Signature:

Executive Summary

A palaeontological Impact Assessment was requested for the Proposed Khutsong Extension 8 Housing Development situated near Carletonville within the Merafong City Local Municipality, West Rand District Municipality, Gauteng. The proposed development entails the construction of a total of 27 000 housing units within a total area of 391ha to accommodate the relocation of residents from the Khutsong Hostel, Khutsong Extensions 1 and 6, as well as the Khutsong informal Area. SAHRA has requested a site visit because the area is very highly sensitive (CaseID:16322).

To comply with the South African Heritage Resources Agency (SAHRA) in terms of Section 38(8) of the National Heritage Resources Act, 1999 (Act No. 25 of 1999) (NHRA), a site visit and ground survey Palaeontological Impact Assessment (PIA) was completed for the proposed development on 17 August 2021 by a palaeontologist.

The proposed site lies on the Malmani Subgroup dolomite, chert and chert breccia (Chuniespoort Group, Transvaal Supergroup) the could potentially have trace fossils such as stromatolites preserved in the dolomites. The site visit confirmed that there are no dolomites and no stromatolites visible in the project area. It is not known what lies below the surface, therefore a Fossil Chance Find Protocol should be added to the EMPr. Based on this information it is recommended that no further palaeontological assessment is required unless the Environmental Officer or other responsible person finds stromatolites once excavations have commenced.

1. Background

A final scoping repost has been submitted for the proposed Khutsong Extension 8 Housing Development situated near Carletonville within the Merafong City Local Municipality, West Rand District Municipality, Gauteng. The proposed development entails the construction of a total of 27 000 housing units within a total area of 391 ha to accommodate the relocation of residents from the Khutsong Hostel, Khutsong Extensions 1 and 6, as well as the Khutsong informal Area.

SAHRA has requested a site visit because the area is very highly sensitive (CaseID:16322).

A Palaeontological Impact Assessment is required for the Khutsong South Ext 8 Housing development in order to comply with the regulations of the South African Heritage Resources Agency (SAHRA) in terms of Section 38(8) of the National Heritage Resources Act, 1999 (Act No. 25 of 1999) (NHRA). A site visit and ground survey Palaeontological Impact Assessment (PIA) was completed by professional palaeontologists for the proposed development and is reported herein.

	A specialist report prepared in terms of the Environmental Impact Regulations of 2017 must contain:	Relevant section in report
ai	Details of the specialist who prepared the report	Appendix B
aii	The expertise of that person to compile a specialist report including a curriculum vitae	Appendix B
b	A declaration that the person is independent in a form as may be specified by the competent authority	Page 1
с	An indication of the scope of, and the purpose for which, the report was prepared	Section 1
сі	An indication of the quality and age of the base data used for the specialist report: SAHRIS palaeosensitivity map accessed – date of this report	Yes

2. Methods and Terms of Reference

The Terms of Reference (ToR) for this study were to undertake a PIA and provide feasible management measures to comply with the requirements of SAHRA.

The methods employed to address the ToR included:

- Consultation of geological maps, literature, palaeontological databases, published and unpublished records to determine the likelihood of fossils occurring in the affected areas. Sources included records housed at the Evolutionary Studies Institute at the University of the Witwatersrand and SAHRA databases;
- 2. Where necessary, site visits by a qualified palaeontologist to locate any fossils and assess their importance (as reported herein, and collect or rescue fossils if required);
- 3. Where appropriate, collection of unique or rare fossils with the necessary permits for storage and curation at an appropriate facility (*as indicated in section 4 below*); and
- 4. Determination of fossils' representivity or scientific importance to decide if the fossils can be destroyed or a just a representative sample collected and housed in a recognised repository.

3. Geology and Palaeontology

i. Project location and geological context

The Late Archaean to early Proterozoic Transvaal Supergroup is preserved in three structural basins on the Kaapvaal Craton (Eriksson et al., 2006). In South Africa are the Transvaal and Griqualand West Basins, and the Kanye Basin is in southern Botswana. The Griqualand West Basin is divided into the Ghaap Plateau sub-basin and the Prieska sub-basin. Sediments in the lower parts of the basins are very similar but they differ somewhat higher up the sequences. Several tectonic events have greatly deformed the south western portion of the Griqualand West Basin between the two sub-basins

The Transvaal Supergroup comprises one of world's earliest carbonate platform successions (Beukes, 1987; Eriksson et al., 2006; Zeh et al., 2020). In some areas there are well preserved stromatolites that are evidence of the photosynthetic activity of blue green bacteria and green algae. These microbes formed colonies in warm, shallow seas.

In the Transvaal Basin the Transvaal Supergroup is divided into two Groups, the lower Chuniespoort Group and the upper Pretoria Group (with ten formations; Eriksson et al., 2006). The Chuniespoort Group is divided into the basal Malmani Subgroup that comprises dolomites and limestones and is divided into five formations based on chert content, stromatolitic morphology, intercalated shales and erosion surfaces. The top of the Chuniespoort Group has the Penge Formation and the Duitschland Formation.

The Malmani Subgroup is up to 2000m thick and has been divided into five formations based on the composition of cherts, stromatolites, limestones and shales. At the base, overlying the Black Reef Formation, is the base is the Oaktree Formation that represents a transition from siliciclastic sedimentation to platform carbonates (Eriksson et al., 2006). It is composed of carbonaceous shales, stromatolitic dolomites and locally developed quartzites.

Next is the Monte Christo Formation that has an erosive breccia base and continues with stromatolitic and oolitic platformal dolomites. Above that is the Lyttleton Formation that is composed of shales, quartzites and stromatolitic and dolomites. The overlying Eccles Formation includes a series of erosion breccias that locally contain gold deposits. This mineralisation has been attributed to hydrothermal remobilisation of fluids by the Bushveld complex (Eriksson et al., 2006). The topmost formation is the Frisco Formation that is composed mainly of stromatolitic dolomites but these become more shale rich towards the top of the sequence because of the deepening depositional environment.

In this region the formations of the Malmani Sungroup have not been distinguished (Figure 2).

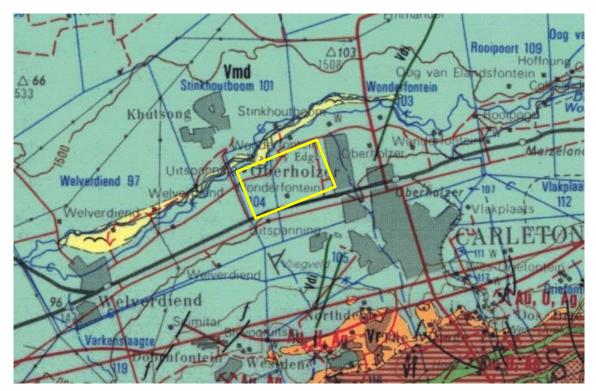

Figure 2: Geological map of the area around the proposed Khutsong Ext 8 social hoyusing development, northeast of Carletonville, shown within the yellow rectangle. Abbreviations of the rock types are explained in Table 2. Map enlarged from the Geological Survey 1: 250 000 map 2626 West Rand.

Table 2: Explanation of symbols for the geological map and approximate ages (Eriksson et al., 2006; Zeh et al., 2020). SG = Supergroup; Fm = Formation; Ma = million years; grey shading = formations impacted by the project.

Symbol	Group/Formation	Lithology	Approximate Age
Q	Quaternary	Alluvium, sand, calcrete	Neogene, ca 2.5 Ma to present
Vt	Timeball Hill Fm, Chuniespoort Group, Transvaal SG	Quartzite	< 2420 Ma

Symbol	Group/Formation	Lithology	Approximate Age
Vr	Rooihoogte Fm,	Quartzite, conglomerate, shale, basalt	Ca 2650 – 2640 Ma
Vmd	Malmani Subgroup	Dolomite, chert, breccia	Ca 2750 – 2650 Ma
Rg	Government Subgroup, West Rand Group, Witwatersrand SG	Quartzite, shale	>2650 Ma

ii. Palaeontological context

The palaeontological sensitivity of the area under consideration is presented in Figure 3. The site for development is in the Malmani Subgroup that could preserve stromatolites in the dolomites.

Stromatolites are the trace fossils that were formed by colonies of green algae and bluegreen algae (Cyanobacteria) that grew in warm, shallow marine settings. These algae were responsible for releasing oxygen via the photosynthetic process where atmospheric carbon dioxide and water, using energy from the sun, are converted into carbon chains and compounds that are the building blocks of all living organisms. The released carbon dioxide initially was taken up by the abundant reducing minerals to form oxides, e.g. iron oxide. Eventually free oxygen was released into the atmosphere and some was converted into ozone by the bombardment of cosmic rays. The ozone is critical for the filtering out of harmful ultraviolet rays.

Stromatolites are the layers upon layers of inorganic materials that were deposited during photosynthesis, namely calcium carbonate, magnesium carbonate, calcium sulphate and magnesium sulphate. These layers can be in the form of flat layers, domes or columns depending on the environment where they grew (Beukes, 1987). Some environments did not form stromatolites, just layers of limestone that later was converted to dolomite. The algae that formed the stromatolites are very rarely preserved, and they are microscopic so they can only be seen from thin sections studies under a petrographic microscope.

From the SAHRIS map below (Figure 3), the area is indicated as very highly sensitive (red) so a site visit was undertaken on 17 August 2021 by Mr Rick Tolchard.

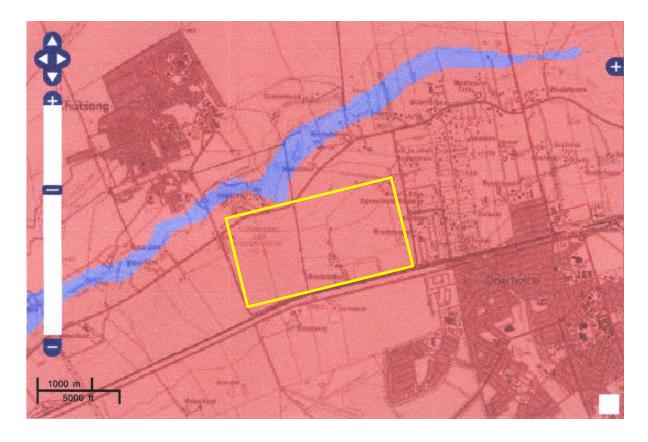

Figure 3: SAHRIS palaeosensitivity map for the site for the proposed Khutsong Ext 8 social housing development near Carletonville shown within the yellow rectangle. Background colours indicate the following degrees of sensitivity: red = very highly sensitive; orange/yellow = high; green = moderate; blue = low; grey = insignificant/zero.

lii Site visit observations

For the palaeontological survey, the ground was examined for the presence of dolomite with stromatolites. GPS coordinates refer to the site stops 1-9 within the project boundary (see Figure 4). All photographs were taken by Tolchard and are referred to in the table below (Table 3). No fossils were found.

Table 3: Site visit stops as numbered in Figure 4, observations and relevant photographs.

GPS coordinates	Observations	Figure
S26°20'05.54117"	Stop 1.	5A, B, C.
E27°20'56.82229"	A - General view looking southwards of the large open	
1508m	area to be developed; B - close-up photograph of the	
	ground showing bare soil and minimal vegetation; C -	
	another close-up photograph – the grass has been burned	
	so the visibility is excellent	
S26°20'20.21261"	Stop 2.	5D, 6A, B

4. Impact assessment

An assessment of the potential impacts to possible palaeontological resources considers the criteria encapsulated in Table 4:

PART A: DEFINITION AND CRITERIA				
	Н	Substantial deterioration (death, illness or injury). Recommended level will often be violated. Vigorous community action.		
	М	Moderate/ measurable deterioration (discomfort). Recommended level will occasionally be violated. Widespread complaints.		
Criteria for ranking of the SEVERITY/NATURE of environmental	L	Minor deterioration (nuisance or minor deterioration). Change not measurable/ will remain in the current range. Recommended level will never be violated. Sporadic complaints.		
impacts	L+	Minor improvement. Change not measurable/ will remain in the current range. Recommended level will never be violated. Sporadic complaints.		
	M+	Moderate improvement. Will be within or better than the recommended level. No observed reaction.		
	H+	Substantial improvement. Will be within or better than the recommended level. Favourable publicity.		
	L	Quickly reversible. Less than the project life. Short term		
Criteria for ranking the DURATION of impacts	М	Reversible over time. Life of the project. Medium term		
Denviron of impacto	Н	Permanent. Beyond closure. Long term.		
Criteria for ranking the	L	Localised - Within the site boundary.		
SPATIAL SCALE of	М	Fairly widespread – Beyond the site boundary. Local		
impacts	Н	Widespread – Far beyond site boundary. Regional/ national		
PROBABILITY	Н	Definite/ Continuous		
(of exposure to	М	Possible/ frequent		
impacts)	L	Unlikely/ seldom		

TABLE 4B: IMPACT ASSESSMENT

PART B: ASSESSMENT				
	Н	-		
	М	Soils do not preserve fossils; so far there are no records from the Malmani Group dolomites of stromatolites in this region so it is unlikely that fossils occur on the site. The impact would be very unlikely		
SEVERITY/NATURE	L			
	L+	-		
	M+	-		
	H+	-		
	L	-		
DURATION	М	-		
	Н	Where manifest, the impact will be permanent.		
SPATIAL SCALE	L	Since the only possible fossils within the area would be trace fossils such as stromatolites from the Malmani Subgroup dolomites, the spatial scale will be localised within the site boundary.		
	М	-		
	Н	-		

PART B: ASSESSMENT		
	Н	-
PROBABILITY	Μ	It is extremely unlikely that any fossils would be found in the loose sand that will be excavated. The site visit confirmed that there are no visible dolomites or stromatolites. Nonetheless, a Fossil Chance Find Protocol should be added to the eventual EMPr
	L	

Based on the nature of the project, surface activities may impact upon the fossil heritage if preserved in the development footprint. The geological structures suggest that the rocks are much too old to contain body fossils; only trace fossils such as stromatolites coul occur in the Malmani Subgroup dolomites. Since there is an extremely small chance that stromatolites might occur below ground, and could be disturbed once excavations commence, a Fossil Chance Find Protocol has been added to this report. Taking account of the defined criteria, the potential impact to fossil heritage resources is extremely low.

5. Assumptions and uncertainties

Based on the geology of the area and the palaeontological record as we know it, it can be assumed that the formation and layout of the dolomites, sandstones, shales and sands are typical for the country and only the dolomites might contain trace fossils such as stromatolites. The site visit confirmed that there are no surface dolomites and no surface <u>stromatolites</u>. The site is covered in sandy soils. While it is unlikely that the dolomites underground might have stromatolites, this is not known. The covering sands and soils of the Quaternary period would not preserve fossils.

6. Recommendation

Based on experience and the lack of any previously recorded fossils from the area, and the site visit observations, it is extremely unlikely that any fossils would be preserved in the loose sands of the Quaternary. <u>No dolomites and no stromatolites were seen during the site survey</u>. There is a very small chance that trace fossils may occur in the dolomites beneath the ground surface so a Fossil Chance Find Protocol should be added to the EMPr. If fossils are found once excavations for amenities and foundations have commenced then they should be rescued and a palaeontologist called to assess and collect a representative sample (see Section 8).

8. Chance Find Protocol

Monitoring Programme for Palaeontology – to commence once the excavations / drilling activities begin.

- 1. The following procedure is only required if fossils are seen on the surface and when excavations commence.
- 2. When excavations begin the rocks and must be given a cursory inspection by the environmental officer or designated person. Any fossiliferous material (stromatolites, plants, insects, bone, coal) should be put aside in a suitably protected place. This way the excavation and construction activities will not be interrupted.
- 3. Photographs of similar fossils and trace fossils must be provided to the developer to assist in recognizing the fossils in the dolomites, shales and mudstones (for example see Figure 10). This information will be built into the EMP's training and awareness plan and procedures.
- 4. Photographs of the putative fossils can be sent to the palaeontologist for a preliminary assessment.
- 5. If there is any possible fossil material found by the developer/environmental officer then the qualified palaeontologist sub-contracted for this project, should visit the site to inspect the selected material and check the dumped material where feasible.
- 6. Fossil plants or vertebrates or trace fossils that are considered to be of good quality or scientific interest by the palaeontologist must be removed, catalogued and housed in a

suitable institution where they can be made available for further study. Before the fossils are removed from the site a SAHRA permit must be obtained. Annual reports must be submitted to SAHRA as required by the relevant permits.

- 7. If no good fossil material is recovered then no site inspections by the palaeontologist will be necessary. A final report by the palaeontologist must be sent to SAHRA once the project has been completed and only if there are fossils.
- 8. If no fossils are found and the excavations have finished then no further monitoring is required.
