

Addendum to permit – two fossil localities have been identified and now labelled UW 102 and UW 103 following the University of the Witwatersrand's cataloguing system for fossil bearing deposits. UW 102 is similar in content to the fossils contained in UW 101 though access and egress is more difficult than in the UW 101 system. It is not known whether the system is connected directly to UW 101 as the deposits are separated by around 40 to 50 linear meters and the underground extent of UW 101 has not been exactly established. UW 103 contains abundant and varied fauna and is located approximately 10 linear meters from UW 101. Locations of these deposits have been provided to SAHRA in email correspondence.
