1. IMPORTANT NOTICE

In terms of the Mineral and Petroleum Resources Development Act (Act 28 of 2002 as amended), the Minister must grant a mining or mining right if among others the mining will not result in unacceptable pollution, ecological degradation or damage to the environment.

Unless an Environmental Authorisation can be granted following the evaluation of an Environmental Impact Assessment and an Environmental Management Programme report in terms of the National Environmental Management Act (Act 107 of 1998) (NEMA), it cannot be concluded that the said activities will not result in unacceptable pollution, ecological degradation or damage to the environment.

In terms of section 16(3)(b) of the EIA Regulations, 2014, any report submitted as part of an application must be prepared in a format that may be determined by the Competent Authority and in terms of section 17 (1) (c) the competent Authority must check whether the application has taken into account any minimum requirements applicable or instructions or guidance provided by the competent authority to the submission of applications.

It is therefore an instruction that the prescribed reports required in respect of applications for an environmental authorisation for listed activities triggered by an application for a right or a permit are submitted in the exact format of, and provide all the information required in terms of, this template. Furthermore please be advised that failure to submit the information required in the format provided in this template will be regarded as a failure to meet the requirements of the Regulation and will lead to the Environmental Authorisation being refused.

It is furthermore an instruction that the Environmental Assessment Practitioner must process and interpret his/her research and analysis and use the findings thereof to compile the information required herein. (Unprocessed supporting information may be attached as appendices). The EAP must ensure that the information required is placed correctly in the relevant sections of the Report, in the order, and under the provided headings as set out below, and ensure that the report is not cluttered with un-interpreted information and that it unambiguously represents the interpretation of the applicant.

2. OBJECTIVE OF THE ENVIRONMENTAL IMPACT ASSESSMENT PROCESS

The objective of the environmental impact assessment process is to, through a consultative process—

- (a) determine the policy and legislative context within which the activity is located and document how the proposed activity complies with and responds to the policy and legislative context;
- (b) describe the need and desirability of the proposed activity, including the need and desirability of the activity in the context of the preferred location;
- (c) identify the location of the development footprint within the preferred site based on an impact and risk assessment process inclusive of cumulative impacts and a ranking process of all the identified development footprint alternatives focusing on the geographical, physical, biological, social, economic, heritage and cultural aspects of the environment;
- (d) determine the--
 - (i) nature, significance, consequence, extent, duration and probability of the impacts occurring to inform identified preferred alternatives; and
 - (ii) degree to which these impacts-
 - (aa) can be reversed;
 - (bb) may cause irreplaceable loss of resources, and
 - (cc) can be avoided, managed or mitigated;
- (e) identify the most ideal location for the activity within the preferred site based on the lowest level of environmental sensitivity identified during the assessment;
- (f) identify, assess, and rank the impacts the activity will impose on the preferred location through the life of the activity;
- (g) identify suitable measures to manage, avoid or mitigate identified impacts; and
- (h) identify residual risks that need to be managed and monitored.

PROJECT DETAILS

Name of Project:	Remainder and Portion 1 of the Farm Damplaats 319			
Mining Right:	FS 10073 MR

PART A

SCOPE OF ASSSSMENT AND ENVIRONMENTAL IMPACT ASSESSMENT REPORT

3. CONTACT PERSON AND CORRESPONDENCE ADDRESS

a) Details of

i.Details of the EAP

Name of the Practitioner: Tshimangadzo Mulaudzi
Tel No.: 079 362 6046
Fax No.: 086 556 2568

E-mail address: mulaudzit@engedime.com

ii. Expertise of the EAP

(1) The qualifications of the EAP

(with evidence).

Tshimangadzo hold an Honours Degree in Mining and Environmental Geology from the University of Venda. Have since been working as an environmental geologist and environmental practitioner. He has 5 years' experience in Environmental Science, 3 years' experience in Geology, and 5 years' experience in public participation.

(2) Summary of the EAP's past experience.

(In carrying out the Environmental Impact Assessment Procedure)

Tshimangadzo has been carrying out Environmental Impact Assessment Procedure since 2012, managing a construction company called Tshedza Concrete Art in Limpopo Province, Makhado town.

In 2014, he joined a large mining consulting company in Kimberly called Breeze Court Investments 47 (Pty) Ltd (Geologist and Mining Consulting firm). This is where Mr Mulaudzi acquired in-depth experience and know how in the mining consulting business by assisting the large to small scale mining companies to obtain mining right, mining rights, mining permits, technical co-operate permits, reconnaissance permits, exploration rights, production rights, integrated water use license, and environmental authorisation among other licenses. Tshimangadzo has five years working experience in environmental management, geology and public participation process.

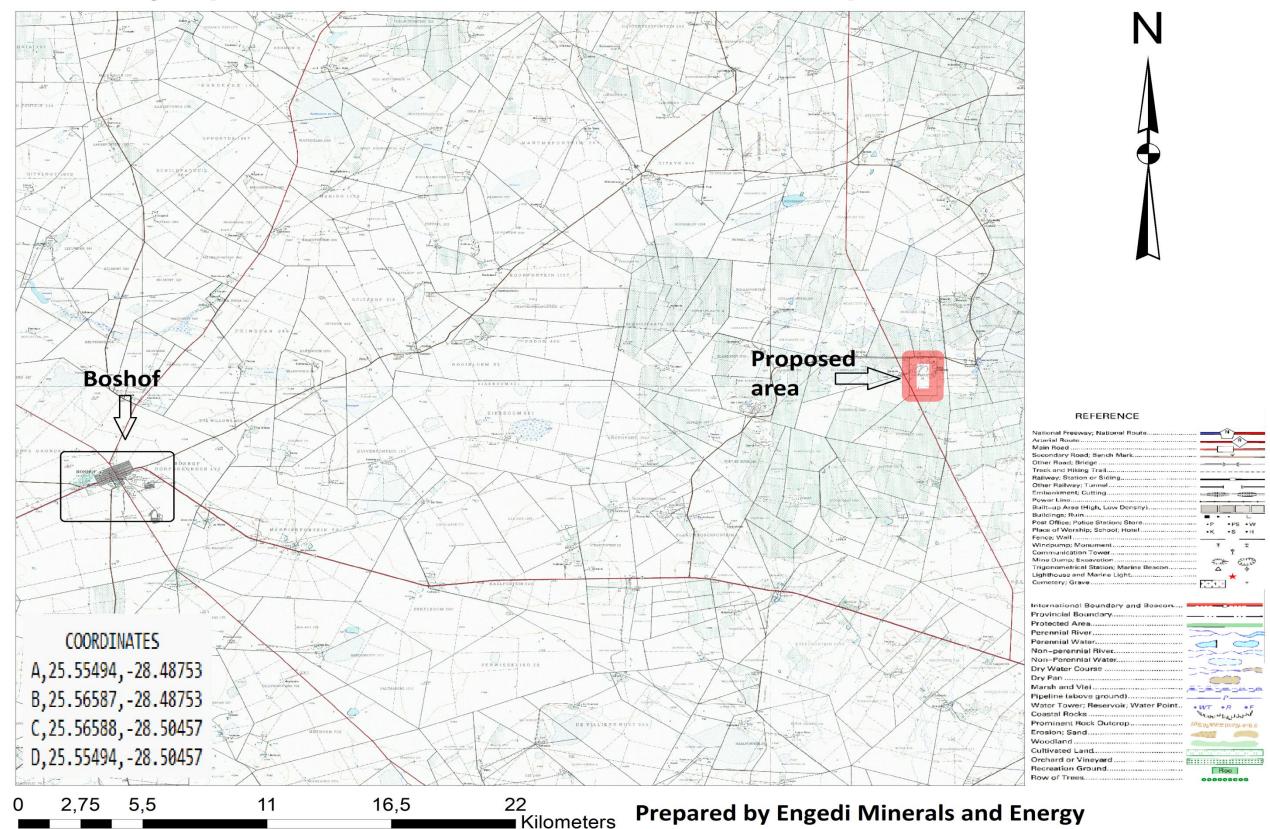

b) Description of the property

Farm Name:	Remainder and Portion 1 of the Farm Damplaats 319
Application area (Ha)	200 Ha
Magisterial district:	Boshof
Distance and direction from nearest town	32 km south east of Dealesville on the R59/R64, 40 km south from Hertzogville on the R59 and 50km west of Boshof on the R64
21 digit Surveyor General Code for each farm portion	F0040000000031900000 F0040000000031900001

c) Locality map

(shows nearest town, scale not smaller than 1:250000 attached as Appendix 2).

Locality Map of the Remainder and Portion 1 of the Farm Damplaats 319

d) Description of the scope of the proposed overall activity

(Provide a plan drawn to a scale acceptable to the competent authority but not less than 1: 10 000 that shows the location, and area (hectares) of all the aforesaid main and listed activities, and infrastructure to be placed on site)

Mining Right

The activity is for the mining right which will involve the mining of diamond (general), diamond (kimberlite) and stone aggregate at the proposed area. The activities include the dredging or removal of gravel, mechanically removing the diamondiferous gravel through excavation. The gravel will be stockpiled and screened.

The topsoil and overburden (if occurring above the diamond containing gravel and other commodities) will be removed with a front-end loader prior to extraction of diamond containing gravel. The gravel will be screened for diamonds and then backfilled into the open trenches before topsoil will be replaced for land rehabilitation. A rotary pan will be used to retrieve the diamonds. Stone aggregate that may occur will be stockpiled and removed before final rehabilitation. The mining activities will not be near a waterway or riparian zone and will only disturb grazing field. No crop fields are present in the proposed mining right footprint area.

The following equipment will be used: front end-loader, dumper and 1xChieftan screening/crushing plant

Semi Maseme is graduating their Prospecting Right.

a) Description of the scope of the proposed overall activity

i) Listed and specified activities

Provide a plan drawn to a scale acceptable to the competent authority but not less than 1: 10 000 that shows the location, and area (hectares) of all the aforesaid main and listed activities, and infrastructure to be placed on site and attach as **Appendix 4**

(E.g. For mining - drill site, site camp, ablution facility, accommodation, equipment storage, sample storage, site office, access route etc. E.g. for mining,- excavations, blasting, stockpiles, discard dumps or dams, Loading, hauling and transport, Water supply dams and boreholes, accommodation, offices, ablution, stores, workshops, processing plant, storm water control, berms, roads, pipelines, power lines, conveyors etc.)	AERIAL EXTENT OF THE ACTIVITY Ha or m²	LISTED ACTIVITY (Mark with an X where applicable or affected).	APPLICABLE LISTING NOTICE (GNR 324, GNR 325 or GNR 327)	WASTE MANAGEMENT AUTHORISATION (Indicate whether an authorisation is required in terms of the Waste Management Act). (Mark with an X)
Any activity including the operation of that activity which requires a mining right as contemplated in section 22 of the Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002), including- a) Associated infrastructure, structures and earthworks, directly related to the extraction of the mineral resource [,],; or b) [including activities for	190 Ha		Listing Notice 2 Activity No. 17	X

ii) DESCRIPTION OF THE ACTIVITIES TO BE UNDERTAKEN

(Describe Methodology or technology to be employed, and for a linear activity, a description of the route of the activity

The method of mining that will be adopted for this operation will be open cast mining. The equipment that will be required for the mining operation will be a front end loader, dump trucks, conveyor belts and washing plant. Access to the site will be controlled by means of property fence and gate. There are existing access road used to link the proposed mine dump and main road. Portable water will be obtained from the municipality, brought to the site daily and stored in a storage tank. The workforce will not reside at the premises as most of them will be from the nearby community. A chemical toilet will also be made available on site. No maintenance yard will be established since all vehicles will be maintained off site at the contractor's workshop. There will be parking space provided closer to the entrance of the mine area.

e) Policy and Legislative Context

(a desc and leg which to proposidentific policies spatial develoe frameworthat are activity	cation of all legislation, s, plans, guidelines, tools, municipal pment planning vorks and instruments e applicable to this and are to be ered in the assessment	REFERENCE WHERE APPLIED	HOW DOES THIS DEVELOPMENT COMPLY WITH AND RESPOND TO THE LEGISLATION AND POLICY CONTEXT. (E.g. in terms of the National Water Act a Water Use License has/has not been applied for)
Manag	al Environmental Jement Act (NEMA), No. 198, as amended	Section 24	In terms of the National Environmental Management Act, an application for an Environmental Authorisation has been applied for.

Regulation 982. National Environmental Management Act (Act No. 107 of 1998): Environmental Impact Assessment Regulations, 2014	Regulation 23	In terms of the NEMA EIA Regulations an Environmental Impact Assessment Report and Environmental Management Programme (EMPr) were prepared to submit to the competent authority.
Regulation 984. National Environmental Management Act (Act No. 107 of 1998): Listing notice 2: List of activities and competent authorities identified in terms of sections 24(2) and 24D	Regulation 23	In terms of NEMA EIA Regulations R.984, Listing notice 2, the activity triggers regulation 23 which refers to a mining right application and therefore needs an Environmental Authorizations to proceed as well as follow procedures as prescribed in regulation 23 of R.982 (EIA Regulations, 2014).
Mineral and Petroleum Resources Development Act (Act No. 28 of 2002)	Section 22	In terms of the MPRDA, any person who wishes to apply for a mining right must lodge the application in the prescribed manner.
Mineral and Petroleum Resources Development Amendment Act (Act No. 49 of 2008)	Section 22	In terms of the MPRDA, any person who wishes to apply for a mining right must simultaneously apply for an environmental authorization and must lodge the application to requirements contemplated by competent authority.

f) Need and desirability of the proposed activities

(Motivate the need and desirability of the proposed development including the need and desirability of the activity in the context of the preferred location).

Project need and desirability

Mining is of great importance to the South African economy. With the increasing demand in market, diamond (general), diamond (kimberlite) and stone aggregate mining has become one of the lucrative small scale mining opportunities. Not only does it meet market demand but the economic contribution to the local economy is significant. Potential impact on the social, social, cultural and environmental aspects was identified. These impacts were assessed for their effect on the social, cultural and environmental aspects. The significance of the impacts was also determined.

Mitigation measures are aimed at lessening negative consequences of the proposed mining operation. The mitigation measures include designs and management practices that will be embarked on, to prevent the identified impacts on the social, cultural and environmental aspects. For each significance identified, mitigation measures were specified. These mitigation measures are described in more detail in the environmental management programme.

Opportunities that exist within mining are as follows:

- Constant demand on the market for commodities;
- Establishment of a permanent working group between the Municipality and the mine managers responsible from developing local economic development initiative;
- Encourage local SMME's and entrepreneurs to take advantage of procurement;
- Develop a database of available labour and skills to encourage the employment of local people;
- Provide skills training and support programmes;
- Instigate mining procurement opportunities in consultation with the mines, develop a
 database of such opportunities and ensure that this information is made available to
 local businesses and communities.

For these to be achievable, investment and skills development, technology and infrastructure, as well as broadening of the supplier base, will need to be addressed. Due to the increased mechanization of mining activities, there has been an overall jobless growth within this sector. Rand volatility of late has not made things easier. The lack of diversification within the industry has led to a mainly commodity export driven industry.

Benefits of the project

Benefits of the project may include increased employment of local residents in the area, greater economic input into the area allowing better development of the towns and surrounding area, and greater socio-economic stability.

b) Period for which the environmental authorisation is required

The required period is 30 years.

g) Motivation for the preferred development footprint within the approved site including a full description of the process followed to reach the proposed development footprint within the approved site.

NB!! - This section is about the determination of the specific site layout and the location of infrastructure and activities on site, having taken into consideration the issues raised by interested and affected parties, and the consideration of alternatives to the initially proposed site layout.

- The comparison of the originally proposed site plan,
- The comparison of that plan with the plan of environmental features and current land uses, the issues raised by interested and affected parties, and
- The consideration of alternatives to the initially proposed site layout as a result

i) Details of the development footprint alternatives considered.

With reference to the site plan provided as Appendix 4 and the location of the individual activities on site, provide details of the alternatives considered with respect to:

- (a) the property on which or location where it is proposed to undertake the activity;
- (b) the type of activity to be undertaken;
- (c) the design or layout of the activity;
- (d) the technology to be used in the activity;
- (e) the operational aspects of the activity; and
- (f) the option of not implementing the activity.

If the project were not to proceed, the additional economic activity, skills development and available jobs would not be created, the reserves would remain unutilised, the current land uses and economic activities would continue as at present, with little or no economic growth developing in the region. There are currently no foreseeable significant environmental impacts that will outweigh the economic benefits that would be generated by the project; however this will be further assessed during the Environmental Impact Assessment (EIA).

If the proposed mining activities were not to proceed, mining activities would not necessarily be avoided, as another application in terms of the MPRDA (Act no. 28 of 2002) can be made by another company. Unless the government declares the area off limits to mining, mining houses will continue to attempt to mine the resources found on the property

- d) The main activity is the proposed mining of diamond (general), diamond (kimberlite) and stone aggregate.
- e) The historic land use is one of crop farming. The mining activities option will result in the continuation of such land use after rehabilitation.

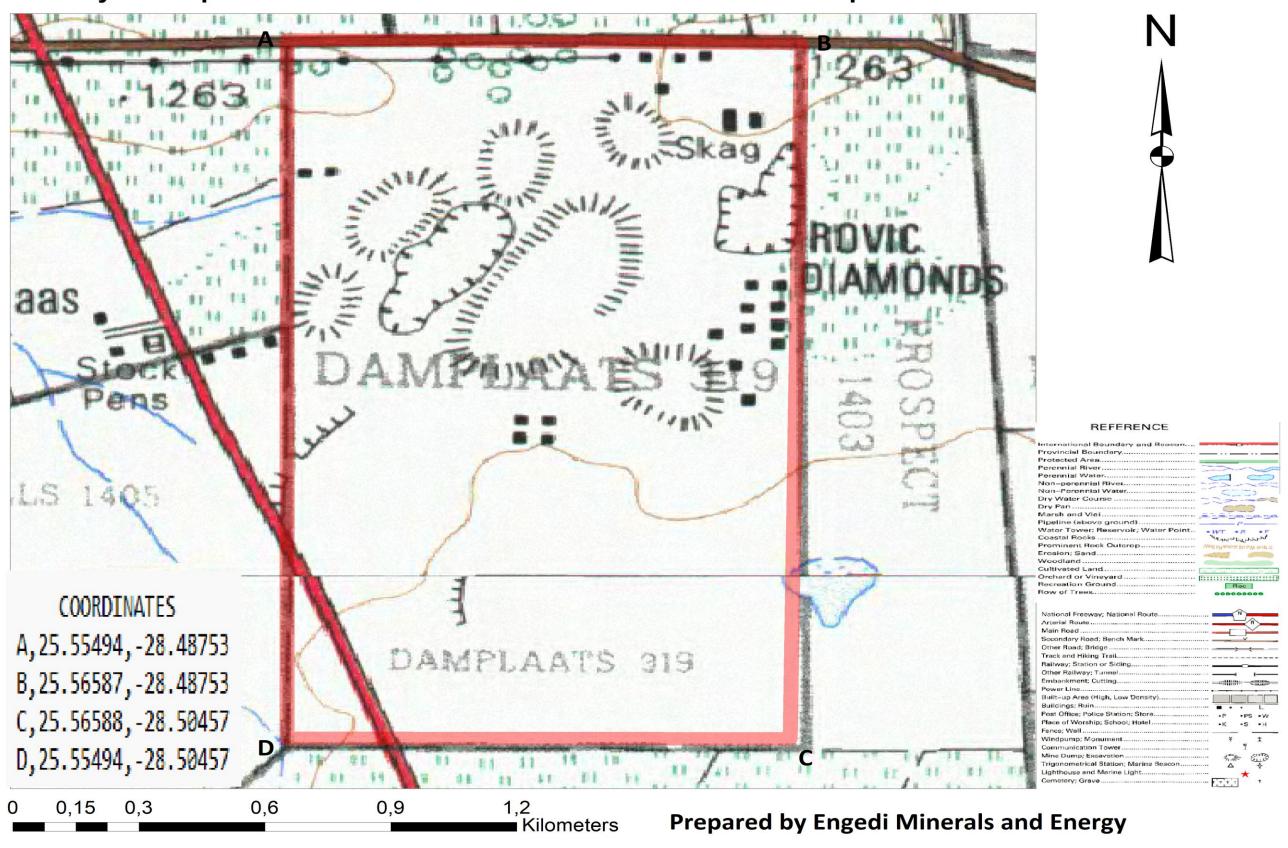

Although it could probably remain economically viable, the continuation of agriculture will not provide the level of economic growth to the area that mining activities would offer. After mine closure and rehabilitation of mined area, the land capability may return to grazing, allowing the continuance of certain agricultural practices. The mine will also promote sustainable local economic development, to give communities the skills required to remain economically viable and successful after mine closure.

If the project were not to proceed, the additional economic activity, skills development and available jobs would not be created, the diamond (general), diamond (kimberlite) and stone aggregate and reserves would remain unutilised, the current land uses and economic activities would continue as at present, with little or no economic growth developing in the region. There are currently no foreseeable significant environmental impacts that will outweigh the economic benefits that would be generated by the project; however this will be further assessed during the EIA.

If mining activities on the Farm Damplats 319 were not to proceed with the proposed project; mining activities of the diamond (general), diamond (kimberlite) and stone aggregate will not necessarily be avoided, as another application in terms of the MPRDA (Act no. 28 of 2002) can be made by another company. Unless the government declares the area off limits to mining activities, mining activities houses will continue to attempt to mine the diamond (general), diamond (kimberlite) and stone aggregate

The map above shows location proposed activities, type of activities and design or layout of activities.

Layout Map of the Remainder and Portion 1 of the Farm Damplaats 319

ii) Details of the Public Participation Process Followed

Describe the process undertaken to consult interested and affected parties including public meetings and one on one consultation. NB the affected parties must be specifically consulted regardless of whether or not they attended public meetings.(Information to be provided to affected parties must include sufficient detail of the intended operation to enable them to assess what impact the activities will have on them or on the use of their land.

Engedi Minerals was appointed by Semi Maseme TV Production CC as the independent consultant to conduct the Public Participation process as part of the EIA as stipulated in Sections 56 - 59 of the NEMA (Act no. 107 of 1998) as well as in Section 22 of the MPRDA (Act no. 28 of 2002).

As stipulated in the MPRDA (Act no. 28 of 2002) and in Regulation 49(1) (f) (MPRDA Regulation GN R527), I&APs need to be notified and consulted with, as part of an application for mining right.

Identification of Interested and Affected Parties

The following categories of stakeholders will be identified:

The landowner/s of the remaining extent and Portion 1 of the Farm
 Damplaats 319 (the area included in the Mining Right Application i.e. the site).

In addition other potential stakeholders will be identified and invited to register themselves as I&APs. This invitation will also be extended to the public by means of site notices and newspaper notices.

Landowners & lawful occupiers of the site

The title deed owners of the application area will be listed in the table below. According to the title deed ownership records, the landowners of the application area are private landowners.

FARM NAME	PORTION	EXTENT (Ha)	OWNER	TITLE DEED NUMBER
Damplaats 319	Remainder	202 3429	Kleinkor Sewentien	T4544/1925-
Damplaats 319	Portion 1			

The landowner of the application area has been informed of the proposed mining activities and the process to follow. According to information provided by the landowner of the application area, there are no communities living on the site, but it could not be established whether there are communities living on adjacent properties.

iii) Summary of issues raised by I&APs (Complete the table summarising comments and issues raised, and reaction to those responses)

^{*}The public participation report is attached as appendix 5.

- iv) The Environmental attributes associated with the sites
- (1) Baseline Environment
- (a) Type of environment affected by the proposed activity.

(Its current geographical, physical, biological, socio- economic and cultural character).

Physical environment

The environment on site relative to the environment in the surrounding area

Climate

Boshof's climate is a local steppe climate. During the year, there is little rainfall in Boshof. This location is classified as BSk by Köppen and Geiger. In Boshof, the average annual temperature is 17.1 °C. Precipitation here averages 450mm. Precipitation is the lowest in June, with an average of 6 mm. Most precipitation falls in February, with an average of 70mm. At an average temperature of 24.0 °C, January is the hottest month of the year. In July, the average temperature is 8.9 °C. It is the lowest average temperature of the whole year.

Topography and Elevation:

The regional topographical setting of the study area is classified as *Plains and Pans*. The site is located in a relatively flat/plain area with a slight rise in slope towards the south-west. The highest point is located in the south-western section of the site at an elevation of approximately 1253 m above mean sea level (mamasl), with the lowest point occurring in the north-east at an elevation of approximately 1250 mamsl.

Geology and Soils:

According to available geological information the study area is underlain by shale of the Ecca Group, Karoo Sequence with dolerite intrusions. The study area does not reflect any risk for the formation of sinkholes or subsidence caused by the presence of water-soluble rocks (dolomite or limestone). This must still be confirmed by the engineering geologist/civil engineer. The site is covered by red-yellow apedal, freely drained soils; red, high base status, > 300 mm deep (no dunes).

Biological Environment

Vegetation

This vegetation type is described as follows: "Grasslands are dominated by a single layer of grasses. The amount of cover depends on rainfall and the degree of grazing. Trees are absent, except in a few localized habitats. Geophytes are often abundant. Frosts, fire and grazing maintain the grass dominance and prevent the establishment of trees. There are two categories of grass plants: sweet grasses have lower fibre content, maintain their nutrients in the leaves in winter and are therefore palatable to stock. Sour grasses have higher fibre content and tend to withdraw their nutrients from the leaves during winter so that they are unpalatable to stock.

At higher rainfall and on more acidic soils, sour grasses prevail, with 625 mm per year taken as the level at which unpalatable grasses predominate. C4 grasses dominate throughout the biome, except at the highest altitudes where C3 grasses become prominent. It is expected due to the altitude that C4 grasses will be the dominant vegetation on this site. Grass plants tolerate grazing, fire, and even mowing, well: most produce new stems readily, using a wide variety of strategies. Overgrazing tends to increase the proportion of pioneer, creeping and annual grasses, and it is in the transition zones between sweet and sour grass dominance that careful management is required to maintain the abundance of sweet grasses.

The Grassland Biome is the mainstay of dairy, beef and wool production in South Africa. Pastures may be augmented in wetter areas by the addition of legumes and sweet grasses. The Grassland Biome is also the cornerstone of the maize crop, and many grassland types have been converted to this crop. Sorghum, wheat and sunflowers are also farmed on a smaller scale.

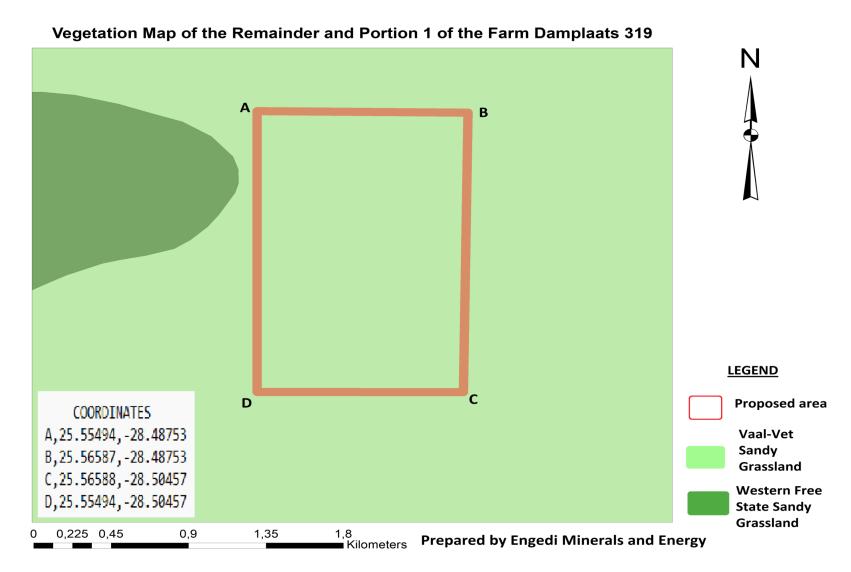

Figure 1 Vegetation Map of the area under application

Fauna

Mammals

In the Boshof area, three very different natural habitats converge: grassland, Karoo and Kalahari bushveld. Therefore, the land is suitable to accommodate a wide variety of species of game. Apart from endemic small mammals, one find springbok, blesbok, reedbuck, redbuck, eland, gemsbok, kudu, rhebuck, zebra, buffalo, deer, warthog, blue- and black wildebeest, red hartebeest, ostrich, bontebok, oribi, tsessebe, nyala and lechwe (roan waterbuck) on various farms - even rhino, giraffe, camel, lions and white lions are found on some of these farms. Some farmers stock game to complement their stock farming.

Birds

If your passion is game or bird watching, most of these farms will accommodate your every wish, as the Boshof district can also boast with a very unique bird list of almost 200 different species of birds. Boshof is also visited every year by large numbers of lesser and Rock Kestrels. A large variety of raptors, including the Lappet-faced Vulture, White-backed Vulture, Cape Vulture, Martial Eagle and Verreaux's Eagle are endemic to the region. There are even the rare visitors to the region: Red-billed Oxpeckers, Common Redstart and Blue Crane

Conservation areas

The site is located within the Sandveld Nature Reserve which is about 37,000 Ha in size. It is named after its sandy sandveld area, although part of its surface consists of thornveld savanna, with camelthorn trees. Among the large mammals present in the reserve, the white rhino, giraffe, sable antelope, roan antelope, African buffalo, blue wildebeest and zebra deserve mention.

Surface water

Harts River

The Harts River is a northern tributary of the Vaal River, which in turn is the largest tributary of the Orange River (also known as the Gariep River, the largest river in South Africa). Its source is in the North West Province, but the greater part of its basin is located in the Northern Cape Province, which it enters a few kilometers downstream from the Taung Dam.

The Harts forms a natural boundary for the Ghaap Plateau, located between the Harts River and the Kuruman Hills.

Molopo River

The Molopo River is one of the main rivers in Southern Africa. It has a length of approximately 960 kilometers and a catchment area of 367,201 km2 with Botswana, Namibia and South Africa sharing roughly about a third of the basin each.

Its source is between Groot Marico and Lichtenburg and the river generally flows first to the west, and then to the southwest from its source. In its middle course the Molopo River forms a significant section of the border between Botswana and South Africa.

River flow is intermittent and when it flows, its water flows very slowly owing to a gradient of only 0.76 m/km. Floods are rare because the vast sandveld areas of the Kalahari Desert on the Namibian side of its basin absorb all water from the seasonal rains.

Vaal River

Vaal River is the largest tributary of the Orange River in South Africa. The river has its source near Breyten in Mpumalanga province, east of Johannesburg and about 30 kilometres (19 mi) north of Ermelo and only about 240 kilometres (150 mi) from the Indian Ocean. It then flows westwards to its conjunction with the Orange River southwest of Kimberley in the Northern Cape. It is 1,120 kilometres (700 mi) long, and forms the border between Mpumalanga, Gauteng and North West Province on its north bank, and the Free State on its south.

It is the third largest river in South Africa after the Orange River (2200 km long) and the Limpopo River (1750 km long) and was established as the main source of water for the great Witwatersrand area after the gold rush during the 19th century. The Vaal Dam lies on the Vaal River in Deneysville just south of the border between Gauteng and the Free State.

Socio-economic setting

Population

Total: 163 564

Density: 1 900/km²

Population by age groups

The is as follows:

Total	Density
8 509	92.78 km²

Race

POPULATION GROUP	PERCENTAGE
Black African	78.5%
Coloured	10.5%
Indian or Asian	0.4%
White	10.1%
Other	0.5%

Gender composition

GENDER	POPULATION	PERCENTAGE
Female	3 882	45.6%
Male	4 627	54.4%

Employment status

9122 people are economically active (employed or unemployed but looking for work), and of these 27, 4% are unemployed. Of the 4647economically active youth (15 - 34 years) in the area, 35, 8%

are unemployed. The unemployment rate increased from 22.5% in 1996 to 27.0% in 2001 (DBSA 2005:164). This was a much lower increase than was reported for the rest of the province's municipalities and the 2001 figure of 27.0% is indeed the lowest figure for the province.

Oddly enough, given the relatively high employment rate, the Real Gross Value-Added (GVA) for 2003 of R2 785 per capita is easily the lowest in the province - the next lowest being Phumelela at R3 528. Tokologo Real Gross Value actually *decreased* from 1996 when it stood at R2 979. The average growth in Real Gross Value between 1996 and 2003 stands at 0.5%. Nominal Real Gross Value for 2003 stood at R162-million which was extremely low, being a little over half of the next lowest (Phumelela at R303-million) and a mere 0.3% of the provincial total of R53-billion.

Education Profile

According to the 2011 census, Tokologo Local Municipality has a total population of 28 986, of which 84, 5% is African Black, 9, 9% is white, with the other population groups making up the remaining 5, 6%. Of those aged 20 years and older, 6, 6% have completed primary school, 27, 3% have some secondary education, 17, 8% have completed matric and 5, 1% have some form of higher education.

Since 1996 to 2011 people attaining matric certificates income from 5.4% in 1996 to 12.6% in 2011. As for higher education levels, there was a decrease in number of people who attained higher education level certificates from 1996 to 2001 from 2.2% to 1.8% whereas there was an increase from 1.8% to 3.4% in 2001 and 2011.

(b) Description of the current land uses.

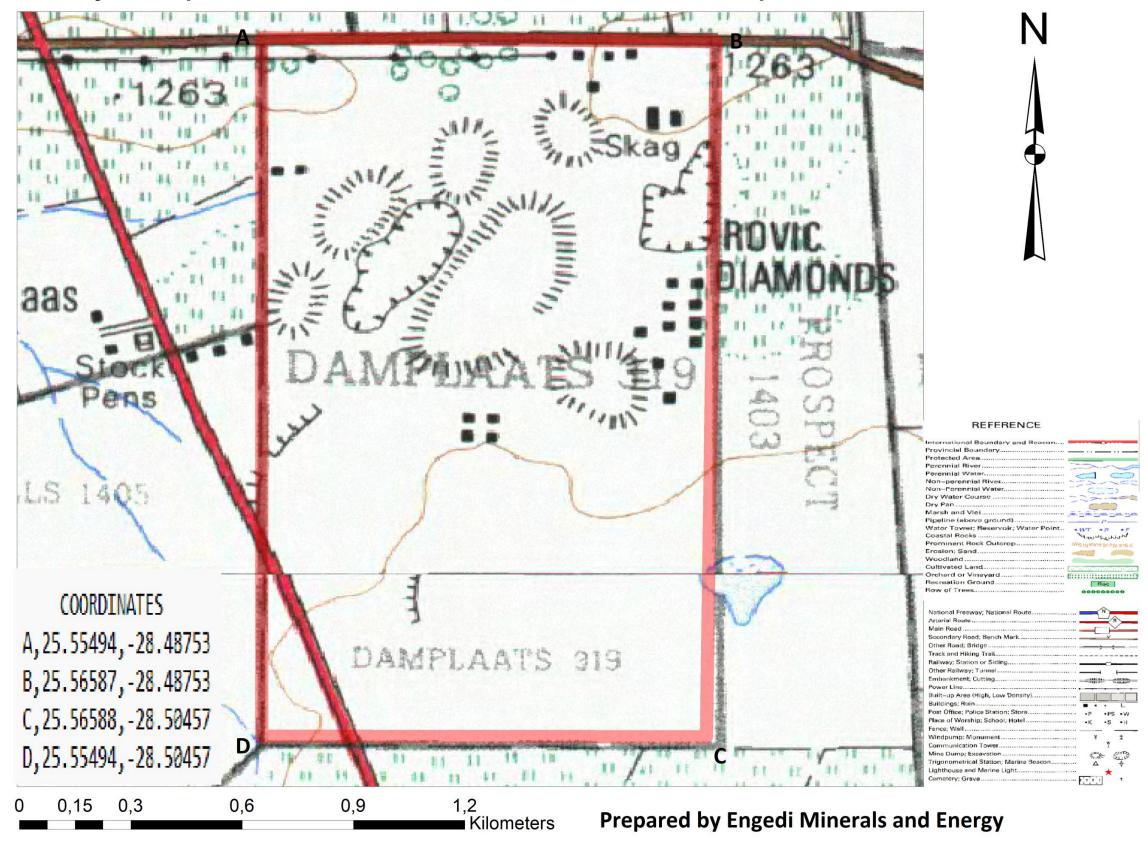

Agriculture and Mining			

(c) Description of specific environmental features and infrastructure on the site.

Mining and agriculture. Vegetation is also available for grazing.

(d) Environmental and current land use map.

Layout Map of the Remainder and Portion 1 of the Farm Damplaats 319

v) Impacts and risks identified including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts

(Provide a list of the potential impacts identified of the activities described in the initial site layout that will be undertaken, as informed by both the typical known impacts of such activities, and as informed by the consultations with affected parties together with the significance, probability, and duration of the impacts. Please indicate the extent to which they can be reversed, the extent to which they may cause irreplaceable loss of resources, and can be avoided, managed or mitigated).

ASPECT	POTENTIAL IMPACT
Soil	Compaction - from movement of heavy machinery
	Contamination - from diesel, oil, grease, etc. used for the mining and from maintenance of machinery conducted on site
	Contamination - from domestic waste.
	Loss of topsoil - when the mining site is cleared of vegetation, topsoil may be lost
	Erosion - from the clearing of mining sites and movement along access tracks
Land use	The land use will temporarily change to mining
	Mining may interfere with any land uses currently taking place on the site
Biodiversity (fauna and flora)	The fauna and flora could be negatively affected by the establishment of the mining sites and access tracks
	Alien and invasive species could be introduced through the disturbance
Surface- and groundwater	Contamination - from diesel, oil, grease, etc. used for the drilling machinery and from maintenance of machinery conducted on site
	Contamination - from domestic waste, sewerage, drilling core and contaminated soil
	Mining requires a large amount of water which may be sourced on site,

	which may result in the reduction of water available to other users
Heritage sites	Heritage sites may be present on the site, which may be disturbed and/or damaged during mining
Dust	Dust from mining activities may coat vegetation making it unsafe for livestock grazing
Noise	Noise from the mining activities could disturb residents within the site

vi) Methodology used in determining the significance of Environmental impacts

(Describe how the significance, probability, and duration of the aforesaid identified impacts that were identified through the consultation process was determined in order to decide the extent to which the initial site layout needs revision).

The significance of the impacts will be determined through the consideration of the following criteria:

Probability:	Provides a description of the likelihood/probability of the impact occurring
Extent:	Describes the spatial scale over which the impact will be experienced
Duration:	The period over which the impact will be experienced
Intensity:	The degree/order of magnitude/severity to which the impact affects the health and welfare of humans and the environment
Significance :	Overall significance of the impact on components of the affected environment and whether it is a negative or positive impact

The impacts will be individually described and assessed using the criteria drawn from the EIA Regulations, published by the DEA in terms of the NEMA (Act 107 of 1998).

The significance of each impact is assessed using the following formula (before and after mitigation):

Significance Point (SP) = (Probability + Extent + Duration) x Intensity

The maximum value is 150 SP. The impact significance will then be rated as follows:

SP > 75	Indicates high environmental significance	An impact that could influence the decision about whether or not to proceed with the project regardless of any possible mitigation.
SP 30 - 75	Indicates moderate environmental significance	An impact or benefit which is sufficiently important to require management and which could have an influence on the decision unless it is mitigated.
SP < 30	Indicates low environmental significance	Impacts with little real effect and which should not have an influence on or require modification of the project design.
+	Positive impact	An impact that is likely to result in positive consequences/effects.

Probability (P)			
None (N)	1	The possibility of the impact occurring in none, due either to the	
		circumstances, design or experience (0%).	
Possible (P)	2	The possibility of the impact occurring is very low, due either to the	
		circumstances, design or experience (25%).	
Likely (L)	3	There is a possibility that the impact will occur to the extent that provisions	
		must therefore be made (50%).	
Highly likely (H)	4	It is most likely that the impacts will occur at some stage of the	
		development and plans must be drawn up before carrying out the activity	
		(75%).	
Definite (D)	5	The impact will take place regardless of any prevention plans, and only	
		mitigation actions or contingency plans to contain the effect can be relied	
		on (100%).	
Extent (E)			
LAIGHT (L)			
Footprint (F)	1	The impact area extends only as far as the activity which occurs within the	

		total site area.
		total site area.
Site (S)	2	The impact could affect the whole site or a significant portion of the site.
Regional (R)	3	The impact could affect the area including the neighbouring farms, the
		transport route and/or the adjoining towns.
National (N)	4	The impact could have an effect that expands throughout the country.
International (I)	5	Where the impact has international ramifications that extend beyond the
		boundaries of the country.
		Duration (D)
The period over v	vhich	the impact will be experienced
Temporary (T)	1	0 - 18 months (or confined to the construction period).
Short term (S)	2	18 - 36 months (or confined to the construction and part of the operational
		period).
Medium term	3	36 - 48 months (or confined to the construction and whole operational
(M)		period).
Long term (L)	5	For the whole life of mine (including closure and rehabilitation period).
Permanent (P)	5+	Beyond the anticipated lifetime of the project.
		Intensity (I)
Insignificant (I)	2	Will have a no or very little impact on the health and welfare of humans
		and environment
Low (L)	4	Will have a slight impact on the health and welfare of humans and
		environment
Moderate (M)	6	Will have a moderate impact on the health and welfare of humans and
		environment
High (H)	8	Will have a significant impact on the health and welfare of humans and the environment
Very high/ don't	10	Will have a severe impact on the health and welfare of humans and the
know (V)		environment
	l	I .

vii) The positive and negative impacts that the proposed activity (in terms of the initial site layout) and alternatives will have on the environment and the community that may be affected.

(Provide a discussion in terms of advantages and disadvantages of the initial site layout compared to alternative layout options to accommodate concerns raised by affected parties)

Description	Occurring phase
Creation of new employment opportunities	
Employment creation during the life of mining activities may be greatly beneficial to a number of households within the surrounding area. It is however anticipated that a contractor operation is the preference and therefore job opportunities might be very limited.	
Transfer of skills to local people	
In order to promote preferential recruitment for local people, it would be necessary to assess the skills available locally and to ensure that these skills match the local positions at the operation. From the data collected to date, it is apparent that there is significant potential for skills transfer given education levels in the area.	
Support of local suppliers and contractors	
During both the construction and operational phases of the operations, it is expected that a wide variety and generally substantial quantities of goods and services will be required by the mine and their contractors. It is recommended that whenever possible, local contractors should be utilized to provide goods and services to the mine.	

viii) The possible mitigation measures that could be applied and the level of risk.

(With regard to the issues and concerns raised by affected parties provide a list of the issues raised and an assessment/ discussion of the mitigations or site layout alternatives available to accommodate or address their concerns, together with an assessment of the impacts or risks associated with the mitigation or alternatives considered).

Aspect	Potential impact	MITIGATION MEASURES
	Compaction - from movement of heavy machinery	 Existing roads and tracks will be used as far as possible. New access tracks will be kept to a minimum. Rehabilitation of disturbed areas will take place.
	Loss of topsoil - when the mining site is cleared of vegetation, topsoil may be lost	 Any removed topsoil will be kept to one side and protected from being blown away or being eroded. Rehabilitation of mining and disturbed areas will take place.
Soil	Erosion - from the clearing of drill sites and movement along access tracks	Sediment and erosion controls will be designed to prevent runoff from the mining sites into the rivers and any wetland areas. • Appropriate water management, sediment and erosion control measures will be designed for roads and tracks that may be constructed. • Rehabilitation of mining and disturbed areas will take place.

	 Contamination - from diesel, oil, grease, etc. used for the mining machinery and from maintenance of machinery conducted on site Contamination - from domestic waste, sewerage and mining core 	to retain all slurry produced during mining. • All chemicals, fuels and oils to be stored on site will
--	---	---

Land use	Mining may interfere with any land uses currently taking place on the site	 Only one quarry site will be operational at any time. The area to be disturbed will be kept to a minimum (not exceeding 20mx20m). No mining site will be established within 50m of any agricultural land unless consent is received from the land owner. Rehabilitation of mining and disturbed areas will take place.
Biodiversity (fauna and flora)	The fauna and flora could be negatively affected by the establishment of the mining sites and access tracks	 Mining and access tracks will be located in areas that will result in minimal ground disturbance. A field survey will be undertaken before mining commences at each mining site to confirm that no threatened species or ecologically sensitive areas are present in sections to be cleared. Permission will be obtained from the landowner before trees are felled, should it be necessary. All trees protected in terms of the National Forests Act, 1998, will be protected – will not be cut, disturbed, damaged, removed, etc.
	Alien and invasive species could be introduced through the disturbance	 Rehabilitation of mining and disturbed areas will take place. Machinery will be cleared of mud and seeds prior to relocation to the next site to prevent the spread of alien invasive species. An inspection on whether there is evidence of alien and invasive species as a result of mining activities will be undertaken and removed if required.

Surface- and groundwater O Contamination - from diesel, oil, grease, etc. used for the mining machinery and from maintenance of machinery conducted on site Contamination - from domestic waste, sewerage, mining and contaminated soil Water discharge during mining Drinking water	permeable bags and disposed of at an approved landfill site. A chemical toilet will be used on site and will be used in such a way as to prevent water pollution. Full or leaking toilets must be reported to the supervisor for corrective action or replacement. All mining will be drilled and constructed in such a way as to prevent ingress of water into the hole. Any completed mining that is not required for groundwater monitoring will be rehabilitated to prevent groundwater contamination. Rehabilitation of disturbed areas will take place.
	 Drinking water will be supplied in plastic containers to be stored on site.

Heritage sites	Heritage sites may be present on the site, which may be disturbed and/or damaged during mining	 Potential heritage sites will be identified during the planning of borehole locations and demarcated. Access to these sites will then be limited and all workers will be notified to keep at least 100m away from these sites.
Air quality (dust)	The air quality will not be disturbed, however, a minimal dust problem may be experienced, especially in the mining area during mining	i areas iniminin warei shravinn
Noise	Noise from the mining activities could disturb residents within the site	 Modern, low noise emission vehicles and equipment will be favoured. All equipment on site will be maintained in good working order. Mining will be restricted to day light hours. Speed limits on gravel roads will be limited to 40km/h to minimise noise generation.
Socio-economic	Expectations could be created that numerous job and business opportunities will become available during mining	Due to the nature of mining, employment opportunities will be minimal. The mining crew is small (4-6 people) with specialised skills. Where possible, local people will however be employed during the project.

ix) Motivation where no alternative sites were considered

No location alternatives are applicable to this project since the diamond (general), diamond (kimberlite) and stone aggregate is contained in the proposed mining area. Locating the development to another area will result in the ore possibly not being found and the economy and society not benefitting from future proposed mining and possible mining activities. The proposed site for the proposed mining is located within an area which is already severely disturbed as a result of agricultural activities.

x) Statement motivating the alternative development location

Within the overall site (Provide a statement motivating the final site layout that is proposed)

The proposed site for the mining activities is located within an area which is already severely disturbed as a result of mining activities. However, whenever mining activities are located within sensitive areas (i.e. wetlands, rivers, streams as well as their buffers), utmost caution will be taken to have as little impact as possible to the environment.

xi) Full description of the process undertaken to identify, assess and rank the impacts and risks the activity will impose on the preferred site

(In respect of the final site layout plan) through the life of the activity (Including

- (i) a description of all environmental issues and risks that are identified during the environmental impact assessment process and
- (ii) an assessment of the significance of each issue and risk and an indication of the extent to which the issue and risk could be avoided or addressed by the adoption of mitigation measures.)

An assessment of each identified potentially significant impact and risk, including-

The following sections present the outcome of the significance rating exercise. The results suggest that almost none of the key issues identified as part of the EIR process had a high negative environmental significance. Instead the overall score indicate a low environmental significance score.

INITIAL CLEARANCE AND SITE PREPARATION PHASE

Direct impacts: During this phase minor negative impacts are foreseen over the short term. The latter refers to a period of weeks. The site preparation may result in the loss or

fragmentation of indigenous natural fauna and flora, loss or fragmentation of habitats, soil erosion, hydrology, and temporary noise disturbance, generation of waste, visual intrusions, increase in heavy vehicle traffic, and risk to safety of livestock and farm infrastructure, and increased risk of veld fires. The above mentioned impacts are discussed in more detail below:

Loss or fragmentation of indigenous natural fauna and flora - Grassland

The Southern parts of the province are mainly grassland. Sometimes farmers burn the grass in winter so that it will grow better in summer. Some trees also grow in the grassland, especially near rivers. The grassland are good for cattle farming. Large areas of grassland have been ploughed up and used for planting such as mealies and sunflowers. Trees and grass shall not be removed or damaged without prior approval and permits.

Loss or fragmentation of indigenous natural fauna and flora	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Extent	Site (1)	Site (1)
Probability	Definite (4)	Definite (4)
Duration	Medium term (2)	Medium term (2)
Magnitude	Medium (2)	Low (1)
Reversibility	Partly reversible (2)	Partly reversible (2)
Irreplaceable loss of resources	Significant loss of	Marginal loss of resource
	resource (3)	(2)
Cumulative impact	Negligible cumulative impacts (1),	
Significance	Negative low (26) Negative low (12)	
Can impacts be mitigated?	If the development is approved, contractors must	
	ensure that no mammalian species are disturbed,	
	trapped, hunted or killed. If the development is	
	approved, every effort should be made to confine the	
	footprint to the blocks allocated for the development	
	and have the least possible edge effects on the	
	surrounding area. The EMPr also provides	
	numerous mitigation measures - refer to section (f)	

of the EMPr. The potential impacts associated with damage to and loss of farmland should be effectively mitigated. The aspects that should be covered include: The site should be fencedoff prior commencement of construction activities: The footprint associated with the construction related activities (access roads, construction platforms, workshop etc.) should be confined to the fenced off area and minimised where possible; An Environmental Control Officer (ECO) should be appointed to monitor the establishment phase of the construction phase; All areas disturbed by construction related activities, such as access roads on the site, construction platforms, workshop area etc., should be rehabilitated at the end of the construction phase; The implementation of a rehabilitation programme should be included in the terms of reference for the contractor/s appointed. Specifications for the rehabilitation are provided throughout the EMPr - section (f) of the EMPr. The implementation of the Rehabilitation Programme should be monitored by the ECO. Thorn trees shall not be removed or damaged without prior approval and permits.

• Loss or fragmentation of habitats - Given the low probability of resident threatened species occurring at the footprint site, the low probability of any significant conservation corridor or buffer zone at the footprint site. A small non-perennial pan is found on site, a Water Use License will be applied for where applicable to prospect in or near this area.

Loss or fragmentation of	Pre-mitigation impact	Post mitigation impact
habitats	rating	rating

resources	resource	resource
	(2)	(2)
Cumulative impact	Negligible cumulative imp	pacts (1)
Significance	Negative low (12)	Negative low (12)
Can impacts be mitigated?	Exotic and invasive plant species should not be	
	allowed to establish, if the development is	
	approved. Where exotic and invasive plant	
	species are found at the site continuous	
	eradication should take place. If the development	
	is approved, every effort should be made to	
	confine the footprint to the blocks allocated for	
	development - section (f) of the EMPr also	
	provides numerous mitigation measures related to	
	fauna and flora.	

• <u>Loss of topsoil</u> – Topsoil may be lost due to poor topsoil management (burial, erosion, etc.) during construction related soil profile disturbance (levelling, excavations, disposal of spoils from excavations etc.) The effect will be the loss of soil fertility on disturbed areas after rehabilitation.

Less of tensoil	Pre-mitigation impact	Post mitigation impact
Loss of topsoil	rating	rating

Status (positive or negative)	Negative	Negative
Geographical extent	Site (1)	Site (1)
Probability	Possible (2)	Unlikely (1)
Duration	Medium term (2)	Medium term (2)
Magnitude	Medium (2)	Medium (2)
Reversibility	Partly reversible (2)	Partly reversible (2)
Irreplaceable loss of resources	Marginal (2)	Marginal (2)
Cumulative impact	Negligible cumulative im	pact (1).
Significance	Negative low (20)	Negative low (18)
Can impacts be mitigated?	The following mitigation or management measures are provided: • If an activity will mechanically disturb below surface in any way, then any	
	 available topsoil should first be stripped from the entire surface and stockpiled for re-spreading during rehabilitation. Topsoil stockpiles must be conserved 	
	 against losses through erosion by establishing vegetation cover on them. Dispose of all subsurface spoils from excavations where they will not impact on 	
	 During rehabilitation, the stockpiled topsoil must be evenly spread over the entire disturbed surface. Erosion must be controlled where necessary on top soiled areas. Establish an effective record keeping system for each area where soil is disturbed for constructional purposes. These records should be included in environmental performance reports, 	
	and should include all th	e records below.

Record the GPS coordinates of each area.	
 Record the date of topsoil stripping. 	
Record the GPS coordinates of where the	
topsoil is stockpiled.	
 Record the date of cessation of 	
constructional (or operational) activities at	
the particular site.	
 Photograph the area on cessation of 	
constructional activities.	
Record date and depth of re-spreading of	
topsoil.	
☐ Photograph the area on completion of	
rehabilitation and on an annual basis thereafter to	
show vegetation establishment and evaluate	
progress of restoration over time.	
Section (f) of the EMPr also provide mitigation measures related to topsoil management.	

• <u>Soil erosion</u> – Soil erosion due to alteration of the land surface run-off characteristics. Alteration of run-off characteristics may be caused by construction related land surface disturbance, vegetation removal and the establishment of roads. Erosion will cause loss and deterioration of soil resources. The erosion risk is low due to the low slope gradients and low to moderate erosion levels of the soils.

Soil erosion	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Geographical extent	Site (1)	Site (1)
Probability	Possible (2)	Unlikely (1)
Duration	Medium term (2)	Medium term (2)

Reversibility	Partly reversible (2)	Partly reversible (2)
Irreplaceable loss of resources	Marginal (2)	Marginal (2)

Cumulative impact	Negligible cumulative impact (1).	
Significance	Negative low (20)	Negative low (18)
Can impacts be mitigated?	The following mitigation or management measures are provided: Implement an effective system of run-off control, where it is required, that collects and safely disseminates run-off water	
	from all hardened surfaces and prevents potential down slope erosion.	
	Include periodical site inspection in environmental performance reporting that inspects the effectiveness of the run-off control system and specifically records the occurrence any erosion on site or downstream – refer to section (f) of the EMPr	

• <u>Temporary noise disturbance</u> - Preparation activities will result in the generation of noise over a period of months. Sources of noise are likely to include vehicles, the use of machinery such as back actors and people working on the site. The noise impact is unlikely to be significant; but activities should be limited to normal working days and hours (6:00 - 18:00).

Temporary noise disturbance	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative

Significance	Negative low (20)	Negative low (9)
Can impacts be mitigated?		ctions related to noise n section (f) of the EMPr.

• Generation of waste - general waste, construction waste, sewage and greywater - The workers on site are likely to generate general waste such as food wastes, packaging, bottles, etc. Construction waste is likely to consist of packaging, scrap metals, waste cement, etc., If any). The applicant will need to ensure that general and construction waste is appropriately disposed of i.e. taken to the nearest licensed landfill. Sufficient ablution facilities will have to be provided, in the form of portable/VIP toilets. No pit latrines, French drain systems or soak away systems shall be allowed.

Generation of waste	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Extent	Local/district (2)	Local/district (2)

Irreplaceable loss of resources	No loss of resource (1)	No loss of resource (1)
Cumulative impact	Medium cumulative impact (3) - An additional	
	demand for landfill space could result in significant cumulative impacts if services become unstable or unavailable, which in turn would negatively impact on the local community.	
Significance	Negative medium (13)	Negative low (13)
Can impacts be mitigated?	Yes, it is therefore important that all management actions and mitigation measures included in section (f) of the EMPr. are implemented.	

• <u>Impacts on heritage objects</u> - No sites, features or objects of cultural significance were found in the study area, and that there would be no impact as a result of the proposed development. It is however noted that, in terms of the National Heritage

Resource Act no 25 of 1999. Heritage resources including archaeological and paleontological sites over 100 years old, graves older than 60 years, structure older than 60 years are protected. They will not be disturbed without a permit from the relevant heritage resource Authority, which means that before such sites are disturbed by development it is incumbent on the developer to ensure that a heritage impact assessment is done and the Provincial Heritage Resources Authority and SAHRA will be contacted immediately and work will stop.

Impacts on heritage	Pre-mitigation impact	Post mitigation impact
objects	rating	rating

Cumulative impact	Low cumulative impact (2). Should these impacts	
	occur, there may be a cu	mulative impact on the
	preservation of heritage	objects in the area.
Significance	Negative low (24)	Negative low (12)
Can impacts be mitigated?	If archaeological sites or graves are exposed	
	during construction work, it should immediately	
	be reported to a heritage practitioner so that an	
	investigation and evaluation of the finds can be	
	made. Also refer to section (f) of the EMPr.	

Indirect impacts: The nuisance aspects generally associated with the installation of infrastructure or ground preparation will also be applicable to this development, which relates primarily to the increase in vehicle traffic associated with mining practices, the influx of job seekers to the area, risk to safety, livestock and farm infrastructure, and increased risk of veld fires.

• Increase in vehicle traffic – The movement of heavy vehicles during the clearance of vegetation and topsoil has the potential to damage local farm roads and create dust and safety impacts for other road users in the area. Access will be obtained from an existing secondary gravel road. While the volume of traffic along this road is low, the movement of heavy vehicles along this road is likely to damage the road surface and impact on other road users. The contractor should be required to ensure that damage to the road is repaired periodically. The movement of additional heavy vehicle traffic is unlikely to increase significantly to the current traffic load on the road. The impact on the road is therefore likely to be low.

Cumulative impact	Medium cumulative impact (3). If damage to roads	
	is	
	not repaired then this will a	affect the farming
	activities in the area and re	esult in higher
	maintenance costs for vehicles of local farmers	
	and other road users. The costs will be borne by	
	road users who were no responsible for the	
	damage.	
Significance	Negative low (22)	Negative low (11)

Can impacts be mitigated?

The potential impacts associated with heavy vehicles can be effectively mitigated. The mitigation measures include:

 The contractor must ensure that damage caused by construction related traffic to the gravel access road is repaired and maintained. The costs associated with the repair must be

borne by the contractor;

- Dust suppression measures must be implemented for heavy vehicles such as wetting of gravel roads on a regular basis and ensuring that vehicles used to transport diamond (general), diamond (kimberlite) and stone aggregate and building materials are fitted with tarpaulins or covers;
- All vehicles must be road-worthy and drivers must be qualified and made aware of the potential road safety issues and need for strict speed limits of 40 km/h.

Also refer section (f) of the EMPr. For mitigation measures related to traffic.

• Risk to safety, livestock and farm infrastructure - The presence on and movement of workers on and off the site poses a potential safety threat to local famer's and farm workers in the vicinity of the site threat. In addition, farm infrastructure, such as fences and gates, may be damaged and stock losses may also result from gates being left open and/or fences being damaged or stock theft linked either directly or indirectly to the presence of farm workers on the site.

Risk to safety, livestock and	Pre-mitigation impact	Post mitigation impact rating
farm infrastructure	rating	
Status (positive or negative)	Negative	Negative

Duration	Short term (1)	Short term (1)
Magnitude	Medium (2)	Low (1)
Reversibility	Completely reversible (1)	Completely reversible (1)
Irreplaceable loss of resources	No loss of resource (1)	No loss of resource (1)
Cumulative impact	Negligible cumulative effects (1), provided losses are compensated for.	
Significance	Negative low (22)	Negative low (11)
Can impacts be mitigated?	Negative low (22) Negative low (11) Key mitigation measures include: Semi Maseme should enter into an agreement with the local farmers in the area whereby damages to farm property etc. during the construction phase will be compensated for. The agreement should be signed before the construction phase commences; The construction area should be fenced off prior to the commencement of the construction phase. The movement of construction workers on the site should be confined to the fenced off area; Contractors appointed by Semi Maseme should provide daily transport for low and semi-skilled workers to and from the site. This would reduce the potential risk of trespassing on the remainder of the	

	Semi Maseme should hold contractors liable for
	compensating farmers in full for any stock losses
	and/or damage to farm infrastructure that can be
	linked to construction workers. This should be
	contained in the Code of Conduct to be signed
	between the proponent, the contractors and
	neighbouring landowners. The agreement should also
	cover loses and costs associated with fires caused by
	construction workers or construction related activities
	(see below);
	The Environmental Management Programme (EMPr)
	should outline procedures for managing and storing
	waste on site, specifically plastic waste that poses a
	threat to livestock if ingested;
	Contractors appointed by Semi Maseme must ensure
	that all workers are informed at the outset of the
	construction phase of the conditions contained on the
	Code of Conduct, specifically consequences of stock
	theft and trespassing on adjacent farms.
	Contractors appointed by Semi Maseme must ensure
	that construction workers who are found guilty of
	trespassing, stealing livestock and/or damaging farm
	infrastructure are dismissed and charged. This should
	be contained in the Code of Conduct. All dismissals
	must be in accordance with South African labour
	legislation;
	The housing of construction workers on the site should
	be strictly limited to security personnel (if any).

• <u>Increased risk of veld fires</u> - The presence of construction workers and construction-related activities on the site poses an increased risk of grass fires that could in turn pose a threat to livestock, crops, wildlife and farmsteads in the area. In the process, farm infrastructure may also be damaged or destroyed and human lives threatened. The potential risk of veld fires was heightened by the windy conditions in the area, especially during the dry, windy winter months from May to October. In terms of potential mitigation measures, a fire-break should be constructed around the

perimeter of the site prior to the commencement of the construction phase. In addition, fire-fighting equipment should be provided on site during the construction phase.

Increased risk of veld fires	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Extent	Region (3)	Local (2)
Probability	Probable (3)	Probable (3)
Duration	Medium term (2)	Short term (1)
Magnitude	High (3)	Low (1)
Reversibility	Completely reversible (1)	Completely reversible (1)
Irreplaceable loss of	No loss of resource (1)	No loss of resource (1)
resources		
Cumulative impact	Negligible cumulative effective	cts (1), provided losses
	are compensated for.	
Significance	Negative medium (33)	Negative low (9)
Can impacts be mitigated?	The mitigation measures include:	
	•A fire-break should be constructed around	
	the perimeter of the site prior to the	
	commencement of the construction phase;	
	Contractor should ensure that open fires on	
	the site for cooking or	•
	allowed except in desi	gnated areas;
	•Contractor to ensure	
	·	ose a potential fire risk,
	such as welding, are p	
	are confined to areas where the risk of fires	
	has been reduced. Measures to reduce the risk of fires include avoiding working in high	
	wind conditions when the risk of fires is	
	greater. In this regard special care should be	
	taken during the high r	

months;

- Contractor to provide
 adequate fire fighting

 equipment on-site, including a fire fighting vehicle;
 - •Contractor to provide fire-fighting training to selected construction staff:
 - No construction staff, with the exception of security staff, to be accommodated on site over night;
 - •As per the conditions of the Code of Conduct, in the advent of a fire being caused by construction workers and or construction activities, the appointed contractors must compensate farmers for any damage caused to their farms. The contractor should also compensate the fire fighting costs borne by farmers and local authorities.

OPERATIONAL PHASE

Direct impacts: During the operational phase the study area will serve as an mining area and the impacts are generally associated with soil erosion, change in land use, impacts associated with the, increase in storm water runoff, increased consumption of water, visual intrusion, the generation of general waste, leakage of hazardous materials, and the change in the sense of place. The operational phase will also have a direct positive impact through the provision of permanent employment opportunities and facilitating a positive economic growth. The abovementioned impacts are discussed in more detail below:

Soil erosion – The largest risk factor for soil erosion will be during the operational phase
when the mining activity ensues and soil is left bare until rehabilitation is initiated.
Erosion will be localised within the site. This will ultimately lead to the irretrievable
commitment of this resource. The measurable effect of reducing erosion by utilizing
mitigation measures may reduce possible erosion significantly.

Soil erosion	Pre-mitigation impact	Post mitigation impact
John Grosion	rating	rating
Status (positive or negative)	Negative	Negative
Extent	Local/Regional (2)	Local/Regional (2)
Probability	Definite (4)	Unlikely (1)
Duration	Long term (3)	Long term (3)
Magnitude	High (3)	Medium (2)
Reversibility	Partly reversible (2)	Partly reversible (2)
Irreplaceable loss of	Significant loss of	Marginal loss of
resources	resource (3)	resource
		(2)
Cumulative impact	Medium cumulative impact (3). Should these	
	impacts occur, there will be a cumulative impact	
	on the air and water resources in the study area	
	in terms of pollution.	
Can impacts be mitigated?	Yes, to avoid soil erosion it will be a good practice	
	to not remove all the vegetation at once but to	
	only clear the area as it becomes necessary and	
	to implement concurrent rehabilitation.	
	Also refer to section (f) of the EMPr.	

<u>Change in land-use</u> – The use of the area for the operation of the mining activity will
result in the area not being used for cultivation anymore. The impact on farm income
due to the loss of agriculture will be more than offset by the income from Semi Maseme
TV Production CC

Change in land use	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative

	0.20Ha per year will b	e excavated. The rest
	of the farm will stay in	tact and undergo
	concurrent rehabilitation	on.
Significance	Negative low (10)	Negative low (10)
Can impacts be mitigated?	The proponent should establish a	
	Rehabilitation Fund to	be used to rehabilitate
	the area once the prop	posed facility has been
	decommissioned. The	fund should be funded
	by revenue generated	during the operational
	phase of the project.	The motivation for the
	establishment of a Rehabilitation Fund is	
	based on the experience in the mining sector	
	where many mines on	
	aside sufficient funds	for closure and
	decommissioning.	
	Also refer to section (f) of the EMPr.

 Generation of alternative land use income – Income generated through the Diamond (general), diamond (kimberlite) and stone aggregate mine will provide the farming enterprise with increased cash flow and rural livelihood, and thereby improve the financial sustainability of farming onsite.

Generation of alternative land use income	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Positive	Positive

resources	(1)	
Cumulative impact	Low cumulative impact (2	2).
Significance	Positive Low (24)	Positive Low (24)
Can impacts be mitigated?	No mitigation required.	

• <u>Increase in storm water runoff</u> – The development will potentially result in an increase in storm water run-off that needs to be managed to prevent soil erosion, especially where vegetation will be cleared. Not all the vegetation should be removed at once. Only the specific area being excavated at the specific time should be cleared.

Increase in storm water runoff	Pre-mitigation impact rating	Post mitigation impact rating

	demand on water sources could result in a	
	significant cumulative impact with regards to	
	the availability of water.	
Significance	Negative medium	Negative medium (40)
	(40)	
Can impacts be mitigated?	Yes, management actions and mitigation	
	measures related to the use of water are	
	included in section (f) of the EMPr.	

 Generation of waste - Approximately 15 Workers will be present on site from 6:00 -18:00, Monday to Saturday. Sources of general waste will be waste food, packaging, paper, etc. General waste will be stored on the site and removed on a weekly basis by a contractor.

Generation of waste	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Extent	Local (2)	Local (2)
Probability	Definite (4)	Definite (4)

Duration	Long term (3)	Long term (3)
Magnitude	Low (1)	Low (1)
Reversibility	Partly reversible (2)	Partly reversible (2)
Irreplaceable loss of resources	No loss of resource (1)	No loss of resource (1)
Cumulative impact	Medium cumulative impact (3) - An additional demand for landfill space could result in significant cumulative impacts with regards to the availability of landfill space.	
Significance	Negative low (15)	Negative low (15)
Can impacts be mitigated?	Yes, management actions related to waste management are included in section (f) of the EMPr.	

Leakage of hazardous materials - The proposed mining activity will make use of
machinery that use fuel and oil. Leakage of these oils and fuel can contaminate water
supplies and must be prevented by constructing oil and diesel permeable bunds to
ensure that any spills are suitably attenuated and not released into the environment.

Leakage of hazardous materials	Pre-mitigation	Post mitigation
	impact rating	impact rating
Status (positive or negative)	Negative	Negative
Extent	Local (2)	Local (2)
Probability	Possible (2)	Unlikely (1)

	resource (2)	resource (2)
Cumulative impact	The impact would result in negligible to no	
	cumulative effects (1)	
Significance	Negative medium (36)	Negative low (22)

Yes. It is therefore important that all
management actions and mitigation
measures included in the section (f) of EMPr
are implemented to ensure that these
impacts do not occur.

Noise disturbance - Mining activities will result in the generation of noise over a period of 10 years. Sources of noise are likely to include vehicles, the use of machinery such as back actors, and people working on the site, as well as occasional blasting. The noise impact is unlikely to be significant as the closest homestead is more than 1km from the site; but mining activities should be limited to normal working days and hours (6:00 - 18:00).

Temporary noise disturbance	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Negative	Negative
Extent	Local (2)	Local (2)

Irreplaceable loss of resources	No loss of resource (1)	No loss of resource (1)
Cumulative impact	The impact would result	in negligible to no
	cumulative effects (1).	
Significance	Negative low (22)	Negative low (10)
Can impacts be mitigated?	Yes, management action pollution are included in	ons related to noise a section (f) of the EMPr.

Indirect impacts: The operational phase will have an indirect negative impact through the change in the sense of place and an indirect positive impact through the provision of additional electrical infrastructure.

<u>Potential impact on tourism</u> - The tourism sector is regarded as an important economic sector in the Free State Province. The tourism potential of the area is linked to the area's

natural resources, including the relatively undisturbed scenery and landscape. The impact of the proposed mining of diamond (general), diamond (kimberlite) and stone aggregate on the areas sense of place with mitigation is likely to be low. The impact of the proposed mine on the tourism potential of the area is therefore likely to be low.

Potential impacts on tourism	Pre-mitigation	Post mitigation
	impact rating	impact rating
Status (positive or negative)	Negative	Negative

Can impacts be mitigated?	No mitigation	
	required	

DECOMMISIONING PHASE (MINE CLOSURE AND REHABILITATION)

Direct impacts: Typically, the major social impacts associated with the decommissioning phase are linked to the loss of jobs and associated income. This has implications for the households who are directly affected, the communities within which they live. If infrastructures are removed after a 3/5 year period, the site will be returned to its natural state.

 Rehabilitation of the physical environment - The physical environment will benefit from the closure of the mining since the site will be restored to its natural state as far as possible

Rehabilitation of the physical environment	Pre-mitigation impact rating	Post mitigation impact rating
Status (positive or negative)	Positive	Positive
Extent	Site (1)	Site (1)

Irreplaceable loss of resources	No loss of resource (1)	No loss of resource
		(1)
Cumulative impact	The impact would result in negligible to no	
	cumulative effects (1)	
Significance	Negative medium (30)	Negative low (18)

Can impacts be mitigated?	The following	mitigation				
	measures	are recommended:				
	•All structures ar associated with t should be disma site on decommi •Semi Maseme s Environmental R	nd infrastructure the proposed facility ntled and transported off- ssioning; should establish an ehabilitation Trust Fund				
	to cover the costs of decommissioning					
	and rehabilitation of disturbed areas.					

Indirect impacts: No indirect impacts are anticipated from the decommissioning phase of the proposed development.

Process for the identification of key issues

The methodology for the identification of key issues aims, as far as possible, to provide a user-friendly analysis of information to allow for easy interpretation.

- <u>Checklist</u>: The checklist consists of a list of structured questions related to the environmental parameters and specific human actions. They assist in ordering thinking, data collection, presentation and alert against the omission of possible impacts.
- Matrix: The matrix analysis provides a holistic indication of the relationship and interaction between the various activities, development phases and the impact thereof on the environment. The method aims at providing a first order cause and effect relationship between the environment and the proposed activity. The matrix is designed to indicate the relationship between the different stressors and receptors which leads to specific impacts. The matrix also indicates the specialist studies, which will be submitted as part of the Environmental Impact Report in order to address the potentially most significant impacts.

Checklist analysis

The site visit was conducted to ensure a proper analysis of the site specific characteristics of the study area. The table below provides a checklist, which is designed to stimulate thought regarding possible consequences of specific actions and so assist scoping of key issues. It consists of a list of structured questions related to the environmental parameters and specific human actions. They assist in ordering thinking, data collection, presentation and alert against the omission of possible impacts. The table highlights certain issues, which are further analysed in matrix format.

Table: Environmental checklist

QUESTION	YES	NO	Un- sure	Description							
Are any of the following located on the site earmarked for the development?											
I. A river, stream, dam or wetland				Small non-perennial pan in the north east corner of thesite							
II. A conservation or open space area				None.							
III. An area that is of cultural importance				The initial site investigation concluded that there are no obvious heritage resources located on the site earmarked for development.							
IV. Site of geological significance				None.							
V. Areas of outstanding natural beauty				None.							
VI. Highly productive agricultural land				None.							
VII. Floodplain				None.							
VIII. Indigenous forest				None.							
IX. Grass land				None.							
X. Bird nesting sites				None.							
XI. Red data species				None.							

XII. Tourist resort			None.							
Will the project potentially result in potential?										
I. Removal of people			None.							
II. Visual Impacts			The visual impact will be managed							
III. Noise pollution			The noise impact is unlikely to be significant.							
IV. Construction of an access road			None. Access will be obtained from a secondary gravel road off the R59							
V. Risk to human or valuable ecosystems due to explosion/fire/ discharge of waste into water or air.			None.							
VI. Accumulation of large workforce (>50 manual workers) into the site.			Approximately 15 employment opportunities will be created during the construction and operational phase of the project.							
VII. Utilisation of significant volumes of local raw materials such as water, wood etc.			10 - 18ft washing pans which utilise approximately 10 000 - 16 000 L per pan/per hour each from which 40% is re-used.							
VIII. Job creation			Approximately 15 employment opportunities will be created during the construction and operational phase of the project.							
IX. Traffic generation			None.							

X. Soil erosion			Only areas earmarked for mining will be cleared. The mining will be phased and the topsoil stockpiled separately. Concurrent rehabilitation will take place. The soil also has a low erosion potential.
XI. Installation of additional bulk			None.
telecommunication transmission lines or facilities			
3. Is the proposed project located near	the foll	owing	
I. A river, stream, dam or wetland			None
II. A conservation or open space area			None.
III. An area that is of cultural importance			None.
IV. A site of geological significance			None.
V. An area of outstanding natural beauty			None.
VI. Highly productive agricultural land			None.
VII. A tourist resort			None.
VIII. A formal or informal settlement			 None.

Matrix Analysis

The matrix describes the relevant listed activities, the aspects of the development that will apply to the specific listed activity, a description of the environmental issues and potential impacts, and the significance and magnitude of the potential impacts. The matrix also highlights areas of particular concern for more in depth assessment during the EIR process. Each cell is evaluated individually in terms of the nature of the impact, duration

and its significance – should no mitigation measures be applied. This is important since many impacts would not be considered insignificant if proper mitigation measures were implemented. The matrix also provides an indication if mitigation measures are available.

In order to conceptualise the different impacts the matrix specify the following:

Stressor: Indicates the aspect of the proposed activity, which initiates and cause impacts on elements of the environment.

Receptor: Highlights the recipient and most important components of the environment affected by the stressor.

Impacts: Indicates the net result of the cause-effect between the stressor and receptor.

Mitigation: Impacts need to be mitigated to minimise the effect on the environment

ix) Environmental impact statement

(iii) Summary of the key findings of the environmental impact assessment;

This section provides a summary of the assessment and conclusion drawn from the proposed mining area. in doing so, it draws on the information gathered as part of the environmental impact assessment process and the knowledge gained by the environmental consultant during the course of the process and presents an informed opinion on the environmental impacts associated with the proposed project. The following conclusions can be drawn for the proposed mining activity:

Potential impacts on biodiversity: There are biodiversity features (aquatic ecosystems) in the form of small non-perennial pan is found on site, which can be adequately mitigated by means of a Water Use License Application if they plan to prospect in on near the pans, otherwise no impacts to the pans are expected.

Potential impacts on land use: The farm is currently utilised as low potential cattle grazing and crop production. The activity which will be subject to concurrent rehabilitation will not have any significant impact on the land use nor will it change the sense of place of the area.

Potential social impacts: The presence of construction workers poses a potential risk to family structures and social networks. While the presence of construction workers does not in itself constitute a social impact, the manner in which construction workers conduct themselves can impact on local communities. The most significant negative impact is associated with the disruption of existing family structures and social networks.

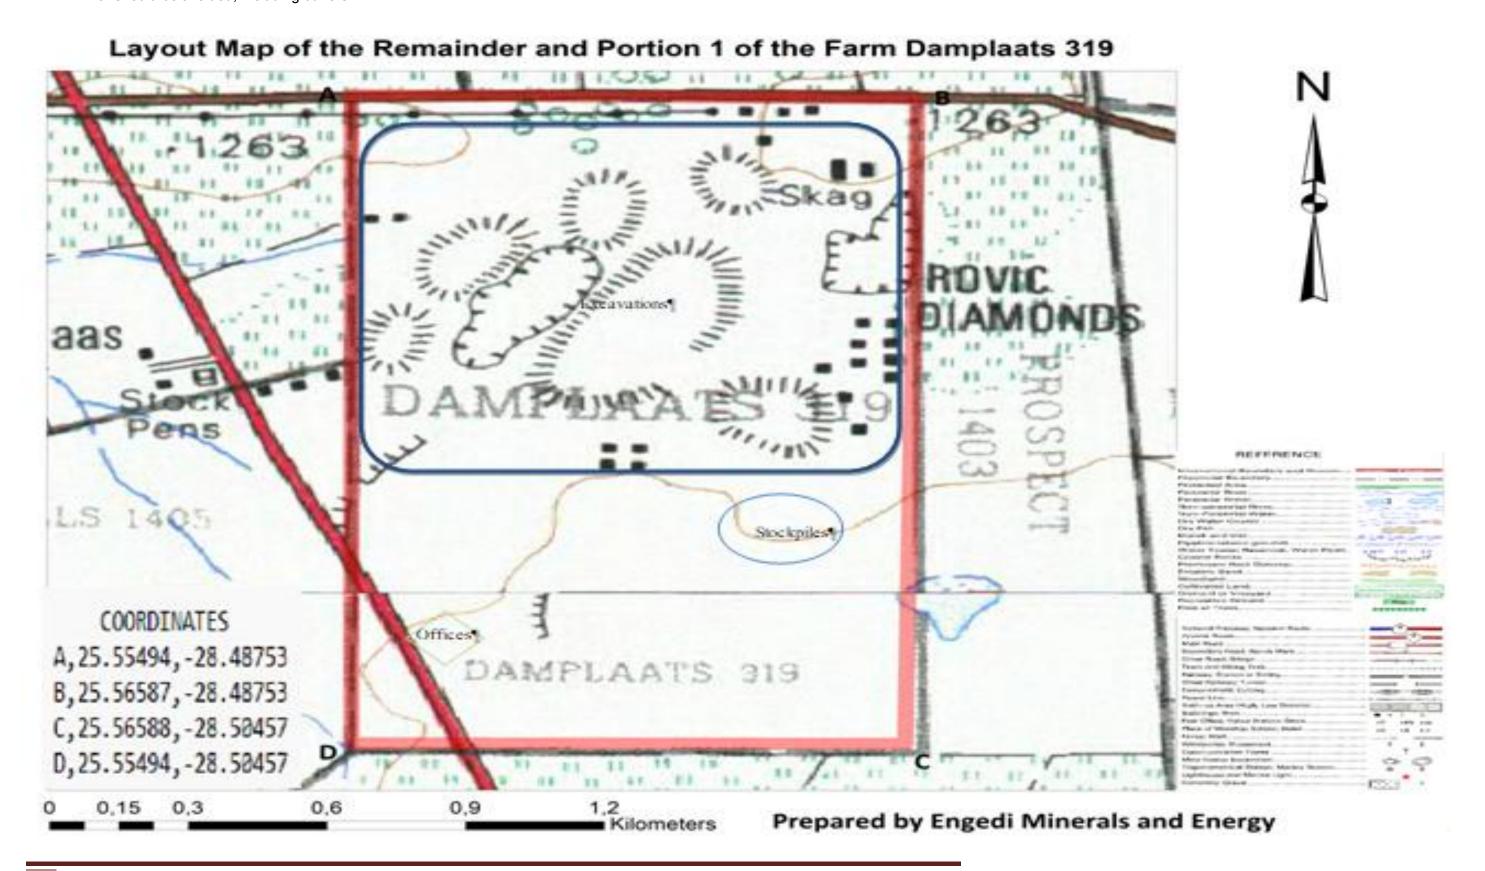

Potential negative impacts: (noise, dust, soil degradation, storm water, traffic, health and safety) associated with the operation of the facility are expected to be low-medium impact, of medium terms and site specific. These can be mitigated or negated through the implementation of practical and appropriate mitigation measures.

Positive impacts: The mining of diamond (general), diamond (kimberlite) and stone aggregate will have socio-economic benefit to the area.

All possible negative impacts and risks that have been identified in this report can be effectively mitigated and managed by implementing the migratory measures as set out in the Environmental Management Programme (EMPr) attached in Part B. It is therefore recommended that the environmental authorisation for the mining right be granted

(iv) Final Site Map

Provide a map at an appropriate scale which superimposes the proposed overall activity and its associated structures and infrastructure on the environmental sensitivities of the preferred site indicating any areas that should be avoided, including buffers.

(v) Summary of the positive and negative implications and risks of the proposed activity and identified alternatives;

There are regional socio economic benefits due to the diamond (general), diamond (kimberlite) and stone aggregate being mined in the Free State Province and greater knowledge is gained on the mineralogy of South Africa. All possible negative impacts and risks that have been identified in this report can be effectively mitigated and managed by implementing the mitigation measures as set in the Environmental Management Programme (EMPr.) attached in Part B. No significantly social or environmental impacts are anticipated.

b) Proposed impact management objectives and the impact management outcomes for inclusion in the EMPr.

Based on the assessment and where applicable the recommendations from specialist reports, the recording of proposed impact management objectives, and the impact management outcomes for the development for inclusion in the EMPr. as well as for inclusion as conditions of authorisation.

Management objectives include:

- ♣ Ensure that mining activity does not cause pollution to the environment or harm to persons.
- Minimise production of waste.
- All mining activities must be conducted in a manner that minimises noise impact, litter, environmental degradation and health hazards i.e. injuries.
- ♣ The mine must be kept neat and tidy during waste handling to prevent unsightliness and accidents.

Expected outcomes include:

- Minimum impacts on the environment as a result of diamond (general),
- diamond (kimberlite) and stone aggregate mining. Compliance with legislative requirements
- Mine is neat and tidy and well managed

c) Final proposed alternatives

(Provide an explanation for the final layout of the infrastructure and activities on the overall site as shown on the final site map together with the reasons why they are the final proposed alternatives which respond to the impact management measures, avoidance, and mitigation measures identified through the assessment)

None were proposed since mining/mining of particular minerals occur at specific areas.

d) Aspects for inclusion as conditions of Authorisation

Any aspects which have not formed part of the EMPr that must be made conditions of the Environmental Authorisation

The operational activities and relevant rehabilitation of disturbed areas should be monitored against the improved EMPr and all other relevant environmental legislation.

A copy of the EMP should be made available onsite at all times. Implementation of the proposed mitigation measures set out in the EMPr.

e) Description of any assumptions, uncertainties and gaps in knowledge

(Which relate to the assessment and mitigation measures proposed)

The uncertainties in results are mostly related to the availability of information, time available to gather the relevant information as well as the sometimes subjective nature of the assessment methodology. In terms of addressing the key issues the EAP is satisfied that there are no major gaps in knowledge and that the specialist reports provide sufficient information to conduct the significant rating and provide the environmental authority with sufficient information to make an informed decision.

f) Reasoned opinion as to whether the proposed activity should or should not be authorised

ii) Reasons why the activity should be authorized or not.

It is the opinion of the EAP that the activity may be authorised.

Based on the outcomes of other Diamond (general), diamond (kimberlite) and stone aggregate mines in the area, the possibility to encounter further Diamond (general), diamond (kimberlite) and stone aggregate Reserves were identified.

The proposed mining area is targeted as, historically, several Diamond (general), diamond (kimberlite) and stone aggregate occurrences are known in the area, and a number of these have been exploited in the past. There are also various Diamond (general), diamond (kimberlite) and stone aggregate operations within the vicinity of exploration area.

No other properties have been secured by the applicant and the site is therefore regarded as the preferred site, and alternatives are not considered.

The option of not approving the activities will result in significant loss to valuable Diamond (general), diamond (kimberlite) and stone aggregate being exploited. And all economic benefits will be lost.

iii) Conditions that must be included in the authorisation

(1) Specific conditions to be included into the compilation and approval of EMPr

(2)

The operational activities and relevant rehabilitation of disturbed areas should be monitored against the improved EMPr and all other relevant environmental legislation.

A copy of EMP should be made available onsite at all times. Implementation of the proposed mitigation measures set out in the EMPr.

The EMPr should binding on all managers and contractors operating/utilizing the site.

(3) Rehabilitation requirements

All the excavated areas and where the mining equipment must rehabilitated to finality and to the satisfaction of the DMR. No area should be left rehabilitated unless it's agreed with the land owner such agreement is submitted to the DMR.

g) Period for which the Environmental Authorisation is required

The environmental authorization is required for 30 years.	

h) Undertaking

Confirm that the undertaking required to meet the requirements of this section is provided at the end of the EMPr and is applicable to both the Basic assessment report and the Environmental Management Programme report.

Semi Maseme TV Production is committed to make available financial provision as will be determined and required by an EAP and DMR.

i) Financial Provision

State the amount that is required to both manage and rehabilitate the environment in respect of rehabilitation.

Section 24P of NEMA, as amended provides that the holder of a mining right or mining permit must make financial provision for the rehabilitation of negative impacts.

The financial provision estimates were made in line with the requirements of the Financial Provision Regulations, 2015 (GNR 1147).

• The financial provision will amount to the total of R 94 076.40 to manage the disturbed environment in respect to rehabilitation.

Applicant: Semi Maseme TV Production CC - FS 10073 MR Location: Boshof Evaluator(s) Engedi Minerals and Energy (Pty) Ltd Date: Nov-22

iv) Explain how the aforesaid amount was derived.

The closure cost estimate provided above is aligned with the Guideline Document for the Evaluation of Quantum of Closure related Financial Provision Provided by a Mine, by the DMR (January, 2005). The amount was calculated by Engedi (Pty) Ltd.

v) Confirm that this amount can be provided for from operating expenditure.

(Confirm that the amount, is anticipated to be an operating cost and is provided for as such in the Mining work programme, Financial and Technical Competence Report or Mining Work Programme as the case may be).

The financial provision will be provided for in the form of a bank guarantee.

- j) Deviations from the approved scoping report and plan of study
- vi) Deviations from the methodology used in determining the significance of potential environmental impacts and risks.

(Provide a list of activities in respect of which the approved scoping report was deviated from, the reference in this report identifying where the deviation was made, and a brief description of the extent of the deviation).

No deviation from scoping in this report.

vii) Motivation for the deviation.

N/A

- k) Other Information required by the competent Authority
- viii)Compliance with the provisions of sections 24(4)(a) and (b) read with section 24 (3) (a) and (7) of the National Environmental Management Act (Act 107 of 1998). the EIA report must include the:-
- (1) Impact on the socio-economic conditions of any directly affected person.
 (Provide the results of Investigation, assessment, and evaluation of the impact of the mining activities on any directly affected person including the landowner, lawful

occupier, or, where applicable, potential beneficiaries of any land restitution claim, attach the investigation report as **Appendix 2.19.1** and confirm that the applicable mitigation is reflected in 2.5.3; 2.11.6.and 2.12.herein).

The diamond (general), diamond (kimberlite) and stone aggregate mine will not impact directly on any socio- economic aspects. Indirect socio-economic benefits are expected to be associated with the creation of employment.

(2) Impact on any national estate referred to in section 3(2) of the National Heritage Resources Act. (Provide the results of Investigation, assessment, and evaluation of the impact of the mining activities on any national estate referred to in section 3(2) of the National Heritage Resources Act, 1999 (Act No. 25 of 1999) with the exception of the national estate contemplated in section 3(2)(i)(vi) and (vii) of that Act, attach the investigation report as **Appendix 2.19.2** and confirm that the applicable mitigation is reflected in 2.5.3; 2.11.6.and 2.12.herein).

The diamond (general), diamond (kimberlite) and stone aggregate mine will not impact on any heritage estate referred to in section 3(2) of the National Heritage Resources Act. It is noted that, in terms of the National Heritage Resource Act no 25 of 199. Heritage resources including archaeological and palaeontological sites over 100 years old, graves older than 60 years, structure older than 60 years are protected. They will not be disturbed without a permit from the relevant heritage resource Authority, which means that before such sites are disturbed by development it is incumbent on the developer to ensure that heritage impact assessment is done and the Provincial Heritage Resources Authority and SAHRA will be contacted immediately and work will stop.

I) Other matters required in terms of sections 24(4)(a) and (b) of the Act.

(the EAP managing the application must provide the competent authority with detailed, written proof of an investigation as required by section 24(4)(b)(i) of the Act and motivation if no reasonable or feasible alternatives, as contemplated in sub-regulation 22(2)(h), exist. The EAP must attach such motivation as **Appendix 4**).

No any other area can be chosen than this one since it is situated where there is diamond (general), diamond (kimberlite) and stone aggregate.

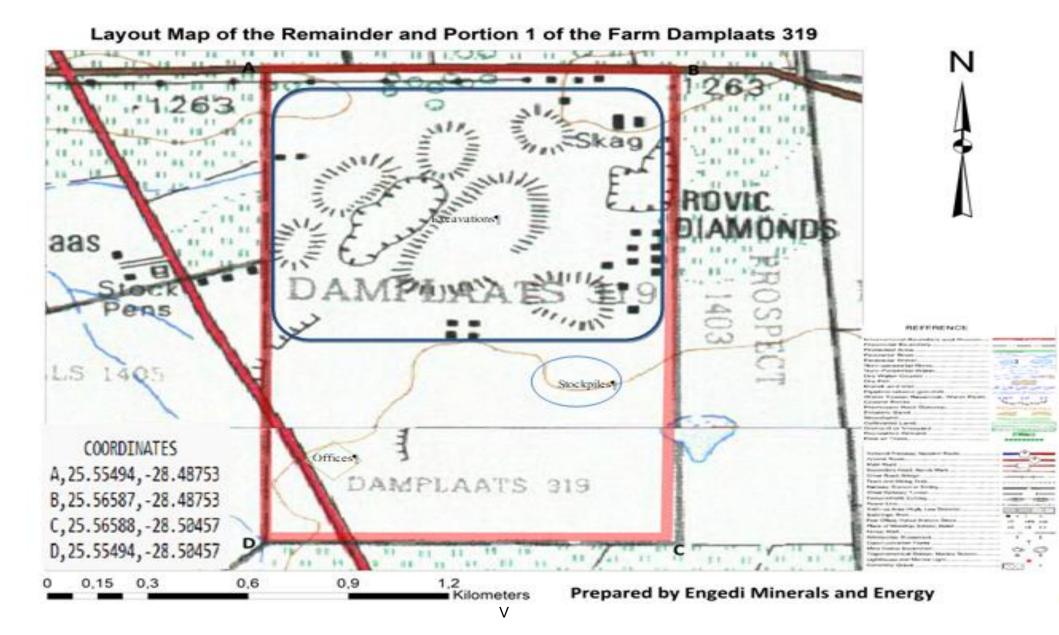

PART B

ENVIRONMENTAL MANAGEMENT PROGRAMME REPORT

- 1. DRAFT ENVIRONMENTAL MANAGEMENT PROGRAMME.
- a) **Details of the EAP**,(Confirm that the requirement for the provision of the details and expertise of the EAP are already included in PART A, section 1(a) herein as required).

Confirmed

- b) Description of the Aspects of the Activity (Confirm that the requirement to describe the aspects of the activity that are covered by the draft environmental management programme is already included in PART A, section (1)(h) herein as required).
 Confirmed
- c) Composite Map

(Provide a map (Attached as an Appendix) at an appropriate scale which superimposes the proposed activity, its associated structures, and infrastructure on the environmental sensitivities of the preferred site, indicating any areas that any areas that should be avoided, including buffers)

d) Description of Impact management objectives including management statements

 Determination of closure objectives. (ensure that the closure objectives are informed by the type of environment described in 2.4 herein)

The closure objectives for diamond (general), diamond (kimberlite) and stone aggregate mining will aim at ensuring that the residual post- closure negating environmental impacts be minimized and kept at an acceptable level to relevant parties. In order to achieve such closure objectives the following measures must be implemented;

All mining related infrastructure, foundations and concrete areas will be decommissioned, removed from the site and appropriately disposed off to a relevant registered facility. Reclaimable structures such as metal, electrical installations or equipment will be sold for re-use or as scrap.

all disturbed areas within the site not already vegetated will be re-vegetated with appropriate indigenous vegetation type, ecologically adopted species appropriate to the area and the final land-use as soon as possible after operation ceases. Progress of vegetation re-establishment, stability and erosion will be monitored and in the event of adverse trends of erosion been identified, corrective measures will be implemented. In the case where the vegetation natural grows after rehabilitation no indigenous re-vegetation will be necessary.

Vegetation monitoring will consider, interlia, the establishment of perennial ground cover and infestation by alien invasive species. The encroachment of indigenous vegetation into the area will be used as an indication of a stable, self-sustaining vegetation cover with little risk of retrogressing to a situation where land and water pollution may occur.

ii) The process for managing any environmental damage, pollution, pumping and treatment of extraneous water or ecological degradation as a result of undertaking a listed activity.

iii)

Any water that will be used in the process of mining activities and get polluted will be re-used in the process or cleaned before its pumped back to the source. No polluted water will be disposed of to the water stream prior to cleaning or recycling.

All the polluted soil by hydrocarbon spills will be rehabilitated by a chemical in the soil rehabilitation farm or be disposed of through a registered facility by a contractor (i.e Oilkol or inter-waste).

iv) **Potential risk of Acid Mine Drainage**. (Indicate whether or not the mining can result in acid mine drainage).

The mining activity at hand is highly unlikely to result in Acid Mine Drainage since the commodity being mine is diamond (general), diamond (kimberlite) and stone aggregate.

v) Steps taken to investigate, assess, and evaluate the impact of acid mine drainage.

The mining activity at hand is highly unlikely to result in Acid Mine Drainage since diamond (general), diamond (kimberlite) and stone aggregate mining uses minimal or no chemicals during processing andother related activities

vi) Engineering or mine design solutions to be implemented to avoid or remedy acid mine drainage.

Not applicable

vii) Measures that will be put in place to remedy any residual or cumulative impact that may result from acid mine drainage.

Not applicable

viii) Volumes and rate of water use required for the mining

100 to 500 L of water per days to wash the mined out diamond (general), diamond (kimberlite) and stone aggregate and also for dust suppression.

ix) Has a water use licence has been applied for?

Not yet.

x) Impacts to be mitigated in their respective phases Measures to rehabilitate the environment affected by the undertaking of any listed activity

		6. Mine workers to wear necessary		
		ear protection gear.		
		7. Noisy activities to take place		
		during allocated hours.		
		8. Noise from labourers must be		
		controlled.		
		9. Noise suppression measures		
		must be applied to all equipment.		
		Equipment must be kept in good		
		working order and where		
		appropriate fitted with silencers		
		which are kept in good working		
		order. Should the vehicles or		
		equipment not be in good working		
		order, the Contractor may be		
		instructed to remove the offending		
		vehicle or machinery from the site.		
		10. The Contractor must take		
		measures to discourage labourers		
		from loitering in the area and		
		causing noise disturbance. Where		
		possible labour shall be		
		transported to and from the site by		
		the		
		Contractor or his Sub-Contractors		
		by the Contractors own transport.		
		11. Implementation of enclosure		
		and cladding of processing plants.		
		12. Applying regular and thorough		
		maintenance schedules to		
		equipment and processes. An		
		increase in noise emission levels		
		very often is a sign of the imminent		
		mechanical failure of a machine.

e) Impact Management Outcomes

(A description of impact management outcomes, identifying the standard of impact management required)

ACTIVITY whether listed or not listed.	POTENTIAL IMPACT	ASPECTS AFFECTED	PHASE In which impact is anticipated	MITIGATION TYPE	STANDARD TO BE ACHIEVED
(E.g. Excavations, blasting, stockpiles, discard dumps or dams, Loading, hauling and transport, Water supply dams and boreholes, accommodation, offices, ablution, stores, workshops, processing plant, storm water control, berms, roads, pipelines, power lines, conveyors, etcetcetc.).	surface		(e.g. Construction, commissioning, operational Decommissioning, closure, post-closure)	(modify, remedy, control, or stop) through (e.g. noise control measures, storm-water control, dust control, rehabilitation, design measures, blasting controls, avoidance, relocation, alternative activity etc. etc) E.g. • Modify through alternative method. • Control through noise control • Control through management and monitoring • Remedy through rehabilitation	
Clearance of vegetation	Loss or fragmentation of habitats	(Avi) Fauna & flora	Mining phase(construction and operation phase)	Existing vegetation 1. Vegetation removal must be limited to the mining area. 2. Vegetation to be removed as it becomes necessary rather than removal of all vegetation throughout the site in one step. 3. No vegetation to be used for firewood. 4. Exotic and invasive plant species should not be allowed to establish, if the development is approved.	Minimisation of impacts to acceptable limits

5. Thorn trees shall not be removed or damaged without prior approval and permits. Rehabilitation 6. All damaged areas shall be rehabilitated upon completion of the contract. 7. Re-vegetation of the disturbed site is aimed at approximating as near as possible the natural vegetative conditions prevailing prior to construction. 8. All natural areas impacted during construction/mining must be rehabilitated with locally indigenous grasses typical of the representative botanical unit. 9. Rehabilitation must take place in a phased approach as soon as possible. 10. Rehabilitation process must make use of species indigenous to the area. Seeds from surrounding seed banks can be used for re-seeding. 11. Rehabilitation must be executed in such a manner that surface run-off will not cause erosion of disturbed areas. 12. Planting of indigenous tree species in areas not to be cultivated or built on must be encouraged. Demarcation of mining area 13. All plants not interfering with mining operations shall be left undisturbed clearly marked and indicated on the site plan.

14. The mining arean must be well demonstrated and no construction mining activities must be allowed outside of this demonstrated foctoprint. 15. Vegetation removal must be phased in order to reduce impact of construction mining. 16. Site office and sydown areas must be clearly demonstrated and no encreadment must occur beyond demonstrated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining process to ensure containment of the mining and laydown areas. 18. Solis must be kept free of perrochemical solutions that may be kept on site during construction mining. Spillings can result in a loss of sol structionality thus limiting the re-establishment of fron. Utilisation of resources 19. Gathering of firewood, fruit, must plants, or any other natural meterial consiste or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Alien vegetation on the site will not be controlled. 21. The Contractor should be responsible for implementing a programme of weed controll (porticularly in areas where soil has been disturbed); and grassing of any remaining atocipiles to prevent weed mostion.				
construction/mining activities must be allowed outside of this demandate forceprint. 15. Vegetation removal must be phased in order to reduce impact of construction/mining. 16. Size office and laydown areas must be clearly demanded and no encreatment must cocur beyond demandated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining and bydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on size during construction/mining. Spillage can result in a loss of soil functionality thus limiting the re-stablishment of flora. Utilisation of resources 19. Garbering of frewood, fruit, mult plants, or any other natural material onsite or in areas adjected to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Allen vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any romaning storuptions to			14. The mining area must be	
must be allowed outside of this demarcated footprint. 15. Vegetation removal must be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly demarcated and no encroachment must occur beyond demarcated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of perrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soft infactionality thus limiting the re-establishment of flora. Utilisation of resources 19. Gathering of firewood. fruit multi plants, or any other natural motorial onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exosic vegetation 20. Allen vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (persicularly in areas where soil has been diskulped), and grassing of any remaining stockpiles to			well demarcated and no	
must be allowed outside of this demarcated fotoprint. 15. Vegetation removal must be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly domarcated and no encreactment must occur beyond demarcated areas. 17. Strict and regular auditing of hermining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of percohemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality thus limiting the re-establishment of fora. Utilisation of resources 19. Gathering of firewood, fruit, must plents, or any other natural material onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Excite vegetation 20. Alen vegetation on the site will need to be controlled. 21. The Contractor's hould be responsible for implementing a programme of weed control (particularly in areas where soil has been diskurbod); and grassing of lay romaining aprogramme of weed control (particularly in areas where soil has been diskurbod); and grassing of lay romaining apocipalities to			construction/mining activities	
this domarcated footprint. 15. Vegetation removal must be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly demoracated and no encroachment must occur beyond demarcated areas. 17. Sinct and regular auditing of the mining process to ensure containment of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on site during constructionning. Spillage context to flora. Utilisation of resources 19. Gathering of firewood, fruit, multi plants, or any other natural material onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Alien vegetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of vew doctortrol (porticularly in areas where soil has been disturbed); and grassing of any remaining stockplies to				
15. Vegelation removal must be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly demarated and no encroschment must occur beyond demarated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality thus limiting the re-establishment of flora. Utilisation of resources 19. Gathering of firewood, fruit, multiplants, or any other natural material cosite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any remaining stockples to				
be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly demarcated and no encrose-threm must occur beyond demarcated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality hus liming the re-establishment of flora. Utilisation of resources 13. Gathering of firewood, faiti, muti plants, or any other natural material onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vogetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any remaining stockples to			triis demarcated footprint.	
be phased in order to reduce impact of construction/mining. 16. Site office and laydown areas must be clearly demarcated and no encrose-threm must occur beyond demarcated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality hus liming the re-establishment of flora. Utilisation of resources 13. Gathering of firewood, faiti, muti plants, or any other natural material onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vogetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any remaining stockples to			15. Vegetation removal must	
impact of construction/mining. 16. Site office and laydown areas must be clearly demarcated and no encroschment must occur beyond demarcated areas. 17. Strict and regular auditing of the mining process to ensure containment of the mining and laydown areas. 18. Solis must be kept free of petrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality thus limiting the re-establishment of fora. Utilisation of resources 19. Gathering of firewood, fruit, must plants, or any other natural material onsite or in areas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any remaining stockples to				
construction/mining. 16. Site office and laydown areas must be clearly demarcated and no encroachment must occur beyond demarcated areas. 17. Sitict and regular auditing of the mining process to ensure containment of the mining and laydown areas. 18. Soils must be kept free of petrochemical solutions that may be kept on site during construction/mining. Spillage can result in a loss of soil functionality thus limiting the re-establishment of flora. Utilisation of resources 19. Gathering of firewood, fruit, mut plants, or any other natural material onsite or in a reas adjacent to the site is prohibited unless with prior approval of the ECO. Exotic vegetation 20. Alien vegetation on the site will need to be controlled. 21. The Contractor should be responsible for implementing a programme of weed control (particularly in areas where soil has been disturbed); and grassing of any remaining stockpiles to

prevent weed invasion.				
			prevent weed invasion.	

22. The spread of exotic species occurring throughout the site should be controlled. Herbicides 23. Herbicide use shall only be allowed according to contract specifications. The application shall be according to set specifications and under supervision of a qualified technician. The possibility of leaching into the surrounding environment shall be properly investigated and only environmentally friendly herbicides shall be used. 24. The use of pesticides and herbicides on the site must be discouraged as these impact on important pollinator species of indigenous vegetation. (Avi) Fauna 25. Rehabilitation to be undertaken as soon as possible after the mining activities have been completed. 26. No trapping or snaring to fauna on the construction/mining site should be allowed. 27. No faunal species must be disturbed, trapped, hunted or killed by maintenance staff during any routine maintenance at the development. 28. No impacts on bats are expected since mining will be taking place during the day and not at night, also no cave like structures are found on site.

Mining of diamond (general), diamond	Loss of topsoil	Soil	Mining	The Contractor should, prior	Minimisation of impacts
(kimberlite) and stone			phase(construction	to the commencement of	to acceptable limits
aggregate			and operation phase)	earthworks determine the	
				average depth of topsoil,	
				and agree on this with the	
				ECO. The full depth of top	
				soil should be stripped from	
				areas affected by construction and related	
				activities prior to the	
				commencement of major	
				earthworks. This should	
				include the building	
				footprints, working areas	
				and storage areas. Topsoil	
				must be reused where	
				possible to rehabilitate	
				disturbed areas.	
				2. Care must be taken not to	
				mix topsoil and subsoil	
				during stripping.	
				3. The topsoil must be	
				conserved on site in and	
				around the mining area.	
				4. Subsoil and overburden in	
				the mining area should be	
				stockpiled separately to be	
				returned for backfilling in the	
				correct soil horizon order.	
				5. If stockpiles are exposed	
				to windy conditions or heavy	
				rain, they should be covered	
				either by vegetation or geo-	
				fabric, depending on the	
				duration of the project.	
				Stockpiles may further be	
				protected by the	
				construction of berms or low	
				brick walls around their	
				bases.	
				6. Stockpiles should be kept	
				clear of weeds and alien	
				vegetation growth by regular	
				weeding.	
				-	
				7. Where contamination of	
				soil is expected, analysis	
				must be done prior to	
				disposal of soil to determine	
				the appropriate disposal	
				route. Proof from an	
	1	•			

			approved waste disposal site where contaminated soils are dumped if and when a spillage/leakage occurs should be attained and given to the project manager. Establish an effective record keeping system for each area where soil is disturbed for mining purposes. These records should be included in environmental performance reports, and should include all the records below. •Record the GPS coordinates of each area. •Record the date of topsoil stripping. •Record the GPS coordinates of where the topsoil is stockpiled. •Record the date of cessation mining activities at the particular site. •Photograph the area on cessation of mining activities. •Record date and depth of re-spreading of topsoil.	
			re-spreading of topsoil.	
Erosion	Air Soil Water	Mining phase(construction and operation phase)	1. An effective system of run-off control should be implemented, where it is required, that collects and safely disseminates run-off water from all hardened surfaces and prevents potential down slope erosion.	Minimisation of impacts to acceptable limits

- 2. Periodical site inspection should be included in environmental performance reporting that inspects the effectiveness of the run-off control system and specifically records the occurrence of any erosion on site or downstream. 3. Wind screening and storm water control should be undertaken to prevent soil loss from the site. 4. The use of silt fences and diamond (general), diamond (kimberlite) and stone aggregate bags must be
 - 5. Other erosion control measures that can be implemented are as follows:

implemented in areas that are susceptible to erosion.

Brush packing with cleared vegetation or Mulchor chip packing or Planting of vegetation or Hydro-seeding/hand sowing

- 6. Sensitive areas need to be identified prior to construction/mining so that the necessary precautions can be implemented.
- 7. All erosion control mechanisms need to be regularly maintained.
- 8. Seeding of topsoil and subsoil stockpiles to prevent wind and water erosion of soil surfaces.
- Retention of vegetation where possible to avoid soil erosion.
- 10. Vegetation clearance should be phased to ensure that the minimum area of soil is exposed to potential erosion at any one time.

		11. Re-vegetation of	

T	<u> </u>	1	I disability of the second	
			disturbed surfaces should occur immediately after	
			construction/mining activities	
			are completed. This should	
			be done through seeding	
			with indigenous grasses.	
			12. No impediment to the	
			natural water flow other than	
			approved erosion control	
			works is permitted.	
			12. To many out otoms where	
			13. To prevent storm water damage, the increase in	
			stormwater run-off resulting	
			from construction/mining	
			activities must be estimated	
			and the drainage system	
			assessed accordingly.	
			14 Oto classification	
			14. Stockpiles not used in	
			three (3) months after stripping must be seeded or	
			backfilled to prevent dust	
			and erosion.	
Air Pollution	Air	Mining	Dust control	Minimisation of impacts
		phase(construction	Wheel washing and	to acceptable limits
		and operation phase)	damping down of un-	
			surfaced and un-vegetated	
			areas.	
			2. Retention of vegetation	
			where possible will reduce	
			dust travel.	
			3. Clearing activities must	
			only be done during agreed	
			working times and permitting weather conditions to avoid	
			drifting of diamond (general),	
			diamond (kimberlite) and	
			stone aggregate and dust	
			into neighbouring areas.	
			4. Damping down of all	
			exposed soil surfaces with a	
			water bowser or sprinklers	
			when necessary to reduce	
			dust.	
			E The Control to the U.S.	
			5. The Contractor shall be	
			responsible for dust control on site to ensure no	
		İ	I OH OILO LO GHOULE HO	
j l			nuisance is caused to the	
			nuisance is caused to the neighbouring communities.	

		must not be exceeded on	
		must not be exceeded on	
	1	•	

site.
7. Any complaints or claims
emanating from the lack of
dust control shall be
attended to immediately by
the Contractor.
8. Any dirt roads that are
utilised by the workers must
be regularly maintained to
ensure that dust levels are
controlled.
Odour control
Regular servicing of
vehicles in order to limit
gaseous emissions.
10. Regular servicing of
onsite toilets to avoid
potential odours.
Rehabilitation
11. The Contractor should
commence rehabilitation of
exposed soil surfaces as
soon as practical after
completion of earthworks.
Fire prevention
12. No open fires shall be
allowed on site under any
circumstance. All cooking
shall be done in demarcated
areas that are safe and
cannot cause runaway fires.
13. The Contractor shall
have operational fire-fighting
equipment available on site
at all times. The level of
firefighting equipment must
be assessed and evaluated
through a typical risk
assessment process.

g) Impact Management Actions

f) Indicate the frequency of the submission of the performance assessment report.

The performance assessment report will be compiled by a relevant specialist and be submitted bi-annually to the DMR.

g) Environmental Awareness Plan

(1) Manner in which the applicant intends to inform his or her employees of any environmental risk which may result from their work.

The following environmental plan will be implemented during mining on site; Employees (full-time and contractors) will be given induction courses which include environmental aspects such hydrocarbon spills handling, veld fires, water pollution, handling of fauna and flora species especially the protected ones and procedures to be followed during an environmental accident occurrence.

All the trainings will be held on the daily basis during the toolbox talks of employees at the beginning of each shift.

(2) Manner in which risks will be dealt with in order to avoid pollution or the degradation of the environment.

Semi Maseme will implement the necessary incident report and reporting procedure in order to identify risks timorously and implement actions to avoid or minimize environmental risks on site.

h) Specific information required by the Competent Authority
 (Among others, confirm that the financial provision will be reviewed annually).

 No specific information has been detailed and required by the competent authority

CLOSURE OBJECTIVES

i) Describe the closure objectives and the extent to which they have been aligned to the baseline environment described under Regulation 22 (2) (d) as described in 2.4 herein.

□ Final landforms must be resilient to perturbation and also be self-sustaining to
obviate/limit further/ongoing interventions and maintenance by Semi Maseme TV
Production CC
☐ The remaining impacts be of an acceptable nature with minimal deterioration over
time.
☐ The final outcome of the mine site rehabilitation would be productive systems, where
required sustaining either cattle or wildlife.
□ Environmental and human quality of life, including health and safety requirements in
general, would not be compromised; and
□ Closure is achieved in an efficient and cost-effective manner as possible and with
minimum socioeconomic changes.
The above goal is underpinned by more specific objectives listed below.
Upfront planning/development
To provide overall guidance and direction to closure planning and/or the implementation
of progressive closure measures over the remaining over the mining life.
2. Physical stability
2. Physical stability To ensure that surface infrastructure and mining residue and/or disturbances that are
•
To ensure that surface infrastructure and mining residue and/or disturbances that are

This will be achieved by: Avoiding and/or limiting the following during mining operations which could result in
To ensure that surface infrastructure and mining residue and/or disturbances that are present at processing plant decommissioning will be removed and/or stabilised in a manner that these will not compromise post-closure land use and be sustainable long-term landforms. Closure, removal and disposal of all surface infrastructure that has no beneficial post-closure use Shaping and vegetating the remaining earth embankments, mining area, etc. to stabilise slopes and integrate with surrounding topography 3. Environmental quality To ensure that local environmental quality is not adversely affected by possible physical effects arising from mining operations and the mining site after closure. This will be achieved by:

- Wash-on and/or mobilisation of chemically contaminated soils and sediments in
the mining site that could have long term adverse effects on local aquatic health and
other water uses.
- Possible shallow groundwater contamination adversely affecting the quality of the
local water resource and its beneficial use.
$\hfill \square$ Limiting the potential for dust generation on the rehabilitated mining site that could
cause nuisance and/or health effects to surrounding landowners;
$\hfill \square$ Limiting the possible adverse water quality and quantity effects arising from t
rehabilitated mining site to ensure that long term beneficial use of local resources is r
compromised;
$\hfill \square$ Conducting soil clean-up/remediation to ensure that the planned land use could I
implemented and maintained;
4. Health and safety
To limit the possible health and safety treats due to terrain hazards to humans and
animals utilizing the rehabilitated mining site after closure by:
$\hfill \square$ Demonstrating through upfront soil testing that any resultant inorganic and organic
pollution present on the site is acceptable;
□ Removal of potential contaminants such as hydrocarbons and chemicals off site;
$\hfill \square$ shaping of embankments and mining area to safe slopes and reintegrating of these
into surrounding topography
☐ Ensuring that the environmental quality as reflected above is achieved
5. Land capability / land use
To ensure that the required land capability to achieve and support the planned land use
can be achieved over the mining site by:
$\hfill \Box$ Clean-up and reclamation of contaminated soil areas in order not to compromise the
above land use planning earmarked for implementation;
☐ To ensure that the overall rehabilitated mining site is free draining
☐ Transferring mining related surface infrastructure to third parties for beneficial use
after closure.
6. Aesthetic quality To ensure that the rehabilitated mining site will display, at a minimum
an acceptable aesthetic appearance that would not compromise the planned land use
by leaving behind:

 A mining area that is properly cleared-up with no fugitive/scattered waste piles Rehabilitated mining area that is free draining and disturbed areas that are suitably vegetated. 	
☐ Rehabilitated mining residues that are suitably landscaped, blending with the surrounding environment as far as possible.	
☐ Shaped and rehabilitated terrace and hard stand areas, roughly emulating the local	
natural surface topography.	
7. Landscape viability	
To create a landscape that is self-sustaining and over time will evolve/converge to the	Э
desired ecosystem structure, function and composition by:	
□ Conducing surface profiling, with associated material movement optimisation, to	0
obtain a landscape resembling the natural landscapes to support the succession	n
trajectory towards a climax ecological system	
☐ Establishing woody patches and create rough and loose areas for pioneer species)
establishment around the respective patches.	
☐ Establishing pioneer species as follows:	
□ Collected and prepared seeds for broad casting;	
□ Seedlings grown on on-site nursery;	
☐ Cuttings collected from surrounding veld areas;	
☐ Conducting rehabilitation monitoring and corrective action as required.	
8. Biodiversity	
To encourage, where appropriate, the re-establishment of native vegetation on the	Э
rehabilitated mine site such the terrestrial biodiversity is largely re-instated over time, by	/ :
□ Stabilising disturbed areas to prevent erosion in the short- to medium term until a	a
suitable vegetation cover has established; and	
$\hfill\Box$ Establishing viable self-sustaining vegetation communities of local fauna, as far as	
possible	
j) Confirm specifically that the environmental objectives in relation to closure	
have been consulted with landowner and interested and affected parties.	
The closure objectives within the EMPr have been presented to the public as part of	
thepublic participation process and on-going closure planning for mining activities.	

k) Provide a rehabilitation plan that describes and shows the scale and aerial extent of the main mining activities, including the anticipated mining area at the time of closure.

Map drawn.

I) Explain why it can be confirmed that the rehabilitation plan is compatible with the closure objectives.

The rehabilitation plan is compatible with the closure plan in that in focuses on rehabilitating all the disturbed environment to archive a closure that will be satisfactory to the DMR, stakeholders, interested and affected parties. And at the end the area will be able to support grazing for cattle as it is currently prior to mining.

m) Calculate and state the quantum of the financial provision required to manage and rehabilitate the environment in accordance with the applicable guideline.

Section 24P of NEMA, as amended provides that the holder of a mining right or mining permit must make financial provision for the rehabilitation of negative impacts.

The financial provision estimates were made in line with the requirements of the Financial Provision Regulations, 2015 (GNR 1147).

Major subject passed: Mathematics, Physical Science, Biology, Agric,

English and Tshivenda all in Higher Grade.

Year : 2006

Institution : University of Venda

Qualification : BSc (Honours). Mining and Environmental Geology

Subject passed : See attached Academic Record

Year : 2011

SUMMARY

I am a Candidate in a possession of a BSc (Hons.) in Mining and Geology with vast variety of experience in Geological, Geochemical, Geophysical Exploration, and Managing of a

107

Manufacturing team. Currently I am working as a Consultant Geologist at Breeze Court

Investments 47 (Pty) Ltd and i have gained experience in Map Production (Using ArcGis),

Identification of Minerals, and Applications for (Mining Right, Mining Right, and Mining Permit

on DMR Samradonline portal), Petroleum applications (Compilation of EMP, EIA, Progress

report, Environmental Performance Assessment, Closure application, and Mineral Laws

Administration (knowledge of MPRDA, 2002, NWA, 1998, NEMA, 1998, NHRA, 1999,

MHSA, 1996, Mining Charter, 2010 and Freedom Charter, 1955.).

I have also worked with the small scale miners in the region of Northern Cape, Free State

and North West helping them with the application for Mining permit, mining right and also

attend the site inspection with the officials from Department Mineral Resources to help the

small scale miners to comply with the legislation of the department.

I served at the Makhado Municipality for two (2) years under Local Economic Development

as an Intern (In Mining, Environmental and Geology Sectors) and was attending

seminars on Local Economic Development issues, interacting with the stake holders and

helping the Small Micro Medium Enterprises (SMME's) to get funds from the sponsors.
