| 1 | RJ Scheepers | I have concerns about operational facility. Landfill Site/Dump Site as follows: A: Site not sealed B: Not controlled C: Material falling off vehicles onto roads through Henley D: Site is on residential one stands/plots E: Rubbish is dumped right next to (Henley on top of graves) F: Rat and Fly problem unbearable G: Council and Private Vehicles use road as a drag strip H: Water Contamination - Borehole water deterioration I: Workers and Vandals inhabit this site and adjacent; causing break-ins and drunkenness on road leading to dump. I would like a draft Basic Assessment Report | The purpose of the application to close the facility is to address the concerns that the residents at HOK have raised. The facility is underlain by dolomite and its positioned along the water course. The closure and end use plan will form part of the license application and will recommend environmental remedies and monitoring. The municipality will comply with conditions of license to ensure that the environmental issues raised are addressed. | The municipality has started the closure process to address the environmental impacts associated with the landfill facility. Mitigation measures in the Draft BAR addresses these issues. | No further comments received | - | - |
| 2 | Lesley Hoy | I would like to see what is planned for the closure. How the Ground water will be monitored. How the sight will be rehabilitated. What about future gas and other emission monitoring? How local residents (I am one living two streets away) will be affected or not? Also what alternative sites are being opened? When is the closure being envisaged? What will the site be used for later? One long term benefit is that it will reduce the traffic in our area and the rubbish that people allow to drop off their vehicles and not pick it up later. | The purpose of the application to close the facility is to address the concerns that the residents at HOK have raised. The facility is underlain by dolomite and its positioned along the water course. The closure and end use plan will form part of the license application and will recommend environmental remedies and monitoring. The municipality will comply with conditions of license to ensure that the environmental issues raised are addressed. | Dates for closure falls outside of the scope of the BAR, all other issues addressed. As indicated in the landfill closure report: "To minimise ingress of rain and storm water in to the waste material at the landfill site, it is recommended that an impervious cover be installed to cover the waste at the site and that any leachates and run-off water be collected in lined ponds. By keeping the waste deposited at this site in the past as dry as possible the chances of pollutants originating from this source can be minimised." Existing boreholes will be monitored and it is recommended that 2 more boreholes are drilled for monitoring. Due to the nature of the waste disposed landfill gas volumes escaping from the landfill directly to the atmosphere would be fairly insignificant and would disperse ,especially on a small site like the H-o-K landfill site | No further comments received | - | - |
| 3 | Joy Kirsten | | | | When is closure being envisaged? What is proposed future use? Would garden refuse (for compost) be allowed? The buildings and the site would be able to be used as a sorting station for recycling | The municipality plan to start the closure process as soon as approval has been received from the Gauteng Dept (GDARD) for this application. The municipality will investigate the viability of keeping the transfer station operational for the community and converting the existing building into a sorting and recycling facility. The rest of the landfill will be a "No Use" facility. | Dates for closure falls outside of the scope of the BAR. Garden refuse will be allowed at the transfer station if the municipality receive approval (Licence) to operate a transfer station. |

| 5 | Mr. Abie Greyling | Yes, I do have concerns about the operational facility. I stay on c/n Windsor & Eaton Street, All vehicles and trucks are passing my property. A truck already damaged our corner post (cost R4500.00) to repair. All of Meyerton, and surrounding areas domestic and industrial waste are passing through in a residential(our) area. Constant rubbish and natural debris(Trees, Branches) are polluting our route along from Meyerton to dump site, which are not cleaned on a regular basis. Lastly the noise pollution of all the trucks and vehicles are very disturbing for a residential area. I would like to request the draft Basic Assessment Report | The purpose of the application to close the facility is to address the concerns that the residents at HOK have raised. The facility is underlain by dolomite and its positioned along the water course. The closure and end use plan will form part of the license application and will recommend environmental remedies and monitoring. The municipality will comply with conditions of license to ensure that the environmental issues raised are addressed. | The closure process will start once approval for the closure application has been received from GDARD. The vehicles transporting the waste will reduce after closure. The Municipality will investigate the viability to use the site as a transfer station for the community and to convert the existing building into a sorting and recycling facility. Mitigation measures in the Draft BAR addresses these issues. | No further comments received | - | - |
| 6 | Rosalie Jennifer Evans | Yes, I do have concerns about the operational facility. 1. Large number of rats in the area. 2. Infestation of flies. 3. Heavy vehicles constantly using roads. I would like to request the draft Basic Assessment Report | The purpose of the application to close the facility is to address the concerns that the residents at HOK have raised. The facility is underlain by dolomite and its positioned along the water course. The closure and end use plan will form part of the license application and will recommend environmental remedies and monitoring. The municipality will comply with conditions of license to ensure that the environmental issues raised are addressed. | The closure process will start once approval for the closure application has been received from GDARD. The vehicles transporting the waste will reduce after closure. The Municipality will investigate the viability to use the site as a transfer station for the community and to convert the existing building into a sorting and recycling facility. Mitigation measures in the Draft BAR addresses these issues. | No further comments received | - | - |
