EXECUTIVE SUMMARY

The purpose of this study was to establish if any heritage sites were present on a portion of the farm Naaupoort 144 near Niekerkshoop, Karoo District Municipality, Northern Cape. Within the ca. 20 ha area that was examined, Precambrian jaspillite with Tigers Eye lenses was noted to be thinly covered by reddish sand with occasional artefacts. No sites, fossil bones or graves were seen and it is consequently considered that envisaged further open cast digging there will have no impact on the heritage resources of the Northern Cape.

BACKGROUND INFORMATION

Tigers Eye is a highly silicified form of asbestos that is, in South Africa, largely confined to ~2.4 billion year – old Asbestos Hills Banded Ironstone Formation (Kent 1980) outcrops between Griquatown and Prieska. On the farm Naauwpoort 144 it occurs in the form of thin and discontinuous lenses in banded ironstone or jaspilite beds which occur on the crest of flat – topped hills covering its central portion (Fig. 1). This study is part of an EMP that is being prepared by Adriaan du Toit for the farm owner, Mr. G. de Witt.

LOCAL ARCHAEOLOGY

The McGregor Museum has a small collection (MMK 1130) of Acheulean handaxes, based on jaspilite, from Griquatown (Goodwin & van Riet Lowe 1929). There is also an extensive handaxe site overlying old river gravels flanking a meander of the Orange River some 10 km upstream of Prieska, according to Adriaan du Toit. However, to my knowledge, no Stone Age localities have as yet been found in the broad vicinity of Niekerkshoop.

PROPERTY DESCRIPTION

The area, ca. 20 ha in extent, that was examined is on the farm Naauwpoort 144, in the Karoo District Municipality about 14 km north – east of Niekerkshoop. It is situated on the crest of flat – topped hills in the southern Asbesberge, centred on 29° 11' 59" S, 22° 58' 23" E , as shown on the appended 1:50,000 map 2922 BB Springfield (Fig 1). About 40 min was spent walking over this area on Wednesday 15 November 2006.

SUPERFICIAL GEOLOGY

The area was pocked by pits, a few of them large, where thin discontinuous lenses of Tigers Eye in the jaspilite had been followed downwards by mechanical means (Fig.

2). Overlying the jaspilite was a generally thin (0 – 10 cm) covering of rubble and / or beige - reddish sand that forms the modern surface.

HERITAGE FINDINGS

My search within the inspected area produced four jaspilite artefacts with slightly smoothed surfaces, namely three flakes and a core (Fig. 3). These, like the sample from nearby Blouboskuil 380, most possibly fall within the ESA. No actual sites, palaeontological bones or graves were seen.

CONCLUSIONS

The inspected area showed a low between – site lithic scatter on or in the thin surface sands, but no sign of a significant heritage occurrence. My conclusion is therefore that the further mining of Tigers Eye there will have no impact on the heritage resources of the Northern Cape. I note also that the mining of Tigers Eye is one of the few potential jobs for the many unemployed people in Niekerkshoop.
