EXECUTIVE SUMMARY

PGS Heritage was appointed by Synergistics Environmental Services to undertake a Heritage Impact Assessment (HIA) that forms part of the Environmental Impact Assessment (EIA) and Environmental Management Plan (EMP) for the proposed mining activities located on the Remainder of the farm Driehoekspan 435 and Portion 1 of the farm Doringpan 445, north of Postmasburg, Northern Cape Province.

Heritage resources are unique and non-renewable and as such any impact on such resources must be seen as significant.

The Heritage Scoping Report has shown that both the study area and surrounding area have a rich historical and archaeological history.

Archival and Historical Maps

The following observations can be made as a result of the study of archival and historical maps of the study area:

- In 1911 the study area was entirely undeveloped and was likely characterised by farming activities.
- By 1928 a farmhouse had been built on Driehoekspan as well as Doringpan. However, based on the information available on the maps, these farmhouses represented the only man-made features within the study area at the time. Although the exact age of these two farmhouses are not known, they would have been built between 1911 and 1928. As such these farmhouses can be anything between 85 years and 102 years old.
- By 1970 considerable development has taken place within the study area and direct surroundings. This includes mining as well as infrastructural development such as the construction of the railway line between Postmasburg and Lohatla which was built in 1936.
- Two additional buildings appear on the farm Driehoekspan on the 1970 map. The locality of these two buildings in close proximity to the abovementioned railway line, suggests that they may have been associated with railway activities at the

time. These two buildings would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old, with a stronger likelihood for these buildings to be closer to the 43 year parameter.

- One additional building appears on the farm Doringpan on the 1970 map. This building appears to be associated with the farmhouse which had been built sometime before. This additional building would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old if it still exists today.

Should any of these identified features be located within (or in close proximity to) the final development areas, the localities of these features will have to be assessed in the field to establish whether any physical remains of them are still preserved, and if so, what their significance would be.

History

The archival and historical research has revealed a long and significant history in terms of the surroundings of the study area. However, even though this historical study was quite intensive and detailed, very little historical information with regard to the study area itself could be located.

The following events from the historic overview can be linked to the study area itself:

- With the establishment of the Griqualand West in 1871 and the proclamation of British Bechuanaland in 1885, the boundary between these areas was defined as passing directly to the north of the study area. In fact, the northern boundary of the Driehoekspan section of the study area formed part of this boundary line between Griqualand West and British Bechuanaland at the time.
- In 1897 a fence was erected on the boundary line between Griqualand West and British Bechuanaland as an attempt to halt the spread of the dreaded Rinderpest from the north into Griqualand West. This fence would have been erected along the northern boundary of the Driehoekspan section of the study area as well.
- The railway line extension between Postmasburg and Lohatla was constructed across the Driehoekspan section of the study area during 1936. A large section of the

siding from this line to Manganore was also constructed within the farm Driehoekspan.

Apart from these aspects, the historic study also highlighted some of the historical and archaeological sites which might potentially be located within the study area. These include Stone Age sites, Iron Age sites associated with the histories of the Thlaro and Thlaping, sites associated with the Kora and Griqua periods (graves, buildings and middens), sites associated with the early and later settlement of white farmers in the area (graves, farmsteads and middens) as well as mining-related sites (shafts, trenches, discard dumps, abandoned mine machinery and mine buildings).

The presence (or absence) of these sites can only be confirmed during the fieldwork.

Archaeology

Previous studies conducted in the surroundings of the study area have identified a number of archaeological sites. These include Stone Age (ESA, MSA and LSA) sites including find spots, surface scatters and rock art sites; pre-colonial specularite mining sites; historic structures and buildings; historic mining sites as well as graves and cemeteries.

Due to the arid nature of the surroundings of the study area, it seems likely for many of the archaeological site types (with the possible exception of pre-colonial and historical mine sites) to be concentrated in proximity to water sources such as riverine edges and pans. However, as no fieldwork has yet been undertaken, this cannot be stated as fact.

This report has highlighted the archaeological potential of the study area and the need for archaeological fieldwork to be undertaken of the proposed development footprint area.

Palaeontology

The study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sedimentary sequences are associated with BIFs in the Postmasburg region where mining is envisaged.

The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.

It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified palaeontologist must be informed and a representative sample of at least 1m3 must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.

Future Work

Utilising the results of this heritage scoping report, field work will be conducted to identify all heritage resources and make recommendations on the management and minimising the possible impacts of the proposed mining activities on identified heritage sites.

The data will be compiled in a report that will utilise the Plan of Study for the EIA/HIA (**Appendix B**). A detailed description of the potential impact of the proposed activities will be provided as will information with regard to the heritage significance of the identified sites. Based on this detailed information, the environmental consultants will conduct a significance of impact rating (which will be approved by the heritage specialist) for their EIA. The significance of impact rating depicted in **Appendix E** will be used by the environmental consultants to conduct the significance of impact ratings in their EIA report.

1 INTRODUCTION

PGS Heritage was appointed by Synergistics Environmental Services to undertake a Heritage Scoping Report as part of the Heritage Impact Assessment (HIA) that forms part of the Environmental Impact Assessment (EIA) and Environmental Management Plan (EMP) for the proposed Coza Iron Ore Project located on the Remainder of the farm Driehoekspan 435 as well as Portion 1 of the farm Doringpan 445. The proposed study area is situated north of Postmasburg, in the Northern Cape Province.

1.1 Scope of the Study

The aim of the study is to identify possible heritage sites and finds that may occur in the proposed development area. The HIA aims to inform the EIA in the development of a comprehensive EMP to assist the developer in managing the discovered heritage resources in a responsible manner, in order to protect, preserve, and develop them within the framework provided by the National Heritage Resources Act of 1999 (Act 25 of 1999) (NHRA).

1.2 Specialist Qualifications

This Heritage Scoping Report was compiled by PGS Heritage (PGS).

The staff at PGS has a combined experience of nearly 40 years in the heritage consulting industry. PGS and its staff have extensive experience in managing HIA processes. PGS will only undertake heritage assessment work where they have the relevant expertise and experience to undertake that work competently.

Polke Birkholtz, the Project Manager, is registered with the Association of Southern African Professional Archaeologists (ASAPA) as a Professional Archaeologist and is accredited with the CRM Section of ASAPA. He has 16 years experience in the heritage assessment and management field and holds a B.A. (cum laude) from the University of Pretoria specialising in Archaeology, Anthropology and History as well as a B.A. (Hons.) in Archaeology (cum laude) from the same university.

Dr Gideon Groenewald, the appointed Palaeontologist for this project, holds a PhD in Geology from the Nelson Mandela Metropolitan University (1996) and the National Diploma

in Nature Conservation from the University of South Africa (1990). He specialises in research on South African Permian and Triassic sedimentology and macrofossils with an interest in biostratigraphy, and palaeoecological aspects. He has extensive experience in the locating of fossil material in the Karoo Supergroup and has more than 20 years of experience in locating, collecting and curating fossils, including exploration field trips in search of new localities in the southern, western, eastern and north-eastern parts of the country. His publication record includes multiple articles in internationally recognized journals. Dr Groenewald is accredited by the Palaeontological Society of Southern Africa (society member for 25 years).

1.3 Assumptions and Limitations

Not detracting in any way from the comprehensiveness of the fieldwork undertaken, it is necessary to realise that the heritage resources located during the fieldwork do not necessarily represent all the possible heritage resources present within the area. Various factors account for this, including the subterranean nature of some archaeological sites and the current dense vegetation cover. As such, should any heritage features and/or objects not included in the present inventory be located or observed, a heritage specialist must immediately be contacted.

Such observed or located heritage features and/or objects may not be disturbed or removed in any way until such time that the heritage specialist has been able to make an assessment as to the significance of the site (or material) in question. This applies to graves and cemeteries as well. In the event that any graves or burial places are located during the development, the procedures and requirements pertaining to graves and burials will apply as set out below.

1.4 Legislative Context

The identification, evaluation and assessment of any cultural heritage site, artefact or find in the South African context is required and governed by the following legislation:

i. National Environmental Management Act (NEMA), Act 107 of 1998
ii. National Heritage Resources Act (NHRA), Act 25 of 1999
iii. Mineral and Petroleum Resources Development Act (MPRDA), Act 28 of 2002
iv. Development Facilitation Act (DFA), Act 67 of 1995

The following sections in each Act refer directly to the identification, evaluation and assessment of cultural heritage resources (CRM).

i. National Environmental Management Act (NEMA) Act 107 of 1998
    a. Basic Environmental Assessment (BEA) – Section (23)(2)(d)
    b. Environmental Scoping Report (ESR) – Section (29)(1)(d)
    c. Environmental Impact Assessment (EIA) – Section (32)(2)(d)
    d. Environmental Management Plan (EMP) – Section (34)(b)
ii. National Heritage Resources Act (NHRA) Act 25 of 1999
    a. Protection of Heritage Resources – Sections 34 to 36; and
    b. Heritage Resources Management – Section 38
iii. Mineral and Petroleum Resources Development Act (MPRDA) Act 28 of 2002
    a. Section 39(3)
iv. Development Facilitation Act (DFA) Act 67 of 1995
    a. The GNR.1 of 7 January 2000: Regulations and rules in terms of the Development Facilitation Act, 1995. Section 31.

The NHRA stipulates that cultural heritage resources may not be disturbed without authorization from the relevant heritage authority. Section 34(1) of the NHRA states that, "no person may alter or demolish any structure or part of a structure which is older than 60 years without a permit issued by the relevant provincial heritage resources authority…" The NHRA is utilized as the basis for the identification, evaluation and management of heritage resources and in the case of CRM those resources specifically impacted on by development as stipulated in Section 38 of NHRA, and those developments administered through NEMA, MPRDA and the DFA legislation. In the latter cases the feedback from the relevant heritage resources authority is required by the State and Provincial Departments managing these Acts before any authorizations are granted for development. The last few years have seen a significant change towards the inclusion of heritage assessments as a major component of Environmental Impacts Processes required by NEMA and MPRDA. This change requires us to evaluate the Section of these Acts relevant to heritage (Fourie, 2008).

The NEMA 23(2)(b) states that an integrated environmental management plan should, "…identify, predict and evaluate the actual and potential impact on the environment, socio-economic conditions and cultural heritage".

A study of subsections (23)(2)(d), (29)(1)(d), (32)(2)(d) and (34)(b) and their requirements reveals the compulsory inclusion of the identification of cultural resources, the evaluation of the impacts of the proposed activity on these resources, the identification of alternatives and the management procedures for such cultural resources for each of the documents noted in the Environmental Regulations. A further important aspect to be taken account of in the Regulations under NEMA is the Specialist Report requirements laid down in Section 33 of the regulations (Fourie, 2008).

Terminology and Abbreviations

Archaeological resources
This includes:

i. material remains resulting from human activity which are in a state of disuse and are in or on land and which are older than 100 years including artefacts, human and hominid remains and artificial features and structures;
ii. rock art, being any form of painting, engraving or other graphic representation on a fixed rock surface or loose rock or stone, which was executed by human agency and which is older than 100 years, including any area within 10m of such representation;
iii. wrecks, being any vessel or aircraft, or any part thereof, which was wrecked in South Africa, whether on land, in the internal waters, the territorial waters or in the maritime culture zone of the republic as defined in the Maritimes Zones Act, and any cargo, debris or artefacts found or associated therewith, which is older than 60 years or which SAHRA considers to be worthy of conservation;
iv. features, structures and artefacts associated with military history which are older than 75 years and the site on which they are found.

Cultural significance
This means aesthetic, architectural, historical, scientific, social, spiritual, linguistic or technological value or significance

Development
This means any physical intervention, excavation, or action, other than those caused by natural forces, which may in the opinion of the heritage authority in any way result in a change to the nature, appearance or physical nature of a place or influence its stability and future well-being, including:

i. construction, alteration, demolition, removal or change in use of a place or a structure at a place;
ii. carrying out any works on or over or under a place;
iii. subdivision or consolidation of land comprising a place, including the structures or airspace of a place;
iv. constructing or putting up for display signs or boards;
v. any change to the natural or existing condition or topography of land; and
vi. any removal or destruction of trees, or removal of vegetation or topsoil

Early Stone Age
The archaeology of the Stone Age between 700 000 and 2 500 000 years ago.

Fossil
Mineralised bones of animals, shellfish, plants and marine animals. A trace fossil is the track or footprint of a fossil animal that is preserved in stone or consolidated sediment.

Heritage
That which is inherited and forms part of the National Estate (historical places, objects, fossils as defined by the National Heritage Resources Act 25 of 1999).

Heritage resources
This means any place or object of cultural significance

Holocene
The most recent geological time period which commenced 10 000 years ago.

Late Stone Age
The archaeology of the last 20 000 years associated with fully modern people.

Late Iron Age (Early Farming Communities)
The archaeology of the last 1000 years up to the 1800's, associated with iron-working and farming activities such as herding and agriculture.

Middle Stone Age
The archaeology of the Stone Age between 20 000-300 000 years ago, associated with early modern humans.

Palaeontology
Any fossilised remains or fossil trace of animals or plants which lived in the geological past, other than fossil fuels or fossiliferous rock intended for industrial use, and any site which contains such fossilised remains or trace.

The table below provides a description of the abbreviations which are used in this report:

2 TECHNICAL DETAILS OF THE PROJECT

2.1 Site Location and Description

Location	S28.18110; E23.06217 The proposed development area is located 15.3 km north of Postmasburg.
Land	1,982 hectares of land under option on the farm Driehoekspan 435, and 930 hectares of land under option on the farm Doringpan 445.
Land Description	The land is currently utilised for grazing purposes and consists of grass and bush cover.

Figure 2 – Location of the Study Area within its Regional Context.

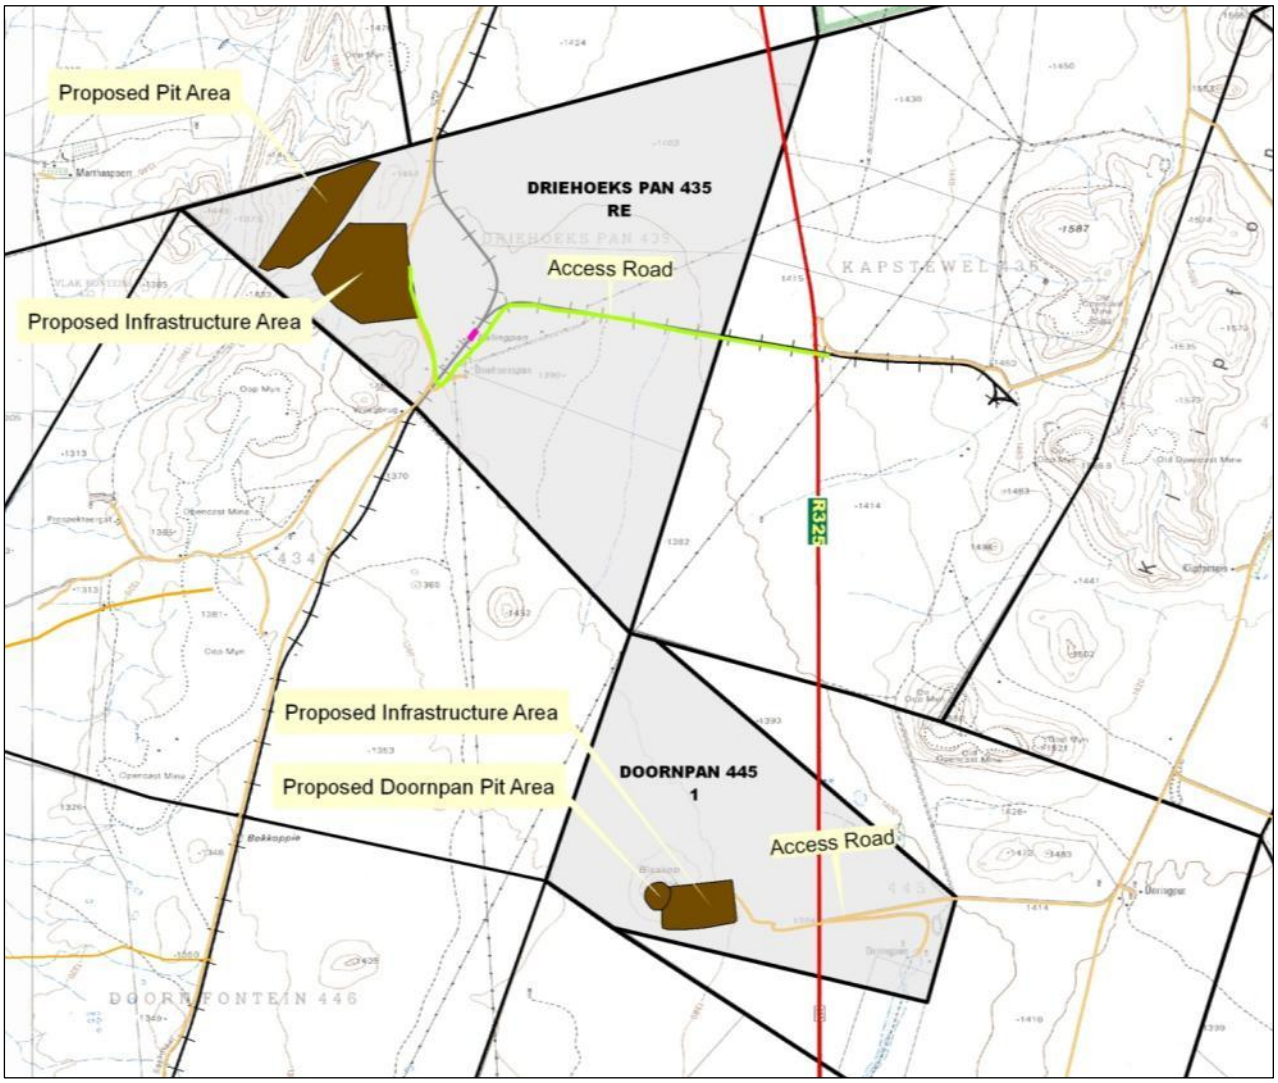

Figure 3 – Location of the Study Area within its Local Context. From a map supplied by Synergistics.

2.2 Technical Project Description

The proposed development is known as the Coza Iron Ore Project and the applicant is Coza Mining (Pty) Ltd.

The proposed development entails the establishment of an iron ore mining pit area as well as mining-related infrastructure areas on both Driehoekspan as well as Portion 1 of the farm Doringpan.

3 ARCHIVAL AND HISTORICAL MAPS OF THE STUDY AREA

3.1 Griquatown Sheet of the Cape of Good Hope Reconnaissance Series, 1914

The figure below depicts a section of the Griquatown Sheet of the Cape of Good Hope Reconnaissance Series (National Archives, Maps, 3/652). The sheet was surveyed in 1911 by Captain R.B. Hopkins (Manchester Regiment) and Lieutenant J.L. Lockhart (Hampshire Regiment) under the direction of the Staff Captain in charge of Reconnaissance Surveys, Cape of Good Hope. The sheet was drawn and printed by the War Office in 1914. The approximate positions of the boundaries of two properties comprising the study area are marked in red on the depicted section. The following observations can be made:

- No heritage sites are depicted within (or in close proximity to) the study area.
- Although a number of farms (with farmsteads) are depicted within the general vicinity, none of these are located within the study area.
- The bold stippled line forming the northern boundary of the farm Driehoekspan represents the old boundary between Griqualand West and British Bechuanaland.

3.2 Geology Map of the Postmasburg Manganese Deposits, 1927 - 1928

The figure below depicts a section of the map titled "*The Geology of the Postmasburg Manganese Deposits and Surrounding Country*" that was surveyed by L.T. Nel (with assistance provided by A.K. Parrott) during 1927 and 1928. This work was undertaken by the Geological Survey of the Union of South Africa's Department of Mines and Industries under the directorship of A.W. Rogers (National Archives, Maps, 3/709). The boundaries of the study area are marked in red and the following observations can be made from the map:

- One building is depicted on the farm Driehoekspan (see white circle) and appears to be a farmhouse.
- One building is depicted on the farm Doringpan as well (see white circle). This building also appears to be a farmhouse.
- As these buildings are not depicted on the 1911 map, it is evident that they were built between 1911 and 1928. If they still exist today, the buildings would be between 102 years and 85 years old.
- It is evident from the surrounding landscape that no railway lines have yet been constructed in this area.
- No evidence for mining activities is depicted within the study area on the map.

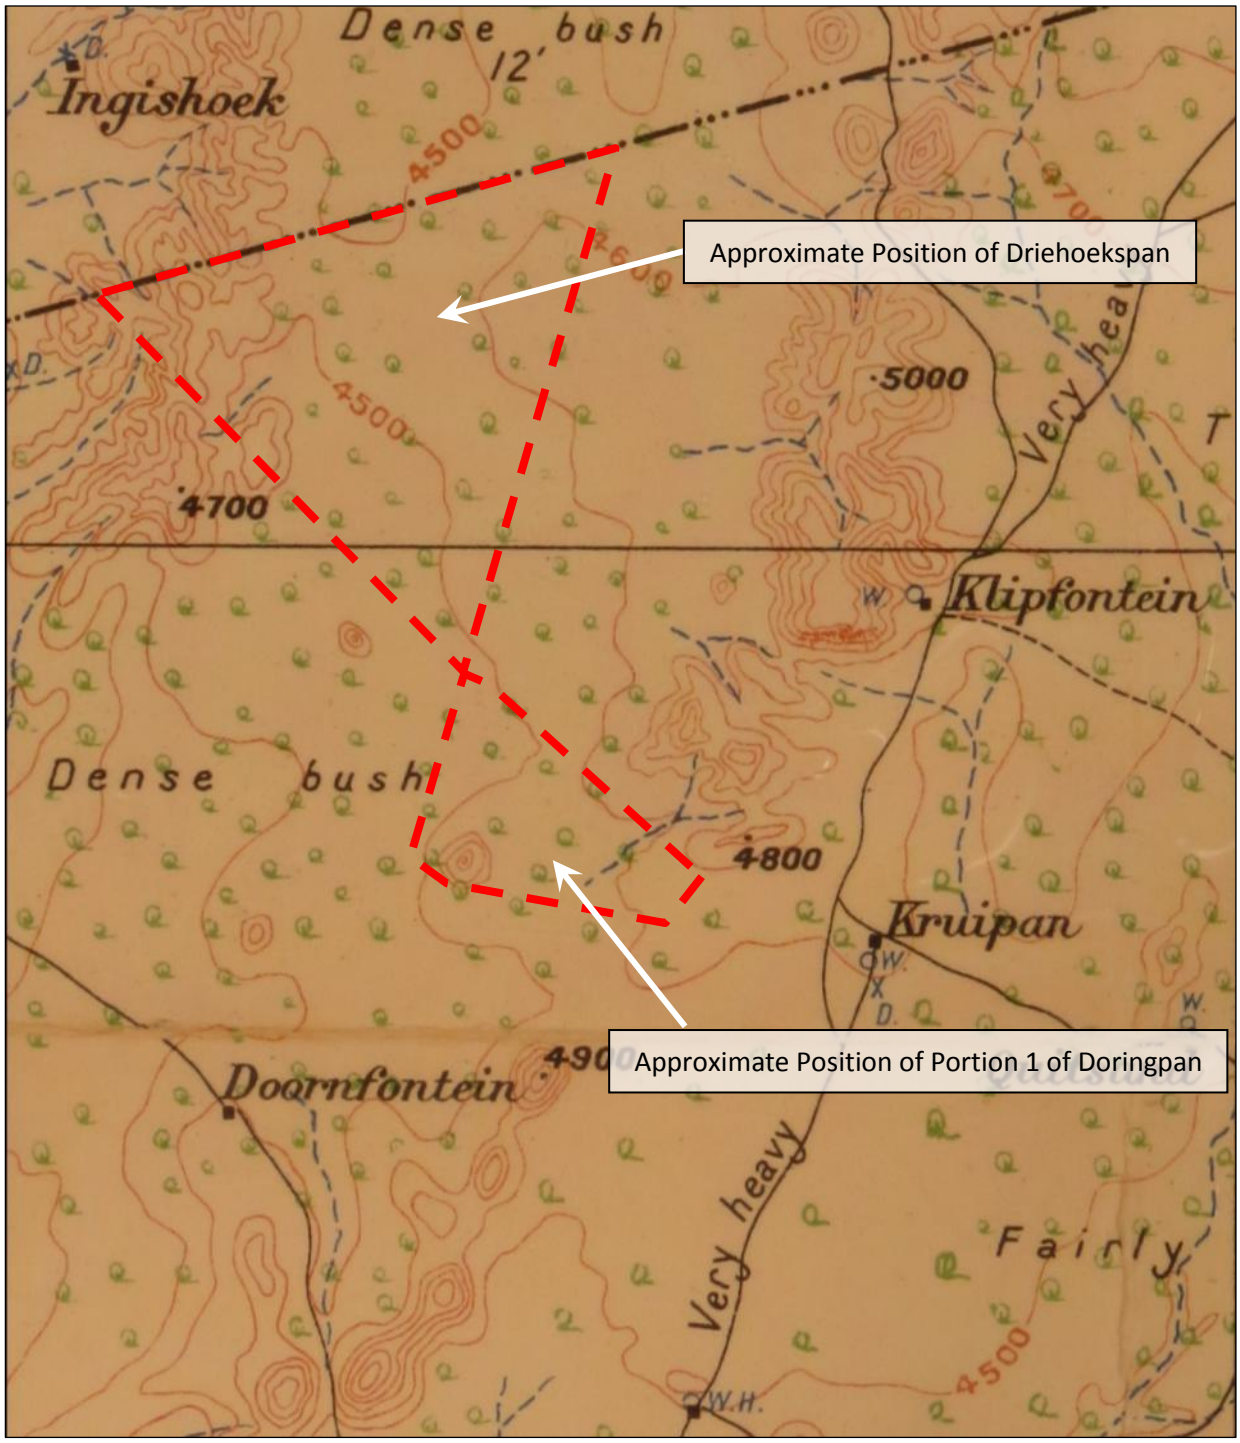

Figure 4 – Section of the Griquatown Sheet of the Cape of Good Hope Reconnaissance Series, dated to 1911 (National Archives, Maps, 3/652).

Figure 5 – Section of the Geology Map of the Manganese Deposits of Postmasburg that was surveyed during 1927 and 1928 (National Archives, Maps, 3/709).

3.3 First Edition of the 2823AA Topographical Sheet, 1970

The two figures below depict sections of the First Edition of the 2823AA Topographical Sheet. The sheet was based on aerial photography undertaken in 1967. It was surveyed in 1970 and drawn by the Trigonometrical Survey Office in 1971.

The following observations can be made in terms of the farm Driehoekspan:

- A farmstead comprising at least one building (with associated windmills) is depicted on Driehoekspan. See blue circle. It is highly likely for the farmstead depicted on the 1928 map to be the same building as the one depicted here. As such, if this building still exists today it would be at least 85 years old, and possibly even as much as 102 years old.
- Two buildings are depicted to the west of the railway line and are separated by a road. These buildings might be associated with the railway line. See purple circle. If any of these two buildings are still located within the study area, they would be at least 43 years old and possibly even 85 years old as well.
- The railway line that was built in 1936 between Postmasburg and Lohatla is depicted. A halt with the name Palingpan is also depicted. The siding which leads to Manganore on the farm Kapstewel is also depicted. This siding was also completed in 1936.

The following observations can be made in terms of Portion 1 of the farm Doringpan:

- A farmstead comprising two buildings is depicted on Doringpan (see green circle). It is highly likely for the farmstead depicted on the 1928 map to be one of these building.
- If these buildings are still located within the study area, it would appear that one of these would be at least 85 years old while the second building would be at least 43 years old.

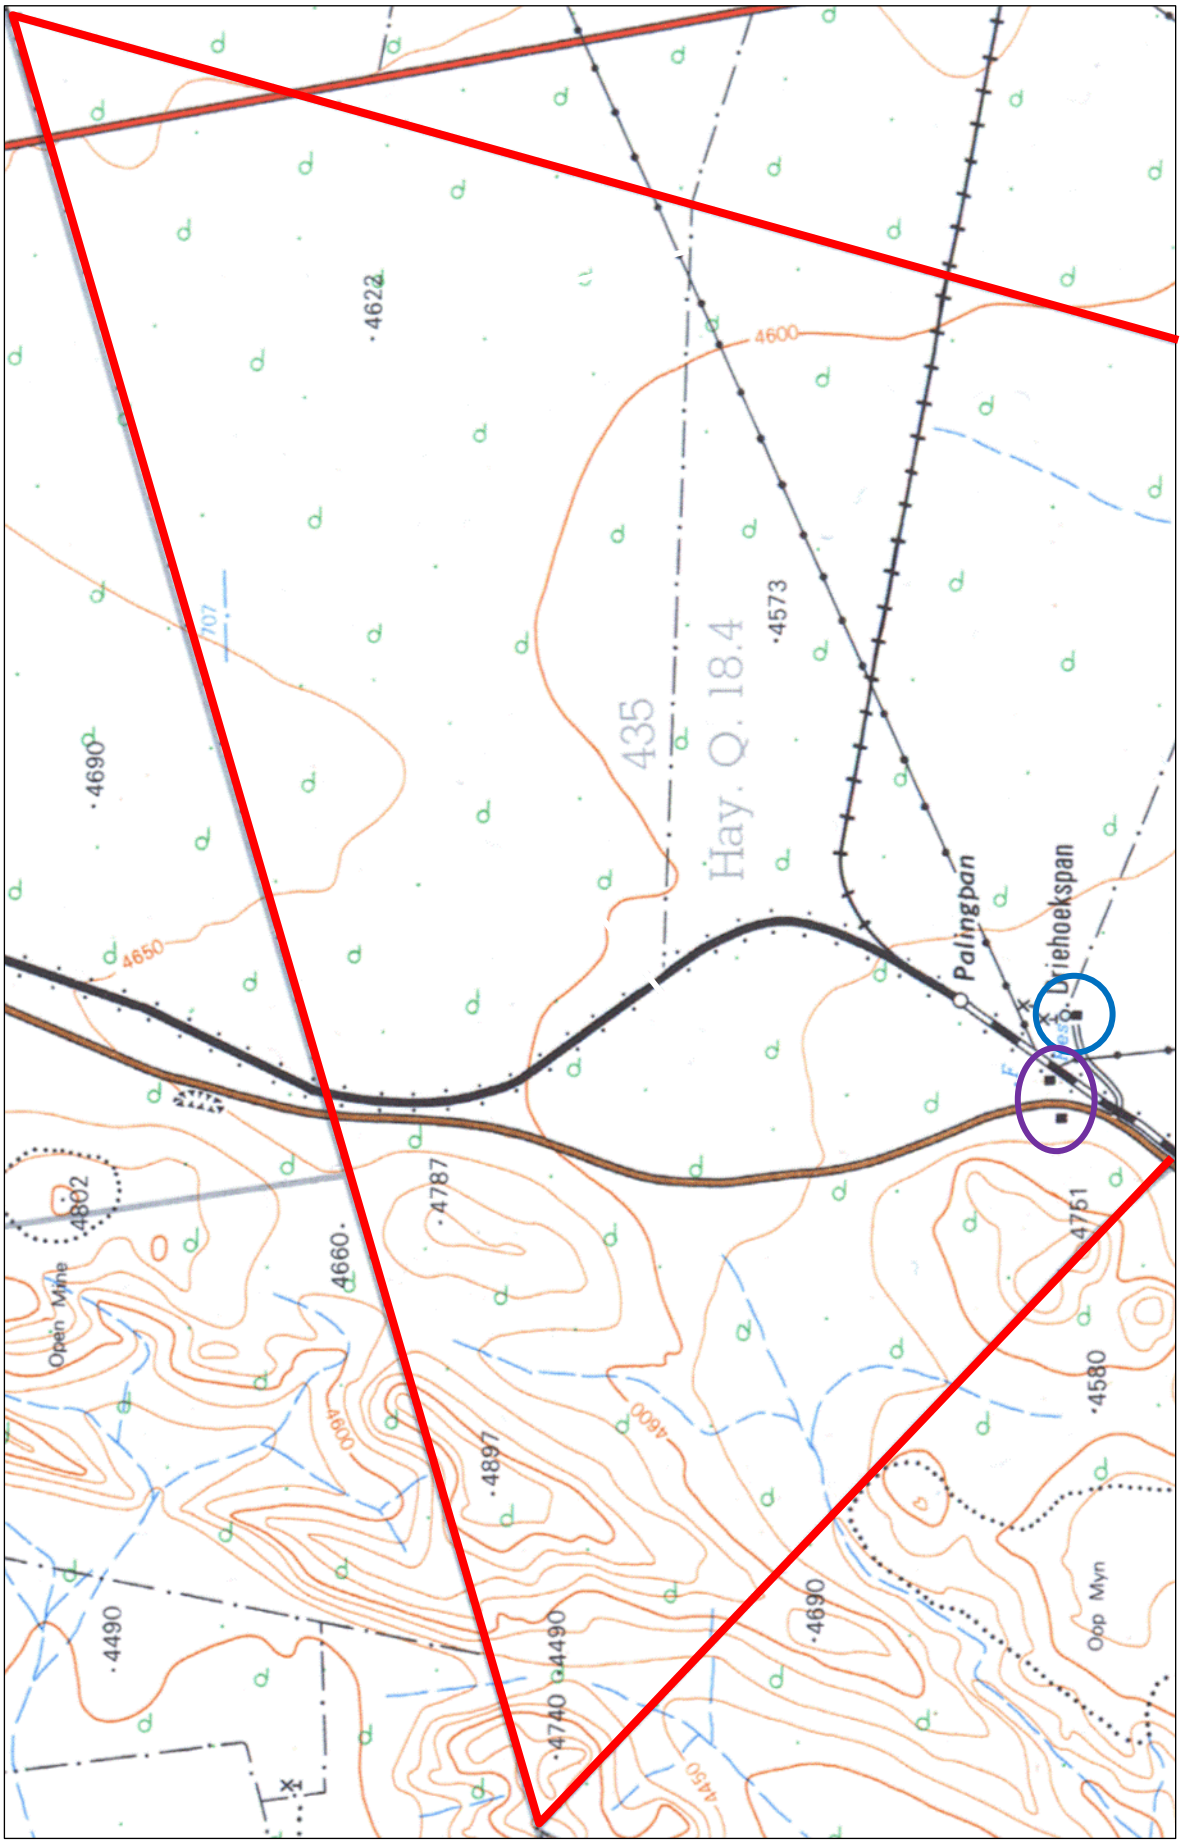

Figure 6 - First Edition of the 2823AA Topographical Sheet that was surveyed in 1970. The boundaries of the farm Driehoekspan are marked.

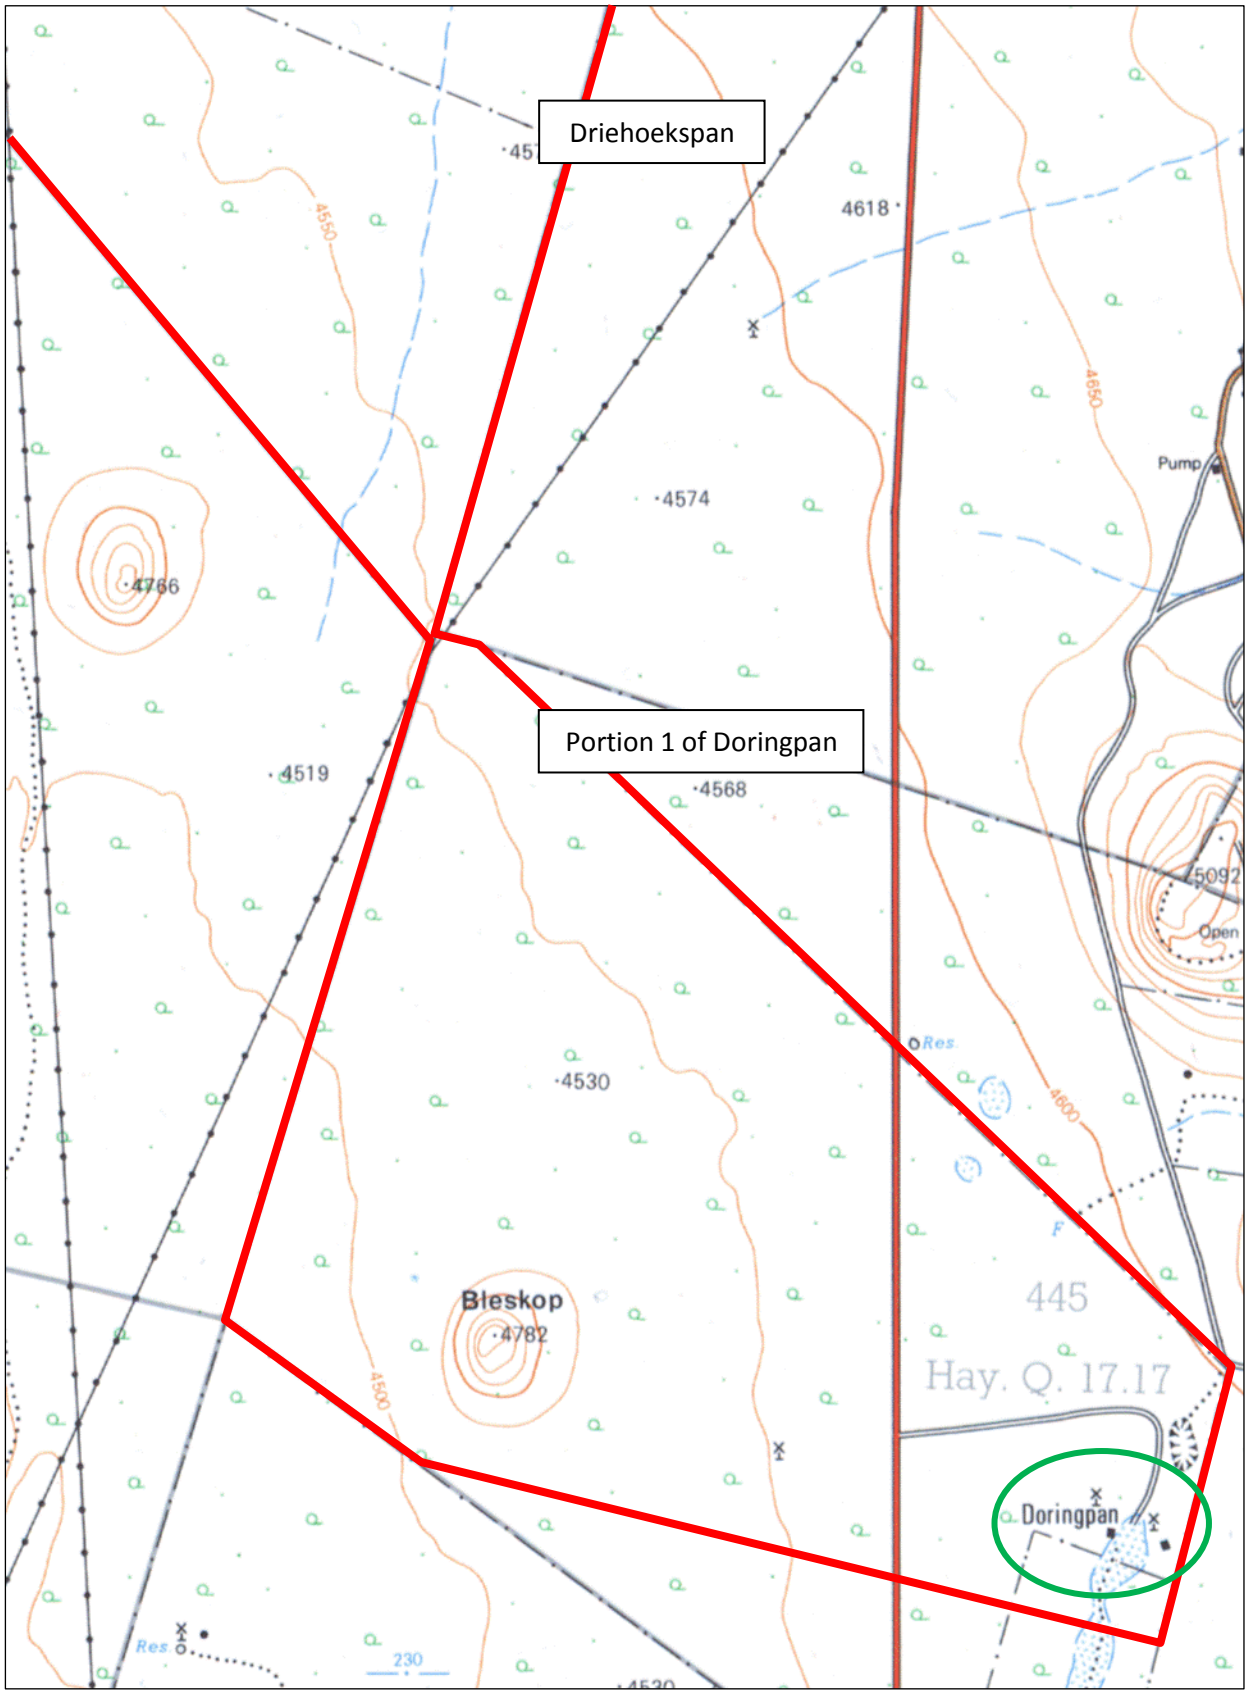

Figure 7 – First Edition of the 2823AA Topographical Sheet that was surveyed in 1970. The southern component of Driehoekspan is depicted above, with Portion 1 of the farm Doringpan shown below.

3.4 Findings in terms of the Archival and Historical Maps

The following observations can be made as a result of the study of archival and historical maps of the study area:

- In 1911 the study area was entirely undeveloped and was likely characterised by farming activities.
- By 1928 a farmhouse had been built on Driehoekspan as well as Doringpan. However, based on the information available on the map, these farmhouses represented the only man-made features within the study area at the time. Although the exact age of these two farmhouses are not known, they would have been built between 1911 and 1928. As such these farmhouses can be anything between 85 years and 102 years old.
- By 1970 considerable development has taken place within the study area and direct surroundings. This includes mining as well as infrastructural development such as the construction of the railway line between Postmasburg and Lohatla which had been completed in 1936.
- Two additional buildings appear on the farm Driehoekspan on the 1970 map. The locality of these two buildings in close proximity to the abovementioned railway line, suggests that they may have been associated with railway activities at the time. These two buildings would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old, with a stronger likelihood for these buildings to be closer to the 43 year mark.
- One additional building appears on the farm Doringpan on the 1970 map. This building appears to be associated with the farmhouse which had been built sometime before. This additional building would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old if it still exists today.

4 ARCHAEOLOGICAL OVERVIEW AND FINDINGS

4.1 Overview of the Archaeological Fabric of the Study Area and Surroundings

A number of archaeological surveys and research projects have been undertaken in the vicinity of Postmasburg and the study area. The reason for this focus in archaeological work in the surrounding area particularly is most likely due to the large scale manganese and iron ore mining activities taking place and the resulting requirement for archaeologists to assess the proposed mining areas as well as the well-known presence of pre-colonial mining sites, rock art sites as well as Stone Age sites from the surroundings of Postmasburg and the study area.

With this as background, two main types of archaeological reports and publications were used to compile this overview. The first of these are reports that were all accessed from the SAHRA electronic database known as SAHRIS, and which for the most part came about due to the requirement for archaeological and heritage impact assessments to be undertaken for mining (and other development) activities. The second source of information on the archaeology of the area was the use of published literature. It is important to note that the information listed here do not necessarily represent all the previous archaeological work undertaken in the vicinity of the study area.

Archaeological Sites as Revealed Through a Study of Published Literature

The following sites were identified by studying archaeological journals and books. The sites are grouped according to their respective farm names. At the end of each description the approximate distance between the site and the present study area is provided.

- **Blinkklipkop**

  This site is arguably the most significant archaeological and historical site in the vicinity of Postmasburg. It is a pre-colonial specularite mine located in a hill known as Blinkklipkop (or Gatkoppies) roughly 5km north-east of the town of Postmasburg. Specularite is a "...*crystalline form of hematite that is steel grey/iron-black in colour with a silvery sparkle*..." (Thackeray et.al., 1983:17) and which was much prised as a cosmetic by the different pre-colonial cultures of the area.

The presence of the site had been known since the early historical times, and European explorers and travellers such as Lichtenstein and Burchell visited the site in 1805 and 1812 respectively. At the time the specularite mine was interpreted by these and other visitors as associated with Kora and Tswana groups. However, the archaeological research undertaken by A.I. Thackeray, J.F. Thackeray and P.B. Beaumont between 8 and 25 April 1980 provided much older origins for the site (Thackeray et.al., 1983).

The archaeological excavations revealed a large number of lithics (stone artefacts) which included mining tools as well as scrapers; ostrich eggshell fragments and beads; pottery; glass beads as well as faunal remains (Thackeray et.al., 1983).

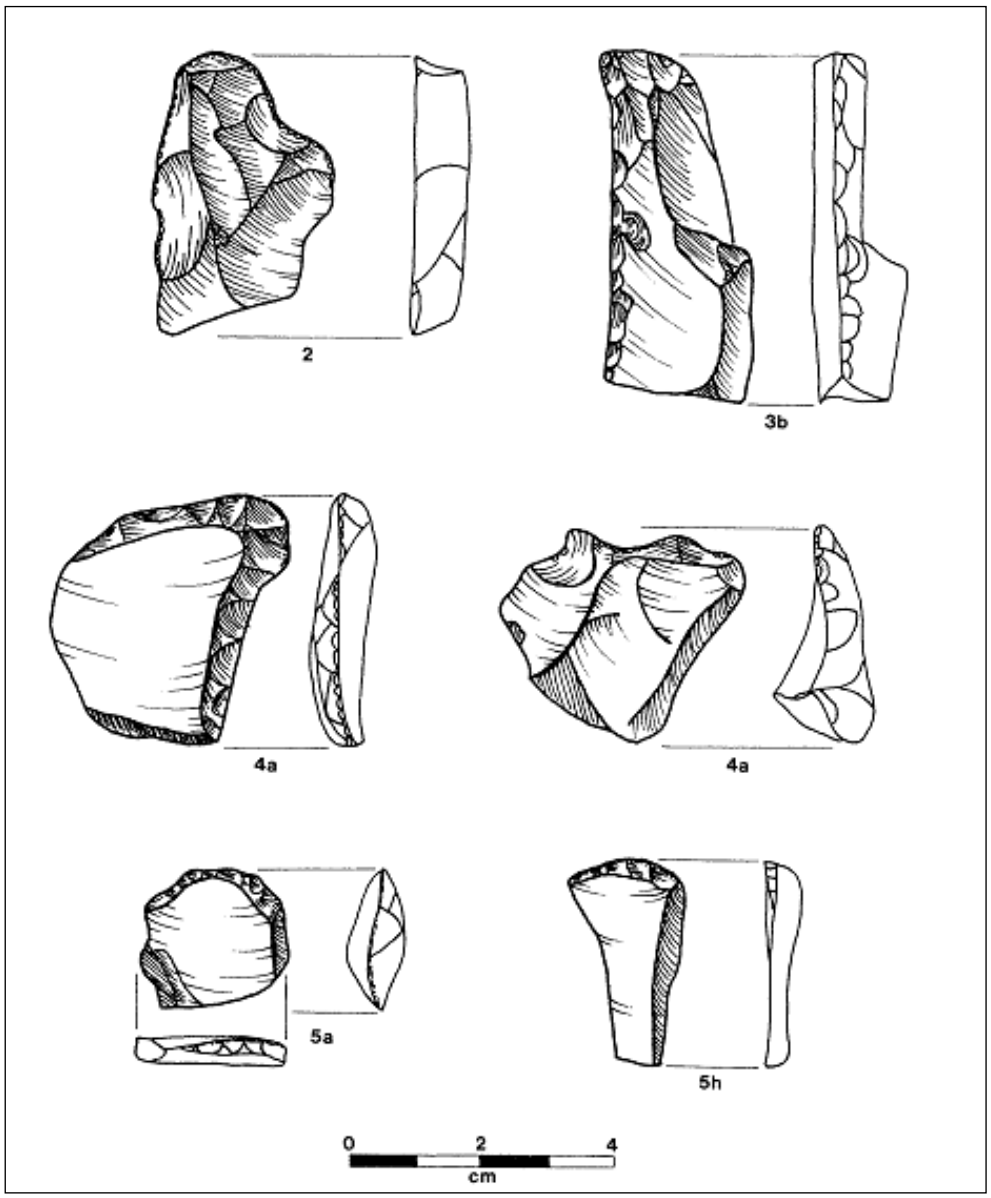

Figure 8 – Examples of scrapers excavated from Blinkklipkop (Thackeray et.al., 1983:20).

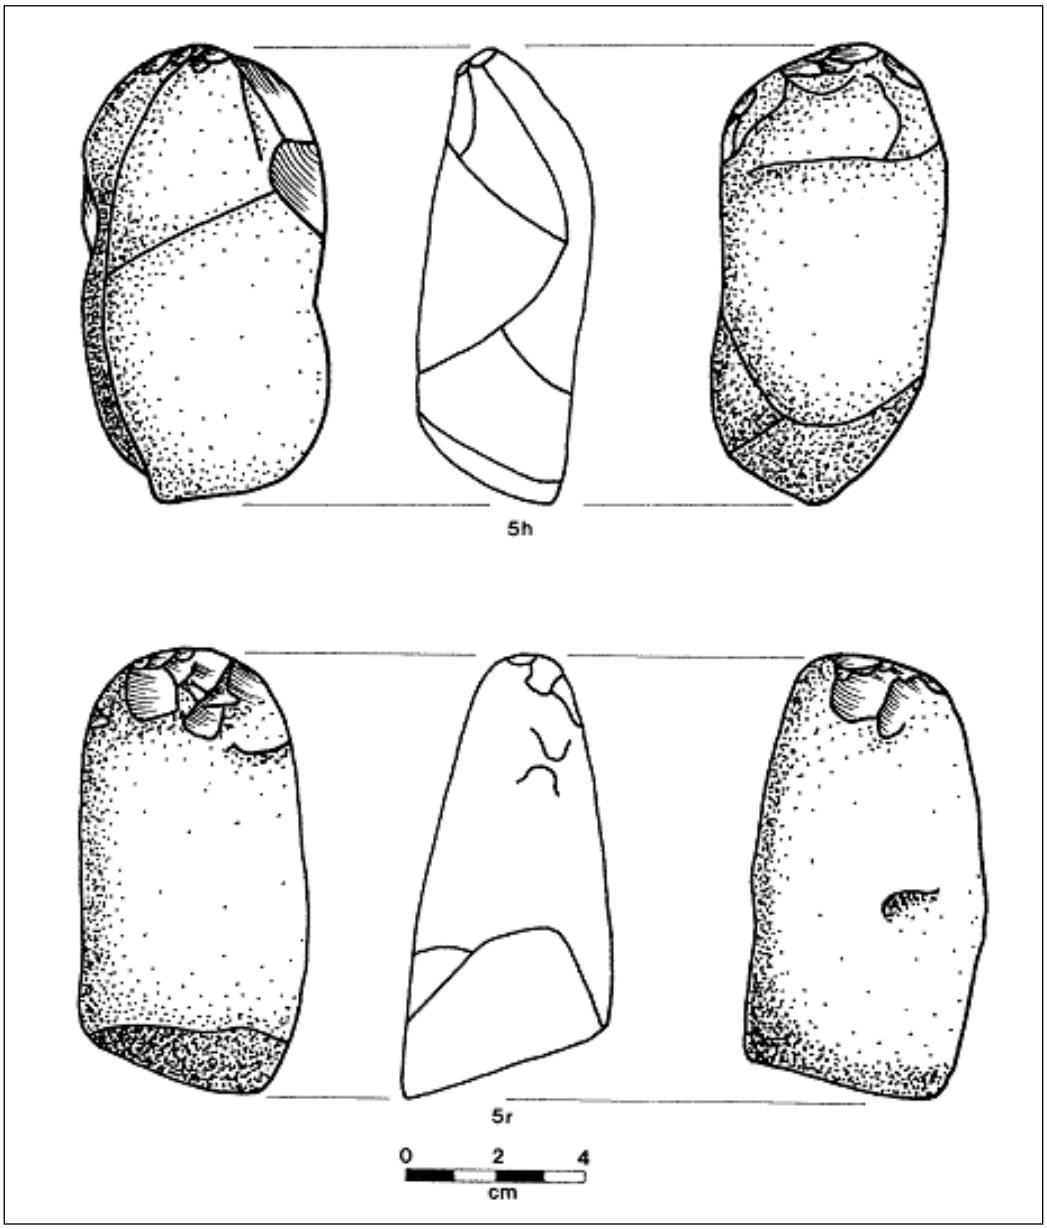

Figure 9 – Examples of mining-related lithics from Blinkklipkop (Thackeray et.al., 1983:20).

The archaeological research have revealed that mining activities at the site likely commenced before roughly 800 AD, and that before the 17th century these mining activities were undertaken by Khoi herders and possibly San hunter gathers with Late Iron Age Tswana pastoralists also in all likelihood involved thereafter (Thackeray et.al., 1983).

Blinkklipkop is located 10.3km south-east of the present study area.

- **Doornfontein**

During 1973 archaeological research was undertaken by P.B. Beaumont and A.K. Boshier on a pre-colonial specularite mine located in a slight rise in an area known as Jonas Vlakte on the farm Doornfontein 446. The farm is located 6.8km north-west of Postmasburg (Beaumont & Boshier, 1974).

The archaeologists identified four chambers at the site, and excavated two trenches located within Chamber 3. The archaeological collection excavated from the site included a large number of lithics of which typical mining tools such as hammer stones were particularly evident; ostrich eggshell fragments and beads; decorated and undecorated pottery, metal artefacts which included an iron spear head and a copper strip bead; bone artefacts such as an arrow point and possible pendant as well faunal remains. Interestingly, human remains were also excavated from the site (Beaumont & Boshier, 1974).

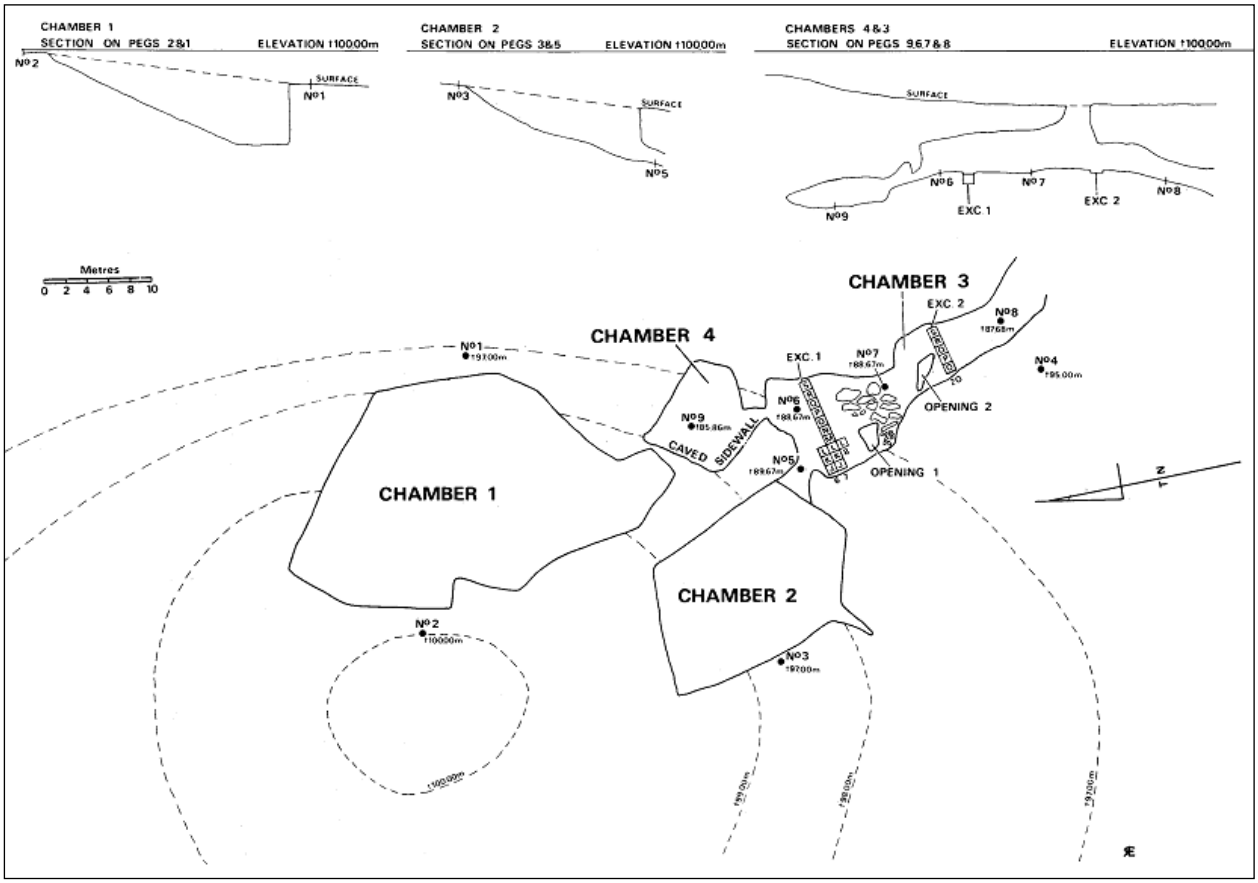

Figure 10 – Site layout plan of the specularite mine at Doornfontein (Beaumont & Bashier., 1983:42).

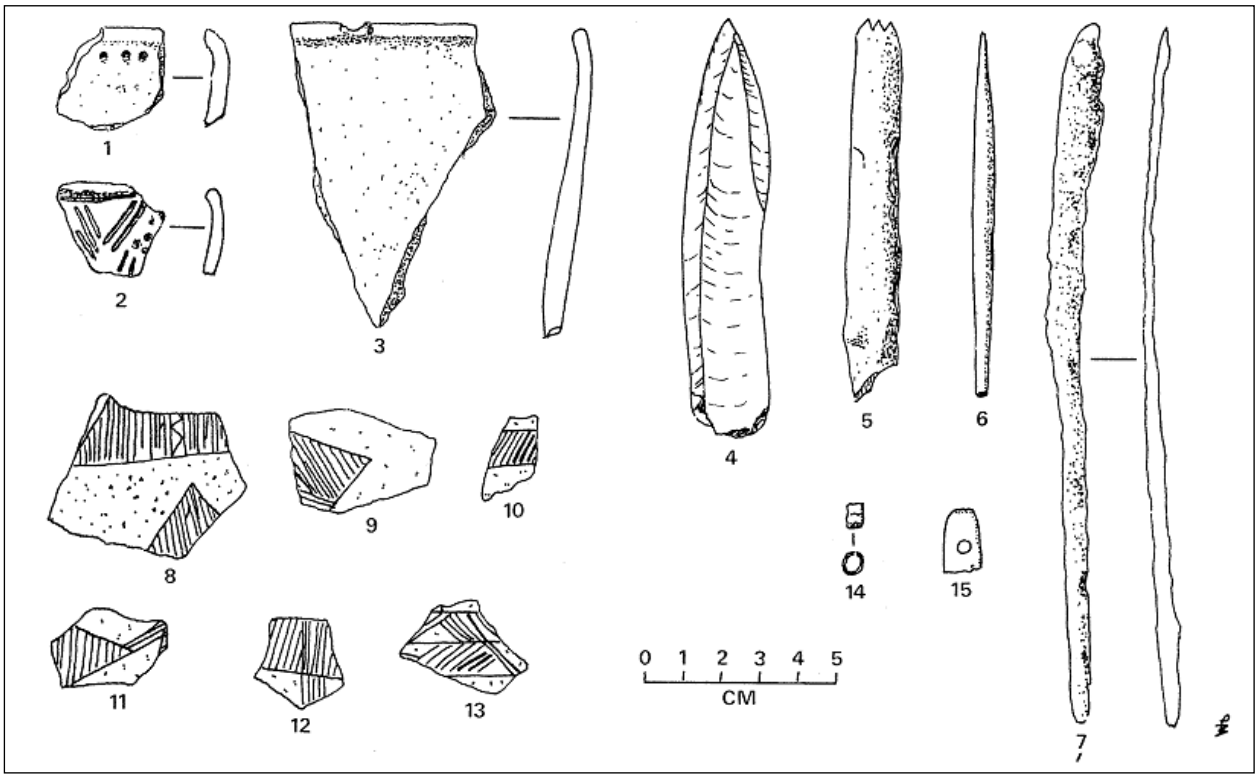

Figure 11 – Non-lithic artefacts from the excavations at Doornfontein (Beaumont & Bashier., 1983:42). Caption numbers 1, 2 and 3 are potsherds; numbers 4, 5 and 6 are bone artefacts (including a bone arrow point); number 7 is a iron spear head; numbers 8, 9, 10, 11, 12, and 13 are decorated ostrich eggshell fragments with numbers 14 and 15 interpreted as a copper strip bead and possible broken bone pendant.

Radiocarbon dates obtained from the excavations indicated that mining activities at this site commenced in approximately 830 AD (Beaumont & Boshier, 1974) which is roughly contemporary with the dates obtained from Blinkklipkop.

The Doornfontein site is located roughly 2km west of the Doringpan section of the study area, and is 3.9km south-west of Driehoekspan.

- **Beeshoek**

The farm is located 5.4km north-west of Postmasburg. The rock art at Beeshoek had been known from some time (Wilman, 1933) (Fock, 1969) (Judner & Judner, 1969) and comprises petroglyphs of various animals such as giraffe, ostrich, elephant, kudu as well as some animal foot prints. A number of examples of geometric symbols are also found at the site (Judner & Judner, 1969).

While the exact position of the rock art site at Beeshoek is not presently known, the site is located approximately 10.5km south-west of the present study area.

- **Paling**

The farm is located 12km north-west of Postmasburg. Beaumont and Boshier (1974) refer to the presence of both a rock art site as well as a pre-colonial specularite mining site on this farm. Although no further information with regard to the mining site is provided, Beaumont and Boshier (1974) state that the rock art site comprises geometric and naturalistic depictions which includes a giraffe. Furthermore, graffiti from the 1920s were also observed here.

While the exact position of the rock art site at Paling is not presently known, the farm is located directly south of Driehoekspan and directly west of Doringpan.

- **Gloucester**

The farm is located 22km north of Postmasburg. Beaumont and Boshier (1974) refer to the presence of a pre-colonial specularite mine here.

While the exact position of the pre-colonial mining site at Gloucester is not presently known, the farm is located directly north of Driehoekspan.

- **Mount Huxley**

The farm is located 24.6km north-east of Postmasburg. Beaumont and Boshier (1974) refer to the presence of a pre-colonial specularite mine here.

While the exact position of the pre-colonial mining site at Mount Huxley is not presently known, the farm is located 4.8km north-east of Driehoekspan.

Archaeological Sites as Revealed Through a Study of the SAHRIS Database

The reports discussed here were all accessed from the SAHRA electronic database known as SAHRIS. It is important to note that the reports listed here do not necessarily represent all

the previous archaeological work undertaken in the vicinity of the study area. An attempt was made to locate reports on the database dealing with farms located either within the present study area, or directly adjacent to it. The archaeological reports with located sites are grouped according to the respective farms on which these studies were undertaken. At the end of each description the approximate distance between these sites and the present study area is provided.

- **Driehoekspan**

  The Archaeological Impact Assessment undertaken by Lita Webley and David Halkett in terms of proposed prospecting activities on the farm Driehoekspan (Webley & Halkett, 2010). A total of three sites were identified, which included one findspot comprising a Quartize Early Stone Age core, a historic structure of unknown function as well as a possible Later Stone Age knapping site comprising three flakes and one core.

  These three archaeological sites are all located within the Driehoekspan section of the present study area.

- **Doornpan**

  The Archaeological Impact Assessment undertaken by Lita Webley and David Halkett in terms of proposed prospecting activities on the farm Doornpan (Webley & Halkett, 2010). A total of two sites were identified, which included one findspot comprising a retouched Middle Stone Age flake as well as another findspot comprising a Quartize Early Stone Age core.

  These two archaeological sites are located within the Doornpan section of the present study area.

- **Paling**

  The Archaeological Impact Assessment undertaken by Anton van Vollenhoven and Anton Pelser in terms of proposed manganese and iron ore mining activities on the farm Paling (Pelser & Van Vollenhoven, 2010). A total of seven sites were identified,

which included one findspot comprising a Middle Stone Age lithic (Site 1), another findspot containing a single Middle Stone Age / Later Stone Age lithic (Site 2), a cemetery comprising roughly eight graves (Site 3), a historic ash heap dating to the late 19th and early 20th centuries (Site 4), a historic mining-related structure (Site 5), a Stone Age site comprising a number of Middle Stone Age and Later Stone Age lithics (Site 6) as well as another historic ash heap dating to the late 19th and early 20th centuries (Site 7).

These seven archaeological sites are distributed across the farm Paling, and as such they are at varying distances from the study area. In terms of the Driehoekspan section of the study area, the sites are between 81m (Site 1) to 4.8km (Site 5) away. In terms of the Doornpan section of the study area, the sites are between 3.6km (Site 1) and 4.7km (Site 4) away.

- **Kapstewel**

The Heritage Impact Assessment undertaken by Anton van Vollenhoven and Anton Pelser in terms of proposed mining activities on portions of the farm Kapstewel (Pelser & Van Vollenhoven, 2009). A total of seven sites were identified, which included the remains of an old mining area (Site 1), a site containing low stone walls which could be associated with either the Late Iron Age or Later Stone Age (Site 2), a possible grave in the form of a rectangular stonepacked structure (Site 3), circular stone-lined depressions which may have been associated with historic mining activities (Site 4), a farmstead (Site 5), the mine offices and complex of the old Manganore mining area (Site 6) as well as a site associated with historic mining activities and which includes features such as an old railway line and conveyor belt (Site 7).

These seven archaeological sites are distributed across the farm Kapstewel, and as such they are at varying distances from the study area. In terms of the Driehoekspan section of the study area, the sites are between 2.6km (Site 7) to 3.9km (Site 1) away. In terms of the Doornpan section of the study area, the sites are between 3.8km (Site 7) and 6.9km (Site 1) away.

4.2 Findings in terms of the Archaeological Overview

The archaeological overview provided above clearly shows that the study area is located in a landscape with a wide array of archaeological resources. As such, the study area has the potential to contain any of the following sites which are known from the surrounding landscape:

- Early Stone Age findspots and sites
- Middle Stone Age findspots and sites
- Later Stone Age findspots and sites
- Rock Art Sites
- Pre-colonial Specularite Mines
- Historic Mining Sites
- Historic Farmsteads
- Graves and Cemeteries

In fact, the use of the SAHRIS database has revealed three known sites from within the Driehoekspan section of the study area (comprising two Stone Age sites and a historic structure of unknown function) and two sites from the Doornpan section of the study area (comprising two Stone Age sites).

5 HISTORICAL OVERVIEW AND FINDINGS

5.1. Historical Overview

DATE	DESCRIPTION
2.5 million to 250 000 years ago	The Earlier Stone Age is the first and oldest phase identified in South Africa's archaeological history and comprises two technological phases. The earliest of these is known as Oldowan and is associated with crude flakes and hammer stones. It dates to approximately 2 million years ago. The second technological phase is the Acheulian and comprises more refined and better made stone artefacts such as the cleaver and bifacial hand axe. The Acheulian dates back to approximately 1.5 million years ago. A number of Early Stone Age sites are known from the general vicinity, though mostly in the form of Early Stone Age findspots. A very significant Early Stone Age site is located at Kathu Pan, some 47.1km north of the study area. Research here was undertaken by P.B. Beaumont and the site is believed to contain millions of Early Stone Age artefacts (Mitchell, 2002).
250 000 to 40 000 years ago	The Middle Stone Age is the second oldest phase identified in South Africa's archaeological history. This phase is associated with flakes, points and blades manufactured by means of the so-called 'prepared core' technique. MSA find spots and sites were identified in the direct vicinity of the study area.
40 000 years ago to the historic past	The Later Stone Age is the third archaeological phase identified and is associated with an abundance of very small artefacts known as microliths. A number of LSA sites are known from the direct vicinity of the study area. Significant examples include the specularite mines at Blinkklipkop and Doornfontein, as well as the rock engraving sites at Beeshoek and Paling.
800 AD – 820 AD	The archaeological excavations undertaken by Beaumont and Bashier (1974) and Thackeray et.al. (1983) have revealed that the mining of specularite at Doornfontein and Blinkklipkop commenced during this time. During this initial period the mining activities would have been undertaken by San hunter-gatherers and Kora pastoralists. Only after the 17th century were such mining activities likely also undertaken by the Iron Age Tswana groups.
Early 1600s	The Tswana groups known as the Thlaping and Thlaro moved southward into the area presently known as the Northern Cape. A century later they were settled in areas as far south as Majeng (Langeberg), Tsantsabane (Postmasburg) and Tlhaka le Tlou (Danielskuil) (Snyman, 1986). In terms of the Thlaro specifically, Breutz (1963) states that after they broke away from the Hurutshe during the period between 1580 and 1610, the Thlaro travelled along the Molopo River and the Southern Kalahari before arriving at the confluence of the Kudumane, Mosaweng and Molopo. From here they established themselves at Tsowe (west of Morokweng), Gatlhose (34km north-east of the study area), Majeng (Langberg) (roughly 35km to the north-east), Khoiise (Khuis on the Molopo River) and Tlhaka-la-Tlou (present day Danielskuil).

	It is evident that the study area and surrounding landscape would be been located on the southern periphery of the overall settlement area of these two Tswana groups at the time. In fact, the surroundings of the study area were to become the southern edge of Late Iron Age expansion into the Northern Cape, a fact which was later signified by the establishment of the boundary between Griqualand West and British Bechuanaland directly north of the present study area.
c. 1770	During this time the Kora moved into the area. Due to their superior firearms they applied increasing pressure on the Thlaping and Thlaro groups. In the end the Thlaping moved into a north-eastern direction to settle in the general vicinity of Dithakong, north-east of present-day Kuruman. The Thlaro settled in areas to the west and north-west of the Thlaping (Snyman, 1986).
c. 1786 – c. 1795	During this time a German deserter by the name of Jan Bloem established himself at Tsantsabane (Blinkklip) (Legassick, 2010). This place is located 5km north-east of the present-day town of Postmasburg. The settlement of Jan Bloem at the specularite mine may have been a way in which to control the valuable site and any trading activities associated with it.
c. 1795	Legassick (2010) confirms the presence of the Thlaping, Thlaro and Kora in the general vicinity of the study area during this time. This said the study area and surrounding landscape would have represented a southern peripheral area of the overall landscape occupied by especially the Thlaping and Thlaro groups at the time. From a map depicted in Leggassick (2010:338) it is evident that at the time the Kora started moving in north-eastern direction from the areas along the central Orange river to the banks of the Harts River.
Early 1800s	After the threat of the Kora became less intensive, the Thlaping moved to the vicinity of present-day Kuruman. The Thlaro returned to the Langeberg, establishing them on a permanent basis there during the 1820s (Snyman, 1986). The settlement of the Thlaping in the vicinity of Kuruman occurred during the reign of Molehabangwe. This period in the history of the Thlaping was seen as a period of wealth and power, and at the time they even had control of the *sibello* quarry near Blinkklip (Legassick, 2010), some 100km to the south-west.
1801	The first known visit to this area by European explorers (i.e. excluding European renegades and fugitives such as Jan Bloem) took place in 1801. The journey was undertaken by P.J. Truter and Dr. W. Somerville. They crossed over the Orange River in the vicinity of Prieska, and passed Blinkklip on their way to present-day Kuruman (Bergh, 1999).
1802 - 1813	During this year William Anderson and Cornelius Kramer, both of the London Missionary Society, established a mission station at a place called Leeuwenkuil. The focus of their work was a group known as the Bastards (Erasmus, 2004). This group could be described as a cultural conglomeration descending not only from relationships between different cultures and races (i.e. European and Khoi), but also comprised remnants of Khoi and San groups as well as freed slaves. The particular group later became known as

	the Griqua. Due to the problems caused by the presence of lions at Leeuwenkuil, the mission station was moved in 1805 to a place higher up called Klaarwater. On 7 August 1813 the name of the settlement which had sprung up at Klaarwater was renamed Griquatown. This came about as a result of a number of proposals made by Reverend John Campbell, the Director of the London Missionary Society who was visiting the mission stations from this area at the time. He suggested that "...*the Bastards change their name to 'Griqua' and that Klaarwater became Griquatown. This was because 'on consulting among themselves they found a majority were descended from a person of the name Griqua'*..." (Legassick, 2010). Griquatown is located 68km south of the present study area.
1805	During this year German explorer Martin Hinrich Carl Lichtenstein travelled through the general vicinity of the study area. After crossing the Orange River in the vicinity of present-day Prieska, Lichtenstein's party visited present-day Danielskuil, and by June 1805 they were at Blinkklip (Postmasburg), a well-known source for obtaining specular haematite. Archaeological investigations at Blinkklipkop (also known as Nauga) established a date of AD 800 for the utilization of this particular rich source (Thackeray, et al 1983). From here they travelled further north and reached the Kuruman River where they met Tswana-speaking people. They followed the river downstream for three days, after which they followed a tributary to reach Lattakoe. From here they turned south and reached the Orange River on 11 July 1805. While on their way to the Kuruman River (and to the south thereof), Lichtenstein and his fellow travellers visited a small settlement consisting of "*…about thirty flat spherical huts.*" Although the people who stayed here were herdsmen who looked after the cattle of richer people living on the Kuruman River, they indicated that San (Bushmen) were also present in the area (Lichtenstein, 1930). Although Lichtenstein was certainly not the first European explorer to travel through this area (the Truter & Somerville expedition had for example passed through this area in 1801), or for that matter the last (Burchell travelled through the area in 1811 followed by John Campbell in 1813) (Bergh, 1999), Lichtenstein did leave behind a written record of this journey providing a valuable glimpse into the early history of the general surroundings of the study area.
1811 - 1813	During this period the famous English explorer and artist William Burchell visited the general vicinity of the study area. Accompanied by missionary Anderson, Burchell crossed over the Orange River at Little Bend from where they travelled to Klaarwater. Using the settlement as a temporary base, Bruchell undertook numerous journeys which included one which passed through Blinkklip (Bergh, 1999).
1813	During 1813 John Campbell of the London Missionary Society also visited the general vicinity of the study area. He arrived at Klaarwater on 9 June 1813, where he rested for a few days before continuing in a northern direction toward present-day Kuruman, passing through Blinkklip on the way (Bergh, 1999).

Figure 12

Reverend John Campbell (Campbell, 1815). He paid a visit to Blinkklip during the second half of 1813.

20 December 1820	On this day Andries Waterboer was elected as leader of Griquatown in the place of Berend Berends (Legassick, 2010). This period saw fission within the Griqua community, and it is not surprising that two long-term leaders moved away from Griquatown to establish autonomous settlements away from their former town. Berend Berends for example moved to Danielskuil (41km east of the study area), whereas Adam Kok II established himself in the vicinity of Campbell (85km south-east of the study area) (Legassick, 2010).
1820s	Barend Barends and his followers moved from their settlement at Danielskuil to Boetsap (roughly 136km north-east of the study area). At the same time Thlaping ruler Mothibi, the brother of Mahura, settled in the vicinity of Boetsap before moving to Griquatown (Legassick, 2010). The first settlement of Blinkklip by the Griqua also took place during this time (Legassick, 2010).
Early 1830s	During this time Andries Waterboer stationed a number of Griqua families at a fountain north of Tsantsabane (Blinkklip) as well as at Danielskuil. Shortly thereafter, a missionary of the London Missionary Society by the name of John Baillie was transferred from the mission station at Kuruman to Tsantsabane. He was to work among the Sotho-Tswana living in and around Tsantsabane at the time. Baillie subsequently left the mission station and resigned from the London Missionary Society in 1836 (Legassick, 2010).

22 April 1842	On this day a treaty was signed between Griqua leader Andries Waterboer and Thlaping leader Mahura at Mahura's settlement near Taungs. The agreement included a definition of the boundary between the two groups. The section of the agreed upon boundary closest to the study area ran from "*...the northerly point of the Langeberg and extending a little south of Nokaneng, and further half-way between Maremane and Klipfontein*..." (Legassick, 2010:291). While the exact location of Nokaneng is not currently known, the farm Klipfontein 437 is situated adjacent and north of the farm Doringpan, whereas the farm Maremane 678 is located 10km to the north-east. This suggests that the present study area was located a short distance south of the boundary line between the Griqua and the Thlaping as defined in the treaty. As such, the study area was defined within this treaty as forming part of the land of the Griqua. However, it must be noted that this boundary line was not cast in stone. This boundary was very similar to an earlier one that was thought to have been agreed to during the 1820s as a boundary between the Griqua and the Thlaping (Legassick, 2010).
1850	During this time a Thlaro leader by the name of Molete and his baThlaro baga Keakopa followers moved away from the Korannaberg and established themselves at Gathlose, roughly 34km north-east of the study area. Breutz (1963) states that the land around Gathlose and Maremane used to belong to the Kora (Koranna) people and that they gave permission to Molete to settle here. After his death between 1885 and 1890, Molete was succeeded by Holele who ruled until his death during the Langberg Rebellion of 1897. Holele was succeeded by Kebiditswe John Holele and filled the post until 1912 when he was succeeded by his younger brother Kgosieng. Kgosieng ruled until he was pensioned on 28 February 1937, and was succeeded by Kebiditswe's son, Kgosietsiele Smous. Kgosietsiele died on 30 June 1956 and was succeeded by his son Frank Motsewakgosi Holele (Breutz, 1963). At roughly the same time (likely between 1850 and 1860) the area known as Maremane (located directly north of Gathlose) was an outpost grazing area of the BaThlaro chief Makgolokwe and his son Toto. The first designated leader of this area was Isaak Thupane Thupane, followed by Toto's son Robanyane who fled to present-day Namibia after the Langberg Rebellion of 1897. He was succeeded by his father's brother Jan Molebane Toto. However, the government only recognised him as chief in 1912 up to which point John Holele of the Gathlose Reserve was appointed by the government to act for the Maremane area as well. Molebane was dismissed in 1925 and was succeeded in 1926 by his brother David Makgolokwe. David Makgolokwe remained at his post until his death in 1942 when he was succeeded by Puso Togelo who remained as leader until his death in 1954. He in turn was succeeded by Felix Kgosithebe Toto (Breutz, 1963).
1850 – 1855	During this period a Thlaro chief by the name of Isaak Thupane Thupane established himself at Logageng (Gatkoppies) near Postmasburg. He subsequently moved with his followers to Groenwater 453. During the time that Thupane was living at Logageng, Kgangeng discovered the fountain at Metsematale. Subsequently, the land was ceded by Waterboer to the Thlaro and Kgangeng and his followers settled at Groenwater as well. Kgangeng was succeeded by Piet Selo in 1897, followed by Sebubi Daniel Selo on 7 February 1908, Leu Motshabeng in 1921 and

	Sebopelo Cornelius Kweetsane in 1927, Steenbok Kgangeng in 1935 and David Mosimanethebe Kweetsane in 1959 (Breutz, 1963). The farm Groenwater 453 is located 15km east of the present study area.
13 December 1852	After the death of Andries Waterboer, his son Nicolaas Waterboer became the leader of Griquatown. He ruled Griquatown until the annexation of the area by the British in 1871 (see below) (Legassick, 2010). It was during the rule of Nicolaas Waterboer that diamonds were discovered in the area which led to a period of claims and counter-claims between the Griqua, the Orange Free State as well as the Zuid-Afrikaansche Republiek and which eventually led to the annexation of the area.

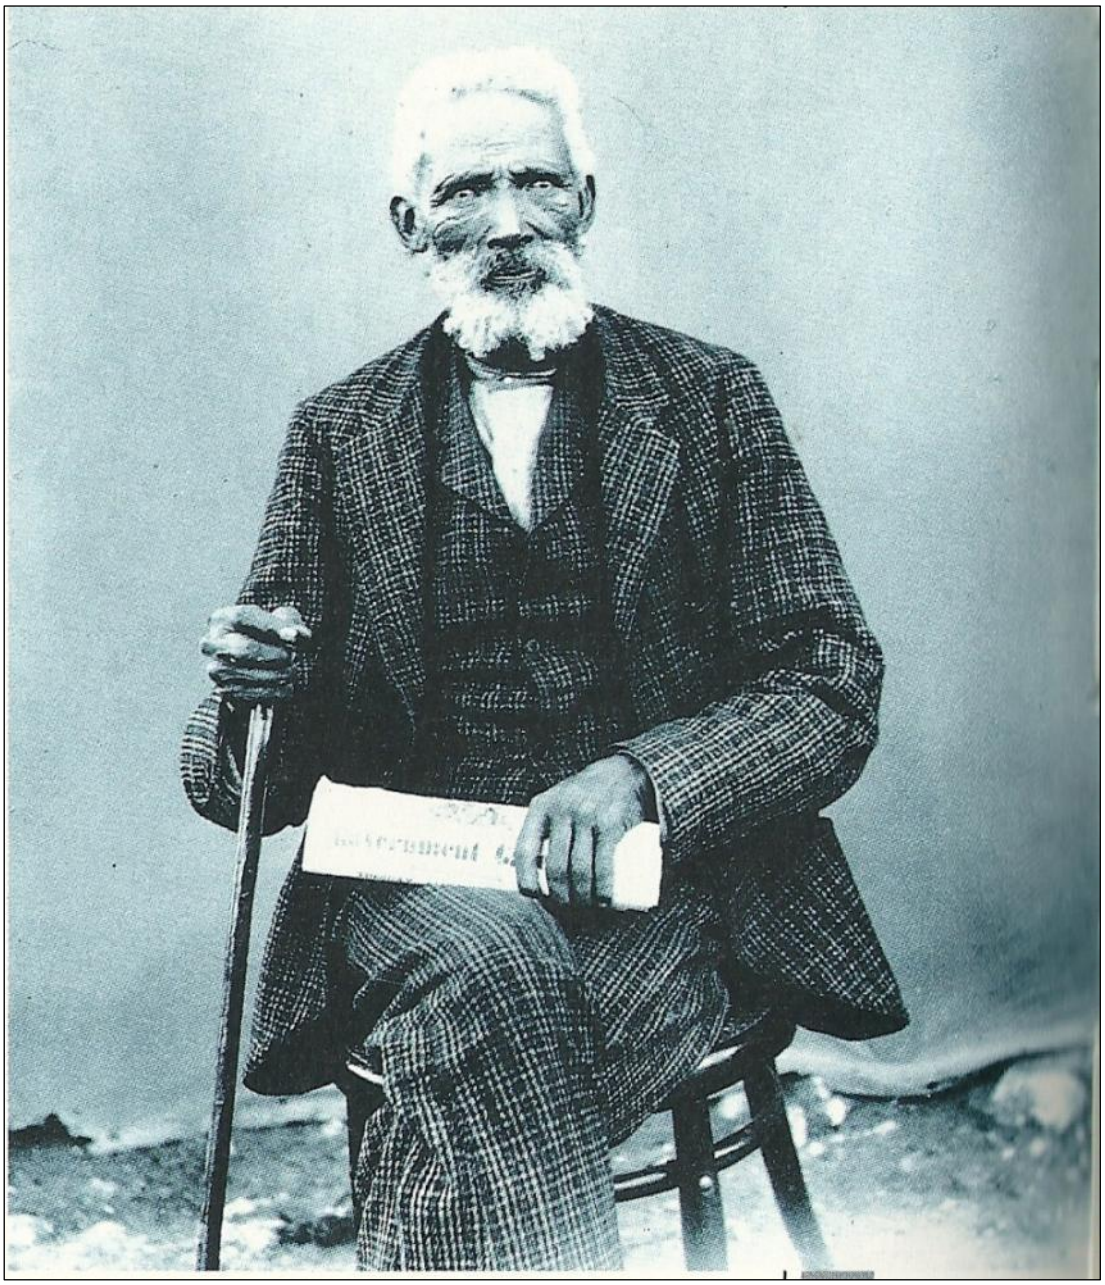

Figure 13

Nicolaas Waterboer, who succeeded as leader of Griquatown in 1852 after the death of his father Andries Waterboer (Reader's Digest, 1994:168).

Before 1856	During the period before 1856 the Thlaro leader Masibi occupied the area known as Skeyfontein (also Skeynfontein or Dikeing). After Masibi left the area, Mpokwe (c. 1837 – 1909) succeeded as leader of the Thlaro at Skyfontein, and in turn was succeeded by Andries Mpokwe (1870 – 1919), Jan Mpokwe, Hendrik Mpokwe and John Diemeng Gaseitsiwe (Breutz, 1963). The farm Skeyfontein 536 is located 16.3km south-east of the present study area.
1867	Diamonds were discovered for the first time in South Africa near Hopetown. Alluvial diamonds were also discovered along both banks of the Orange River in the vicinity of the confluence of the Vaal and Harts Rivers (Van Staden, 1983). This resulted in large numbers of fortune seekers streaming into the wider vicinity of the study area from overseas. This factor would have had a profound impact on the social-dynamics of the landscape.
27 October 1871	The area located in general terms between the Orange and Vaal Rivers and south of Kuruman was proclaimed as British Territory and named Griqualand West. This proclamation came as a result of ownership disputes between the Griqua, the Boer Republic of the Orange Free State and the Boer Republic of the Zuid-Afrikaansche Republiek in terms of the newly discovered diamond diggings (www. wikipedia.org). The study area fell within this territory at the time.

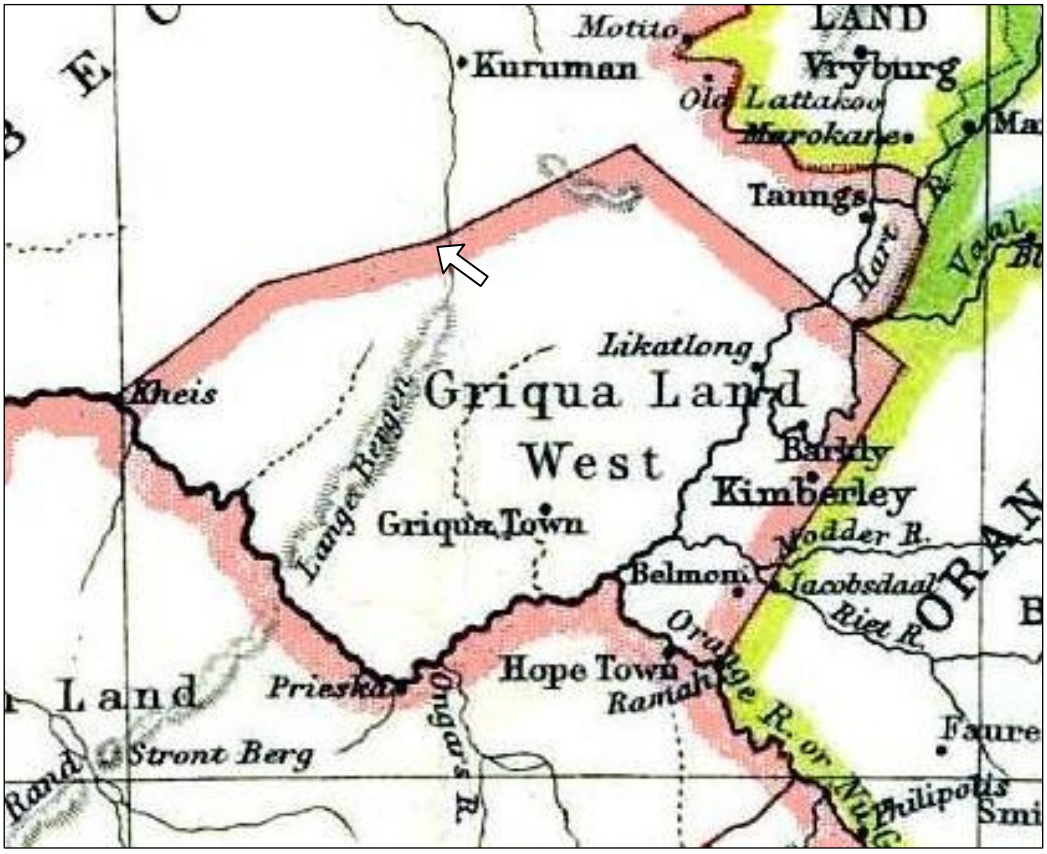

Figure 14

Section of a map titled "Sketch Map of South Africa showing British Possessions". The map is dated to July 1885. (www.wikipedia.com).The boundaries and position of Griqualand West is depicted on this figure. The approximate position of the present study area is shown.

1873 - 1876	After the province of Griqualand West came into existence in 1873, the study area now fell within the Griquatown (later Hay) District of Griqualand West. Subsequently, three government surveyors namely M.P. Auret, F.H.S. Orpen and J. Mintern were sent out to survey the whole district into individual farms (Snyman, 1983).
1876 - 1878	During this period the first farms in the vicinity of Blinkklip were bought by white farmers. These included the farms Pensfontein (bought by C. And G. Harrison), Kappies (bought by John Ryland), Soetfontein (bought by Henry Immuell) as well as the farms Vlakplaats, Abelsvlakte, Blouboskuil, Bloubosputs and Geelputs (all bought by R. Attwell). At the time farms such as Matsap, Klipfontein, Olynfontein, Kalkfontein, Gazip, Ploegfontein, Goedgedacht, Lukasdam, Vaalpan, Rooipoort and Klipbanksfontein had Griqua owners (Snyman, 1983).
1878	A rebellion broke out amongst some of the Tswana communities living in Griqualand West. This rebellion, which was a response to British expansion and colonialism, spread to the Langberg. A force under Colonel Charles Warren left Griqualand West during October 1878 and defeated the “rebels” at the Langberg (Snyman, 1986).
1880 - 1892	During this period a number of events took place which led to the establishment of the town of Postmasburg. One of these events occurred during February 1880 when a troop of the Griqualand West Border Police was stationed at Blinkklip. The reason for this decision was that Blinkklip was situated strategically close to the Bechuanaland border (Snyman, 1983). Another event was the inclusion of Griqualand West in the Cape Colony during 1880, which resulted in higher numbers of permanent white settlement in the area (Snyman, 1983). That the Blinkklip area was seen from government side as favourable for the establishment of a town, can be deduced from the fact that during 1881 a government surveyor by the name of J. Mintern had surveyed the whole Blinkklip valley between Olynfontein and Vinci into agricultural stands. During the same year as many as 38 whites were staying on farms at Blinkklip (Snyman, 1983). During 1882 a number of Reformed Church congregates arrived in the area between Griquatown and Blinkklip. In May 1884 the congregation agreed to establish a church place on the farm Ploegfontein (located 5km south of Postmasburg) for a period of five years. When the period of five years ended, the church council undertook an investigation to find a suitable place for a new church as well as a new town. On 30 November 1889 the congregation finally decided to establish the new town and church at Blinkklip. They submitted an application to the authorities, but it was turned down. On 2 March 1891 their religious leader Dominie Martinus Postma submitted a petition which had been signed by 51 people in favour of the establishment of a town at Blinkklip, to the authorities. This application was approved and during April 1891 a government surveyor by the name of J.A. Thwaites surveyed 82 stands around the police camp. As it took more than a year for

	the stands to be allocated, a second petition was organised during September 1891. The petition asked for the rapid allocation of stands, as well as for the renaming of the settlement from Blinkklip to Postmasburg in honour of Professor Dirk Postma, the founder of the Reformed Church of South Africa. Although the authorities were in favour of the establishment of a town, they did not agree with the proposed name change. In January 1892 Dominie Martinus Postma again asked for the name change and indicated that all the white residents of area were in favour of this. On 14 April 1892 the Assistant-Commissioner of Crown Lands reported as follows: "...*in view of the unanimous request of the inhabitants, instructions have been issued for the necessary arrangements to be made for the change of the name of the township from 'Blink Klip' to 'Postmasburg'* (Snyman, 1983:10). The town's stands were eventually only sold on 12 August 1892 (Snyman, 1983).

Figure 15

Historic portraits of the two members of the Postma family associated with early development of Postmasburg. On the left is Professor Dirk Postma in whose honour the town of Postmasburg was named, with Dominie Martinus Postma on the right. He was the person driving the establishment and naming of the town (Snyman, 1983:9).

30 September 1885	Sir Charles Warren proclaims British Bechuanaland. This area comprised the land between Griqualand West and the Molopo River (Snyman, 1986). As mentioned elsewhere, the boundary between British Bechuanaland and Griqualand West was established directly north of the study area. In fact, the northern boundary of the farm Driehoekspan formed part of this boundary line.
1886	As a result of the work of a commission appointed by the British rulers of the Crown Colony of British Bechuanaland, a number of so-called "native reserves" were established in this area. These included the Gatlhose Reserve and the Maremane Reserve (Snyman, 1986).
c. 1890	During roughly this time the Griqua mined iron at Gatkoppies near Postmasburg (Breutz, 1963).
September 1896	During this time a viral disease affecting cattle (and some other species of even-toed ungulates) known as Rinderpest swept through Southern Africa (www.wikipedia.org). Although attempts were made to halt the spread of the disease from the north by erecting a fence between the boundaries of Griqualand West and Bechuanaland, this proved unsuccessful. Incidentally, only three gates were placed in this fence, namely at Gatlhose, Nelsonsfontein and Blikfontein (Snyman, 1988). Of these three places, Gatlhose is the closest and is situated 30km north-east of the study area. Furthermore, it is worth noting that a section of the Rinderpest fence erected between Griqualand West and British Bechuanaland during this time would have been placed along the northern boundary of the farm Driehoekspan.

Figure 16 An everyday scene in Griqualand West during the Rinderpest Epidemic: large numbers of destroyed cattle (Snyman, 1983:20).

1897	The Rinderpest epidemic did not only have a massive socio-economic impact on the landsccape, it also resulted in the Langberg Rebellion of 1897. During this time conflict broke out between the authorities and a Thlaping leader from Taung, Galeshiwe. The conflict arose after some of Galeshiwe's cattle that were infected by Rinderpest were destroyed by representatives of the government as a way of kerbing the spread of the disease. After killing an officer, Galishewe fled to the Thlaro leader Toto of the Langberg. Subsequently, a full-scale rebellion broke out that was eventually suppressed (Breutz, 1963). Although most of the activities associated with the rebellion took place some distance to the west and north-west of the study area, the impact of the rebellion was felt throughout the surrounding landscape. For example, farms located to the west and south-west of the study area such as Lukasdam (16.5km south-west of the study area), Mount Temple (27.7km west of the study area) and Vlakfontein (located directly west of the study area) came under attack from stock thieves during this time. After the farms Mount Temple and Groenkloof were physically attacked, a police post which had been established on the farm Vlakfontein was reinforced (Snyman, 1983).

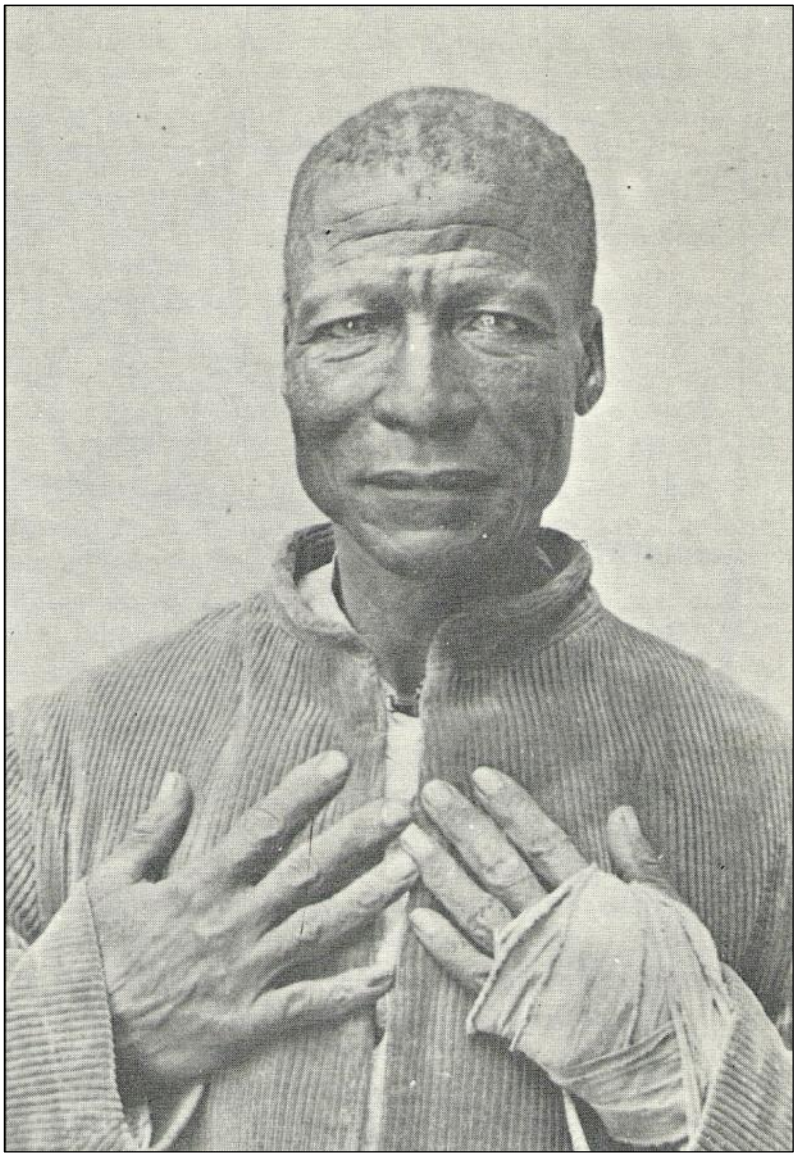

Figure 17

Toto, leader of the Thlaro along the Langberg (Snyman, 1986:17).

1899 - 1902	The South African War (also known as the Anglo Boer War) was fought between Great Britain and the Boer republics of the Zuid-Afrikaansche Republiek and Orange Free State. After the outbreak of hostilities on 11 October 1899, the military commander of Griqualand West and British Bechuanaland Lieutenant-Colonel R.P. Kekewich issued a proclamation whereby all residents of these areas were considered British subjects and as such had to refrain from assisting the Boer forces. However, when a Free State Commando under Kommandant Jan Jordaan and Judge J.B.M. Hertzog occupied Postmasburg on 18 November 1899, a large number of Postmasburg residents took up arms and joined the commando. These rebels formed part of the force under the command of P.J. de Villiers which by March 1900 was in command of the entire Griqualand West. The rebels were under the direct command of Kommandant Jan Vorster and Veldkornet Piet Venter (Snyman, 1983). In April 1900 Sir Charles Warren received the order to retake Griqualand West and British Bechuanaland. Apart from a short delay caused by a skirmish at Fabersput (near Campbell), Warren occupied the towns from within the area (including Postmasburg) within a short period of time. This had a devastating effect on the morale of the rebel forces, who for the most part surrendered. However, fifty rebels under the command of General De Villiers joined the Transvaal forces under the command of General J.H. de la Rey in the western part of the Zuid-Afrikaansche Republiek (Snyman, 1983). In June 1901 General De Villiers attacked the region again to act as a link between General J.H. de la Rey in the Western Transvaal and General J.C. Smuts in the North-Western Cape. On 10 August 1901 the town of Postmasburg was occupied by Boer forces under the command of Kommandant E. Conroy. A number of victories for the Boer forces in this area followed, including the attack on 10 August 1901 of Veldkornet Van Aswegen at Kareepan which resulted in the taking of 110 horses. The farm Kareepan 450 is located directly adjacent and to the south of the study area. Other successes took place at Griquatown and Rooikoppies. These victories resulted in almost the entire white population of Postmasburg taking up arms on the Boer side during August and September 1901. After a battle at Kalkfontein (south of Postmasburg) on 15 September 1901, the town was retaken by the British. However, during January and February 1902 General De Villiers was again in control of Postmasburg and used it as his headquarters during this period (Snyman, 1983). During the last few months of the war, the Boer forces focussed their attention on attacking the British convoys operating between Griquatown and Danielskuil. This resulted in skirmishes and battles at places such as Dirkspan and Doornfontein (not to be confused with the farm Doornfontein located directly south and south-west of the present study area), both located east of the study area (Snyman, 1983). The war ended on 31 May 1902 with the British as victors. The effects of the war were felt for years after the hostilities had actually ended.

Figure 18 A group of Boer rebels from Postmasburg (Snyman, 1983:16).

Figure 19

Captain T.L.H. Shone, who not only discovered a Kimberlite pipe near Postmasburg, but who is also regarded as the first person to mine manganese in the vicinity of the study area (S.A. Manganese, 1977:24)

1913	In this year the so-called “Native Locations” of Skeyfontein and Groenwater were established by Proclamation 131 of 1913 (Breutz, 1963).
1918	During this period the Influenza Pandemic arrived in South Africa. Although the Postmasburg area was seemingly not seriously affected by the disease (Snyman, 1983), the situation on the diamond diggings toward Lichtenburg and Bloemhof were much worse and hundreds of people died there during this period (Van Onselen, 1996).
1918 - 1920	During 1918 a prospector by the name of Casper Venter and his assistant Plaatjie discovered a Kimberlite pipe on the townlands of Postmasburg. The following year T.L.H. Shone discovered a second Kimberlite pipe which became the Postma’s Diamond Mine. Venter sold his discovery rights to Oliver Daniel, and during May 1920 the West End Diamond Mine was established. In the same year Daniel and his partners sold the mine to Sir Abe Bailey for an amount of £80,000.00 (Snyman, 1983). Although the discovery of the Kimberlite pipe brought large numbers of fortune seekers to Postmasburg in the hope that the town would become the new Kimberley, it was only the West End Mine as well as the Postma’s Mine which proceeded with the mining of diamonds (S.A. Manganese, 1977).
1919 - 1930	Mine activities at the West End Diamond Mine continued during this period, until work was ceased due to the financial crisis associated with the Great Depression. During this time the mine retrieved 182, 955 carats of diamonds (Snyman, 1983).
1920 - 1921	The Kimberlite pipe which had been discovered by Shone was mined during this time by Postma’s Diamond Prospect Limited (Snyman, 1983).
1922	In this year T.L.H. Shone (who had discovered the Kimberlite pipe at Postma’s Mine three years earlier) discovered manganese on the farm Doornfontein. Although the presence of manganese in the surrounding landscape had been known before this discovery Shone was the first person to actually mine manganese in this area and was also responsible for focussing the attention of those interested in manganese on the surroundings of Postmasburg (Snyman, 1983). The farm Doornfontein 446 is located directly west of the portion of the study area at Doringpan.
1922 - 1923	After the cessation of activities by the Postma’s Diamond Prospect Limited, mining activities were undertaken during this time by the Diamond Fields of Africa Exploration Company Limited (Snyman, 1983).
1925	With partners Reg Saner and John Dale-Lace, T.L.H. Shone established the first manganese mining company in South Africa, namely Union Manganese Mines and Minerals Limited. The company obtained options on a number of farms in the Postmasburg district (Snyman, 1983).
1924 - 1927	Mining activities were taken over by the Postma’s Diamond Syndicate in 1934 after the cessation of activities by Diamond Field (Snyman, 1983).

22 December 1926 – May 1927	On 22 December 1926 a second manganese mining company was established by Niels Langkilde and A.J. Bester. The company was named South African Manganese Limited (Snyman, 1983). During 1927 the company appointed two experienced prospectors to investigate the properties of the company. These two prospectors were S. Griffiths and W.J. Marais. Their work focussed on the four most important farms owned by the company, namely Kapstewel (located directly adjacent to the study area), Thaakwanene (located directly north-east of the study area), Knoffelfontein (unknown location) and Doornput (seemingly located either directly adjacent to or within the study). Although the results of the prospecting activities were deemed to be very positive, the lack of a railway link between the market and these properties was a serious hurdle (S.A. Manganese, 1977).
1929	A company by the name of the Postma's Diamond Mine undertook mining activities at the Postma's Mine (Snyman, 1983).
4 November 1930	On this day the extension of the railway line from Koopmansfontein to Postmasburg was officially opened by the Minister of Railways, C.W. Malan. This meant that Postmasburg was now one of the few towns in the Northern Cape which boasted a direct rail link. The extension of the railway line to Beeshoek was built by the Manganese Corporation, whereas the further extensions of the line to Lohatla and Manganore (1936), Sishen (1953) and Hotazel (1961) were undertaken by the South African Railways (Snyman, 1983).
1930 - 1932	During 1930 an Englishman by the name of Pringle-Smith was appointed by S.A. Manganese to devise and execute a "...*thorough prospecting programme of S.A. Manganese's properties*..." (S.A. Manganese, 1977:46). This meant that the prospecting work undertaken in 1927 and which had been halted due to the poor financial climate and the lack of a railway link could now be proceeded with. Within a relatively short spate of time Pringle-Smith started opening up the beds on the farms Kapstewel and Doornput. However, the company did not have the market which for example the Manganese Corporation possessed at the time, and as a result the ore was stockpiled at these two farms. Pringle-Smith left the Postmasburg area in 1932 after the financial implications of the Great Depression worsened the situation for S.A. Manganese to such an extent that he was asked to agree to a much lower salary (S.A. Manganese, 1977).
1930 - 1931	The activities at the Postma's Mine were continued during this time by the company Postma's Mine (Snyman, 1983).
1931 -1939	During this time the dumps at the West End Diamond Mine were mined by F. Bernhardi, R.A. Dunsford and T. Begbie. However, this proved unsustainable and this work was ceased in 1939 (Snyman, 1983).
Early 1930s	Due to the financial impacts of the Great Depression, a number of smaller manganese mining companies were closed down. A period of amalgamation followed which resulted in the South African Manganese Limited as well as the Associated Manganese Miners of South Africa Limited becoming the

	leaders in the manganese mining industry (Snyman, 1983).
1935	The Postmasburg Diamond Mine was the last company to undertake mining activities at the Postma's Mine. All activities at the mine were halted when the mine became flooded during this year. The different mining companies operating at the Postma's Mine during the period from 1919 to 1935 retrieved a total of 5,155 carats of diamonds (Snyman, 1983). The Mancorp Mine village was established during this year (Snyman, 1983).
c. 1936	After the willingness of the South African Railways Administration to extend the railway line from Postmasburg to Kapstewel and Lohatla became known, the entire manganese industry north of Postmasburg changed for the better. An example of this was that S.A. Manganese stepped up operations on the farm Kapstewel. The work here was overseen by none other than Captain T.L.H. Shone (S.A. Manganese, 1977). The promise of railway extensions to this area also resulted in other mining activities such as the establishment of a mining company by the name of Gloucester Manganese. This company was established to mine the manganese deposits on the farm Gloucester (located directly north of the Driehoekspan section of the study area). Shortly thereafter an amalgamation took place between Gloucester Manganese and the Manganese Corporation which resulted in the formation of the Associated Manganese Mines of South Africa Limited (Ammosal). Ammosal re-erected the old ore handling plant from Beeshoek on the farm Gloucester and the operations here represented a large portion of the total manganese production of 250,000 tons (S.A. Manganese, 1977).

Figure 20 Prospecting activities on the farm Kapstewel during 1937 (S.A. Manganese, 1977:59).

1937	The farm to the east of Gloucester, named Lohatla, was now being viewed more favourably by S.A. Manganese. During this year they reached an agreement with the owner, which eventually resulted in the acquisition of the farm (S.A. Manganese, 1977). During the same year the company bought the freehold of the farm Klipfontein (located directly north of Doringpan) and also bought 600 morgen of the farm Kapstewel in order to build a staff village. This village was named Manganore (S.A. Manganese, 1977). The Lohatla mine village was also established during this time (Snyman, 1983).
1948	The production of iron ore came to the foreground during this time with the mining of iron ore by S.A. Manganese at Manganore and by the Associated Manganese Miners of South Africa at Beeshoek (Snyman, 1983).
1953	In this year Iscor commenced iron production at Sishen (Snyman, 1983).
1958 - 1978	Iron ore (and manganese) mining activities were undertaken by Consolidated African Mines on the farms Pensfontein (3.2km south of study area), Kapstewel (directly adjacent study area) and Rooinekke. These activities were halted when the market for iron disappeared in 1978 (Snyman, 1983).
1959 - 1966	Iron ore mining activities were started at the so-called Springbok Mine during 1959. These activities took place around a low hill situated south-west of Postmasburg. The work on the town end of the property was undertaken by the Springbok Industrial and Mineral Ventures Limited and the work undertaken on the other end (toward the farm Koeispeen 475) were undertaken by Griqualand Iron Ore (Pty) Ltd. The mining activities of the companies at Springbok Mine ceased in 1966 (Snyman, 1983). The Springbok Mine is situated 11.8km south-west of the study area.
Early 1960s	The residents of Skeyfontein and Groenwater were forcibly removed from their land as part of the system of Apartheid (BAO, 2390, D188/1235/1).
1963	F.M. Mangan discovered iron ore deposits on the farm Kareepan (Snyman, 1983). This farm is situated adjacent to Doringpan.
1963 - 1977	During this time mining activities were renewed on the original prospecting land of West End Diamond Mine. Mining activities included the sinking of two shafts as well as the working of the old mine dumps. Due to financial losses, all activities here were ceased in 1977 (Snyman, 1983).
c. 1966 - 1978	During this time Springbok Industrial started mining the iron ore deposits which had been discovered on Kareepan in 1963. By 1978 all activities were halted as there was no more market for iron ore (Snyman, 1973).
1976 - 1977	During this time the Gatlhose and Maremane Communities were removed from their land and taken to the Shipton Farms in the then homeland of Bophutatswana. After their removal, the South African Government decided to establish a Battle School here. As the Khosis Community was still staying on the land, they were moved to a section of the original land roughly 14 000 hectares in extent. The Lohatla Battle School was subsequently established (www.lrc.org.za/Docs/Judgments/khosis.doc).

5.2 Findings from Historic Overview

Although the historic overview of the study area and surroundings has revealed a long and significant history for the surroundings of the study area, almost none of the historical events highlighted in this report can be positively linked to the study area itself. This said, in a number of cases, mention is made to properties and localities located adjacent or very close to the study area. For the most part these include aspects relating to the history of manganese and iron mining.

The following events from the historic overview can be linked to the study area itself:

- With the establishment of the Griqualand West in 1871 and the proclamation of British Bechuanaland in 1885, the boundary between these areas was defined as passing directly to the north of the study area. In fact, the northern boundary of the Driehoekspan section of the study area formed part of this boundary line between Griqualand West and British Bechuanaland.
- In 1897 a fence was erected on the boundary line between Griqualand West and British Bechuanaland as an attempt to halt the spread of the dreaded Rinderpest from the north into Griqualand West. This fence would have been erected along the northern boundary of the Driehoekspan section of the study area as well.
- The railway line extension between Postmasburg and Lohatla was constructed across the Driehoekspan section of the study area during 1936. A large section of the siding from this line to Manganore was also constructed within the farm Driehoekspan.

Apart from these aspects, the historic study also highlighted some of the historical and archaeological sites which might potentially be located within the study area. These include Stone Age sites, Iron Age sites associated with the histories of the Thlaro and Thlaping (likely in the form of old homesteads with or without stone walling), sites associated with the Kora and Griqua periods (graves, buildings and middens), sites associated with the early and later settlement of white farmers in the area (graves, farmsteads and middens) as well as mining-related sites (shafts, trenches and discard dumps as well as abandoned mine machinery and mine buildings).

6 PALAEONTOLOGICAL OVERVIEW AND FINDINGS

Refer Annexure A for the complete Palaeontological Report

6.1 Geology of the Study Area

The proposed development site is underlain by low to medium grade metamorphic rocks of the Transvaal Supergroup in the Griqualand West Sequence. Rocks of both the Vaalian-aged Postmasburg (clastic sedimentary and volcanic rocks) and Campbell (chemical sedimentary rocks) Groups have been affected by the stacking of thrust packages as can be seen in the Maremane Dome Region North of Postmasburg.

Banded Iron Formations (BIF) are the result of chemical sedimentary cycles starting with carbonates, followed by sideritic iron-stones and cherts and ending with silicic iron-stones. Iron precipitation was seen as occurring in a bar-basin or lagoon in the most marginal zones of the basin (Eriksson et. al., 1976 in: Johnson et.al., 2009). The interpretation of Banded Iron Formation deposition is further complicated by the Maremane Dome Structure North of Postmasburg, where the Kuruman BIF has a unique setting (Johnson et. al., 2009) leading to the development of rich Sishen-type iron ores.

The farm Driehoeks Pan 435 is underlain by rocks of the Gamagara Formation (Vg) of the Postmasburg Group as well as rocks of the Lime Acres Member of the Ghaapplato Formation (Vgl) of the Campbell Group. The rocks of the Gamagara Formation underlie the Western Corner of the Farm. This formation consists of quartzites, conglomerates, flagstones and shales and constitutes the base of the Postmasburg Group. The formation lies unconformably upon the Ghaapplato and Asbesberge Formations. Lenticular basal conglomerates contain pebbles of jasper and banded iron stone and are completely ferruginised in places. The shales contain lenses of conglomerate and are also locally ferruginised or manganised. Ferruginous flagstone and white, purple and brown quartzites form the top of the formation. Rocks of the Lime Acres Member of the Ghaapplato Formation of the Campbell Group consist of dolomitic limestone with subordinate coarsely crystalline dolomite and chert with lenses of limestone. Stromatolitic puckered limestone consisting of alternating dark and light bands can be found. Lenticular bodies of limestone occurring in the dolomite are probably the result of irregular dolomitisation of the original limestone (Moen HFG, 1977).

The farm Doornpan 445 1 is mainly underlain by dolomitic limestone with subordinate coarsely crystalline dolomite, and chert with lenses of limestone of the Lime Acres Member of the Ghaapplato Formation of the Campbell Group. Some of the hills on the farm consist of rocks of the upper section of the Lime Acres Member of the Ghaapplato Formation. These rocks consist of chert and chert breccia (silica breccia or manganese marker) containing a thin ferruginous layer of shale that grades southwards into red jasper with chert. This ferruginous layer is fairly constant throughout the area and serves as a marker. Stromatolitic puckered limestone consisting of alternating dark and light bands lies underneath the chert member which forms the top of the Ghaapplato Formation. Lenticular bodies of limestone occurring in the dolomite are probably the result of irregular dolomitisation of the original limestone (Moen HFG, 1977).

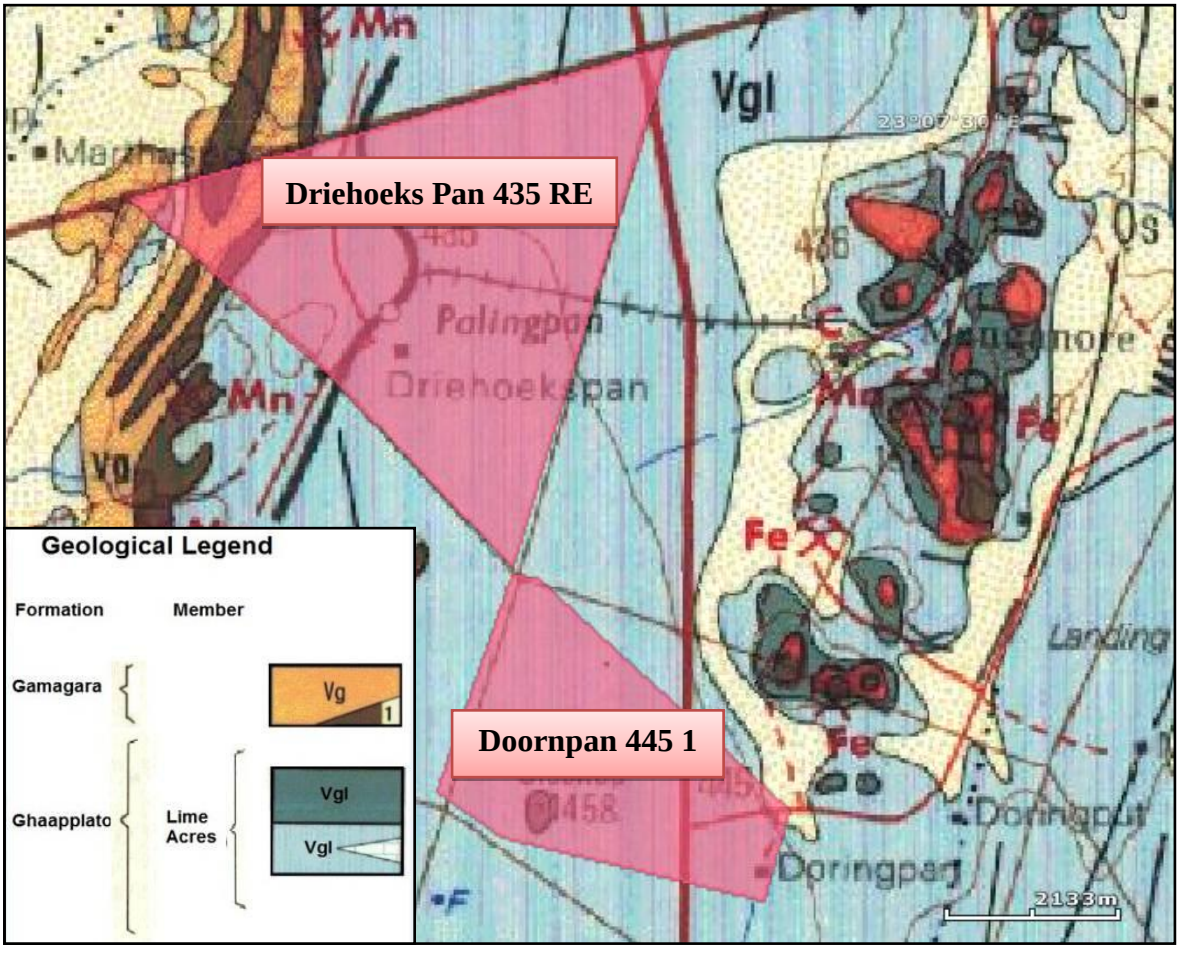

Figure 21 – Map showing the geology of the study area

6.2 Palaeontology of the Study Area

In most of the models presented for the deposition of BIFs, there is a strong correlation with carbonate deposition in shallow marine environments. These environments are in turn known to be associated with well-defined domical stromatolites with fine, internal lamination. Elongated, large stromatolite domes with laminated internal structures reflecting a sub-tidal current-influenced environment have been described from the Ghaapplato Formation, Campbell-Rand Subgroup near Boetsap, east of the study area (Johnson et. al., 2009).

Stromatolite structures are best observed as internal, wavy patterns in limestones or dolomites.

Figure 22 – Typical stromatolite structures usually associated with dolomite deposits such as the dolomite of the Campbell Group. It is highly likely that structures such as in this photograph, might be exposed during exposure of the dolomite and Banded Iron Units. (Photograph from Wikipedia 201 en.wikipedia.org/wiki/Stromatolite.

Stromatolites can also be identified as large domal structures on the bedding plains of chemical sedimentary sequences. Structures like those depicted below are known from the Ghaapplato Formation and might be associated with carbonate rocks such as the dolomites which are in turn associated with BIFs in the study area.

Figure 23 – Dome structures associated with stromatolites in chemical sedimentary sequences (http://jfmoyen.free.fr/IMG/jpg/Stromato-Fig11.jpg)

6.2 Palaeontological Sensitivity of the Study Area

The palaeontological sensitivity is predicted after identifying potentially fossiliferous rock units; ascertaining the fossil heritage from the literature and evaluating the nature and scale of the development itself.

The scale of the quarries proposed for the mining of iron ore will most probably lead to the exposure of chemical sedimentary sequences associated with the deposition of BIFs. Sequences of chemical sedimentary rocks can in turn contain stromatolite structures which will only be exposed during the mining operation. Due to the likelihood of finding these structures during mining operations, the study areas have a moderate palaeontological sensitivity rating with a low sensitivity rating only in the western corner of the farm Driehoeks Pan 435 RE.

6.3 Palaeontological Findings

The study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sedimentary sequences are associated with BIFs in the Postmasburg region where mining is envisaged. The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.

It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified

palaeontologist must be informed and a representative sample of at least 1m3 must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.

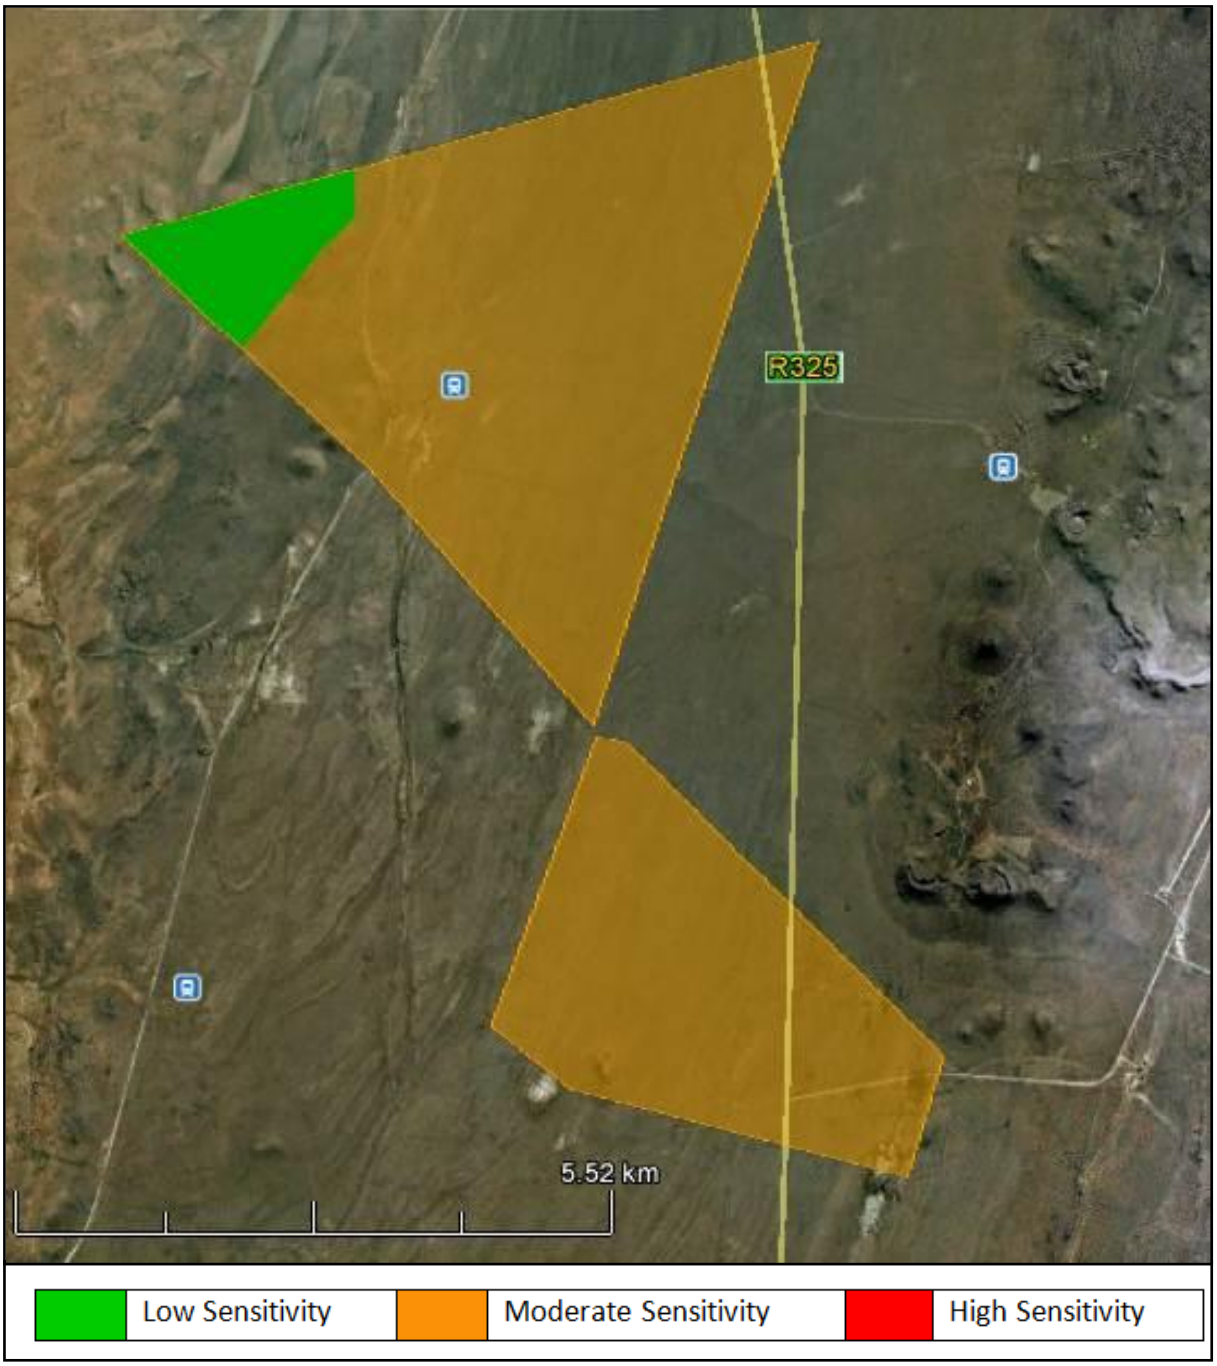

Figure 24 – Map showing the palaeosensitivity of the study area

7 CONCLUSIONS AND FINDINGS

PGS Heritage was appointed by Synergistics Environmental Services to undertake a Heritage Impact Assessment (HIA) that forms part of the Environmental Impact Assessment (EIA) and Environmental Management Plan (EMP) for the proposed mining activities located on the Remainder of the farm Driehoekspan 435 and Portion 1 of the farm Doringpan 445, north of Postmasburg, Northern Cape Province.

Heritage resources are unique and non-renewable and as such any impact on such resources must be seen as significant.

The Heritage Scoping Report has shown that both the study area and surrounding area have a rich historical and archaeological history.

7.1 Findings from Study

A number of aspects dealing with heritage were studied for this heritage scoping study, including archival and historical maps, history, archaeology and palaeontology. In this section a summary will be provided in terms of the study findings with regard to each of these items.

Archival and Historical Maps

The following observations can be made as a result of the study of archival and historical maps of the study area:

- In 1911 the study area was entirely undeveloped and was likely characterised by farming activities.
- By 1928 a farmhouse had been built on Driehoekspan as well as Doringpan. However, based on the information available on the maps, these farmhouses represented the only man-made features within the study area at the time. Although the exact age of these two farmhouses are not known, they would have been built between 1911 and 1928. As such these farmhouses can be anything between 85 years and 102 years old.
- By 1970 considerable development has taken place within the study area and direct surroundings. This includes mining as well as infrastructural development such as

the construction of the railway line between Postmasburg and Lohatla which was built in 1936.

- Two additional buildings appear on the farm Driehoekspan on the 1970 map. The locality of these two buildings in close proximity to the abovementioned railway line, suggests that they may have been associated with railway activities at the time. These two buildings would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old, with a stronger likelihood for these buildings to be closer to the 43 year parameter.
- One additional building appears on the farm Doringpan on the 1970 map. This building appears to be associated with the farmhouse which had been built sometime before. This additional building would have been constructed between 1928 and 1970, and as such would be between 85 years and 43 years old if it still exists today.

Should any of these identified features be located within (or in close proximity to) the final development areas, the localities of these features will have to be assessed in the field to establish whether any physical remains of them are still preserved, and if so, what their significance would be.

History

The archival and historical research has revealed a long and significant history in terms of the surroundings of the study area. However, even though this historical study was quite intensive and detailed, very little historical information with regard to the study area itself could be located.

The following events from the historic overview can be linked to the study area itself:

- With the establishment of the Griqualand West in 1871 and the proclamation of British Bechuanaland in 1885, the boundary between these areas was defined as passing directly to the north of the study area. In fact, the northern boundary of the Driehoekspan section of the study area formed part of this boundary line between Griqualand West and British Bechuanaland at the time.
- In 1897 a fence was erected on the boundary line between Griqualand West and British Bechuanaland as an attempt to halt the spread of the dreaded Rinderpest

from the north into Griqualand West. This fence would have been erected along the northern boundary of the Driehoekspan section of the study area as well.

- The railway line extension between Postmasburg and Lohatla was constructed across the Driehoekspan section of the study area during 1936. A large section of the siding from this line to Manganore was also constructed within the farm Driehoekspan.

Apart from these aspects, the historic study also highlighted some of the historical and archaeological sites which might potentially be located within the study area. These include Stone Age sites, Iron Age sites associated with the histories of the Thlaro and Thlaping, sites associated with the Kora and Griqua periods (graves, buildings and middens), sites associated with the early and later settlement of white farmers in the area (graves, farmsteads and middens) as well as mining-related sites (shafts, trenches, discard dumps, abandoned mine machinery and mine buildings).

The presence (or absence) of these sites can only be confirmed during the fieldwork.

Archaeology

Previous studies conducted in the surroundings of the study area have identified a number of archaeological sites. These include Stone Age (ESA, MSA and LSA) sites including find spots, surface scatters and rock art sites; pre-colonial specularite mining sites; historic structures and buildings; historic mining sites as well as graves and cemeteries.

Due to the arid nature of the surroundings of the study area, it seems likely for many of the archaeological site types (with the possible exception of pre-colonial and historical mine sites) to be concentrated in proximity to water sources such as riverine edges and pans. However, as no fieldwork has yet been undertaken, this cannot be stated as fact.

This report has highlighted the archaeological potential of the study area and the need for archaeological fieldwork to be undertaken of the proposed development footprint area.

Palaeontology

The study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sedimentary sequences are associated with BIFs in the Postmasburg region where mining is envisaged. The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.

It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified palaeontologist must be informed and a representative sample of at least 1m3 must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.

Future Work

Utilising the results of this heritage scoping report, field work will be conducted to identify all heritage resources and make recommendations on the management and minimising the possible impacts of the proposed mining activities on identified heritage sites.

The data will be compiled in a report that will utilise the Plan of Study for the EIA/HIA (**Appendix B**). A detailed description of the potential impact of the proposed activities will be provided as will information with regard to the heritage significance of the identified sites. Based on this detailed information, the environmental consultants will conduct a significance of impact rating (which will be approved by the heritage specialist) for their EIA. The significance of impact rating depicted in **Appendix E** will be used by the environmental consultants to conduct the significance of impact ratings in their EIA report.

7.2 Heritage Issues and Potential Impacts

ISSUE	Impact on archaeological sites
DISCUSSION	As seen from the archaeological overview provided in Section 4, a number of significant archaeological sites are known from the surroundings of the study area. Furthermore, previous archaeological surveys (not undertaken by PGS Heritage) also revealed the existence of archaeological sites within the study area boundaries.

EXISTING IMPACT	None known.
PREDICTED IMPACT	Unidentified archaeological sites and the discovery of such sites during construction can seriously hamper construction timelines. Archaeological fieldwork can therefore provide valuable information on such sites in the study area and provide timeous management of such sites through realignment of development or mitigation of such sites where needed.
EIA INVESTIGATION	Archaeological walkthrough of the entire development area.
CUMULATIVE EFFECT	None foreseen at this stage.

ISSUE	Impact on palaeontological sites
DISCUSSION	As seen from the section dealing with palaeontology (see Section 6) as well as the Palaeontological Report in Appendix A) the study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sedimentary sequences are associated with BIFs in the Postmasburg region where mining is envisaged. The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.
EXISTING IMPACT	If no mitigation is undertaken, the development may result in the destruction of stromatolite structures which are of medium palaeontological significance.
PREDICTED IMPACT	If no mitigation is undertaken, the development may result in the destruction of stromatolite structures which are of medium palaeontological significance.
EIA INVESTIGATION	It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified palaeontologist must be informed and a representative sample of at least $1m^3$ must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.
CUMULATIVE EFFECT	None foreseen at this stage.

ISSUE	Impact on historical sites
DISCUSSION	A detailed historic overview of the study area and surrounding landscape was undertaken (see Section 5). This study has shown that project area is located within a landscape which has a long and significant history.
EXISTING IMPACT	None known.
PREDICTED IMPACT	Unidentified historical sites and the discovery of such sites during construction can seriously hamper construction timelines.

	Archaeological fieldwork can therefore provide valuable information on such sites in the study area and provide timeous management of such sites through realignment of development or mitigation of such sites where needed.
EIA INVESTIGATION	Archaeological walkthrough of the entire development area.
CUMULATIVE EFFECT	None foreseen at this stage.

ISSUE	Impact on graves and cemeteries
DISCUSSION	The existence of graves and cemeteries within the development area is a possibility and as a result archaeological fieldwork would be required.
EXISTING IMPACT	None known.
PREDICTED IMPACT	Unidentified graves and cemeteries and the discovery of such sites during construction can seriously hamper construction timelines. In the case that such graves and cemeteries cannot be avoided, grave relocation would be required. Such a process impacts on the spiritual and social fabric of the next of kin and associated communities. Archaeological fieldwork can therefore provide valuable information on the location of such sites within the development area and provide timeous management of such sites through realignment of development or mitigation of such sites where needed.
EIA INVESTIGATION	Archaeological walkthrough of the entire development area.
CUMULATIVE EFFECT	None foreseen at this stage.

7.3 General Recommendations and Conclusions

The following general recommendations and conclusions can be made:

- **A heritage impact assessment must be undertaken of the proposed development area of the mine. This heritage impact assessment must be underpinned by an archaeological walkthrough of the entire development area.**

PALAEONTOLOGICAL DESKTOP STUDY

PALAEONTOLOGICAL DESKTOP ASSESSMENT FOR TWO PITS AND ASSOCIATED INFRASTRUCTURE ON THE FARMS DRIEHOEKS PAN 435 RE AND DOORNPAN 445 1 NEAR THE TOWN OF POSTMASBURG IN THE TSANTSABANE LOCAL MUNICIPALITY, SIYANDA DISTRICT MUNICIPALITY IN THE NORTHERN CAPE PROVINCE

Developer:
ArcelorMittal South Africa (Pty) Ltd

For:

HIA CONSULTANTS

DATE: 30 April 2013

By

GIDEON GROENEWALD

EXECUTIVE SUMMARY

Gideon Groenewald was appointed by PSG Heritage and Grave Relocation Consultants to undertake a desktop survey, assessing the potential palaeontological impact of the proposed developments of two pits and associated infrastructure on the farms Driehoeks Pan 435 RE and Doornpan 445 1 near the town of Postmasburg in the Tsantsabane Local Municipality, Siyanda District Municipality of the Northern Cape Province.

This report forms part of the Environmental Impact Assessment and complies with the requirements of the South African National Heritage Resource Act No 25 of 1999. In accordance with Section 38 (Heritage Resources Management), a Heritage Impact Assessment (HIA) is required to assess any potential impacts to palaeontological heritage within the development footprint of the development.

The project entails the development of two separate quarries and associated infrastructure on the farms Driehoeks Pan 435 RE and Doornpan 445 1 near the town of Postmasburg in the Tsantsabane Local Municipality, Siyanda District Municipality of the Northern Cape Province. The quarries will be developed as part of an iron ore mining project proposed by ArcelorMittal South Africa (Pty) Ltd

The proposed development site is underlain by low to medium grade metamorphic rocks of the Transvaal Supergroup in the Griqualand West Sequence. Rocks of both the Postmasburg (clastic sedimentary and volcanic rocks) and Campbell (chemical sedimentary rocks) Groups have been affected by the stacking of thrust packages as can be seen in the Maremane Dome Region North of Postmasburg.

In most of the models presented for the deposition of BIFs, there is a strong correlation with carbonate deposition in shallow marine environments. These environments are in turn known to be associated with well-defined domical stromatolites with fine, internal lamination. Elongated, large stromatolite domes with laminated internal structures reflecting a sub-tidal current-influenced environment have been described from the Ghaapplato Formation, Campbell-Rand Subgroup near Boetsap, east of the study area.

The study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sequences are associated with BIFs in the Postmasburg region where mining is envisaged. The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.

The scale of the quarries proposed for the mining of iron ore will most probably lead to the exposure of chemical sedimentary sequences associated with the deposition of BIFs. Sequences of chemical sedimentary rocks can in turn contain stromatolite structures which will only be exposed during the mining operation. Due to the likelihood of finding these structures during mining operations, the study areas have a moderate palaeontological sensitivity rating with a low sensitivity rating only in the western corner of the farm Driehoeks Pan 435 RE.

It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified palaeontologist must be informed and a representative sample of at least $1m^3$ must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.

LIST OF TABLES

1. INTRODUCTION

1.1. Background

Gideon Groenewald was appointed by PSG Heritage and Grave Relocation Consultants to undertake a desktop survey, assessing the potential palaeontological impact of the proposed developments of two pits and associated infrastructure on the farms Driehoeks Pan 435 RE and Doornpan 445 1 near the town of Postmasburg in the Tsantsabane Local Municipality, Siyanda District Municipality of the Northern Cape Province.

This report forms part of the Environmental Impact Assessment and complies with the requirements of the South African National Heritage Resource Act No 25 of 1999. In accordance with Section 38 (Heritage Resources Management), a Heritage Impact Assessment (HIA) is required to assess any potential impacts to palaeontological heritage within the development footprint of the development.

Categories of heritage resources recognised as part of the National Estate in Section 3 of the Heritage Resources Act, and which therefore fall under its protection, include:

- geological sites of scientific or cultural importance;
- objects recovered from the soil or waters of South Africa, including archaeological and palaeontological objects and material, meteorites and rare geological specimens;
- objects with the potential to yield information that will contribute to an understanding of South Africa's natural or cultural heritage.

1.2. Aims and Methodology

Following the *"SAHRA APM Guidelines: Minimum Standards for the Archaeological & Palaeontological Components of Impact Assessment Reports"* the aims of the palaeontological impact assessment are:

- to identifying exposed and subsurface rock formations that are considered to be palaeontologically significant;
- to assess the level of palaeontological significance of these formations;
- to comment on the impact of the development on these exposed and/or potential fossil resources and
- to make recommendations as to how the developer should conserve or mitigate damage to these resources.

In preparing a palaeontological desktop study the potential fossiliferous rock units (groups, formations etc) represented within the study area are determined from geological maps. The known fossil heritage within each rock unit is inventoried from the published scientific literature and previous palaeontological impact studies in the same region.

The likely impact of the proposed development on local fossil heritage is determined on the basis of the palaeontological sensitivity of the rock units concerned and the nature and scale of the development itself, most notably the extent of fresh bedrock excavation envisaged. The different sensitivity classes used are explained in Table 1.1 below.

Table 1.1 Palaeontological Sensitivity Analysis Outcome Classification

Sensitivity	Description
Low Sensitivity	Areas where a negligible impact on the fossil heritage is likely. This category is reserved largely for areas underlain by igneous rocks. However, development in fossil bearing strata with shallow excavations or with deep soils or weathered bedrock can also form part of this category.
Moderate Sensitivity	Areas where fossil bearing rock units are present but fossil finds are localised or within thin or scattered sub-units. Pending the nature and scale of the proposed development the chances of finding fossils are moderate. A field-based assessment by a professional palaeontologist is usually warranted.
High Sensitivity	Areas where fossil bearing rock units are present with a very high possibility of finding fossils of a specific assemblage zone. Fossils will most probably be present in all outcrops and the chances of finding fossils during a field-based assessment by a professional palaeontologist are very high. Palaeontological mitigation measures need to be incorporated into the Environmental Management Plan

1.3. Scope and Limitations of the Desktop Study

The study will include: i) an analysis of the area's stratigraphy, age and depositional setting of fossil-bearing units; ii) a review of all relevant palaeontological and geological literature, including geological maps, and previous palaeontological impact reports; iii) data on the proposed development provided by the developer (e.g. location of footprint, depth and volume of bedrock excavation envisaged) and iv) where feasible, location and examination of any fossil collections from the study area (e.g. museums).

The key assumption for this scoping study is that the existing geological maps and datasets used to assess site sensitivity are correct and reliable. However, the geological maps used were not intended for fine scale planning work and are largely based on aerial photographs alone, without ground-truthing. There is also an inadequate database for fossil heritage for much of the RSA, due to the small number of professional palaeontologists carrying out fieldwork in RSA. Most development study areas have never been surveyed by a palaeontologist.

These factors may have a major influence on the assessment of the fossil heritage significance of a given development and without supporting field assessments may lead to either:

- an underestimation of the palaeontological significance of a given study area due to ignorance of significant recorded or unrecorded fossils preserved there, or
- an overestimation of the palaeontological sensitivity of a study area, for example when originally rich fossil assemblages inferred from geological maps have in fact been destroyed by tectonism or weathering, or are buried beneath a thick mantle of unfossiliferous "drift" (soil, alluvium etc).

2. DESCRIPTION OF THE PROPOSED DEVELOPMENT

The project entails the development of two separate quarries and associated infrastructure on the farms Driehoeks Pan 435 RE and Doornpan 445 1 near the town of Postmasburg in the Tsantsabane Local Municipality, Siyanda District Municipality of the Northern Cape Province.
The quarries will be developed as part of an iron ore mining project proposed by ArcelorMittal South Africa (Pty) Ltd.

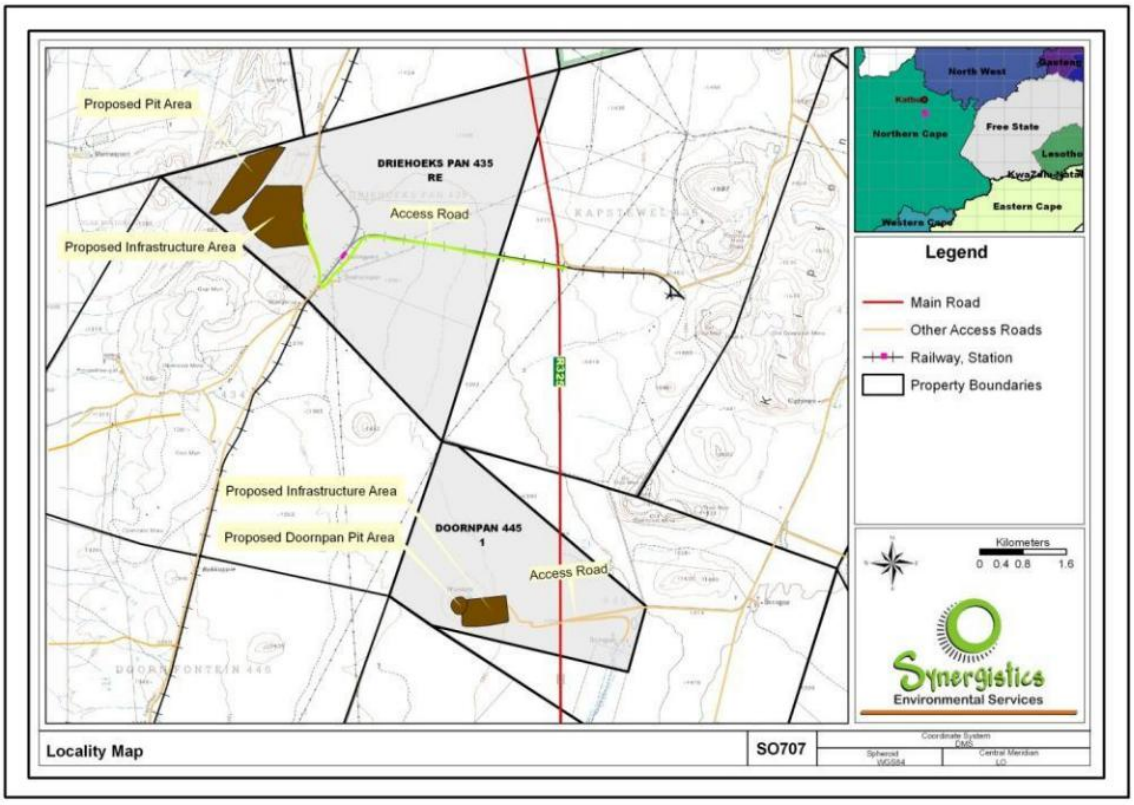

Figure 2.1 Location of study area

3. GEOLOGY

The proposed development site is underlain by low to medium grade metamorphic rocks of the Transvaal Supergroup in the Griqualand West Sequence (Figure 3.1). Rocks of both the Vaalian-aged Postmasburg (clastic sedimentary and volcanic rocks) and Campbell (chemical sedimentary rocks) Groups have been affected by the stacking of thrust packages as can be seen in the Maremane Dome Region North of Postmasburg.

Banded Iron Formations (BIF) are the result of chemical sedimentary cycles starting with carbonates, followed by sideritic iron-stones and cherts and ending with silicic iron-stones. Iron precipitation was seen as occurring in a bar-basin or lagoon in the most marginal zones of the basin (Eriksson et. al., 1976 in: Johnson et.al., 2009). The interpretation of Banded Iron Formation deposition is further complicated by the Maremane Dome Structure North

of Postmasburg, where the Kuruman BIF has a unique setting (Johnson et. al., 2009) leading to the development of rich Sishen-type iron ores.

The farm Driehoeks Pan 435 is underlain by rocks of the Gamagara Formation (Vg) of the Postmasburg Group as well as rocks of the Lime Acres Member of the Ghaapplato Formation (Vgl) of the Campbell Group. The rocks of the Gamagara Formation underlie the Western Corner of the Farm. This formation consists of quartzites, conglomerates, flagstones and shales and constitutes the base of the Postmasburg Group. The formation lies unconformably upon the Ghaapplato and Asbesberge Formations. Lenticular basal conglomerates contain pebbles of jasper and banded iron stone and are completely ferruginised in places. The shales contain lenses of conglomerate and are also locally ferruginised or manganised. Ferruginous flagstone and white, purple and brown quartzites form the top of the formation. Rocks of the Lime Acres Member of the Ghaapplato Formation of the Campbell Group consist of dolomitic limestone with subordinate coarsely crystalline dolomite and chert with lenses of limestone. Stromatolitic puckered limestone consisting of alternating dark and light bands can be found. Lenticular bodies of limestone occurring in the dolomite are probably the result of irregular dolomitisation of the original limestone (Moen HFG, 1977).

The farm Doornpan 445 1 is mainly underlain by dolomitic limestone with subordinate coarsely crystalline dolomite, and chert with lenses of limestone of the Lime Acres Member of the Ghaapplato Formation of the Campbell Group. Some of the hills on the farm consist of rocks of the upper section of the Lime Acres Member of the Ghaapplato Formation. These rocks consist of chert and chert breccia (silica breccia or manganese marker) containing a thin ferruginous layer of shale that grades southwards into red jasper with chert. This ferruginous layer is fairly constant throughout the area and serves as a marker. Stromatolitic puckered limestone consisting of alternating dark and light bands lies underneath the chert member which forms the top of the Ghaapplato Formation. Lenticular bodies of limestone occurring in the dolomite are probably the result of irregular dolomitisation of the original limestone (Moen HFG, 1977).

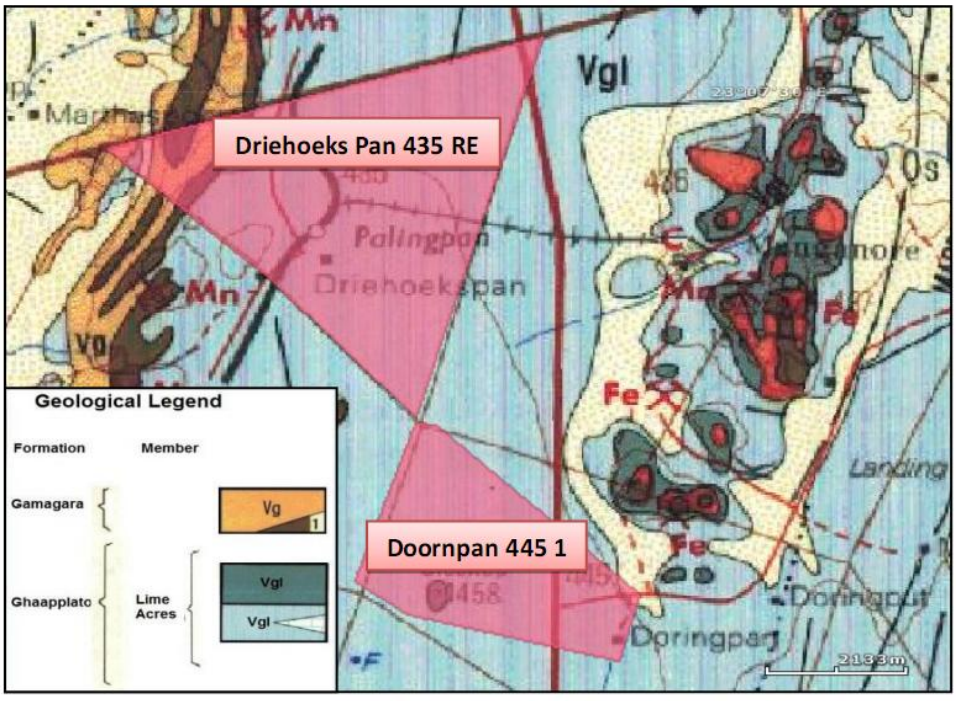

Figure 3.1 Map showing the geology of the study area

4. PALAEONTOLOGY OF THE AREA

In most of the models presented for the deposition of BIFs, there is a strong correlation with carbonate deposition in shallow marine environments. These environments are in turn known to be associated with well-defined domical stromatolites with fine, internal lamination. Elongated, large stromatolite domes with laminated internal structures reflecting a sub-tidal current-influenced environment have been described from the Ghaapplato Formation, Campbell-Rand Subgroup near Boetsap, east of the study area (Johnson et. al., 2009).

Stromatolite structures are best observed as internal, wavy patterns in limestones or dolomites (Figure 4.1).

Figure 4.1 Typical stromatolite structures usually associated with dolomite deposits such as the dolomite of the Campbell Group. It is highly likely that structures such as in this photograph, might be exposed during exposure of the dolomite and Banded Iron Units. (Photograph from Wikipedia 201) en.wikipedia.org/wiki/Stromatolite.

Stromatolites can also be identified as large domal structures on the bedding plains of chemical sedimentary sequences (Figure 4.2). Structures like those depicted in figure 4.2 are known from the Ghaapplato Formation and might be associated with carbonate rocks such as the dolomites which are in turn associated with BIFs in the study area.

Figure 4.2 Dome structures associated with stromatolites in chemical sedimentary sequences. (http://jfmoyen.free.fr/IMG/jpg/Stromato-Fig11.jpg)

5. PALAEONTOLOGICAL SENSITIVITY

The palaeontological sensitivity is predicted after identifying potentially fossiliferous rock units; ascertaining the fossil heritage from the literature and evaluating the nature and scale of the development itself.

The scale of the quarries proposed for the mining of iron ore will most probably lead to the exposure of chemical sedimentary sequences associated with the deposition of BIFs. Sequences of chemical sedimentary rocks can in turn contain stromatolite structures which will only be exposed during the mining operation. Due to the likelihood of finding these structures during mining operations, the study areas have a moderate palaeontological sensitivity rating with a low sensitivity rating only in the western corner of the farm Driehoeks Pan 435 RE (Figure 5.1).

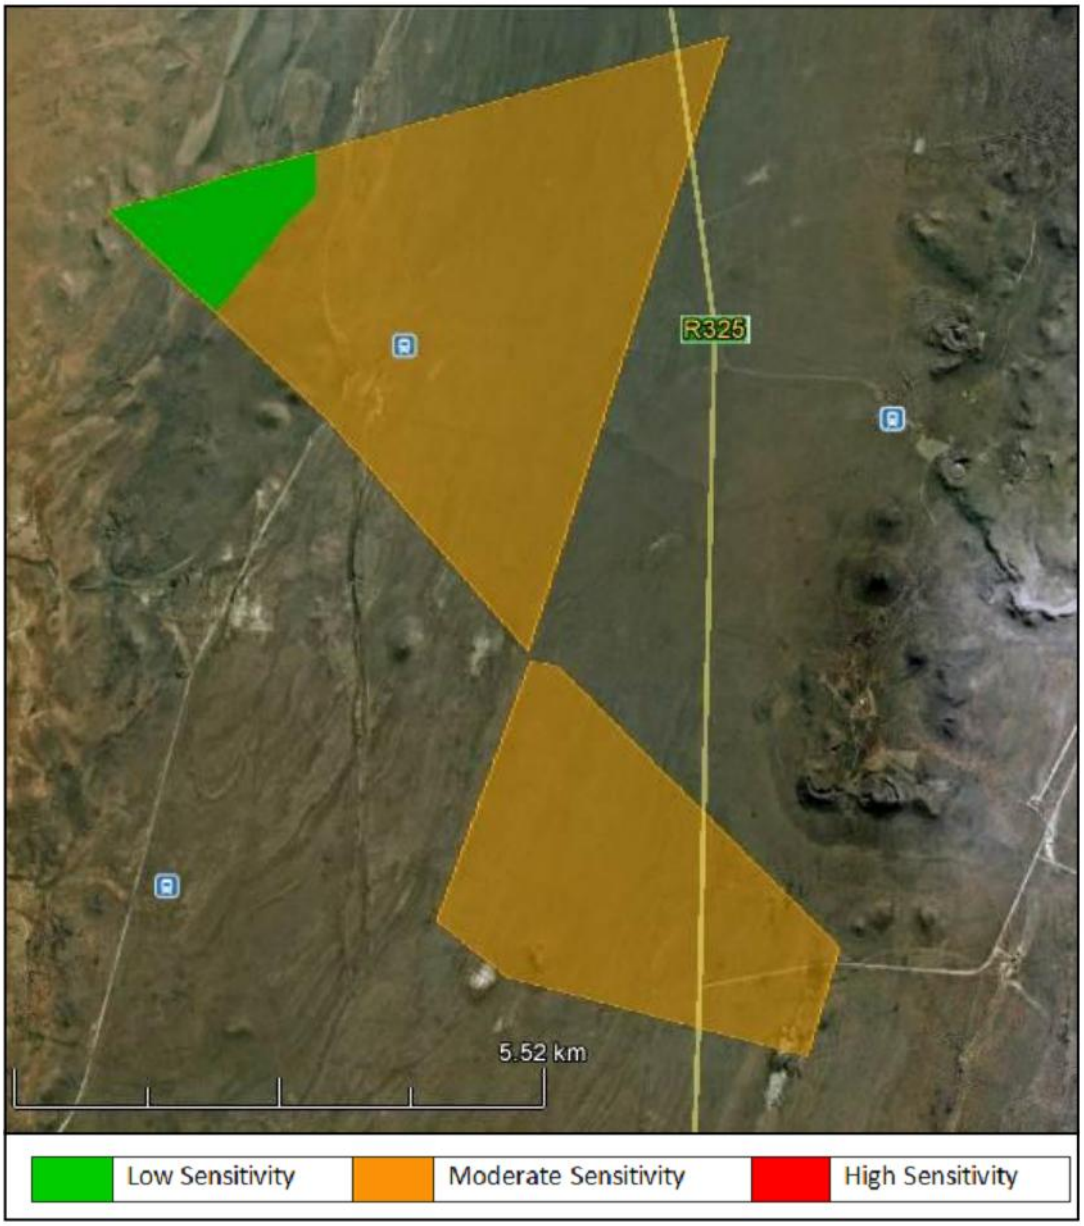

Figure 5.1 Map showing the palaeosensitivity of the study areas

6. CONCLUSION AND RECOMMENDATIONS

The study areas are underlain by chemical and clastic sedimentary sequences of the Campbell and Postmasburg Groups of the Transvaal Supergroup. These sedimentary sequences are associated with BIFs in the Postmasburg region where mining is envisaged. The dolomite sequences can contain good examples of stromatolite structures that are of medium palaeontological significance.

It is recommended that the developer and the ECO of the development be made aware of the possible presence of stromatolites. If these structures are present, a qualified palaeontologist must be informed and a representative sample of at least $1m^3$ must be collected for future reference. Photographic recording of the structures must form part of the Environmental Management Plan of the mining development.

8. QUALIFICATIONS AND EXPERIENCE OF THE AUTHOR

Dr Gideon Groenewald has a PhD in Geology from the University of Port Elizabeth (Nelson Mandela Metropolitan University) (1996) and the National Diploma in Nature Conservation from Technicon RSA (the University of South Africa) (1989). He specialises in research on South African Permian and Triassic sedimentology and macrofossils with an interest in biostratigraphy, and palaeoecological aspects. He has extensive experience in the locating of fossil material in the Karoo Supergroup and has more than 20 years of experience in locating, collecting and curating fossils, including exploration field trips in search of new localities in the southern, western, eastern and north-eastern parts of the country. His publication record includes multiple articles in internationally recognized journals. Dr Groenewald is accredited by the Palaeontological Society of Southern Africa (society member for 25 years).

9. DECLARATION OF INDEPENDENCE

I, Gideon Groenewald, declare that I am an independent specialist consultant and have no financial, personal or other interest in the proposed development, nor the developers or any of their subsidiaries, apart from fair remuneration for work performed in the delivery of palaeontological heritage assessment services. There are no circumstances that compromise the objectivity of my performing such work.

Dr Gideon Groenewald
Geologist

The following will be required to manage the heritage resources within the development areas.

1. METHODOLOGY

Aerial Photographical Survey

Aerial photographs will be used to identify possible places where heritage sites might be located.

Physical Surveying

The fieldwork component will consist of a walkthrough of the proposed development footprint areas and is aimed at locating heritage resources falling within (and directly adjacent to) the proposed development footprint areas. The locations of all heritage resources that are identified during the survey will be documented using a hand-held GPS. Furthermore, the documentation will reflect a brief qualitative description and statement of significance for each site and includes a photographic record of all the sites.

It is important to also note that informal social consultation (i.e. with local community members, residents and knowledgeable individuals) will be undertaken during the fieldwork component. The aim of social consultation is to identify any tangible and intangible resources (i.e. graves and other sacred places, myths and indigenous knowledge systems) that may exist.

2. DELIVERABLES

A report will be written which would include the following components:

- The identification and mapping of all heritage resources in the affected area;
- An assessment of the significance of such resources using heritage assessment criteria;
- An assessment of the impact of the development of such heritage resources;
- If heritage resources will be adversely affected by the proposed development, consideration of the alternatives; and
- Proposed mitigation of any adverse effects during and after the completion of the proposed development.

LEGISLATIVE REQUIREMENTS – TERMINOLOGY AND ASSESSMENT CRITERIA

1. GENERAL PRINCIPLES

In areas where there has not yet been a systematic survey to identify conservation-worthy places, a permit is required to alter or demolish any structure older than 60 years. This will apply until a survey has been completed and identified heritage resources are formally protected.

Archaeological and palaeontological sites, materials, and meteorites are the source of our understanding of the evolution of the earth, life on earth and the history of people. In terms of the heritage legislation, permits are required to damage, destroy, alter, or disturb such sites. People who already possess such material are required to register it. The management of heritage resources is integrated with environmental resources and this means that before development takes place heritage resources are assessed and, if necessary, rescued or mitigated.

In addition to the formal protection of culturally significant graves, all graves which are older than 60 years and are not in a cemetery (such as ancestral graves in rural areas) are protected. The legislation protects the interests of communities who have an interest in the graves: they must be consulted before any disturbance takes place. The graves of victims of conflict and those associated with the liberation struggle should be identified, cared for, protected and memorials erected in their honour.

Anyone who intends to undertake a development must notify the heritage resource authority and if there is reason to believe that heritage resources will be affected, an impact assessment report must be compiled at the applicant's (i.e. mining company or development company) cost. Thus, the applicant will be able to proceed without uncertainty about whether work will have to be stopped if an archaeological or heritage resource is discovered.

According to the National Heritage Act (Act 25 of 1999 section 32) it is stated that:

An object or collection of objects, or a type of object or a list of objects, whether specific or generic, that is part of the national estate and the export of which SAHRA deems it necessary to control, may be declared a heritage object, including –

- objects recovered from the soil or waters of South Africa, including archaeological and palaeontological objects, meteorites and rare geological specimens;
- visual art objects;
- military objects;
- numismatic objects;
- objects of cultural and historical significance;
- objects to which oral traditions are attached and which are associated with living heritage;
- objects of scientific or technological interest;
- books, records, documents, photographic positives and negatives, graphic material, film or video or sound recordings, excluding those that are public records as defined in section 1 (xiv) of the National Archives of South Africa Act, 1996 (Act No. 43 of 1996), or in a provincial law pertaining to records or archives; and
- any other prescribed category.

Under the National Heritage Resources Act (Act No. 25 of 1999), provisions are made that deal with, and offer protection to, all historic and prehistoric cultural remains, including graves and human remains.

2. GRAVES AND CEMETERIES

Graves younger than 60 years fall under Section 2(1) of the Removal of Graves and Dead Bodies Ordinance (Ordinance no. 7 of 1925) as well as the Human Tissues Act (Act 65 of 1983) and National Health Act (Act 61 0f 2003) and are the jurisdiction of the National Department of Health and the relevant Provincial Department of Health and must be submitted for final approval to the Office of the relevant Provincial Premier. This function is usually delegated to the Provincial MEC for Local Government and Planning or in some cases the MEC for Housing and Welfare. Authorisation for exhumation and reinterment must also be obtained from the relevant local or regional council where the grave is situated, as well as the relevant local or regional council to where the grave is being relocated. All local and regional provisions, laws and by-laws must also be adhered to. In order to handle and transport human remains, the

institution conducting the relocation should be authorised under Section 24 of Act 65 of 1983 (Human Tissues Act).

Graves older than 60 years, but younger than 100 years, fall under Section 36 of Act 25 of 1999 (National Heritage Resources Act) as well as the Human Tissues Act (Act 65 of 1983) and National Health Act (Act 61 0f 2003) and are the jurisdiction of the South African Heritage Resource Agency (SAHRA). The procedure for Consultation Regarding Burial Grounds and Graves (Section 36(5) of Act 25 of 1999) is applicable to graves older than 60 years that are situated outside a formal cemetery administrated by a local authority. Graves in the category located inside a formal cemetery administrated by a local authority will also require the same authorisation as set out for graves younger than 60 years over and above SAHRA authorisation.

If the grave is not situated inside a formal cemetery but is to be relocated to one, permission from the local authority is required and all regulations, laws and by-laws set by the cemetery authority must be adhered to.

HERITAGE ASSESSMENT METHODOLOGY

The section below outlines the assessment methodologies utilised in the study.

The Heritage Impact Assessment (HIA) report to be compiled by PGS Heritage (PGS) for the proposed mining activities at Coza Iron Ore Mine will assess the heritage resources found on site.

This report will contain the applicable maps, tables and figures as stipulated in the NHRA (no 25 of 1999), the National Environmental Management Act (NEMA) (no 107 of 1998) and the Minerals and Petroleum Resources Development Act (MPRDA) (28 of 2002). The HIA process consists of three steps:

Step I – Literature Review: The background information to the field survey usually leans greatly on the Heritage Scoping Report completed by PGS for this site.

Step II – Physical Survey: A physical survey will be conducted on foot by a qualified archaeologist through the proposed project area and is aimed at locating and documenting sites falling within and adjacent to the proposed development footprint.

Step III – The final step involves the recording and documentation of relevant archaeological resources, as well as the assessment of resources in terms of the heritage impact assessment criteria as well as report writing. This component would include mapping and constructive recommendations.

The significance of heritage sites is based on four main criteria:

- **site integrity** (i.e. primary vs. secondary context),
- **amount of deposit, range of features** (e.g., stonewalling, stone tools and enclosures),
    - Density of scatter (dispersed scatter)
        - Low - <10/50m^2
        - Medium - 10-50/50m^2
        - High - >50/50m^2
- **uniqueness** and
- **potential** to answer present research questions.

Management actions and recommended mitigation, which will result in a reduction in the impact on the sites, will be expressed as follows:

A - No further action necessary;

B - Mapping of the site and controlled sampling required;

C - No-go or relocate pylon position

D - Preserve site, or extensive data collection and mapping of the site; and

E - Preserve site

Site significance classification standards prescribed by the South African Heritage Resources Agency (2006) and approved by the Association for Southern African Professional Archaeologists (ASAPA) for the Southern African Development Community (SADC) region, will be used for the purpose of the HIA report.

FIELD RATING	GRADE	SIGNIFICANCE	RECOMMENDED MITIGATION
National Significance (NS)	Grade 1	-	Conservation; National Site nomination
Provincial Significance (PS)	Grade 2	-	Conservation; Provincial Site nomination
Local Significance (LS)	Grade 3A	High	Conservation; Mitigation not advised
Local Significance (LS)	Grade 3B	High	Mitigation (Part of site should be retained)
Generally Protected A (GP.A)	-	High/Medium	Mitigation before destruction
Generally Protected B (GP.B)	-	Medium	Recording before destruction
Generally Protected C (GP.A)	-	Low	Destruction

Appendix E

SIGNIFICANCE RATING SCALES FOR THE EIA

IMPACT ASESSMENT METHODOLOGY

In order to ensure uniformity, a standard impact assessment methodology will be utilised so that a wide range of impacts can be compared. The impact assessment methodology makes provision for the assessment of impacts against the following criteria:

- Significance
- Spatial scale
- Temporal scale
- Probability; and
- Degree of certainty.

PART A: DEFINITION AND CRITERIA*		
Definition of SIGNIFICANCE		**Significance = consequence x probability**
Definition of CONSEQUENCE		**Consequence is a function of severity, spatial extent and duration**
Criteria for ranking of the SEVERITY of environmental impacts	**H**	Substantial deterioration. Recommended level will often be violated. Vigorous community action.
	M	Moderate/ measurable deterioration (discomfort). Recommended level will occasionally be violated. Widespread complaints.
	L	Minor deterioration (nuisance or minor deterioration). Change not measurable/ will remain in the current range. Recommended level will never be violated. Sporadic complaints.
	L+	Minor improvement. Change not measurable/ will remain in the current range. Recommended level will never be violated. Sporadic complaints.
	M+	Moderate improvement. Will be within or better than the recommended level. No observed reaction.
	H+	Substantial improvement. Will be within or better than the recommended level. Favourable publicity.
Criteria for ranking the DURATION of impacts	**L**	Quickly reversible. Less than the project life. Short term
	M	Reversible over time. Life of the project. Medium term
	H	Permanent. Beyond closure. Long term.
Criteria for ranking the SPATIAL SCALE of impacts	**L**	Localised - Within the site boundary.
	M	Fairly widespread – Beyond the site boundary. Local
	H	Widespread – Far beyond site boundary. Regional/ national

PART B: DETERMINING CONSEQUENCE					
SEVERITY = L					
DURATION	Long term	**H**	**Medium**	**Medium**	**Medium**
	Medium term	**M**	**Low**	**Low**	**Medium**
	Short term	**L**	**Low**	**Low**	**Medium**
SEVERITY = M					
DURATION	Long term	**H**	**Medium**	**High**	**High**
	Medium term	**M**	**Medium**	**Medium**	**High**
	Short term	**L**	**Low**	**Medium**	**Medium**
SEVERITY = H					
DURATION	Long term	**H**	**High**	**High**	**High**
	Medium term	**M**	**Medium**	**Medium**	**High**
	Short term	**L**	**Medium**	**Medium**	**High**
			L	**M**	**H**
			Localised - Within site boundary - Site	Fairly widespread - Beyond site boundary - Local	Widespread - Far beyond site boundary - Regional/ national
			SPATIAL SCALE		

PART C: DETERMINING SIGNIFICANCE					
PROBABILITY (of exposure to impacts)	Definite/ Continuous	**H**	**Medium**	**Medium**	**High**
	Possible/ frequent	**M**	**Medium**	**Medium**	**High**
	Unlikely/ seldom	**L**	**Low**	**Low**	**Medium**
			L	**M**	**H**
			CONSEQUENCE		

PART D: INTERPRETATION OF SIGNIFICANCE	
Significance	**Decision guideline**
High	It would influence the decision regardless of any possible mitigation.
Medium	It should have an influence on the decision unless it is mitigated.
Low	It will not have an influence on the decision.

***H = high, M= medium and L= low and + denotes a positive impact.**
