- So, an earth panel needs to be earthed in the earth pit. All other parts need three physical electrical connections with the earth panel, initiated by the following connections:
- Interference systems – buses and cables; E.g. put twisted screen cable per lift for lift hardware, from lift controller to the required motor or return location to be supplied and protected. If a solid-state system is specified, a connection has to be supplied and protected. If a solid-state system is specified, a connection has to be supplied and protected. If a solid-state system is specified, a connection has to be supplied and protected.
 - Lifts can be held stable for any suspension cable, for the system.
 - E.g. Emergency operation or the installation under emergency power conditions are specified. It is agreed that the bidder will provide the lift controller with the necessary equipment and software to ensure the required operation, with the power supply and distribution of the emergency standby generator with a voltage free contact at the lift controller to be supply by the customer.
