Re: Brockwell Mine Closure

I have undertaken a desktop survey of the area to be affected by the Brockwell Mine Closure. No known archaeological sites exist in the affected area and it appears as if the area has low archaeological sensitivity. This means that it is unlikely to find an archaeological site of such significance to warrant further mitigation and/or survey. Any site that may exist is probably of low significance and would thus not require further mitigation.

If any stone-walling does exist in the affected area, that did not occur on the maps, then archaeological mitigation may be required.

Yours sincerely
