

Fig 23; In winter, bus drivers create small seats for themselves and make fires to keep warm (see middle foreground) because there are no shelter facilities for them. Uncontrolled fires can easily start on site in this way

Fig 24: The traffic throughflow, service vehicle routes and turning facilities for buses have not been well thought through. Buses waiting for tours to finish often pile up one behind the other causing traffic congestion

3.3.4 Built environment

This part of the Status Quo report has been divided onto Part 1: the public area of the site and Part 2, the fossil site enclosure:

Status quo:

PART 1 PUBLIC AREA

Tourist-related, including signage

- There is a long single-storey building which houses a site museum dedicated to the interpretation of the site and the broader concepts which are needed to interpret the Cradle of Humankind as a whole, a restaurant, a curio-cum-tuck shop, conference rooms, store rooms and toilets (Fig 6)
- There is interpretative material on sale in the tuck shop which includes booklets concerning the site. Price is a deterrent for many visitors (school children and their teachers)
- This part of the site is accessible to the disabled
- There is a brass plaque (erected by SAHRA) identifying the site as a National Heritage Site
- The World Heritage Emblem is displayed on the signifier at the front gate
- There is directional signage on site, but the museum is labeled 'Waiting Area' and many visitors miss it (Fig 25)
- There are behavioural modifiers (e.g. no eating in the caves, no littering)
- There are some safety warnings e. g. do not throw objects down sinkholes
- There is an introductory series of engraved granite blocks showing stages in the history of life on earth. Some types of rock surface are weathering faster than others.
- There are interpretive illustrated boards along the boardwalk (Fig. 12)
- There is an interpretative video in the cave part of the tour

Ablutions and toilets

- There are male and female restrooms with flush toilets and a septic tank sewage system which is not ideal (Fig.16).

Pathways, walkways and viewing platforms

- The tourist route is paved with pavers along pathways. Where there is open rough or steep ground, Loose concrete blocks placed on flat foundations have been used in the form of steps and pathways.
- There is a raised boardwalk which is unfortunately not accessible to the disabled, but it could easily be made so.
- The boardwalk includes viewing platforms but these can unfortunately not look into the excavation site itself

Sheds and storage

- There is a new store room and laboratory for the use of the permitted scientists busy on site, with storage room, work room and offices (Fig 26). Unfortunately the design of this building has many flaws and it does not suit the activities it was originally planned for. Details have been included in the Site Inspection Report for Sterkfontein, October 2006.
- There are toilets, ablution facilities and a wash basin
- The laboratory is air-conditioned but not dust-proof.

Accommodation

- The 'Compound' provides on-site accommodation for the fossil site excavators and preparators. This is an aging facility and requires renovation urgently. Attention to limiting the inmates to authorized persons and to safety aspects are recommended
- The 'Compound" as it now is, or will be after renovation, should be screened from view and appropriate building material selected.

This management area is the responsibility of the University of the Witwatersrand. It is unfortunate that this Status Quo report is still mentioning items which were issues at the time that the original management plan was developed.

Risks and threats:

- These are not relevant to the fossil site management plan

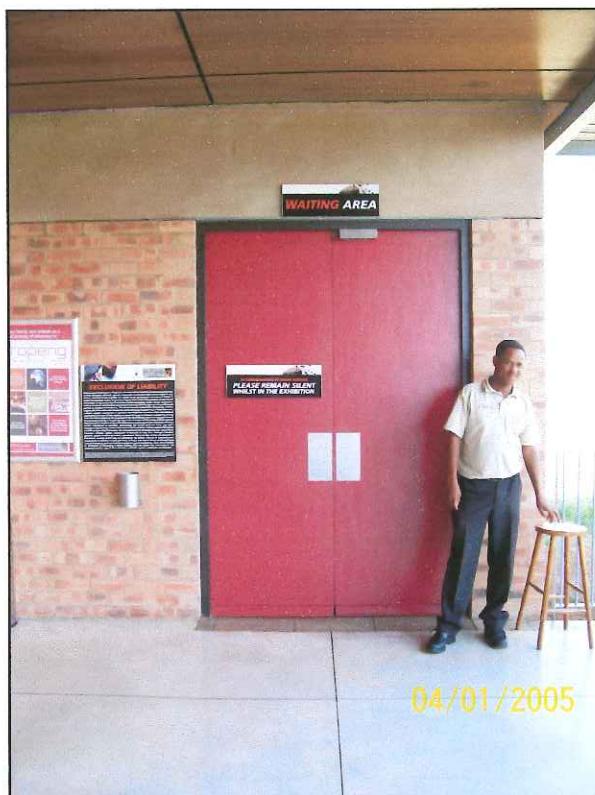

Fig 25: Inappropriate label over Museum door reads 'Waiting Area' – many visitors have departed unaware that there was a museum. Waiting area is being interpreted as an organizing venue for large groups of schoolchildren

Fig 26. The laboratory and fossil store built for the scientists has many inherent flaws in its design. It is utilized by the swartkrans excavation team from across the valley and by the Sterkfontein technicians for casting. Future planning should address ways in which amendments to inappropriate design could be rectified to make the structure fulfill the purposes for which it was built, or fit it for alternative purposes if this is not possible

PART 2: FOSSIL SITE ENCLOSURE

Status quo:

Tourist-related, including signage

- There is no infrastructure dedicated to tourism because this is exclusively a work environment.
- There are some explanatory boards and texts inside the store for use when students, academics and high –profile visitors come to the site

Ablutions and toilets

- There are toilet and ablution facilities on site for the use of site users

Pathways, walkways and viewing platforms

- There are traditional pathways around the site, some of them passing dangerously high and unprotected drops
- There is an extensive metal walkway crossing the site with a handrail. This has no mesh between the handrail and the footplate and is not safe for small or very short persons. The drops to the excavation floor are dangerous (Fig. 7).

Sheds and storage

- There is a metal shed which was erected in the early 1970s, using the surface of a flattened dump as a foundation. It is used to store excavation equipment, prepared fossils awaiting transportation to the University, and the casts and demonstration material needed for site interpretation for professional and international academic visitors (Fig 27)

Fig 27: The metal shed within the fossil site enclosure is used as a store and as a delightful informal site interpretation facility for students and scientific visitors. It is not open to the public, but serves an important function. Preparators can work indoors / inclement weather, increasing productivity (Note: date not correct)

Accommodation

- There is no accommodation within the fossil site enclosure

Risks and threats:

- Despite a full-time caretaker presence, break-ins and theft continue to be a threat

3.3.5 Waste Management (Concessionaire management issue)

Status quo:

Sewage

- There are flush toilets at the Visitor centre which discharge into a septic tank system. This situation is far from ideal in a dolomitic area with a known void beneath the site because of risk of water contamination- the authorities are aware of this.
- The system needs to be re-engineered to accommodate unexpectedly high volumes of through-put.
- The overflow flows through a series of reed beds which assist in filtering process (Fig 16)
- The final effluent is discharged under the Sterkfontein tar road and seeps down into the Blaauwbank drainage system, an already heavily polluted conduit (Fig 28).
- The toilets in the scientists' laboratory also drains into the septic tank
- The toilet facilities in the excavation enclosure have their own septic tank
- The ideal situation would be a closed sewage system with a holding tank which could be emptied periodically

Litter

- Litter bins are provided in the main tourist areas
- Restaurant waste is also catered for

- There is a 'waste away' metal hopper parked opposite the bus park (Fig 11) but this does not have a confining net to prevent litter from blowing about
- The excavation area is kept litter free by the excavation team and researchers
- Litter is always to be found but is not a serious problem. No eating is allowed in the caves

Threats and risks:

- Not relevant to fossil site management plan

3.3.6 Energy (Concessionaire management issue)

Status quo:

- The site is on ESKOM power.
- There are several redundant power lines and poles which need to be removed in order to improve visual aesthetics (Fig 20)
- The present power should ideally be buried in order that there is better integration of the site with its surrounding landscape

Threats and risks:

- Redundant infrastructure is an eyesore

Fig 28: Effluent from the multiple septic tank system at Sterkfontein caves spills over into the Blaauwbank River, an already heavily polluted drainage system. The throughput at Sterkfontein exceeds design specifications and an upgrade is planned. The overflow seen here is on its way to the Blaauwbank at the valley bottom seen in the distance

3.3.7 Water (Concessionaire management issue)

Status quo:

Please elaborate how the site is currently supplied – Compound, visitor centre and excavation site

Threats and risks:

- None, at the fossil site

3.3.8 Telecommunications

Status quo:

- The site has good telecommunications and a good cellular phone signal
- There are redundant telephone lines and poles which need to be removed in order to improve visual aesthetics (Fig 29)

Threats and risks:

- Redundant telecommunications infrastructure is an impediment to visual integrity and sense of place

Fig 29: redundant infrastructure such as telephone lines that once served the former Cave Inn Restaurant and the pipeline water supply need to be removed to reduce visual impact.

3.4 Research Environment

Status quo:

In-house expertise such as the skills and advice of Prof Tim Partridge, a geological engineer, and John Cruise, a mining engineer and explosives practitioner, allow for professional monitoring of most aspects of the work. The researchers, particularly Prof Ron Clarke, have many years of excavation experience. The management of all activities taking place within the excavation area is under his personal supervision.

3.4.1 Previous and ongoing research and excavations

Status quo:

The bone-bearing breccias at Sterkfontein were noted soon after 1895 when prospecting and exploitation of the cave travertine was initiated by G. Martinaglia, a gold and lime prospector. Some fossils were described and reported in the scientific press e.g. Draper 1895 and Frames, 1897, but nothing further was done for almost three decades, during which time many thousands of fossils were probably consigned to the lime-burning kilns and "forever destroyed" (Broom, 1950).

Fossil bones from the Sterkfontein caves were brought to the attention of Raymond Dart by two of his students in 1935, who in turn alerted Robert Broom, then at the Transvaal Museum. Broom discovered the first hominin material from the site in 1936. He initially classified the remains as *Australopithecus transvaalensis*, later creating a new genus to accommodate the material, which he re-named *Plesianthropus transvaalensis*, and hence, "Mrs. Ples". Since the mid-1950s, this hominin has been considered synonymous with *Australopithecus africanus*.

Broom worked the site more or less continuously (together with Kromdraai and Swartkrans) from this time until about 1958, by which time his protégé, John Robinson, had taken over the excavations.

New excavations were begun by the Wits Anatomy Department in 1966 and the site has been continuously excavated since then, by researchers such as Emeritus Professor P.V.Tobias, the late Alun Hughes, Ron Clarke, Tim Partridge and Kathy Kuman. This makes it the world's longest-running archaeological and palaeontological excavation. Current research falls under the aegis of the Sterkfontein Research Unit of the University of the Witwatersrand School of Anatomical Sciences.

The ongoing and proposed excavation targets have been discussed in section 3.1.4 above.

3.4.2 Excavation edges

Status quo:

- The excavation edges are stable where the underlying breccia is calcified or partly so. Paths do not run too close to the edge and a metal walkway makes access across the site easy without putting edges at risk (Fig.7).
- Large boulders and fallen blocks of dolomite which are embedded in friable material need watching to see that they are not de-stabilised by excavation proceeding underneath

Risks and threats:

- None at present

3.4.3 Excavation walls

Status quo:

- Excavation walls have reached dangerously impressive heights at Sterkfontein. The excavations have not been benched but have mostly proceeded straight down (Fig 30). This has created dangerous overhangs and vertical faces, particularly where patches of decalcified breccias underlie solid deposit. Some of the overhanging material has had to be blasted down before excavation could continue.
- Another consequence is the problem of access to the base of the excavation when it is 5 or 6 metres down.
- The creation of a huge sump in which rainwater can collect, or drain off into the underground cave, taking sediment with it, is a further problem. Water in the underground cave causes its own problems. At the time of the discovery of Little Foot, the walls of the Silberberg Grotto were wet and muddy with water draining into the cavern from above.
- The situation is one which should be watched closely. Each case needs to be assessed on its own merits, but as yet there are no agreed guidelines as to how deep, (apart from the safety factor), excavations should go without benching out, and without preserving sections of deposit which demonstrate contacts and field relationships between different sedimentary strata. Such situations need to be discussed in the proposed scientific advisory committee (see generic issues document)

Risks and threats:

- Collapse of friable wall material
- Loose boulders may collapse, together with wall material
- Safety aspects of steep drops
- Ponding of water destabilizes footwall and washes sediment into underlying caves

Fig 30: Excavations into the breccias at Sterkfontein have reached a considerable and dangerous depth. The report of a professional site safety officer is awaited. Cracks, overhangs and unstable breccia make the site unsafe for excavators and other site users (Image from May to July folder)

3.4.4 Access to excavations: steps, ladders, lifts etc.

Status quo:

- The deeper parts of the surface excavations can be accessed by means of a ladder or by climbing down residual portions of the deposit. Ladders and scaffolding can be unstable and unsafe because of the uneven substrate.
- Access by whatever means needs to be checked by a site safety officer and an inspection will take place shortly
- The Silberberg Grotto, where there is a deep excavation taking place underground, is accessed by means of the tourist stairs. There is a gate which can be locked.
- The old gate has almost rusted away but provides an additional security barrier. If removed, it should be replaced. There is a newer, second inner gate already in place.

Risks and threats:

- The report of the professional site safety officer is awaited

3.4.5 Erosion

Status quo:

- Erosion within the fenced off area is not a problem. Fortunately, being near the crest of the hill, most drainage is away from the excavation.
- Erosion beyond the confines of the excavation area is the concern of the landowner and Concessionaire. The bus park and car park need attention.

Risks and threats:

- Not a problem within the fossil site

3.4.6 Compliance with conditions of excavation permit

Status quo:

Inspection by a SAHRA permitting committee member takes place twice a year to check compliance with the terms of the permit

Risks and threats:

- Excavation is inevitably a destructive process. Inappropriate excavation techniques, recording techniques, recovery techniques, preparation techniques, inadequate subsequent publication and indifferent conservation of artefacts recovered is perhaps the greatest threat to the fossil sites. This is an issue generic to all the sites in the COH WHS, hence the SAHRA twice-yearly inspections. Non-compliance is not an issue at this site.

3.4.7 Witness sections

Status quo:

- A witness section demonstrating members 4,5 and 6 plus post-6 has been identified in squares U,T,S and R, and R66. This area of the deposit demonstrates contacts between these members (Fig 31)
- Witness section at the 'Historic face' at the original 'Mrs Ples' discovery site (Fig 32)
- Witness section in south wall at M4 near STW 53 find site and contact between Member 4 and Member 5

Risks and threats:

- Stratigraphic conclusions reached should be independently verifiable. If no witness sections are preserved, this would not be possible
- Dating results need to be independently verifiable. If witness sample sections are not preserved, this will not be possible
- New techniques and analytical procedures are perpetually coming to light. These need to be applied to sites from which earlier conclusions were obtained, in order to verify and expand understanding. If there are no witness sections, this cannot be accomplished.

Fig 31: Witness section along south-western extremity of the de-roofed Sterkfontein deposit showing interdigititation of Member 4 (chocolate brown) and Member xx (beige, and with considerable more embedded clasts). Last remaining roof blocks of dolomite can be seen just below the walkway, with breccia fill underneath

3.4.8 Dumps

Status quo:

- The Sterkfontein excavation site has very confined space and large dumps cannot be accommodated. The resident excavators and preparators normally process dumps resulting from excavation as they are created so that on site storage is not problematic.
- Waste material has been dumped and leveled and the spaces so created built on. The entire shed is built on an old leveled dump of sterile waste material
- The dumps are properly made with foundations and toes and correct angles of repose because they have not been piled up too high
- There are still a few unworked dumps dating from the time of the lime workers but the scientists plan to sort these to recover fossils

- A plan on which all dumps are marked and annotated is still required

Threats and risks:

- Dumps well documented at this site and mostly processed for their fossil content. Nothing at risk at present.

3.4.9 Repository

Status quo:

- The University of the Witwatersrand is the designated repository of the fossil material and artefacts recovered. This institution has been accredited by SAHRA as it has all the necessary controls in place and it conforms to the minimum standards laid down by SAHRA

Risks and threats:

- Loss of, or deterioration of artefacts
 - Loss of information concerning artefacts
 - Lack of publicized information about artefacts
- These threats are not an issue at present.

3.5 Site safety and security

There has not been a site safety inspection by a professional site safety officer for some years but an inspection is due to take place shortly. The site also needs a public health and safety inspection unless these aspects are also covered by the site safety inspector.

3.5.1 Physical safety

Status quo:

- The site has until recently been situated within a relatively remote rural area where most people used to know each other, and at that time personal security was not a problem. However, there has of recent years been a tremendous influx of people from all over South Africa, and informal settlements have grown up, bringing in many strangers. Personal safety can no longer be taken for granted. There has been an increase in theft, some break-ins made in broad daylight. The excavator across the valley at Swartkrans was assaulted and crime has become a management factor when it was previously not an issue

Risks and threats:

- Theft and crimes of violence have increased dramatically over the last two years and are an ongoing risk

3.5.2 Safety of surface and built environment

Status quo:

This section looks only at the safety situation of the fossil site excavation area, and not the whole property, which is the management domain of the Concessionaire or University, as the landowner:

- Fuel tanks; see below
- Walkway: see below

- The remaining elements of the built environment (shed, shelter, garage, outbuildings and toilet block appear to be safe and the report of the site safety officer should be awaited

Threats and risks:

- A site safety inspection is due, and the report of the professional site safety inspector is awaited

3.5.3 Safety of excavation area

Status quo:

- The excavation has now reached an irregular depth of about 5 to 6 metres and further excavation is still continuing
- This has resulted in some very steep drops
- Loose boulders and dolomite blocks embedded in friable walls may become unstable and collapse into the excavation, putting those at work below at risk
- There is a fracture in the north wall of Member 4, monitor for widening
- Excavation in Member 5 has produced a dangerous overhang
- At ground level, the edges of the excavation are unprotected
- The surface of the excavation area is breccia in some areas and extremely irregular making for a dangerous walking surface (tripping, sprained ankles, falling etc)
- There are several old abandoned excavation pits in the type site area which are very deep and which have unprotected edges
- The walkway has a handrail but the space between the handrail and footplate is not meshed and small and short people might be at risk
- There is loose gravel lying on pathways
- Where chipping with hammers and chisels is carried out and airscribes are used there is a risk of eye damage from flying chips of material and safety goggles are a legal requirement (Public Health and Safety Act). The same is true wherever rock drills are used in the excavation process
- Where dust is created, breathing masks are required
- Where loud noise is created (such as from jackhammers) earmuffs are necessary
- The use of dangerous chemicals requires special gloves
- The storage of chemicals must conform to safety and fire hazard requirements
- The use of flammable chemicals for preparation and protection of fossils requires other special safety interventions, also for the disposal of waste chemicals
- Hard hats are required on excavation sites such as this one, where there is loose and friable material above head height
- The fuel storage tank is a potential fire hazard, particularly from uncontrolled fires started elsewhere
- Fuel build-up in the form of long dry grass which encroaches on the excavation area is a threat but is usually well controlled

Risks and threats:

- There are a number of potential safety risks. The report of the professional site safety inspector is awaited
- There is a beehive in the dolomite between the Type Site and the viewing platform, and this should be removed as it is a potential danger to visitors.

3.5.4 Subterranean safety

The Status Quo report does not deal with safety issues in the underground cave. This awaits the report of a professional site safety officer. The inspection will shortly take place

Status quo:

- The Little Foot excavation is being carried out in the subterranean Silberberg Grotto which is the remains of a cavity mined out by lime workers in the past. Its location is shown in the site plans, Fig 4 a, b, and c.
- The extremely irregular mined out floor surface is dangerous especially to those who are unfamiliar with the site
- The stairway is potentially dangerous, not from a structural safety point of view but from the possibility of falls. Wood rot in the damp atmosphere is a risk
- There is low headroom in places, especially at the top of the ladderway
- The approach tunnel also has low headroom
- There are unexpected changes in level both of the roof and floor and several unprotected pits and long drops
- The report of a site safety officer is awaited before this section can be completed

Risks and threats:

- There are a number of potential safety risks. The report of the professional site safety inspector is awaited

3.6 Presentation of site value

Many values at Sterkfontein go without presentation. These include:

- Natural values such as rare plants, edible plants, medicinal, magical, toxic and economically significant species e.g. they were traditionally used to make bows and arrows, etc.)
- Cave ecology and cave taphonomy (there is a little)
- Mining relics on site
- Geological and geomorphological heritage values
- How fossils are prepared, interpreted and reconstructed
- The most significant values of the other sites, especially Swartkrans, Drimolen Gladysvale, Coopers, Kromdraai, Bolt's Farm and Plover's Lake
- There is little in the way of reasonably priced pamphlets which are within the financial reach of school pupils and their teachers, although there are several good books on the fossil sites

3.6.1 Site interpretation

Status quo:

- The fossil site values are adequately presented in the museum attached to the Visitor Centre
- The display addresses general concepts of the origin and evolution of life on this planet, creation stories, cave formation, cave taphonomy, fossil hominids and associated animals, lime mining and stone tools.
- The display includes both actual specimens (as casts, not originals) and flesh reconstructions
- The site values of the other 12 sites in the COH WHS receive scant treatment.
- It was noted that several school groups by-passed the museum but site interpretation is incomplete without a visit.
- The lack of appropriate bold signage has meant that people have visited the site without knowing that there is a museum, visiting only the restaurant and curio shop, and going on the tour.

Threats and risks:

- Lack of full site interpretation (visual, signage, oral, experiential) diminishes tourist experience

- Lack of presentation of site values (there are 15 separate fossil sites) to a wider audience prevents information concerning site significance from reaching public psyche
- Potential funders might not know about site significance, particularly of the non-Sterkfontein sites. Sterkfontein is the only site open to the public.
- Public not educated about full range of COH WHS values

3.6.2 Visitor numbers

Status quo:

- There is no regular mechanism for recording and reporting visitor numbers as yet, particularly visitors to the fossil site, who are mainly academic.

4 MANAGEMENT OBJECTIVES, DESIRED OUTCOMES

4.1 Physical environment, surface

Desired outcomes for the physical environment include:

Rangeland:

- To ensure that contextual veld conditions and rangeland in the Isaac Edwin Stegmann Reserve are maintained in as good a condition as possible.

Erosion:

- To ensure that the fossil site and its environs are free of active erosional problems and that existing areas of erosion are identified, analysed, remedied, rehabilitated and monitored for follow-up action if necessary

Fire management:

- Fire management of the greater reserve area is a Concessionaire issue
- To ensure that fossil site users are aware of fire hazards and can control on-site fires.
- To ensure that the fossil site does not harbor or create fire hazards
- To ensure that the necessary fire-fighting equipment is on hand in the event of a domestic fire (fire extinguishers and beaters)
- To ensure that the basic data necessary to assess the long-term impact of frequent fires is available, which information is necessary to feed back into appropriate fire management. This is a generic issue pertinent to all the fossil sites as well as the remainder of the COH WHS.

Biodiversity, rare plants and animals:

- To ensure that a database of plant and animal species present on site becomes available, because biological values are as yet poorly understood
- To assess which of these are target species for use as food, medicines, economic reasons, etc., and to what extent they are being collected
- To identify, record and map special species in order to ensure their protection

Alien vegetation and weeds:

- Desired outcome is a fossil site which is free from alien invasive species, and, as far as possible, from weeds. This will necessitate a 'generic' programme which includes the whole of the COH WHS plus upstream areas from which new infestations are introduced,

particularly into the wetland below Sterkfontein. The proper rehabilitation of the old restaurant site would help in weed control.

- A further desired outcome is the generation of a list of invasive alien species and weeds present on the site in order that optimum control measures can be implemented

Visual aesthetics:

- Desired outcome is protection of viewshed and contextual environment in order that the site does not become an island in a sea of inappropriate development or land use.
- A further desired outcome is the removal of all redundant infrastructure from the site, and the rehabilitation of foundations, if any

4.2 Physical environment, subterranean

- Desired outcome is a subterranean environment in which the cave atmosphere, substrate, biota and appearance is kept in as undisturbed and natural a condition as possible
- A further desired outcome is a subterranean environment which, if it is being visited or excavated, is safe for all site users.
- Desired outcomes for the tourist route are:
 - Ultimate replacement of galvanized metal with stainless steel,
 - Proper lighting (floor level, with cables concealed under boardwalk and special features only spotlighted),
 - Concealment or camouflage of lighting cables, transformer boxes, lamps, etc.
 - Raised boardwalk
 - Rehabilitated cave floor
 - Properly monitored cave atmosphere (humidity, temperature, carbon-dioxide levels, dust)
 - Properly monitored groundwater
 - Properly monitored biota and substrate
 - No graffiti
 - No algal or plant growth
 - Improved quality of tourist guide input

4.3 Infrastructure, built environment

TOURIST AREA

The problems connected with the built environment have been discussed in the October 2006 Site Inspection Report for Sterkfontein. They fall under the management plans developed by the Concessionaire

- Disabled access is problematic, given Government policy in this regard.

FOSSIL SITE EXCAVATION AREA

There are no special management outcomes that are needed or desired states requiring attention with regard to the built environment in the excavation area at present.

4.4 Research environment

- Isolation from communication with specialist scientists and peers can lead to becoming cut off from peer feedback and review and a desired outcome is a forum where matters of mutual concern can be reviewed – see generic Issues document.

- To ensure that the activities of scientists on site are perceived as 'adding value' rather than as 'site users' and that authorities take cognizance of this, particularly with regard to funding items which are not directly research or science-orientated, such as the purchase of materials for storage containers, which items have little hope of being funded by the NRF or other funding bodies
- To ensure that lack of funding does not inhibit research opportunities and prevent site potential from being realised
- To ensure that the Management Authority has in-house heritage expertise which allows for the follow-up of fossil site inspection observations and recommendations
- To ensure that all structures, excavations and site features are committed to a site plan which includes the gazetted proclamation boundary
- To ensure that all dumps, old and new, are committed to plan, with appropriate annotations
- To ensure that new dumps are appropriately sited and properly constructed
- To ensure that excavations are safely executed and compliant with permit terms and conditions
- To ensure that appropriate witness sections are left and stabilized
- To ensure that sample sites are properly recorded and that results are independently verifiable
- To ensure safe excavation edges, walls and bases, and that these are stabilized when work ceases
- To ensure that fossils are carefully and properly prepared, catalogued, curated and housed in a safe repository
- To ensure that regular site safety inspections take place

4.5 Site safety and security

- Desired outcomes include the provision of safety interventions recommended by the professional site safety officer after inspection of the surface and subterranean environments as well as all infrastructure has taken place
- Desired outcome is an underground disaster plan (e.g. major roof collapse) in place and guides trained to implement it
- Desired outcome is a first aid and evacuation policy in the event of an accident or medical crisis
- Desired outcome is the removal of the beehive between the Type Site and the viewing platform because it is a danger to visitors

4.6 Presentation of site values

- To ensure that the many heritage and natural values of the site are interpreted and made available to as wide a public as possible
- To ensure that appropriate attention is drawn to the Sterkfontein Museum with an obvious sign, as many people miss it.
- A desired outcome is the inclusion of mining values into the tourist route
- A greater variety of affordable information pamphlets is required, especially as palaeontology is now a grade 11 and 12 topic in Life Science syllabus
- A desired outcome is a new balance in the present disproportionate emphasis on Sterkfontein – it is the flagship site, but other sites are in danger of being marginalized

Deleted:

5 MANAGEMENT AND MONITORING TASKS

The following are operational management tasks and issues that need to be addressed now or in the future as part of on-going management actions in order to achieve the above-mentioned desired outcomes. Their funding is still problematic.

The development of research at the fossil sites has been limited by the unfortunate perceptions that the State may not fund development on privately owned property and that the scientists are 'site-users'. This needs to change as it must be seen as the responsibility of the authorities to foster research and necessary associated development on these sites. It is recommended that in future, scientists be viewed rather as 'value adders' and thus eligible for some easement for the funding of heritage site management interventions which they are currently expected to fund, for example, fencing. In effect, the state has been expecting others to finance the protection of the COH WHS fossil sites.

Sites which have no active scientist are generally neglected – this is an indication of the positive influence which scientists have on fossil sites.
which scientists have on fossil sites.

The following tables have been drawn up with the specific aim of clarifying who should do what, and when, on the heritage site. The Tables also provide some indication of priority ratings. They have been constructed in such a way as to incorporate all the key management issues, strategies and monitoring criteria so that they may be used independently of the text.

The relative priority of the management measures has been identified based on ICCROM definitions as follows:

- Immediate - to be attended to urgently as it constitutes a danger to the public or a resource;
- Urgent - to be attended to urgently to protect the resource;
- Necessary - to be attended to, to protect the resource;
- Desirable - to be attended to from a development perspective;
- Keep watch – to be monitored to see if the problem is serious.

TABLE 1 FOLLOWS: MANAGEMENT AND MONITORING; STERKFONTEIN
