to be impacted on by the proposed development activities:

- (1) Avoidance/Preserve: This is viewed to be the primary form of mitigation and applies where any type of development occurs within a formally protected or significant or sensitive heritage context and is likely to have a high negative impact. This measure often includes the change / alteration of development planning and therefore impact zones in order not to impact on resources. The site should be retained *in situ* and a buffer zone should be created around it, either temporary (by means of danger tape) or permanently (wire fence or built wall). Depending on the type of site, the buffer zone can vary from
  - 10 metres for a single grave, or a built structure, to
  - 50 metres where the boundaries are less obvious, e.g. a Late Iron Age site.
- (2) Archaeological investigation/Relocation of graves: This option can be implemented with additional design and construction inputs. This is appropriate where development occurs in a context of heritage significance and where the impact is such that it can be mitigated. Mitigation is to excavate the site by archaeological techniques, document the site (map and photograph) and analyse the recovered material to acceptable standards. This can only be done by a suitably qualified archaeologist.
  - This option should be implemented when it is impossible to avoid impacting on an identified site or feature.
  - This also applies for graves older than 60 years that are to be relocated. For graves younger than 60 years a permit from SAHRA is not required. However, all other legal requirements must be adhered to.
    - Impacts can be beneficial – e.g. mitigation contribute to knowledge
- (3) Rehabilitation: When features, e.g. buildings or other structures are to be re-used. Rehabilitation is considered in heritage management terms as an intervention typically involving the adding of a new heritage layer to enable a new sustainable use.
  - The heritage resource is degraded or in the process of degradation and would benefit from rehabilitation.
  - Where rehabilitation implies appropriate conservation interventions, i.e. adaptive reuse, repair and maintenance, consolidation and minimal loss of historical fabric.
    - Conservation measures would be to record the buildings/structures as they are (at a particular point in time). The records and recordings would then become the ‘artefacts’ to be preserved and managed as heritage features or (movable) objects.
    - This approach automatically also leads to the enhancement of the sites or features that are re-used.

- (4) Mitigation is also possible with additional design and construction inputs. Although linked to the previous measure (rehabilitation) a secondary though 'indirect' conservation measure would be to use the existing architectural 'vocabulary' of the structure as guideline for any new designs.
  - The following principle should be considered: **heritage informs design**.
    - This approach automatically also leads to the enhancement of the sites or features that are re-used.
  
- (5) No further action required: This is applicable only where sites or features have been rated to be of such low significance that it does not warrant further documentation, as it is viewed to be fully documented after inclusion in this report.
  - Site monitoring during development, by an ECO or the heritage specialist are often added to this recommendation in order to ensure that no undetected heritage/remains are destroyed.

#### **4. Relocation of graves**

If the graves are younger than 60 years, an undertaker can be contracted to deal with the exhumation and reburial. This will include public participation, organising cemeteries, coffins, etc. They need permits and have their own requirements that must be adhered to.

If the graves are older than 60 years old or of undetermined age, an archaeologist must be in attendance to assist with the exhumation and documentation of the graves. This is a requirement by law.

Once it has been decided to relocate particular graves, the following steps should be taken:

- Notices of the intention to relocate the graves need to be put up at the burial site for a period of 60 days. This should contain information where communities and family members can contact the developer/archaeologist/public-relations officer/undertaker. All information pertaining to the identification of the graves needs to be documented for the application of a SAHRA permit. The notices need to be in at least 3 languages, English, and two other languages. This is a requirement by law.
- Notices of the intention needs to be placed in at least two local newspapers and have the same information as the above point. This is a requirement by law.
- Local radio stations can also be used to try contact family members. This is not required by law, but is helpful in trying to contact family members.
- During this time (60 days) a suitable cemetery need to be identified close to the development area or otherwise one specified by the family of the deceased.
- An open day for family members should be arranged after the period of 60 days so that they can gather to discuss the way forward, and to sort out any problems. The developer needs to take the families requirements into account. This is a requirement by law.
- Once the 60 days has passed and all the information from the family members have been received, a permit can be requested from SAHRA. This is a requirement by law.
- Once the permit has been received, the graves may be exhumed and relocated.
- All headstones must be relocated with the graves as well as any items found in the grave.

#### **Information needed for the SAHRA permit application**

- The permit application needs to be done by an archaeologist.
- A map of the area where the graves have been located.
- A survey report of the area prepared by an archaeologist.
- All the information on the families that have identified graves.
- If graves have not been identified and there are no headstones to indicate the grave, these are then unknown graves and should be handled as if they are older than 60 years. This information also needs to be given to SAHRA.
- A letter from the landowner giving permission to the developer to exhume and relocate the graves.
- A letter from the new cemetery confirming that the graves will be reburied there.
- Details of the farm name and number, magisterial district and GPS coordinates of the gravesite.

## 5. Curriculum vitae

### Johan Abraham van Schalkwyk

#### Personal particulars

Date of birth: 14 April 1952  
Identity number: 520414 5099 08 4  
Marital status: Married; one daughter  
Nationality: South African

#### Current address: home

62 Coetzer Ave, Monument Park, Pretoria, 0181  
Mobile: 076 790 6777; E-mail: jvschalkwyk@mweb.co.za

#### Qualifications

1995 DLitt et Phil (Anthropology), University of South Africa  
1985 MA (Anthropology), University of Pretoria  
1981 BA (Hons), Anthropology, University of Pretoria  
1979 Post Graduate Diploma in Museology, University of Pretoria  
1978 BA (Hons), Archaeology, University of Pretoria  
1976 BA, University of Pretoria

#### Non-academic qualifications

12th HSRC-School in Research Methodology - July 1990  
Dept. of Education and Training Management Course - June 1992  
Social Assessment Professional Development Course - 1994  
Integrated Environmental Management Course, UCT - 1994

#### Professional experience

Private Practice  
2017 - current: Professional Heritage Consultant

8. Grant by the National Research Foundation to develop a model for community-based tourism - 2013. In association with RARI, Wits University.

**Publications**

Published more than 70 papers, mostly in scientifically accredited journals, but also as chapters in books.

**Conference Contributions**

Regularly presented papers at conferences, locally as well as internationally, on various research topics, ranging in scope from archaeology, anthropological, historical, cultural historical and tourism development.

**Heritage Impact Assessments**

Since 1992, I have done more than 2000 Phase 1 and Phase 2 impact assessments (archaeological, anthropological, historical and social) for various government departments and developers. Projects include environmental management frameworks, roads, pipeline-, and power line developments, dams, mining, water purification works, historical landscapes, refuse dumps and urban developments.
